Anatidae	Australian Shelduck, Australian Wood Duck, Black Swan, Grey Teal, Musk Duck, Pacific Black Duck	Abundance: 1,133 No. records: 188 Species richness: 6	Records spread throughout WFA, in cleared and MJP woodland habitats. Also recorded outside WFA in wider BIA. Around 75% of records as singleton and pairs, but also several flocks up to >30 individuals recorded (Australian Shelduck, Black Swan, Pacific Black Duck) and up to 650. The majority of records in winter months, but members of the family present throughout the year. Also represented in Basic and Targeted fauna survey records, notably in wetland habitats.

Family name	Common names	Data summary	Summary of records
Charadriidae	Banded Lapwing	Abundance: 4 No. records: 3 Species richness: 1	Limited records in WFA, only Banded Lapwing, which was restricted to sites in the south of the WFA in Cleared habitat, absent in summer months. Red-capped plover also, but restricted to Regional reference sites. Also represented in Basic and Targeted fauna survey, including additional member and additional Banded Lapwing record, notably in wetland habitats.
Ardeidae	White-faced Heron, White-necked Heron	Abundance: 161 No. records: 50 Species richness: 2	Records throughout the WFA, from cleared areas and MJP woodland habitats. Recorded mostly as singletons and pairs, but with a few flocks also recorded, and up to 55 individuals. Most observations were of White-faced Heron. Also recorded outside WFA in wider BIA and at Regional reference sites (but much rarer). Mainly recorded in summer, some spring records. Also represented in Basic and Targeted fauna survey, including additional member.
Threskiornithidae	Australian White Ibis, Royal Spoonbill, Straw-necked Ibis, Yellow-billed Spoonbill	Abundance: 4,147 No. records: 146 Species richness: 4	Records dominated by Straw-necked Ibis and Australian White Ibis which are both in the top 10 most abundant species for the survey; the other 2 species were rare. The 2 dominant species were recorded throughout WFA, and flocks of Straw-necked Ibis >100 individuals regularly recorded. Recorded from cleared and MJP woodland habitat in the WFA. Also recorded outside WFA in wider BIA and at Regional reference sites (Australian White Ibis only). Rare in winter, mainly recorded in summer. Also represented in Basic and Targeted fauna survey.
Phalacrocoracidae	Great Cormorant, Little Black Cormorant, Little Pied Cormorant, Pied Cormorant	Abundance: 18 No. records: 14 Species richness: 4	Records throughout the WFA, from cleared areas and MJP woodland habitats. Also recorded from Regional reference sites. Little Pied Cormorant and Pied Cormorant commonly recorded. Predominantly recorded as singletons and largely restricted to spring and summer months. Also represented in Basic and Targeted fauna survey.

5.1.3 Flight heights and movements

Table 5-5 summarises flight height and movement recorded in this survey and Phoenix (2025a) for all species where flight data was recorded, including the Regional reference sites (see full dataset in Appendix 6). Figure 5-6 presents the same data with respect to the direction of observed flights. Further information with respect to conservation significant species and other species of potential concern is provided below (section 5.1.4.2).

The data in Table 5-5 shows that far fewer birds were recorded within the RSA range (25.3%) than below (74.7%) or above (0.01%). In total 71.7% of birds were stationary below the minimum RSA height. The number of records (n = 71) and abundance of 'moving' birds (4.3%) in Table 5-5 indicates that relatively few, larger flocks were observed making distinct movements within the RSA.

Table 5-5 Summary of bird height records in relation to RSA height categories for all point-count sites

Bird movement	RSA Location	Height cat.	No. of species	No. consig. species	Abund.	No. of records	Relat. abund.	Pct. rcords
Moving	Below	0-24	35	2	448	136	2.9%	5.0%

Grant total			**100**	**12**	**15,437**	**2,716**	**100.0%**	**100.0%**

The following conservation significant species were recorded within the RSA (25–250 m) in the WFA:

- Forest Red-tailed Black Cockatoo (*Calyptorhynchus banksii naso*) (VU)
- Baudin's Cockatoo (*Zanda baudinii*) (EN)
- Carnaby's Cockatoo (*Zanda latirostris*) (EN)
- Peregrine Falcon (*Falco peregrinus*) (OS)
- Osprey (*Pandion haliaetus*) (Mig.).

The following conservation significant species were recorded within the RSA (25–250 m) at the Regional reference sites:

- Sharp-tailed Sandpiper (*Calidris acuminata*) (VU/Mig.)

- Sanderling (*Calidris alba*) (Mig.)
- Red-necked Stint (*Calidris ruficollis*) (Mig.)
- Caspian Tern (*Hydroprogne caspia*) (Mig.)
- Bar-tailed Godwit (*Limosa lapponica*) (Mig.)
- Fairy Tern (*Sternula nereis nereis*) (VU)
- Greater Crested Tern (*Thalasseus bergii*) (Mig.).

Figure 5-6 shows the direction of bird movements across the landscape, using abundance and number of records. The majority of distinct movements were toward the west (38.9%). This was closely followed by birds moving north, from the south (44.4%). However, a fair proportion were also moving in the opposite direction, south to north, and less so west to east. When movements are considered in either direction (east/west or north/south) the data is well balanced (abundance = 434 vs 496, respectively). Overall, the data therefore does not suggest any strong movement direction trends.

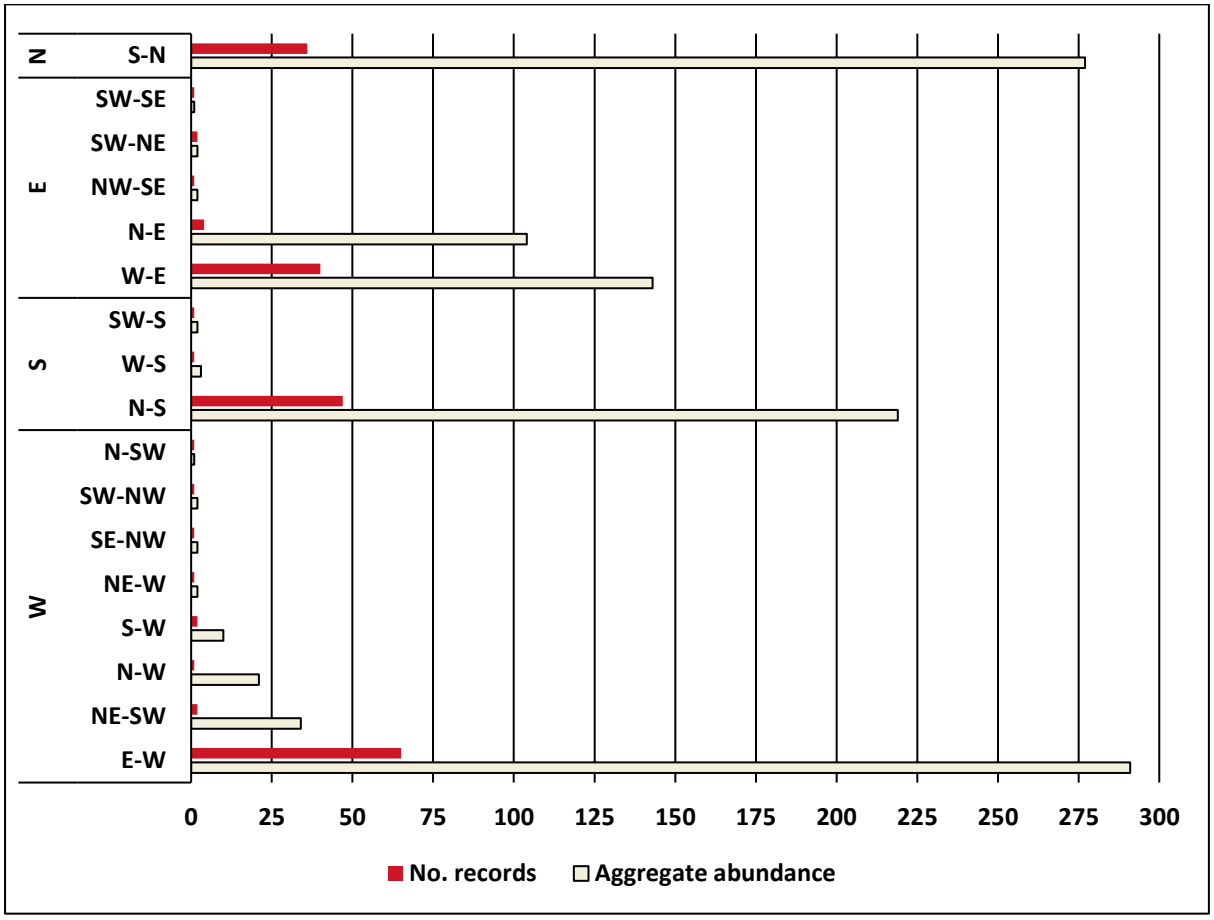

Figure 5-6 **Summary of flight direction: abundance and number of records for all point-count sites**

5.1.4 Conservation significant birds and other birds potentially of concern recorded

5.1.4.1 Species records

Fourteen bird species of conservation significance were recorded across the BBRAS survey and the Basic and Targeted fauna survey, one of which was only recorded from the latter (Wood sandpiper; Table 5-6; Figure 5-7). Seven of these species were recorded in the WFA and/or wider BIA:

- Baudin's Cockatoo (*Zanda baudinii*; EN) – recorded during both surveys, in the WFA and wider BIA
- Carnaby's Cockatoo (*Zanda latirostris*; EN) – recorded during both surveys, in the WFA and wider BIA
- Forest Red-tailed Black Cockatoo (*Calyptorhynchus banksii naso*; VU) – recorded during both surveys, in the WFA and wider BIA
- Wood Sandpiper (*Tringa glareola*; Mig.) – recorded during the Basic and Targeted survey, in the WFA only
- Osprey (*Pandion haliaetus*; Mig.) – recorded during both surveys, in the WFA and at Regional reference sites
- Peregrine Falcon (*Falco peregrinus*; OS) – recorded during the BBRAS, in the WFA only
- Masked Owl (southwest) (*Tyto novaehollandiae novaehollandiae*; P3) – recorded during the BBRAS, outside the WFA in the wider BIA.

The remaining 7 conservation significant species, all Migratory shorebirds, were recorded only at Regional reference sites, during Year 2 of the BBRAS:

- Caspian Tern (*Hydroprogne caspia*; Mig.) – recorded at Hardy Inlet, unlikely to occur in WFA
- Fairy Tern (*Sternula nereis nereis*) – recorded at Hardy Inlet, unlikely to occur in WFA
- Greater Crested Tern (*Thalasseus bergii*; Mig.) – recorded at Hardy Inlet, unlikely to occur in WFA
- Sharp-tailed Sandpiper (*Calidris acuminata*; VU; Mig.) – recorded at Hardy Inlet, may possibly occur in WFA on occasion
- Sanderling (*Calidris alba*; Mig.) – recorded at Hardy Inlet, unlikely to occur in WFA
- Red-necked Stint (*Calidris ruficollis*; Mig.) – recorded at Hardy Inlet, may possibly occur in WFA on occasion
- Bar-tailed Godwit (*Limosa lapponica*; Mig.) – recorded at Hardy Inlet, unlikely to occur in WFA.

All conservation significant species recorded in the WFA or wider BIA are considered potential species of concern to the Project per Brett Lane and Associates (2005) and DCCEEW (2024). Sharp-tailed Sandpiper and Red-necked Stint are also considered potential species of concern as they may possibly occur in the WFA on occasion. Caspian Tern, Greater Crested Tern, Sanderling and Bar-tailed Godwit are not considered of concern as they are unlikely to occur in the WFA as no suitable habitat is present.

In addition to the recorded conservation significant species, non-conservation significant raptors recorded were also identified as potential species of concern as they are particularly vulnerable to collision risk due to their morphology and/or flight behaviour, though susceptibility varies between species. Eleven non-conservation significant raptors were recorded across the BBRAS survey and the Basic and Targeted fauna survey (Table 5-6; Figure 5-7).

Table 5-6 Summary of conservation significant bird records and other recorded birds potentially of concern

Species	Cons. status	Rec. area[1]	Sites[2]	Evidence	Pot. use WFA	No. rec (ab.)		Habitats[3,4]										Rel. ab.	Rec. flight height cat. (# records), Flight direction/s
						BBRAS sites	B/T sites[2]	SIPW	SISE	SISH	MJP	OWP	Cleared	Clrd – DS	Dam	Bluegum	Pine		
Conservation significant bird species recorded																			
Pandion haliaetus (Osprey)	Mig. (EPBC & BC Acts)	WFA, Reg.	BBRAS sites – BUS030, BUS032, BUS033, BUS034 B/T sites – Osprey	Direct sighting at 'Osprey' site in WFA; opportunistic record during heritage survey, flying over a paddock. All other records from Regional sites at Hardy Inlet. Known to utilise a variety of near-coastal habitats. Study area considered minor/supplemental foraging habitat within the home range of Hardy Inlet individuals. Suitable foraging habitat is abundant outside the WFA. Unlikely to nest within the study area.	None, transitory only	6 (6)	1 (1)	S	S	S			R					0.05%	0-24 m (2) 25-50 m (3) 51-75 m (1)
Calyptorhynchus banksii naso (Forest Red-tailed Black Cockatoo)	VU (EPBC & BC Acts)	WFA, BIA	BBRAS sites – BUS008, BUS013 B/T sites – AQU-01, AQU-02, AQU-03, AQU-25, AQU-40, AQU-55, BC2024_01, BCForaging, BCRoosting05, BCRoosting09, FRTBC-01, FRTBC-02, FRTBC-03, FRTBC-04, FRTBC-05, FRTBC-06, Opp12, Opp13,	Audio recording, direct sighting and foraging evidence in the WFA. Records from the WFA and wider BIA. Most records of individuals and pairs, with only 9 records of >2 birds. The largest flock (53 individuals) recorded 1.5 km west of study area during the BBRAS (site BUS013). It was directly observed foraging at one site (VER-Opp04) while foraging evidence (chewed Marri nuts predominantly) was obtained from 7 sites. 15 audio detections it total, but only once from the BBRAS recorders (open paddocks). The Phase 3 audio recordings identified 12 detections, of which 6 were flyovers and 6 were foraging detections where the birds spent >1 minute at that site presumably foraging, or prospecting. All other records were of the birds moving	Roosting, foraging. Study area contains PNTs but none with hollows currently suitable for breeding	3 (55)	45 (104)	R, S	R, S	R, S	R, S	S	R		R			0.83%	0-24 m (3) 25-50 m (2) N-S

Species	Cons. status	Rec. area[1]	Sites[2]	Evidence	Pot. use WFA	No. rec (ab.)		Habitats[3,4]										Rel. ab.	Rec. flight height cat. (# records), Flight direction/s
						BBRAS sites	B/T sites[2]	SIPW	SISE	SISH	MJP	OWP	Cleared	Clrd – DS	Dam	Bluegum	Pine		
			Opp15, Opp19, SM4-01, SM4-02, SM4-06, SM4-07, VER-22, VER-32, VER-33, VER-40, VER-45, VER-47, VER-Opp04, VER-Opp07, VER-Opp08	through/over this habitat. No breeding or night roosting behaviour was observed. Suitable habitat within and surrounding the WFA.															
Zanda baudinii (Baudin's Cockatoo)	EN (EPBC & BC Acts)	WFA, BIA	BBRAS sites – BUS014, BUS015, BUS019 B/T sites – Opp11, VER-41, VER-42, VER-Opp01	Calls, direct sightings in the WFA. Records from the WFA and wider BIA. Largest flocks – 26, 10, 9 and 8 individuals. Observed foraging just once in the WFA (site VER-Opp01). All other observations were of birds moving through the landscape. No breeding or night roosting behaviour was observed. In addition to the records of Baudin's, *Zanda* sp. (either Baudin's or Carnaby's) was detected during Phase 3 audio recordings at all sites (92 individual detections) for a total occupation time of 9.5 hours over ~2 months of recording, with 37 (45%) of these being birds flying over the site. *Zanda* sp. was also recorded directly 5 times, twice foraging and 3 times moving through the landscape. It is likely that most of these records were Carnaby's Cockatoo given the much higher detection rate of this species over Baudin's (~4:1) during the surveys. Suitable habitat within and surrounding the WFA.	Roosting, foraging. Study area contains PNTs but none with hollows currently suitable for breeding	3 (11)	4 (46)	S	S	S	R, S	S	R	S		S		0.30%	0-24 m (3)

Zanda latirostris (Carnaby's Cockatoo)	EN (EPBC & BC Acts)	WFA, BIA	BBRAS sites – BUS001, BUS004, BUS005, BUS010, BUS014, BUS016, BUS019, BUS020, BUS026, BUS027 B/T sites – AQU-28, AQU-39, AQU-51, AQU-53, AQU-55, BCRoosting05, BCRoosting09, CarnabysCockies 02, VER-31, VER-33, VER-39, VER-41, VER-42	Calls, direct sightings in the WFA. Records from the WFA and wider BIA. Evidence of occupation via calls and direct sightings at 23 sites (36 total records), with repeated detections at a number of those sites. Predominantly recorded as singles, with only 9 records of more than one individual and flocks >10 birds observed on 3 occasions. Observed foraging in MJP woodland once outside the WFA. Two observations of foraging on the ground in the WFA eating paddock seeds. All other records were of birds moving through the landscape. In addition to the records of Carnaby's, *Zanda* sp. (either Baudin's or Carnaby's) was detected during Phase 3 audio recordings at all sites (92 individual detections) for a total occupation time of 9.5 hours over ~2 months of recording, with 37 (45%) of these being birds flying over the site. *Zanda* sp. was also recorded directly 5 times, twice foraging and 3 times moving through the landscape. It is likely that most of these records were Carnaby's Cockatoo given the much higher detection rate of this species over Baudin's (~4:1) during the surveys. Suitable habitat within and surrounding the WFA.	Roosting, foraging. BBRAS sites – BUS001, BUS002, BUS004, BUS005, BUS007, BUS008, BUS010, BUS011, BUS012, BUS013, BUS016, BUS018, BUS019, BUS020, BUS026, BUS027, BUS030, BUS034 B/T sites – VER-21, VER-45	Direct sightings in the WFA, BIA and Regional reference sites. Singles, pairs. All records were of birds in flight. Observed soaring and foraging in the WFA and flying over.	Foraging, roosting, breeding	45 (56)	2 (2)	S	S	S	S	S	S	S	S			0.30%	0-24 m (34) 25-50 m (8) 76-150 m (3) S-N
Falco longipennis (Australian Hobby)	Not listed	WFA	BBRAS sites – BUS001, BUS006 B/T sites – none	Direct sightings in the WFA. Singles, one pair. All records were of birds in flight.	Foraging, roosting, breeding	3 (4)	0 (0)	S	S	S	S	S	S	S	S			0.02%	0-24 m (2) 51-75 m (1) N-S

1 – BIA in this column refers to the BIA extent that is outside the WFA. Reg. = Regional sites.

2 – B/T sites = Basic and Targeted fauna survey sites.

3 – SIPW – seasonally inundated paperbark woodland (wetland); SISE – seasonally inundated sedgeland (wetland); SISH – seasonally inundated shrubland; MJP – Marri-Jarrah-Peppermint woodland; OWP – Open woodland of Peppermint trees (degraded); Clrd DS – Cleared–degraded sumpland; Bluegum – Bluegum plantation; Pine – Pine plantation.

4 – 'R' = Recorded from habitat. 'S' = Suitable habitat for species.

Figure 5-7

Recorded conservation significant birds and other birds potentially of concern

PHOENIX ENVIRONMENTAL SCIENCES

5.1.4.2 Flight heights and movements

The flight data presented below (Table 5-7) includes records from the current survey and the Basic and Targeted fauna survey (Phoenix 2025a). Not all records for conservation significant species included flight details due to the sample method (e.g. audio recordings), or other factors, and therefore the numbers below do not necessarily match those presented in Table 5-6 above.

Seven conservation significant species were recorded flying at heights within the RSA (Table 5-7), although most records were of birds flying below the RSA (i.e., 0-24m):

- Caspian Tern (0-50 m) – Regional reference sites only
- Fairy Tern (0-50 m) – Regional reference sites only
- Greater Crested Tern (25-50 m) – Regional reference sites only
- Osprey (0-75 m) – Regional reference sites, plus recorded in the WFA but no height recorded
- Peregrine Falcon (25-50 m) – WFA
- Forest Red-tailed Black Cockatoo (0-50 m) – WFA and BIA
- Carnaby's Cockatoo (0-50 m) – WFA and BIA.

Flight direction for most observations was determined to be 'stationary', as the birds were either hovering or showing no distinct direction of movement. However, where they were recorded as moving in a distinct direction they were typically moving N-S/S-N and there is no difference in movement between conservation significant species and the broader assemblage, as presented in section 5.1.3 (Figure 5-6; Table 5-5).

Wood Sandpiper and Peregrine Falcon were recorded from only a single observation each, therefore no substantive comments can be made concerning observed behaviour, site utilisation etc for these species. Masked Owl was only recorded indirectly via nocturnal audio recording therefore no flight heights were recorded.

Table 5-7 Flight directions per record for conservation significant birds (grey rows denote RSA heights)

5.2 BATS

5.2.1 General summary

A summary of the data for the 16 sites where ultrasonic recorders were deployed in Year 1 is presented in Table 5-8. The site level data presents a compelling and consistent theme of relatively high bat diversity, but generally low levels of activity, across the WFA. A total of 55 samples were recorded over 71 nights and bats were detected in 43 of those nights, which means over 20% of samples detected no bats at all. Further, 50% of sites (8 of 16) detected no bats at least once. Those samples where no bats were detected occurred in all seasons (seasonal trends are presented in more detail below).

Where bats were detected, all metrics presented in Table 5-8 demonstrate low bat activity, with a few exceptions. For example, a total of 1,233 detections were found from an approximate 852 hours of recording, meaning bats were detected at a rate of 1.5 per hour, or one detection every 40 minutes, on average across the Impact and Reference sites. Similarly for the number of calls, a total of 9,803 were obtained (from 852 hours of recording), resulting in just 11.5 calls per hour on average being recorded. Further, the average number of calls per detection was just 5.5 overall, with 11 sites (69% of sites) recording an average number of calls per detection of <5. These results suggest either very low numbers of individuals typically are being detected when bats are present, and/or bats are not actively hunting in the cleared areas at or near ground-level but are instead passing through on their way to more productive remnant patches; It is considered likely a combination of both scenarios.

The highest activity levels were at sites BUS002 and BUS013 (25.7 and 15.6 average number of calls per detection respectively; Table 5-8). These sites were located on a roadside remnant in the BIA west of the WFA and in a cleared area in the southern half of the WFA, respectively. Sites BUS001, BUS014 and BUS035 also recorded relatively high activity levels, based on average number of calls per detection (6–8). BUS012 was the least active site which although only sampled once before access to this area was removed, recorded a single species, from a single detection and call.

While the number of calls detected vary considerably between sites and species (Table 5-11), a rather homogenous bat assemblage was recorded for the most part across the WFA and immediate surrounds. For example, Impact sites recorded 7 species and Reference sites 8 species; both Impact and Reference sites recorded 2 families. The mean total number of calls per site was 476 at Impact sites and 632.2 at Reference sites, whereas the average number of calls per detection was 4.1 at Impact sites, 8.9 at Reference sites and 8.0 overall, suggesting almost 50% lower activity at Impact sites and low activity generally in both.

Table 5-8 Sites summary for bats

Total abund.		**55**	**71**	**852**	**43**	**8**	**2**	**9,803**	**1,233**	**8.0**	**1.4**	**11.5**

When the bat data is considered spatially, a clear picture emerges, that is that bat activity at sites outside the WFA or at its borders (i.e. in proximity to native vegetation) is much higher than in the central areas (Figure 5-8). The data therefore suggests that while there may be as many species being detected over time inside the WFA, the bat activity at those sites, located in the cleared landscape of the WFA is much lower than at sites outside the WFA. Indeed, the number of calls and detections are so low at many sites (68.75% of them), the data suggests that the individuals detected were moving through the area only, and not actively foraging, which is important when considering risk to bats in general and to individual species.

The bat data is summarised with respect to season in Table 5-9 and shown visually in Figure 5-9. While species richness stayed relatively constant over the 4 seasons (6-8 species), bat detection changed markedly, peaking in summer (634), then declining through the rest of the year, so that summer detections were 4 times that of winter (155), 3 times that of autumn (201) and over twice that of spring (283).

The 2 species not detected in winter were *Falsistrellus mackenziei* (Western False Pipistrelle; P4) and *Nyctophilus holtorum* (Holt's Long-eared Bat). While no data is available concerning the hibernation or torpor of *F. mackenziei* and *N. holtorum* specifically, seasonal fluctuation in species diversity and detection is well documented for bats in temperate climates. Bats may be homeothermic like other mammals but their high energy requirements and large surface area to volume ratio mean they expend a lot of energy and get cold easily, hence many undertake a form of hibernation or torpor each winter, and/or will dramatically reduce their activity in response to daily temperature variations. For example, Chocolate Wattled Bat is typically one of the last species to emerge from winter hibernation (Churchill 2008).

Other members of the family Vespertilionidae (such as *F. mackenziei*) as well as *Nyctophilus* species such as, *N. gouldi* and *N. geoffroyi* are also known to go into extended periods of torpor of up to 15 days (Genoud & Christe 2011; Turbill & Geiser 2008). Therefore, the declines in activity per the number detections are a response to seasonal conditions and not due to migration out of the study area to warmer climes.

Table 5-9 Summary of bat data per season

Season	No. of samples	Species richness	Family richness	No. of detections	No. of calls	Mean detections
Autumn	12	8	2	201	2,733	13.6
Winter	8	6	2	115	1,041	9.1

PHOENIX ENVIRONMENTAL SCIENCES

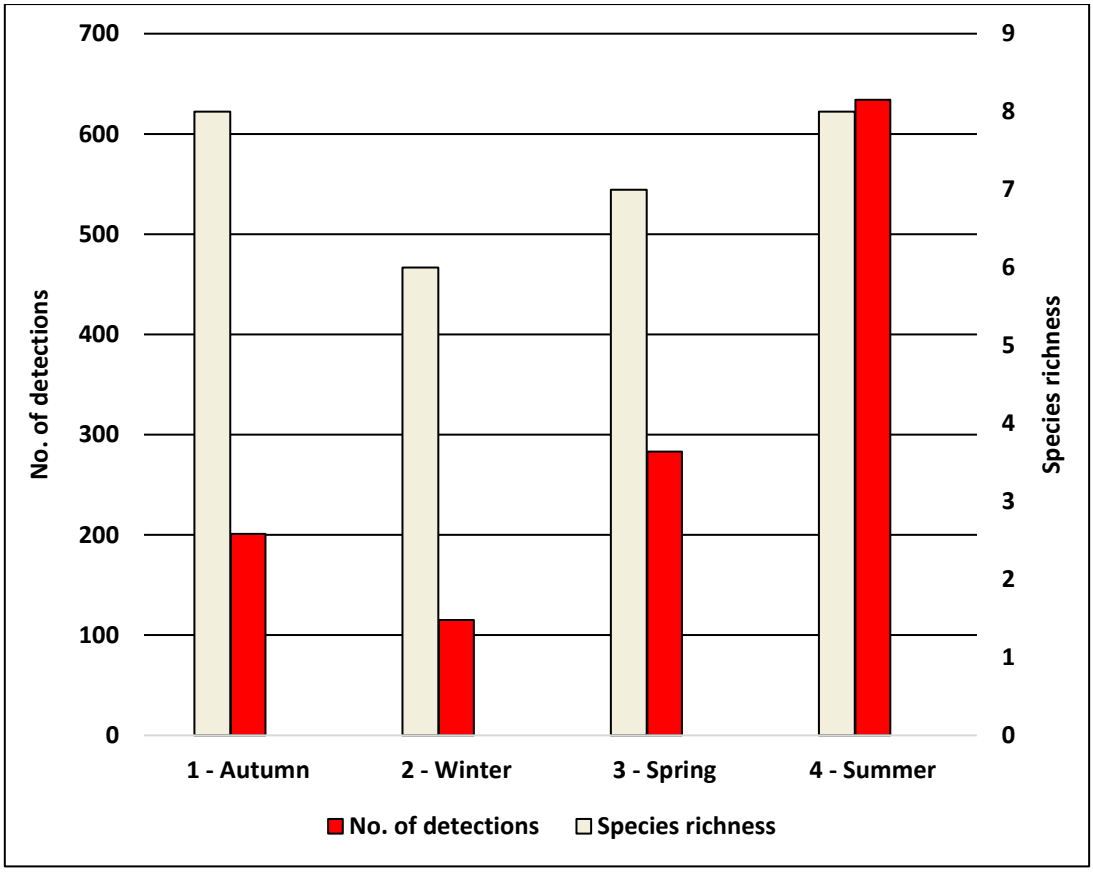

Figure 5-9 Number of bat species and detections per season at BBRAS sites

5.2.2 Assemblage summary

All bats herein are treated as species of concern. A total of 8 bat species were recorded in the current BBRAS survey and 7 in the Basic and Targeted survey (Table 5-10; Appendix 3; Appendix 5). The data presented here relates only to the current survey, unless otherwise stated. *Nyctophilus major* was not recorded by Phoenix (2025a).

Three of the recorded bat species were not identified in the desktop assessment for the species characterisation (Section 4.2), which reflects changes in Chiropteran taxonomy rather than historic or current survey efforts. The assemblage represented 2 families, Vespertilionidae (7 species) and Molossidae (one species; Table 5-10).

Table 5-10 Recorded bat assemblage, by family

Family	Species recorded	Summary of records
Molossidae	White-striped Free-tailed Bat *Austronomus australis*	Recorded at 15 of the 16 sites, mainly in cleared areas between remnants but also 2 Marri Jarrah Peppermint woodland BBRAS sites. However, the species is believed to generally be strongly tied to dense, often old-growth, forest (Churchill 2008). Second most detected species (2,939). Far more active in summer, almost absent in winter.
Vespertilionidae	Gould's Wattled Bat *Chalinolobus gouldii* Chocolate Wattled Bat *Chalinolobus morio* Western False Pipistrelle *Falsistrellus mackenziei* Lesser Long-eared Bat *Nyctophilus geoffroyi* Holt's Long-eared Bat *Nyctophilus holtorum* Greater Long-eared Bat *Nyctophilus major* Southern Forest Bat *Vespadelus regulus*	Activity of the members of this family varied greatly across 15 of the 16 sites (this family was not detected at BUS012). For example, *Falsistrellus mackenziei* (P4) was detected rarely (9 detections from 1 impact site and 5 reference sites), whereas *Vespadelus regulus* was the most detected species (5,478 detections from 14 sites). All species were recorded from both cleared and Marri Jarrah Peppermint woodland[1] BBRAS sites. Representatives were also recorded from Seasonally inundated sedgeland (wetland), Seasonally inundated shrubland (wetland), Open woodland of Peppermint trees (degraded) habitats in the Basic and Targeted fauna survey. As above, members of this family were most active in summer and least active in winter.

The aggregated bat data per species is presented as a species-site matrix in Table 5-11. Bats were recorded at all 16 sites, with just one species detected at site BUS012 (White-striped Free-tailed Bat) and all 8 species detected at sites BUS014 and BUS015, both located outside the study area. The species richness of Impact and Reference sites was similar, with only *Nyctophilus major* being absent from Impact sites.

The activity levels were high for White-striped Free-tailed Bat (overall mean = 12.9) and Southern Forest Bat (overall mean = 11.4) (Table 5-11; Figure 5-10) despite being absent from one and 2 sites, respectively. Activity levels of Southern Forest Bat were however moderate within the WFA but high outside this in the wider BIA.

The activity levels of all other species were low, recording mean call numbers of between 1.0 and 3.5, over all records. Holt's Long-eared Bat and Western False Pipistrelle were the rarest species, being present from 4 and 6 sites and having mean call numbers of 1.1 and 1, respectively. The results suggest that other than for White-striped Free-tailed Bat and Southern Forest Bat, the other 6 species infrequently foraged within the detection circumference of the recorders, and were mostly passing by as either individuals, pairs or small groups.

Bat activity was also analysed by 30-minute intervals to investigate whether there were any periods of particularly high activity as bats typically show strong site fidelity and consistent nightly movement patterns. As can be seen in Figure 5-10 all bats were present throughout the night, although generally less active in the first and last 1–2 hours each night. And, with the exceptions of White-striped Free-tailed Bat and Southern Forest Bat, activity was typically low throughout the night.

Calls of Southern Forest Bat typically peaked between 7–730pm each night, then showed a steady decline throughout the night (Table 5-10; Appendix 7). White striped Free-tailed Bat was generally not active until 8–830pm, after which activity steadily increased until 1130–12pm, then steadily declined toward dawn each night. Chocolate Wattled Bat was the 3rd most active species. It was active from 830pm–4am, being most active at around 2am.

The delayed arrivals and early departures of most species suggest, as would be excepted, that bats are not roosting in the open paddock habitats in which the recorders were located and the proposed impact would take place, but are instead roosting elsewhere in native remnant habitats and moving into the cleared paddocks after foraging near their roost sites. This is certainly the case for the only significant bat recorded, Western False Pipistrelle, which was only detected a handful of times from 1–2 calls per detection (also see section 5.2.3; Table 5-12).

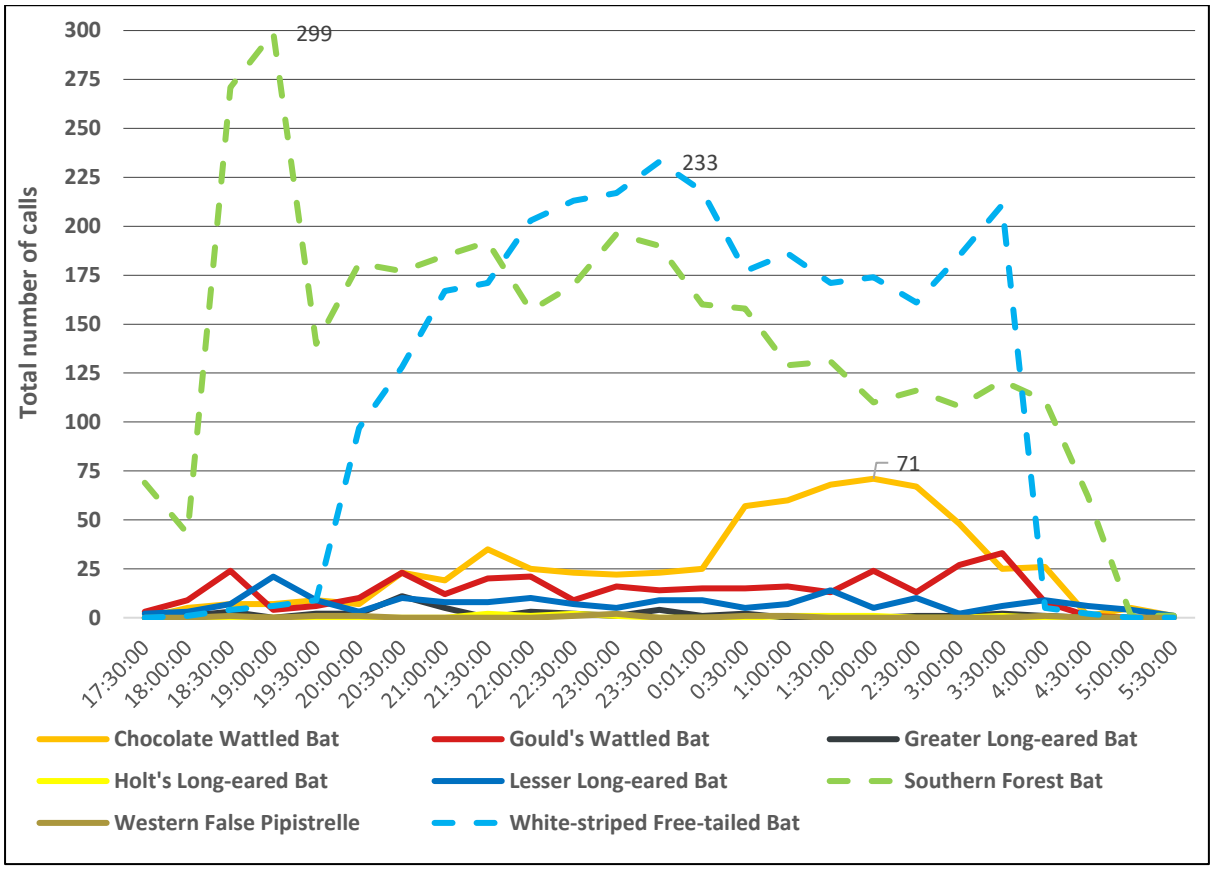

Figure 5-10 Total number of calls per 30-minute time interval

5.2.3 Conservation significant bats

A single conservation significant bat species, Western False Pipistrelle (*Falsistrellus mackenziei*; P4), was recorded across both the BBRAS and the Basic and Targeted fauna survey (Phoenix 2025a). The species was detected once each from 4 BBRAS sites within the WFA and twice at site BUS015 and in 3 consecutive nights at BUS014, both of which are located outside the WFA (within Chester National Park and on the Scott River respectively). It was also detected at site VER-43 on one occasion (Table 5-12). It was recorded from 3 habitat types, Marri-Jarrah-Peppermint woodland, seasonally inundated sedgeland (wetland) and Cleared areas (Figure 5-7).

The timing of the calls for Western False Pipistrelle display no obvious pattern with sparse records throughout the night. Detections were rare, and occurred at sporadic times, over several seasons, primarily in summer (Table 5-12). On this basis it is difficult to say whether or not it is resident in the WFA. The literature suggests it has a strong preference for dense 'old-growth'/mature wet sclerophyll forests of Karri, Jarrah and Tuart (Churchill 2008), from which it rarely ventures far, and this data tends to support that understanding. Within the WFA suitable nesting/roosting habitat occurs in the hollow-supporting MJP woodland, located primarily on the northern boundary, and near Governor Broome Road in the southeast, south and southwest. Abundant, suitable roosting habitat is present in the forested conservation reserves and the Scott River outside the WFA, where this species was most frequently detected.

Table 5-12 Western False Pipistrelle detections

Area	Site	Site description	Season	Date	Time	No. detections
Impact	BUS004	Cleared, open paddock, near several small remnants, in study area.	Spring	18/11/2023	01:00	1
Reference	BUS001	Cleared paddock, directly adjacent narrow roadside Marri-Jarrah-Peppermint woodland, in study area.	Spring	18/11/2023	23:00	1
	BUS011	Cleared roadside, directly adjacent narrow roadside seasonally inundated shrubland, in study area.	Summer	13/01/2024	20:00	1
	BUS013	Narrow roadside remnant vegetation directly adjacent paddock, outside (west of) study area.	Autumn	24/05/2023	19:30	1
	BUS014	Cleared, roadside, directly adjacent large contiguous woodland (conservation reserve), outside (north of) study area.	Summer	12/01/2024	22:30	1
			Summer	13/01/2024	00:30	1
			Summer	14/01/2024	04:00	1
	BUS015	Cleared paddock, directly adjoining vegetation remnant outside (south of) study area.	Autumn	25/05/2023	18:30	1
			Summer	12/01/2024	23:00	1
	VER-43[1]	Seasonally inundated sedgeland (wetland), in study area; within Bluegum plantation stand.	Summer	10/12/2023	00:00	1

Significant bats (all survey records)

Falsistrellus mackenziei, P4 (DBCA list)

Figure 5-11

Recorded conservation significant bats and other bats potentially of concern

PHOENIX ENVIRONMENTAL SCIENCES

5.3 LIKELIHOOD OF OCCURRENCE ASSESSMENT

Aside from the 7 conservation significant bird and one significant bat species that were recorded in the WFA or wider BIA (sections 5.1.4 and 5.2.3), the likelihood of occurrence assessment for the remaining 33 significant species identified in the regional overview as potentially relevant to the Project (section 4.2) determined 2 were likely to occur in the WFA, 9 may possibly occur and 10 may also possibly occur on rare occasions (Table 5-13). The remaining 12 significant species were considered unlikely to occur in the WFA and therefore are not considered potential species of concern to the Project (Table 5-13).

The 7 conservation significant Migratory shorebirds that were recorded in the survey only at Hardy Inlet Regional sites (section 5.1.4) are included in Table 5-13 so that comment can be made on their likelihood of occurrence in the WFA.

Table 5-13 Likelihood of occurrence assessment for significant species not recorded in the WFA/BIA

Species	Cons. status	LOO	Comment	Suitable habitats in study area									
				SIPW[1]	SISE[1]	SISH[1]	MJP[1]	OWP[1]	Cleared	Clrd–DS[1]	Dam	Bluegum[1]	Pine[1]
Oxyura australis Blue-billed Duck	P4 (DBCA list)	Likely	Previously recorded near the WFA from multiple sources. Desktop records are greater than 10 years old (some <15 years) but there are close records from several sources, and suitable habitat in the WFA, particularly the larger lakes. Therefore, is it considered likely to occur, at least on occasion.	●									
Apus pacificus Fork-tailed Swift	Mig. (EPBC & BC Acts)	Possible	WFA within species distribution but no previous records within 10 km. Known to occur in a wide range of habitats. Aerial feeder, may feed over the WFA on occasion.	●	●	●	●	●	●	●	●		
Botaurus poiciloptilus Australasian Bittern	EN (EPBC & BC Acts)	Possible	WFA is within known range and potentially suitable habitat is present. No previous records within 10 km (nearest desktop records from Hardy Inlet ~12 km SW and Gingilup/ wetlands ~30 km SE, dates unknown). While targeted searches and ARUs deployed did not detect the species during the surveys, potential for occasional presence cannot be discounted. Potential for rare use of the larger wetlands in the WFA but unlikely a regular visitor or regularly transit through the WFA.	●	●	●							
Anarhynchus bicinctus Double-banded Plover	Mig. (EPBC & BC Acts)	Possible (rare)	Previous desktop records within 10 km of WFA but old (1979-80) and from a single site near the artificial wetlands. No other desktop records returned. While the species is known to use terrestrial wetlands and pasture near the coast, it occurs rarely in WA. Therefore, considered unlikely to occur except as possibly a very rare visitor.	●	●	●			●	●			
Anarhynchus leschenaultii Greater Sand Plover	VU/Mig. (EPBC Act); VU (BC Act)	Unlikely	Suitable habitat not present in WFA, occurs in littoral and estuarine habitats large intertidal mudflats or sandbanks. There are desktop records from a single site near the artificial wetlands but old (1980).										

Species	Cons. status	LOO	Comment	Suitable habitats in study area									
				SIPW[1]	SISE[1]	SISH[1]	MJP[1]	OWP[1]	Cleared	Clrd–DS[1]	Dam	Bluegum[1]	Pine[1]
Anarhynchus mongolus Siberian Sand Plover	EN/Mig. (EPBC Act); EN (BC Act)	Possible (rare)	Previous old (1980) desktop record within 10 km of WFA but mainly uses coastal habitats such as beaches, mudflats and sandflats. Potential for rare use of wetlands in WFA.	●	●	●							
Charadrius cucullatus Hooded Plover/Dotterel	P4 (DBCA list)	Unlikely	Nearby record but is from sandy beach habitat. Suitable habitat not present in WFA, generally a beach and salt lake species.										
Pluvialis fulva Pacific Golden Plover	Mig. (EPBC & BC Acts)	Possible	Previous desktop record within 10 km of WFA, though not recent. Mainly uses coastal habitats but also recorded from wetlands, paddocks. Potential for occasional use of the larger wetlands in the WFA but unlikely a regular visitor to the WFA when present in the southwest. Very limited overlap between species arrival in region (desktop records indicate December) and when most wetlands in WFA have suitable foraging habitat.	●	●	●			●	●			
Pluvialis squatarola Grey Plover	VU/Mig. (EPBC Act); Mig. (BC Acts)	Possible (rare)	No previous record within 10 km of WFA. Suitable main habitat not present, prefers coastal habitats. Potential for rare use of wetlands, paddocks in WFA.	●	●	●			●	●			
Anous tenuirostris melanops Australian Lesser Noddy	VU (EPBC Act); EN (BC Act)	Unlikely	Desktop record is projected distribution only. No nearby records, and no suitable habitat in WFA.										
Hydroprogne caspia Caspian Tern	Mig. (EPBC & BC Acts)	Recorded Regional sites, Possible (rare) in WFA	Previous desktop records within 10 km of WFA and was recorded in survey only at Hardy Inlet Regional sites. Mainly found in sheltered coastal embayments. May also occur in near-coastal terrestrial wetlands; however, the wetlands present in the WFA are shallow and unlikely to provide the species' preferred food sources (hunts for fish). Habitat in WFA therefore considered marginal. May occur as rare visitor or transit through but unlikely to utilise the WFA.	●	●	●							

Species	Cons. status	LOO	Comment	Suitable habitats in study area									
				SIPW[1]	SISE[1]	SISH[1]	MJP[1]	OWP[1]	Cleared	Clrd–DS[1]	Dam	Bluegum[1]	Pine[1]
Onychoprion anaethetus Bridled Tern	Mig. (EPBC & BC Acts)	Unlikely	No previous records within 10 km of WFA. Mainly offshore species. No suitable habitat in WFA.										
Sternula nereis nereis Fairy Tern	VU (EPBC & BC Acts)	Recorded Regional sites, Unlikely in WFA	Desktop record was projected distribution only but was recorded in the survey at Hardy Inlet Regional sites only. Occurs in coastal habitats and on offshore islands. Suitable habitat not present in WFA. Species is unlikely to utilise WFA.	●	●	●							
Thalasseus bergii Greater Crested Tern	Mig. (EPBC & BC Acts)	Recorded Regional sites, Unlikely in WFA	Desktop records within 10 km but not recent. All recent desktop records associated with the Hardy Inlet and the coast. Survey records only from Hardy Inlet Regional sites. No suitable habitat present in WFA. species is unlikely to utilise the WFA.										
Leipoa ocellata Malleefowl	VU (EPBC & BC Acts)	Unlikely	Locally extinct.										
Motacilla cinerea Grey Wagtail	Mig. (EPBC & BC Acts)	Possible (rare)	Desktop record is projected distribution only. Suitable habitat is present but occurs in a wide range of habitats. Very few records of this species from the region. May occur in the WFA on rare occasion only.	●	●	●			●	●	●		
Actitis hypoleucos Common Sandpiper	Mig. (EPBC & BC Acts)	Possible	Previous recent desktop records within 10 km of WFA. Uses variety of coastal and inland wetlands. Suitable habitat present when species arrives in the region (September-October). Occasional use of the larger wetlands in the WFA possible, but unlikely a regular visitor or regular transit through the WFA.	●	●	●							
Arenaria interpres Ruddy Turnstone	VU/Mig. (EPBC Act); Mig. (BC Act)	Unlikely	Few desktop records none within 10 km (i.e. from Hardy Inlet and over open ocean). Species mainly uses coastal habitats.										

Species	Cons. status	LOO	Comment	Suitable habitats in study area									
				SIPW[1]	SISE[1]	SISH[1]	MJP[1]	OWP[1]	Cleared	Clrd–DS[1]	Dam	Bluegum[1]	Pine[1]
Calidris acuminata Sharp-tailed Sandpiper	VU/Mig. (EPBC Act); Mig. (BC Act)	Recorded Regional sites, Possible in WFA	Previous desktop records within 10 km of WFA, not recent. Uses shallow fresh or brackish wetlands, with inundated or emergent vegetation and inundated paddocks. Suitable habitat present in early spring when it arrives in the southwest (from September). Occasional occurrence in the WFA possible, but unlikely a regular visitor or regular transit through.	●	●	●			●	●	●		
Calidris alba Sanderling	Mig. (EPBC & BC Acts)	Recorded Regional sites, Unlikely in WFA	Old (1979-80) desktop records within 10 km of WFA from site near the artificial wetlands. All other desktop records are associated with the Hardy Inlet and the coast. Survey records also only from Hardy Inlet Regional sites. Almost always prefers coastal habitats. Suitable habitat not present in WFA.										
Calidris canutus Red Knot	VU/Mig. (EPBC Act); EN (BC Act)	Unlikely	Old (1979-80) desktop records within 10 km of WFA from site near the artificial wetlands. All recent desktop records are from the Hardy Inlet. Mainly uses coastal habitats. Suitable habitat not present.										
Calidris falcinellus Broad-billed Sandpiper	Mig. (EPBC & BC Acts)	Possible (rare)	Old (1979-80) desktop records within 10 km of WFA from site near the artificial wetlands. All recent desktop records are from the Hardy Inlet. Mainly uses sheltered coastal habitats, favouring estuarine mudflats. Only occasional records from swamps and lakes. Arrives in southwest in September, but rare.	●	●	●							
Calidris ferruginea Curlew Sandpiper	CR/Mig. (EPBC Act); CR (BC Act)	Possible	Old (1979-80) desktop records within 10 km of WFA from site near the artificial wetlands. All recent desktop records are from the Hardy Inlet. Uses intertidal and wetland habitats, sometimes forages in flooded paddocks. Desktop records indicate arrival in region from September. Suitable habitat present. Occasional use of paddocks, wetland habitats in the WFA possible.	●	●	●			●	●	●		

Species	Cons. status	LOO	Comment	Suitable habitats in study area									
				SIPW[1]	SISE[1]	SISH[1]	MJP[1]	OWP[1]	Cleared	Clrd–DS[1]	Dam	Bluegum[1]	Pine[1]
Calidris melanotos Pectoral Sandpiper	Mig. (EPBC & BC Acts)	Possible	No previous records within 10 km from WFA; however, desktop record just outside the BIA SW of the WFA on the Hardy Inlet. Uses a variety of wetland habitats and inundated grasslands. Arrives in southwest in spring. Suitable habitat present. Occasional use of paddocks, wetland habitats in the WFA possible.	●	●	●			●	●			
Calidris ruficollis Red-necked Stint	Mig. (EPBC & BC Acts)	Recorded Regional sites, Possible in WFA	Old (1980) desktop records within 10 km of WFA from a site near the artificial wetlands, and another near the Blackwood River. All other desktop records, including all recent records, are associated with the Hardy Inlet. Survey records also only from Hardy Inlet Regional sites. Found across a wide range of open mudflat-like habitats in salt and freshwater systems. Uses coastal and wetland habitats and inundated paddocks. Arrives in the southwest in spring. Occasional use of paddocks, wetland habitats in the WFA possible.	●	●	●			●	●	●		
Calidris tenuirostris Great Knot	VU/Mig. (EPBC Act); CR (BC Act)	Possible (rare)	Old (1979-80) desktop records within 10 km of WFA from site near the artificial wetlands. All recent desktop records are from the Hardy Inlet. Prefers sheltered coastal habitats with large intertidal flats. Rarely uses swamps near the coast and saltlakes. Uncommon in the Southwest.	●	●	●							
Limosa lapponica Bar-tailed Godwit	Mig. (EPBC & BC Acts)	Recorded Regional sites, Possible (rare) in WFA	Old (1980) desktop records within 10 km of WFA from a site near the artificial wetlands, and another near the Blackwood River. All other desktop records, including all recent records, are associated with the Hardy Inlet and coast. Survey records also only from Hardy Inlet Regional sites. Occurs almost entirely in coastal habitats such as intertidal sandflats, mudflats and estuaries. It has been observed on occasion on inland wetlands and paddocks but potential presence in the WFA is considered likely very rare.		●	●			●				

Species	Cons. status	LOO	Comment	Suitable habitats in study area									
				SIPW[1]	SISE[1]	SISH[1]	MJP[1]	OWP[1]	Cleared	Clrd–DS[1]	Dam	Bluegum[1]	Pine[1]
Limosa limosa Black-tailed Godwit	EN/Mig. (EPBC Act); Mig. (BC Act)	Possible (rare)	Old (1981) desktop records within 10 km of WFA from site near the artificial wetlands. All recent desktop records are from the Hardy Inlet. Prefers coastal habitats but will use shallow and sparsely vegetated, near-coastal wetlands, such as river pools, swamps and floodplains on occasion.	●	●	●			●				
Numenius madagascariensis Eastern Curlew	CR/Mig. (EPBC Act); CR (BC Act)	Unlikely	Old (1981) desktop records within 10 km of WFA from a site near the Blackwood River. No other desktop records. Mainly uses sheltered intertidal sandflats/ mudflats with no vegetation. No suitable habitat present in the WFA.										
Numenius phaeopus Whimbrel	Mig. (EPBC & BC Acts)	Unlikely	Old (1981) desktop records within 10 km of WFA from site near the artificial wetlands. All recent desktop records are from the Hardy Inlet. Inhabits coastal habitats. Suitable habitat not present in the WFA.										
Tringa brevipes Grey-tailed Tattler	Mig. (EPBC and BC Acts); P4 DBCA list	Possible (rare)	Three old (1978) desktop records within 10 km of WFA but offshore. No other desktop records returned. Inhabits coastal habitats, and occasionally found around near-coastal wetlands, such as lakes. Inland records for the species are rare.	●	●	●							
Tringa nebularia Common Greenshank	EN/Mig. (EPBC Act); Mig. (BC Act)	Likely	Several recent records within 10 km of WFA. Uses variety of wetlands and coastal habitats, as well as inundated paddocks. Habitat present in WFA when species arrives in early spring.	●	●	●				●	●		
Tringa stagnatilis Marsh Sandpiper	Mig. (EPBC & BC Acts)	Possible	No previous desktop records within 10 km of study area, last record in December 2000 (BirdLife 2023) at Swan Lake which is part of the Hardy Inlet. Inhabits a range of permanent or ephemeral wetlands and inundated floodplains. Suitable habitat present when species arrives in southwest in early spring.	●	●	●			●	●	●		

[1]SIPW – seasonally inundated paperbark woodland (wetland); SISE – seasonally inundated sedgeland (wetland); SISH – seasonally inundated shrubland; MJP – Marri-Jarrah-Peppermint woodland; OWP – Open woodland of Peppermint trees (degraded); Clrd DS – Cleared–degraded sumpland; Bluegum – Bluegum plantation; Pine – Pine plantation.

5.4 ESTIMATE OF SURVEY COMPLETENESS

In order to gauge whether the survey effort completed can be considered adequate to capture the seasonal diversity of the 2 assemblages present in the study area, 2 sets of species accumulation curves were produced based on the Chao2, Jacknife2, Sobs and Bootstrap indices, one set for birds (Figure 5-12) and one set for bats (Figure 5-13); as each group was systematically surveyed using different methods. For birds, the curves were based on the fixed-point method only. While for bats the curves were derived from echolocation recordings completed at the same BBRAS sites in Year 1.

For birds all 3 curves came close to a horizontal asymptote, indicating that few species remain undetected (Figure 5-12). The Chao2, Jacknife2 and Bootstrap indices calculated an expected species richness of 110, 118 and 106, respectively, compared with a recorded species richness of 97. The results therefore indicate that the effort undertaken is adequate to characterise the avian assemblage.

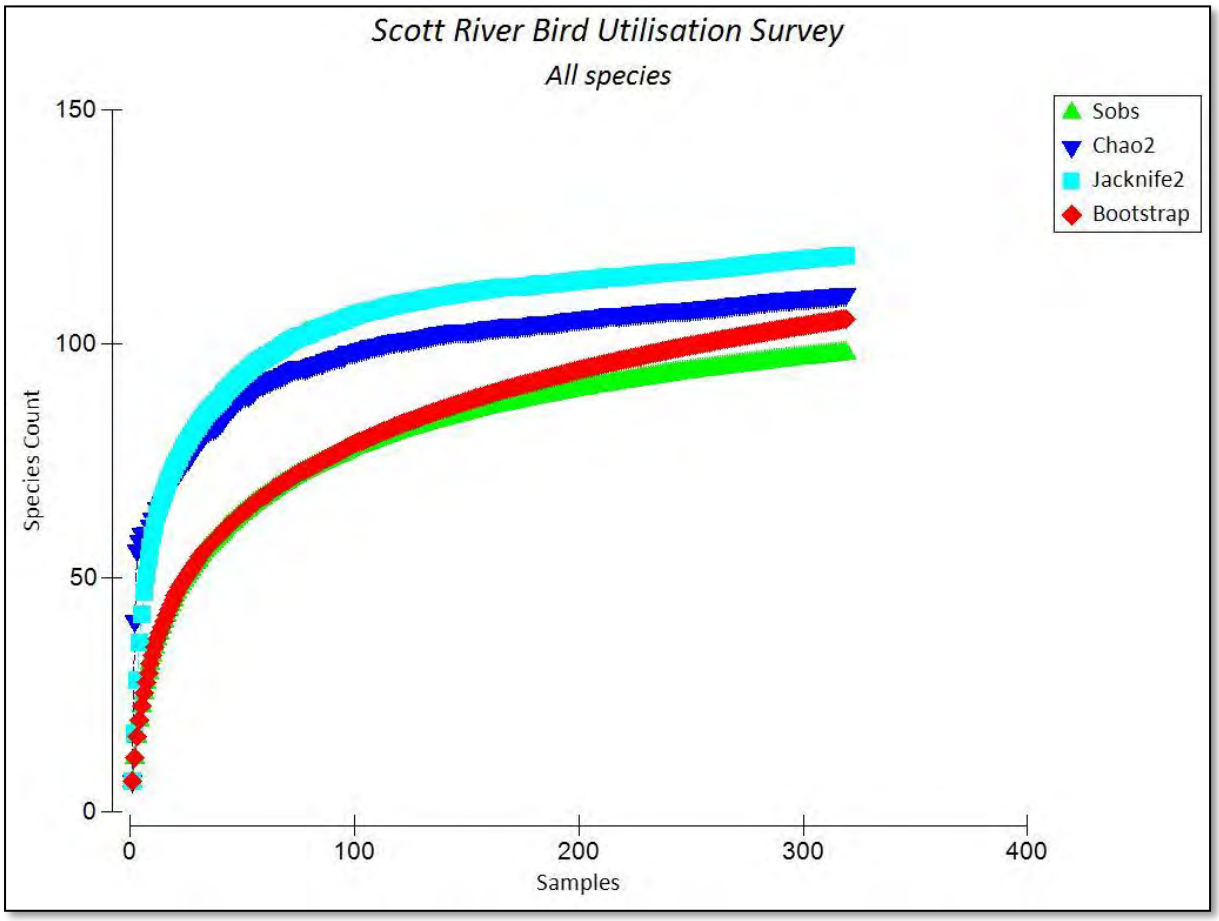

Figure 5-12 Species accumulation curve of bird data for BBRAS survey

The species accumulation curves derived from the Chao1, Jacknife1, Sobs and Bootstrap indices for bats all reached the asymptote at approximately 32 samples (Figure 5-13), with no additional species being detected after that. The curves therefore strongly indicate that is it unlikely any additional bat species would be detected with additional sampling using the echolocation sampling method. This is also evident when the assemblage per site is compared, which showed a largely homogenous assemblage across all sites (Table 5-8).

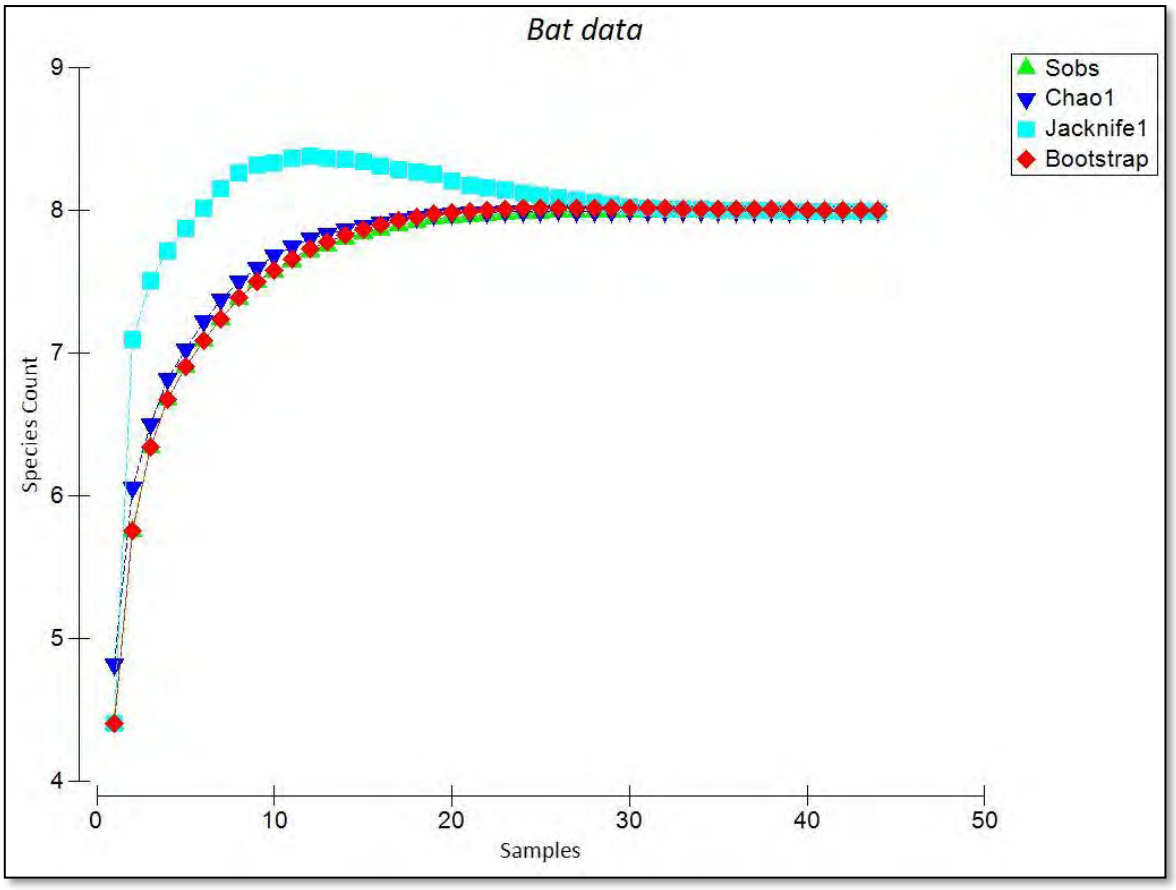

Figure 5-13 Species accumulation curve of bat data for BBRAS survey

5.5 SURVEY LIMITATIONS

The limitations of the survey have been considered in accordance with EPA (2020) and are presented in Table 5-14.

Table 5-14 Consideration of potential survey limitations

Limitations	Comments
Availability of contextual information at a regional and local scale	Database searches and previous surveys within the vicinity of the Project provided a comprehensive species list for birds within the region. There was not a comprehensive species list for bats available, and as such several species were detected during the surveys that were not returned by the database and literature searches.
Competency/experience of the team carrying out the survey	The survey team members all have extensive experience conducting fauna surveys.
Scope and completeness	Sampling effort was adequate for the size of the study area and to meet the objectives of the BBRAS. The basic/targeted fauna survey provided supplemental data to define the bird and bat assemblages of the study area. As bats were detected via echolocation recording rather than direct observation, it was not possible to determine flight heights, or distance and direction from the recording device.
Proportion of fauna recorded and/or collected, any identification issues	Based on species accumulation curves the sample effort was considered adequate to characterise the bird and bat assemblages present in the period the survey was conducted (Section 5.4). Well below average rainfall between July and November may have influenced the number and diversity of Migratory bird records in the spring 2024 sampling event.
Access within the study area	All parts of the study area were accessible for most of the year. Some sites had to be sampled a hundred or so metres from the initial location when the study area was inundated over winter in Year 1. Two sites were on land that was not accessible due to land holder restrictions that took effect in early Year 1 and were not surveyed again (BUS012 and BUS035).
Timing, rainfall, season	Year 1 sampling was completed across all 4 seasons (four sampling events). In Year 2, sampling concentrated on the drier period of the year targeting species of concern identified during Year 1 (i.e., migratory shorebirds and breeding period of the 3 black cockatoo species). Year 2 involved monthly sampling between September 2024 and March 2025. This resulted in a total of 12 sampling events over 2 consecutive years satisfying the relevant guidance (Brett Lane and Associates 2005; DCCEEW 2024). All efforts were made to undertake fixed-point bird sampling during favourable weather conditions.
Disturbance that may have affected the results of the survey	No disturbances affected the results of the survey.

6 RISK ASSESSMENT FOR POTENTIAL SPECIES OF CONCERN

6.1 POTENTIAL IMPACTS

The main risks to birds and bats from wind farms (Section 2.3) have been considered for relevance to the current Project below in Table 6-1.

Table 6-1 Consideration of potential impacts

Potential impact	Comments
Habitat loss through clearing for turbines and other infrastructure	Minimal clearing of native vegetation proposed – no more than 2 ha total (at the time of this assessment), and less than 1 ha of black cockatoo foraging habitat. No removal of PNTs. No clearing of any native vegetation growing in association with wetlands., Proposed maximum number of turbines is 20, all within the WFA. Proposed site placement of turbines is within cleared paddock areas or Bluegum plantation that is scheduled to be harvested prior to construction and will not be replanted (Figure 6-1).
Mortality or injury from collision with turbine blade or as a result of barotrauma[1]	Birds or bats that fly within heights of the RSA at-risk of rotor strike and/or barotrauma. Potential RSA height is within the range of 25–250 m. Encompasses 4 of the flight height categories recorded in the surveys (see section 3.2.1): • 25-50 m • 51-75 m • 76-150 m • 151-250 m.
Alienation of important sites, e.g. key roosting, feeding or breeding areas	No important roosting or breeding sites for birds or bats have been detected within the WFA. Black cockatoos however were observed to forage widely in the WFA principally within MJP woodland, and raptors were observed to forage widely across the entire site. There is therefore potential for the turbines to deter some birds from continuing to forage within the WFA, including the excised areas within the study area of which one is a conservation reserve (Figure 4-2). However, it is not clear how relevant or impactful such a deterrence would be with respect to conservation significant species and other species of potential concern recorded, due to a paucity of such data with respect to WA species.
Displacement leading disruption to feeding or breeding patterns, e.g. from wind turbine noise and/or artificial light sources	May affect birds or bats that would usually use the WFA to move between (for example) roosting sites and foraging habitat. Birds/bats may have to fly longer distances to get to foraging/breeding areas. For example, black cockatoos moving between roost sites in conservation reserves north of the WFA to foraging habitat in Scott National Park/Hardy Inlet, or coastal vegetation south of the WFA. Directional movements of most birds, including black cockatoos, show movements are mainly S-N/N-S and E-W/W-E, though a very limited number of distinct movements were detected and thus no clear trends could be determined. Construction activities are likely to generate the loudest noise (e.g. from vehicle and machinery operation), but will be temporary, the construction period likely to be between 18-24 months. During operations, the wind turbines will be the primary noise source, followed by the substation. The aerodynamic noise generated by a turbine typically increases with rotor speed, which is directly correlated to wind speed. Maximum predicted noise levels at each turbine range from 35-55dB(A), dependent on wind

Potential impact	Comments
	speed, and reducing with distance. Existing background noise as measured in the vicinity of the proposed wind farm ranged from 20-50dB(A). Sources of artificial light during construction are expected to be minimal, assuming construction activities will be restricted to daylight hours. Mobile lighting towers may be used to ensure safe work environment in certain situations. Light sources during operations will primarily be associated with night lighting around the perimeter of buildings and substation for security and emergency purposes. SynergyRED advises consultation to date has suggested aviation obstruction lighting will not be required; however, this may change if the Civil Aviation Safety Authority determines there to be suitable risk to aviation safety. Generally, aviation lighting involves the installation of red LED lights on the nacelle of turbines around the perimeter of the Project. Overall, lighting for the Project is unlikely to be of a scale that would cause significant displacement of birds or bats.

[1]Risk of barotrauma treated together here with collision risk, as noted in Section 2.3.

6.2 POTENTIAL SPECIES OF CONCERN

Based on the findings of the site and species characterisation (Section 3.1.1 and Section 3.1.2), and the field surveys (Section 5), 29 conservation significant species are considered potential species of concern, including the 8 species that were recorded in the WFA or wider BIA (7 birds, Section 5.1.4 and one bat, Section 5.2.3) and the 21 additional species considered likely, possibly or possibly (rare) to occur in the WFA (Section 5.3). Detailed profiles for the conservation significant species are provided in Appendix 4.

In addition, the 11 non-significant raptors and 7 non-significant bat species recorded during the survey were also identified as potential species of concern (Section 5.1.4 and Section 5.2.2) and are therefore included in the risk assessment (Section 6.3).

6.3 RISK ASSESSMENT OUTCOMES

A risk assessment was conducted for all potential species of concern in accordance with the risk assessment framework defined in Section 3.5. The risk assessment outcomes for conservation significant species are detailed in Table 6-2. From this assessment, 3 conservation significant species were considered at moderate risk of impact from the Project, Forest Red-tailed Black Cockatoo, Baudin's Cockatoo and Carnaby's Cockatoo. Two species were considered at low risk, Australasian Bittern and Western False Pipistrelle. Risk was assessed as negligible for the remaining 24 conservation significant species (Table 6-2).

The risk assessment for other potential species of concern (i.e. non-conservation significant) is detailed separately in Table 6-3. None of the other potential species of concern assessed received a high or moderate risk rating. Six birds and 2 bats were assessed as at low risk from the Project, Wedge-tailed Eagle, Swamp Harrier, Black-shouldered Kite, Brown Goshawk, Brown Falcon, Australian Kestrel, White-striped Free-tailed Bat and Southern Forest Bat. The risk rating was found to be negligible for the remaining species (Table 6-3).

Table 6-2 Risk assessment for conservation significant potential species of concern

Species	Cons. status	Potential use in WFA	No records/ detects (birds) Activity level (bats)[1]	Rec. flight height range	Potential impact	Likelhd.	Conseq.	Risk rating	Justification
Pandion haliaetus (Osprey)	Mig. (EPBC & BC Acts)	Occasional foraging	7 (7)	0-75 m	Direct collision/ barotrauma	Potential	Insignificant	Negligible	Recorded only once in WFA across all surveys. Recorded flying within RSA heights at Regional reference sites. No mortalities recorded in carcass monitoring from reviewed sources at Australian sites, but collision deaths have been reported overseas. Common and widely distributed in coastal regions across most of the country. Many individual Osprey are known in the Busselton to Augusta region (pers. comm. B. Wykes). The population is limited by viable nest sites, not biological factors. Desktop records are nearly all SW of the WFA associated with Hardy Inlet, Augusta beaches, Scott and Blackwood Rivers. Sampling at the Regional reference sites supports this, with several records made during the Year 2 surveys at the Hardy Inlet coastal sites. Unlikely to utilise habitats in study area regularly because it primarily feeds on fish, though may be an occasional foraging site. Potential for rare loss of individuals but no reduction in population viability.
Oxyura australis (Blue-billed Duck)	P4 (DBCA list)	Foraging Roosting Breeding	-		Direct collision/ barotrauma	Potential	Insignificant	Negligible	No record from surveys; however, although considered likely to occur within the WFA on occasion (Table 5-13). Suspected to fly at heights within RSA. No mortalities recorded in carcass monitoring from reviewed sources. Potential for occasional use of the larger wetlands in the WFA but unlikely to be a regular visitor. A few records from the artificial wetlands west of the WFA but limited desktop records returned within 10 km, and all from 2010 or older. Potential for rare loss of individuals but no reduction in population viability.

Species	Cons. status	Potential use in WFA	No records/ detects (birds) Activity level (bats)[1]	Rec. flight height range	Potential impact	Likelhd.	Conseq.	Risk rating	Justification
Apus pacificus (Fork-tailed Swift)	Mig. (EPBC & BC Acts)	Foraging	-		Direct collision/ barotrauma	Potential	Insignificant	Negligible	No record from surveys, although considered to possibly occur within the WFA (Table 5-13). Suspected to fly at heights within RSA. Only one mortality recorded in carcass monitoring from reviewed sources. Common species, considered to possibly occur on occasion. Potential for rare loss of individuals/undetectable loss of EAAF population over 10 years (<0.005%).
Botaurus poiciloptilus (Australasian Bittern)	EN (EPBC & BC Acts)	Foraging Roosting	-		Direct collision/ barotrauma	Unlikely	Medium	Low	No record from surveys, although considered to possibly occur within the WFA (Table 5-13). Suspected to fly at heights within RSA. No mortalities recorded in carcass monitoring from reviewed sources. Known from Hardy Inlet ~12 km SW of the WFA and the Gingilup/Quitchup/Jasper wetlands ~30 km SE (dates of records unknown). Latter is an important wetland suite for the species. Potential for rare use of the larger wetlands in the WFA but unlikely a regular visitor or regularly transit through the WFA. WA population very small therefore any loss of individuals may have temporary impact on local population viability.
Calyptorhynchus banksii naso (Forest Red-tailed Black Cockatoo)	VU (EPBC & BC Acts)	Foraging Roosting Breeding NCS[2]	45 (159)	0-50 m	Direct collision/ barotrauma, Displacement, Habitat loss	Likely	Medium	Moderate	Recorded frequently in WFA in low numbers (mostly singles). A large flock (53 individuals) recorded west of WFA so may also occur in WFA in large flocks on occasion. Heights not recorded for many observations, mostly observed at or below tree height but 2 of 5 records at RSA height. No mortality monitoring data available for this species but there are no reported mortalities in carcass monitoring for surrogate species *Zanda funerea*. High and moderate quality foraging habitat in WFA. Foraging habitat also likely to be present in the excised

Species	Cons. status	Potential use in WFA	No records/ detects (birds) Activity level (bats)[1]	Rec. flight height range	Potential impact	Likelhd.	Conseq.	Risk rating	Justification
									areas in the centre of the WFA one of which is a conservation reserve. No known breeding or roost sites within BIA. Minor foraging habitat loss only. Small total population, pair bonding and slow breeding. Loss in numbers of individuals may lead to minor reduction in population viability for between one and 5 years.
Zanda baudinii (Baudin's Cockatoo)	EN (EPBC & BC Acts)	Foraging Roosting Breeding NCS[2]	7 (57)	0-25 m	Direct collision/ barotrauma, Displacement, Habitat loss	Likely	Medium	Moderate	Recorded frequently in WFA in low numbers (singles, small flocks). No records within the RSA of the WFA but suspected to fly at RSA height. No mortality monitoring data available for this species but there are no reported mortalities in carcass monitoring for surrogate species *Zanda funerea*. High and moderate quality foraging habitat in WFA. Foraging habitat also likely to be present in the excised areas in the centre of the WFA one of which is a conservation reserve. Minor foraging habitat loss only. No known breeding sites within BIA but 2 known *Zanda* sp. roosts located within 12 km of the WFA; black cockatoos known to forage in areas up to 20 km from night roosting habitat during the non-breeding season. Small total population, pair bonding and slow breeding. Loss in numbers of individuals may lead to minor reduction in population viability for between one and 5 years.

Species	Cons. status	Potential use in WFA	No records/ detects (birds) Activity level (bats)[1]	Rec. flight height range	Potential impact	Likelhd.	Conseq.	Risk rating	Justification
Zanda latirostris (Carnaby's Cockatoo)	EN (EPBC & BC Acts)	Foraging Roosting Breeding NCS[2]	36 (150)		Direct collision/ barotrauma, Displacement, Habitat loss	Likely	Medium	Moderate	Recorded frequently in WFA, in low numbers (mostly singles). Recorded within the RSA of the WFA (2 records), though most recorded heights below the RSA. No mortality monitoring data available for this species but there are no reported mortalities in carcass monitoring for surrogate species *Zanda funerea*. High and moderate quality foraging habitat in WFA. Foraging habitat also likely to be present in the (excised) conservation reserve and covenant areas in the centre of the WFA. Minor habitat loss only. No known breeding sites within BIA but 2 known Zanda sp. roosts located within 12 km of the WFA; black cockatoos known to forage in areas up to 20 km from night roosting habitat during the non-breeding season. Small total population, pair bonding and slow breeding. Loss in numbers of individuals may lead to minor reduction in population viability for between one and 5 years.
Anarhynchus bicinctus (Double-banded Plover)	Mig. (EPBC & BC Acts)	Foraging	-	-	Direct collision/ barotrauma	Unlikely	Insignificant	Negligible	No record from surveys, although may possibly occur within the WFA on very rare occasion (Table 5-13). Suspected to fly at heights within RSA. No mortalities recorded in carcass monitoring from reviewed sources. Utilises terrestrial wetlands and pasture near the coast but rarely occurs in WA. Previous desktop records within 10 km of WFA but old (1979-80). Potential for rare loss of individuals/undetectable loss of EAAF population over 10 years (<0.005%).

Species	Cons. status	Potential use in WFA	No records/ detects (birds) Activity level (bats)[1]	Rec. flight height range	Potential impact	Likelhd.	Conseq.	Risk rating	Justification
Anarhynchus mongolus (Siberian Sand Plover)	EN/Mig. (EPBC Act); EN (BC Act)	Foraging	-	-	Direct collision/ barotrauma	Unlikely	Insignificant	Negligible	No record from surveys, although may possibly occur within the WFA on rare occasion (Table 5-13). Suspected to fly at heights within RSA. No mortalities recorded in carcass monitoring from reviewed sources. Utilises terrestrial wetlands and pasture near the coast but rarely occurs in WA. Previous old (1980) desktop record within 10 km of WFA but mainly uses coastal habitats such as beaches, mudflats and sandflats. Potential for rare loss of individuals/undetectable loss of EAAF population over 10 years (<0.005%).
Pluvialis fulva (Pacific Golden Plover)	Mig. (EPBC & BC Acts)	Foraging	-		Direct collision/ barotrauma	Potential	Insignificant	Negligible	No record from surveys, although considered to possibly occur within the WFA (Table 5-13). Desktop records all SW of the WFA associated with the Hardy Inlet and Scott River. Suspected to fly at heights within RSA. No mortalities recorded in carcass monitoring from reviewed sources. Mainly uses coastal habitats. Potential for occasional use of the larger wetlands in the WFA but unlikely a regular visitor to the WFA when present in the region, noting very limited overlap between species arrival in region (December) and persistence of suitable foraging habitat in the WFA. Potential for rare loss of individuals/undetectable loss of EAAF population over 10 years (<0.005%).
Pluvialis squatarola (Grey Plover)	VU/Mig. (EPBC Act); Mig. (BC Acts)	Foraging	-	-	Direct collision/ barotrauma	Unlikely	Insignificant	Negligible	No record from surveys, although may possibly occur within the WFA on rare occasion (Table 5-13). Suspected to fly at heights within RSA. No mortalities recorded in carcass monitoring from reviewed sources. Mainly utilises coastal habitats but potential for rare use of wetlands/paddocks in WFA. Potential for rare loss of individuals/undetectable loss of EAAF population over 10 years (<0.005%).

Species	Cons. status	Potential use in WFA	No records/ detects (birds) Activity level (bats)[1]	Rec. flight height range	Potential impact	Likelhd.	Conseq.	Risk rating	Justification
Falco peregrinus (Peregrine Falcon)	OS (BC Act)	Foraging	1 (1)	26-50 m	Direct collision/ barotrauma	Potential	Insignificant	Negligible	Recorded in WFA only once across all surveys. Recorded flying at height within RSA of the WFA. Recorded mortalities in carcass monitoring from reviewed sources. WFA considered foraging habitat within a resident bird's home range. Unlikely to nest in WFA. Several desktop records, nearly all SW of the WFA, mainly associated with the Hardy Inlet and Scott River. Individuals/pairs may hunt in the WFA on occasion as part of their large home range, and or transit through. Potential for rare loss of individuals but unlikely to lead to reduction in population viability.
Hydroprogne caspia (Caspian Tern)	Mig. (EPBC & BC Acts)	None	6 (62)		Direct collision/ barotrauma	Unlikely	Insignificant	Negligible	No record from surveys, although may possibly occur within the WFA on rare occasion (Table 5-13). Suspected to fly at heights within RSA. No mortalities recorded in carcass monitoring from reviewed sources. Previous desktop record within 10 km of WFA . Known to utilise near-coastal terrestrial wetlands. May occur as a visitor but the wetlands present in the WFA are too shallow to provide the species' preferred food source (fish). Potential for rare loss of individuals/undetectable loss of EAAF population over 10 years (<0.005%).
Motacilla cinerea (Grey Wagtail)	Mig. (EPBC & BC Acts)	Foraging	-	-	Direct collision/ barotrauma	Unlikely	Insignificant	Negligible	No record from surveys, although may possibly occur within the WFA on rare occasion (Table 5-13). Suspected to fly at heights within RSA. No mortalities recorded in carcass monitoring from reviewed sources. No previous desktop records within 10 km of WFA. Occurs in a wide range of habitats. Potential for rare loss of individuals but no reduction in population viability.

Species	Cons. status	Potential use in WFA	No records/ detects (birds) Activity level (bats)[1]	Rec. flight height range	Potential impact	Likelhd.	Conseq.	Risk rating	Justification
Actitis hypoleucos (Common Sandpiper)	Mig. (EPBC & BC Acts)	Foraging	-		Direct collision/ barotrauma	Potential	Insignificant	Negligible	No record from surveys, although considered to possibly occur within the WFA (Table 5-13). Suspected to fly at heights within RSA. No mortalities recorded in carcass monitoring from reviewed sources. Most desktop records associated with the Hardy Inlet SW of the study area. Does not form large flocks (mainly occurs singly or in pairs). Potential for occasional use of the larger wetlands in the WFA, but unlikely a regular visitor or regular transit through the WFA when present in the region. Limited overlap between species arrival (September-October) and when wetlands in WFA have suitable foraging habitat. Potential for rare loss of individuals / undetectable loss of EAAF population over 10 years (<0.005%).
Calidris acuminata (Sharp-tailed Sandpiper)	VU/Mig. (EPBC Act); Mig. (BC Act)	Foraging	1 (40)		Direct collision/ barotrauma	Potential	Insignificant	Negligible	Recorded in survey only from Regional site. Record is from Hardy Inlet in much more suitable and extensive habitat than WFA. Considered to possibly occur within the WFA (Table 5-13). Desktop records all SW of the WFA associated with Hardy Inlet and Scott River, with one record from the artificial wetlands west of the WFA. Suspected to fly at heights within RSA. No mortalities recorded in carcass monitoring from reviewed sources. May arrive in Augusta area from September. Potential for occasional occurrence in the WFA, but unlikely a regular visitor or regular transit through the WFA when present in the region. Limited overlap between species arrival and when wetlands/paddocks in WFA have suitable foraging habitat. Potential for rare loss of individuals / undetectable loss of EAAF population over 10 years (<0.005%).

Species	Cons. status	Potential use in WFA	No records/ detects (birds) Activity level (bats)[1]	Rec. flight height range	Potential impact	Likelhd.	Conseq.	Risk rating	Justification
Calidris falcinellus (Broad-billed Sandpiper)	Mig. (EPBC & BC Acts)	Foraging	-	-	Direct collision/ barotrauma	Unlikely	Insignificant	Negligible	No record from surveys, although may possibly occur within the WFA on rare occasion (Table 5-13). Suspected to fly at heights within RSA. No mortalities recorded in carcass monitoring from reviewed sources. Mainly utilises coastal habitats but occasional records from swamps and lakes so potential for rare use of wetlands in WFA. Potential for rare loss of individuals/undetectable loss of EAAF population over 10 years (<0.005%).
Calidris ferruginea (Curlew Sandpiper)	CR/Mig. (EPBC Act); CR (BC Act)	Foraging	-		Direct collision/ barotrauma	Unlikely	Insignificant	Negligible	No record from surveys, although considered to possibly occur within the WFA (Table 5-13). Suspected to fly at heights within RSA. No mortalities recorded in carcass monitoring from reviewed sources. Desktop records nearly all SW of the WFA associated with Hardy Inlet, which aligns with its preferred foraging habitats. Desktop records indicate arrival from September. Potential for occasional use of paddocks, wetland habitats in the WFA, but unlikely a regular visitor or regular transit through the WFA when present in the region. Limited overlap between species arrival and when wetlands/ paddocks in WFA have suitable foraging habitat. Potential for rare loss of individuals/undetectable loss of EAAF population over 10 years (<0.005%).
Calidris melanotos (Pectoral Sandpiper)	Mig. (EPBC & BC Acts)	Foraging	-		Direct collision/ barotrauma	Potential	Insignificant	Negligible	No record from surveys, although considered to possibly occur within the WFA (Table 5-13). Desktop records just outside the BIA SW of the WFA on the Hardy Inlet. Suspected to fly at heights within RSA. No mortalities recorded in carcass monitoring from reviewed sources. Arrives in the southwest in spring. Potential for occasional use of paddocks, wetland habitats in the WFA, but unlikely

Species	Cons. status	Potential use in WFA	No records/ detects (birds) Activity level (bats)[1]	Rec. flight height range	Potential impact	Likelhd.	Conseq.	Risk rating	Justification
									a regular visitor or regular transit through the WFA when present in the region. Potential for rare loss of individuals/undetectable loss of EAAF population over 10 years (<0.005%).
Calidris ruficollis (Red-necked Stint)	Mig. (EPBC & BC Acts)	Foraging	2 (72)		Direct collision/ barotrauma	Potential	Insignificant	Negligible	Recorded in survey only from Regional site. Records are from Hardy Inlet in much more suitable and extensive habitat than WFA. Desktop records also mainly SW of the WFA, associated with Hardy Inlet. Considered to possibly occur within the WFA (Table 5-13). Suspected to fly at heights within RSA. No mortalities recorded in carcass monitoring from reviewed sources. Arrives in the southwest in spring. Potential for occasional use of paddocks, wetland habitats in the WFA, but unlikely a regular visitor or regular transit through the WFA when present in the region. Potential for rare loss of individuals / undetectable loss of EAAF population over 10 years (<0.005%).
Calidris tenuirostris (Great Knot)	VU/Mig. (EPBC Act); CR (BC Act)	Foraging	-	-	Direct collision/ barotrauma	Potential	Insignificant	Negligible	No record from surveys, although may possibly occur within the WFA on very rare occasion (Table 5-13). Suspected to fly at heights within RSA. No mortalities recorded in carcass monitoring from reviewed sources. Old (1980) desktop records within 10 km of the WFA from near the artificial wetlands. Occurs mostly in coastal intertidal habitats, but rare use of swamps. Potential presence in the WFA is considered likely very rare. Potential for rare loss of individuals/undetectable loss of EAAF population over 10 years (<0.005%).

Species	Cons. status	Potential use in WFA	No records/ detects (birds) Activity level (bats)[1]	Rec. flight height range	Potential impact	Likelhd.	Conseq.	Risk rating	Justification
Limosa lapponica (Bar-tailed Godwit)	Mig. (EPBC & BC Acts)	Foraging	1 (1)		Direct collision/ barotrauma	Unlikely	Insignificant	Negligible	No record from surveys, although may possibly occur within the WFA on very rare occasion (Table 5-13). Suspected to fly at heights within RSA. No mortalities recorded in carcass monitoring from reviewed sources. Old (1980) desktop records within 10 km of the WFA from near the artificial wetlands and at Blackwood River. Occurs mostly in coastal habitats but occasionally observed at inland wetlands and paddocks. Potential presence in the WFA is considered likely very rare. Potential for rare loss of individuals/undetectable loss of EAAF population over 10 years (<0.005%).
Limosa limosa (Black-tailed Godwit)	EN/Mig. (EPBC Act); Mig. (BC Act)	Foraging	-	-	Direct collision/ barotrauma	Unlikely	Insignificant	Negligible	No record from surveys, although may possibly occur within the WFA on very rare occasion (Table 5-13). Suspected to fly at heights within RSA. No mortalities recorded in carcass monitoring from reviewed sources. Old (1980) desktop records within 10 km of the WFA from near the artificial wetlands. Occurs mostly in coastal habitats but occasionally uses near-coastal wetlands and floodplains. Potential for rare loss of individuals/undetectable loss of EAAF population over 10 years (<0.005%).
Tringa brevipes (Grey-tailed Tattler)	Mig. (EPBC and BC Acts); P4 DBCA list	Foraging	-	-	Direct collision/ barotrauma	Unlikely	Insignificant	Negligible	No record from surveys, although may possibly occur within the WFA on very rare occasion (Table 5-13). Suspected to fly at heights within RSA. No mortalities recorded in carcass monitoring from reviewed sources. Old (1981) desktop records within 10 km of the WFA. Occurs mostly in coastal habitats but occasionally observed at near-coastal wetlands. Potential presence in the WFA is considered likely very rare.

Species	Cons. status	Potential use in WFA	No records/ detects (birds) Activity level (bats)[1]	Rec. flight height range	Potential impact	Likelhd.	Conseq.	Risk rating	Justification
									Potential for rare loss of individuals/undetectable loss of EAAF population over 10 years (<0.005%).
Tringa glareola (Wood Sandpiper)	Mig. (EPBC & BC Acts)	Foraging	1 (3)	0-25 m	Direct collision/ barotrauma	Potential	Insignificant	Negligible	Three individuals recorded in a single observation within the WFA, across all surveys. Suspected to fly at heights within RSA. No mortalities recorded in carcass monitoring from reviewed sources. Limited desktop records (only 2 just west of WFA). Mainly occurs singly, in pairs or small flocks. Arrives in southwest in spring, though more common from summer to autumn when habitat in WFA mainly unsuitable (largely dried out). Occasional use of wetlands in WFA and transit through WFA by small numbers of birds. Potential for rare loss of individuals/undetectable loss of EAAF population over 10 years (<0.005%).
Tringa nebularia (Common Greenshank)	EN/Mig. (EPBC Act); Mig. (BC Act)	Foraging	-		Direct collision/ barotrauma	Potential	Insignificant	Negligible	No record from surveys, however considered likely to occur within the WFA (Table 5-13). Desktop records within 10 km of WFA. Suspected to fly at heights within RSA. No mortalities recorded in carcass monitoring from reviewed sources. Desktop records all SW of the WFA, mainly associated with Hardy Inlet, Scott River, but also recorded from the artificial wetlands directly west of the WFA. Arrives in the southwest in early spring. Occasional use of the paddocks/wetland habitats in the WFA.

Species	Cons. status	Potential use in WFA	No records/ detects (birds) Activity level (bats)[1]	Rec. flight height range	Potential impact	Likelhd.	Conseq.	Risk rating	Justification
									Potential for rare loss of individuals but undetectable loss of EAAF population over 10 years (<0.005%).
Tringa stagnatilis (Marsh Sandpiper)	Mig. (EPBC & BC Acts)	Foraging	-		Direct collision/ barotrauma	Potential	Insignificant	Negligible	No records from surveys, although considered to possibly occur within the WFA (Table 5-13). Suitable habitat present in the WFA when they arrive in early spring. Suspected to fly at heights within RSA. No mortalities recorded in carcass monitoring from reviewed sources. Limited desktop records, SW of WFA at Augusta. Occasional use of paddocks, wetland habitats in the WFA. Potential for rare loss of individuals / undetectable loss of EAAF population over 10 years (<0.005%).
Tyto novaehollandiae novaehollandiae (Masked Owl (southwest))	P3 (DBCA list)	Foraging Roosting Breeding	2 (2)	NR[3]	Direct collision/ barotrauma, Displacement	Unlikely	Insignificant	Negligible	Recorded at 2 locations outside the WFA, as singles. Only likely to fly at RSA heights when displaying courtship over a prospective nest site of which none are present in study area. Unlikely to fly within RSA while hunting. No mortality monitoring data available for this species. No other Masked Owl mortalities from reviewed sources. May hunt in woodland habitats of the study area and transit through but not likely to utilise extensively. Potential for rare loss of individuals but unlikely to lead to reduction in population viability.

Species	Cons. status	Potential use in WFA	No records/ detects (birds) Activity level (bats)[1]	Rec. flight height range	Potential impact	Likelhd.	Conseq.	Risk rating	Justification
Falsistrellus mackenziei (Western False Pipistrelle)	P4 (DBCA list)	Foraging Roosting Breeding	Low	NR[3]	Direct collision/ barotrauma	Potential	Minor	Low	Infrequently detected in WFA and low number of calls (1 mean detection per night). Suspected to fly at heights within RSA. No mortality monitoring data available for this species but there are reported mortalities in carcass monitoring for closely related species Falsistrellus tasmaniensis. Consistent single detections suggest rare/occasional movement through cleared habitats between remnant patches, and thus foraging typically close to vegetation, rather than open paddocks. May possibly roost and breed in best examples of MJP woodland, where the PNT assessment (Phoenix 2025a) recorded most trees with hollows, many of which would be considered suitably sized to support the species. Occasional loss of small numbers of individuals possible but unlikely to lead to reduction in local population viability.

[1]No. records (no. individuals) for birds; activity level for bats (see section 3.2.2). [2]Breeding NCS – study area contains PNTs but none with hollows currently suitable for breeding. [3]NR – not recorded; species detected via audio recording only.

Table 6-3 Risk assessment for other potential species of concern

Species	Cons. status	Potential use in WFA	No records/ detects (birds) Activity level (bats)[1]	Rec. flight height range	Potential impact	Likelhd.	Conseq.	Risk rating	Justification
Aquila audax (Wedge-tailed Eagle)	Not listed	Foraging Roosting Breeding	37 (50)		Direct collision/ barotrauma	Almost certain	Minor	Low	Frequently recorded in WFA, as singles/pairs. Frequently recorded flying at heights within RSA. Recorded high mortalities (>100) in carcass monitoring from reviewed sources. Lower avoidance rate than other raptors. Likely uses the WFA regularly for foraging. Potential for breeding but no known nest sites in WFA. Loss of individuals likely but is a widespread, abundant species, therefore unlikely to lead to reduction in population viability.
Circus approximans (Swamp Harrier)	Not listed	Foraging Roosting Breeding	57 (66)		Direct collision/ barotrauma	Almost certain	Minor	Low	Frequently recorded in WFA, as singles/pairs. Frequently recorded flying at RSA heights. Recorded moderate mortalities (10 - 100) in carcass monitoring from reviewed sources. Likely uses the WFA regularly for foraging. Potential for breeding but no known nest sites in WFA. Occasional loss of individuals likely but is a widespread, abundant species, therefore unlikely to lead to reduction in population viability.
Elanus axillaris (Black-shouldered Kite)	Not listed	Foraging Roosting Breeding	4 (4)		Direct collision/ barotrauma	Potential	Minor	Low	Infrequently recorded in WFA, as singles. Recorded flying at RSA height. Recorded moderate mortalities (10 - 100) in carcass monitoring from reviewed sources. Likely to forage in WFA. Potential for breeding but no known nest sites in WFA. Widespread, abundant species. Occasional loss of individuals likely but is a widespread, abundant species, therefore unlikely to lead to reduction in population viability.

Species	Cons. status	Potential use in WFA	No records/ detects (birds) Activity level (bats)[1]	Rec. flight height range	Potential impact	Likelhd.	Conseq.	Risk rating	Justification
Haliaeetus leucogaster (White-bellied Sea-Eagle)	Not listed	Foraging	2 (2)		Direct collision/ barotrauma	Potential	Insignificant	Negligible	Only one record in WFA of a bird flying over. Recorded flying at RSA height. Only one recorded mortality in carcass monitoring from reviewed sources. Mostly occurs in coastal habitats. May hunt for waterbirds in the WFA on occasion, or transit through but no breeding and unlikely to be a regular visitor. Territorial and occur sparsely across their range. Rare loss of individuals possible but reduction in population viability unlikely.
Haliastur sphenurus (Whistling Kite)	Not listed	Foraging Roosting Breeding	8 (9)		Direct collision/ barotrauma	Potential	Insignificant	Negligible	Infrequently recorded in WFA, as singles, one pair. Recorded flying at heights within RSA. Recorded low mortalities (<10) in carcass monitoring from reviewed sources. Likely to forage in WFA. Potential for breeding but no known nest sites in WFA. Rare loss of individuals possible but is a widespread, abundant species, therefore unlikely to lead to reduction in population viability.
Hieraaetus morphnoides (Little Eagle)	Not listed	Foraging Roosting Breeding	3 (3)		Direct collision/ barotrauma	Potential	Insignificant	Negligible	Infrequently recorded in WFA, as singles. Recorded flying at RSA height. Recorded low mortalities (<10) in carcass monitoring from reviewed sources. Likely to forage in WFA. Potential for breeding but no known nest sites in WFA. Rare loss of individuals possible but is a widespread, abundant species, therefore unlikely to lead to reduction in population viability.
Tachyspiza cirrocephala (Collared Sparrowhawk)	Not listed	Foraging Roosting Breeding	4 (4)		Direct collision/ barotrauma	Potential	Insignificant	Negligible	Infrequently recorded in WFA, as singles. Recorded flying at heights within RSA. Recorded low mortalities (<10) in carcass monitoring from reviewed sources. Highly manoeuvrable species. Likely to forage in WFA. Potential for breeding but no known nest sites in WFA. Rare loss of individuals possible but is a widespread, abundant species,

Species	Cons. status	Potential use in WFA	No records/ detects (birds) Activity level (bats)[1]	Rec. flight height range	Potential impact	Likelhd.	Conseq.	Risk rating	Justification
									therefore unlikely to lead to reduction in population viability.
Tachyspiza fasciata (Brown Goshawk)	Not listed	Foraging Roosting Breeding	6 (7)		Direct collision/ barotrauma	Potential	Minor	Low	Infrequently recorded in WFA, as singles, one pair. Recorded flying at heights within RSA. Recorded moderate mortalities (10 - 100) in carcass monitoring from reviewed sources. Likely to forage in WFA. Potential for breeding but no known nest sites in WFA. Occasional loss of individuals possible but is a widespread, abundant species, therefore unlikely to lead to reduction in population viability.
Falco berigora (Brown Falcon)	Not listed	Foraging Roosting Breeding	17 (21)		Direct collision/ barotrauma	Almost certain	Minor	Low	Frequently recorded in WFA, as singles, pairs. Recorded flying at heights within RSA. Recorded high mortalities (>100) in carcass monitoring from reviewed sources. Relatively heavy slow flight. Likely to forage in WFA regularly. Potential for breeding but no known nest sites in WFA. Occasional loss of individuals likely but is a widespread, abundant species, therefore unlikely to lead to reduction in population viability.
Falco cenchroides (Australian Kestrel)	Not listed	Foraging Roosting Breeding	47 (58)		Direct collision/ barotrauma	Almost certain	Minor	Low	Frequently recorded in WFA, as singles, pairs. Recorded flying at heights within RSA. Recorded high mortalities (>100) in carcass monitoring from reviewed sources. Observed foraging in WFA and likely to hunt there regularly. Potential for breeding but no known nest sites in WFA. Loss of individuals likely but is a widespread, abundant species, therefore unlikely to lead to reduction in population viability.
Falco longipennis (Australian Hobby)	Not listed	Foraging Roosting Breeding	3 (4)		Direct collision/ barotrauma	Potential	Insignificant	Negligible	Infrequently recorded in WFA, as singles, one pair. Recorded flying at height within RSA. Only 1 mortality in carcass monitoring from reviewed sources. Occasional foraging in WFA likely but not a regular inhabitant.

Species	Cons. status	Potential use in WFA	No records/ detects (birds) Activity level (bats)[1]	Rec. flight height range	Potential impact	Likelhd.	Conseq.	Risk rating	Justification
									Potential for breeding but no known nest sites in WFA. Rare loss of individuals possible but is a widespread, abundant species, therefore unlikely to lead to reduction in population viability.
Austronomus australis (White-striped Free-tailed Bat)	Not listed	Foraging Roosting Breeding	High		Direct collision/ barotrauma	Almost certain	Minor	Low	Activity levels highest within the WFA. Second highest total number of calls recorded, overall. Largely absent in winter and autumn. Suspected to fly at heights within RSA. Recorded high mortalities (>100) in carcass monitoring from reviewed sources. Often represents the species with highest documented mortality. Loss in numbers of individuals likely but is a widespread and relatively abundant species in the WFA and surrounds, therefore unlikely to lead to reduction in population viability.
Chalinolobus gouldii (Gould's Wattled Bat)	Not listed	Foraging Roosting Breeding	Low		Direct collision/ barotrauma	Potential	Insignificant	Negligible	Low activity levels in WFA and BIA, all year. Suspected to fly at heights within RSA. Recorded moderate mortalities (10 - 100) in carcass monitoring from reviewed sources. Rare loss of individuals due to low activity in WFA, reduction in population viability unlikely.
Chalinolobus morio (Chocolate Wattled Bat)	Not listed	Foraging Roosting Breeding	Low		Direct collision/ barotrauma	Potential	Insignificant	Negligible	Low activity levels in WFA and BIA overall. Far more active in summer by a factor of 10-20 compared with other seasons. Suspected to fly at heights within RSA. Recorded moderate mortalities (10-100) in carcass monitoring from reviewed sources. Rare loss of individuals due to low activity in WFA, reduction in population viability unlikely.
Nyctophilus geoffroyi (Lesser Long-eared Bat)	Not listed	Foraging Roosting Breeding	Low		Direct collision/ barotrauma	Potential	Insignificant	Negligible	Low activity levels in WFA and BIA, all year. Suspected to fly at heights within RSA. Recorded moderate mortalities (10 - 100) in carcass monitoring from reviewed sources. Rare loss of individuals due to low activity in WFA, reduction in population viability unlikely.

Species	Cons. status	Potential use in WFA	No records/ detects (birds) Activity level (bats)[1]	Rec. flight height range	Potential impact	Likelhd.	Conseq.	Risk rating	Justification
Nyctophilus holtorum (Holt's Long-eared Bat)	Not listed	Foraging Roosting Breeding	Low		Direct collision/ barotrauma	Potential	Insignificant	Negligible	Low activity levels in WFA and BIA, present in summer and autumn only. Suspected to fly at heights within RSA. No data found on wind farm mortalities but was previously classified within C. gouldii (Parnaby *et al.* 2021) therefore assume similar mortality risk to this species (moderate mortalities). Rare loss of individuals due to low activity in WFA, reduction in population viability unlikely.
Nyctophilus major (Greater Long-eared Bat)	Not listed	Foraging Roosting Breeding	Low		Direct collision/ barotrauma	Potential	Insignificant	Negligible	Low activity levels in WFA and BIA, all year, almost absent in winter. Suspected to fly at heights within RSA. No data found on wind farm mortalities. Rare loss of individuals due to low activity in WFA, reduction in population viability unlikely.
Vespadelus regulus (Southern Forest Bat)	Not listed	Foraging Roosting Breeding	Mod. (WFA) High (BIA)		Direct collision/ barotrauma	Almost certain	Minor	Low	Moderate activity levels in the WFA and high activity levels in the BIA. Highest total number of calls recorded, but also highest number of detections, so activity lower than for A. australis. Active all seasons. Suspected to fly at heights within RSA. Recorded moderate mortalities (10-100) in carcass monitoring from reviewed sources. Loss in numbers of individuals likely but is a widespread and relatively abundant species in the WFA and surrounds, therefore unlikely to lead to reduction in population viability.

[1]No. records (no. individuals) for birds; activity level for bats (see section 3.2.2).

7 DISCUSSION

This report documents the results of the two-year BBRAS, commencing in autumn 2023 and finishing in autumn 2025. Most analyses presented in this report (Section 5) have focused on the data collected in the fixed-point counts (birds) and 'ultrasonic recordings' (bats) from the BBRAS survey sites. The risk assessment (Section 6) also incorporates results from the Basic and Targeted fauna survey undertaken for the Project, with respect to birds and bats, as this provided additional data for potential species of concern (Phoenix 2025a).

The survey work completed to date represents a bird and bat utilisation survey program equivalent to a Level Two investigation in accordance with Brett Lane and Associates (2005). The risk assessment completed serves to evaluate the potential environmental impacts to birds and bats associated with the Project.

7.1 REGIONAL OVERVIEW

The climate of the WFA is moderate Mediterranean, with a strong seasonal rainfall gradient where over 65% of annual rainfall occurs between May and August each year. As such, the WFA has a distinct wet-dry regime over the course of a year. For around 3–4 months of the year (May–August), surface water is present across much of the Cleared areas, which essentially act as flooded grassland habitat, but which dissipates rapidly thereafter. Many of the wetlands retain surface water into spring, with at least one wetland, located south of Governor Broome Road, retaining water into summer and possibly permanently. This hydrologic regime is not as evident in the assemblage data as would be expected.

The study area is situated in a region of high floristic diversity (Phoenix 2025b) and is surrounded by a variety of bird and bat attracting landscape features/habitats, some occurring within the BIA outside the WFA boundary, such as dense forests (some of which are preserved in State Forest and National Park) and regionally important rivers (such as the Blackwood River and associated Hardy Inlet, and Scott River). Forest and woodland vegetation complexes mapped in the BIA (DBCA 2018) contain black cockatoo foraging, nesting and roosting plant species (e.g. *Acacia saligna*, *Agonis flexuosa*, *Banksia attenuata*, *B. grandis*, *B. littoralis*, *C. calophylla*, *E. marginata*, *E. patens* and *E. megacarpa*).

There are a number of ESAs associated with Threatened flora, TECs and wetlands, and a PEC present either in the WFA or the wider BIA. Artificial wetlands are present immediately west of the WFA which contain desktop records for a diversity of birds, including several conservation significant species in low numbers that were not recorded in this survey (Ninox 2011). There are no RAMSAR sites or internationally important wetlands located within the BIA; however, the 'Blackwood River (Lower Reaches) and Tributaries System' located ~4.5 km west of the WFA at its closest point (within the BIA) is listed as a nationally important wetland. The WFA is situated at the junction of 3 regional ecological linkages (Molloy *et al.* 2009a).

The topography of the WFA is generally flat to undulating. There are no outstanding topographic features that may cause updraft areas for soaring birds for example (though many soaring bird observations were made), or unique nesting opportunities, such as on cliffs tops or faces. This is important as the availability of nesting resources is often the limiting factor for raptor breeding, such as for Wedge-tailed Eagle, Peregrine Falcon and Osprey.

The regional overview found a diverse bird and bat assemblage as potentially occurring (199 and 7 species, respectively), that included 58 conservation significant birds and one conservation significant bat. Most of the conservation significant birds were listed as Migratory under the EPBC Act and/or BC Act. Three conservation significant species, the 3 Threatened black cockatoo species, had previously been recorded within the WFA (Figure 4-7), although the nature of how the cockatoos were using the site was not noted in the desktop records.

Fauna habitat mapping generated from the Detailed flora and vegetation survey (Phoenix 2025b) and the Basic and Targeted fauna survey (Phoenix 2025a) found 10 fauna habitat types in the WFA, including 3 wetland habitats, 2 woodlands and 5 highly modified habitats (comprising cleared areas, plantations and dams), with 68.7% of the WFA mapped as Cleared areas. The native habitats largely align with the habitats described for the Warren bioregion in which the majority of the WFA is located (May & McKenzie 2003).

7.2 FIELD SURVEY RESULTS

The fixed-point counts from the BBRAS field surveys recorded 96 bird species, which represents 49% of those identified in the desktop review. Eight bat species were recorded, which is one more than identified in the desktop review.

Despite the variety of habitats present in the WFA, and the BIA more broadly, just 6 of the 58 conservation significant birds from the regional overview were detected in the WFA during the surveys, including 5 in this BBRAS survey and Wood Sandpiper (Mig.) only during the Basic and Targeted fauna surveys Phoenix (2025a). The 3 Threatened black cockatoo species, Forest Red-tailed Black Cockatoo (VU), Baudin's Cockatoo (EN) and Carnaby's Cockatoo (EN), including those where the species could not be determined) were overwhelmingly the dominant conservation significant species recorded, collectively contributing 98% of such records in the WFA. All 3 black cockatoo species were directly observed feeding and were recorded from old feeding debris. However, while the PNT assessment conducted as part of the Basic and Targeted fauna survey (Phoenix 2025a) identified PNTs with hollows suitable for breeding in the WFA, no evidence of roosting or breeding was recorded.

The remaining 3 significant birds recorded in the WFA, Wood Sandpiper (Mig.), Osprey (Mig.) and Peregrine Falcon (OS), were all recorded from single observations, suggesting they are uncommon in the WFA. For Osprey and Peregrine Falcon, the data suggests the WFA forms a portion of a much larger home range and that breeding is taking place outside the WFA. This is supported by multiple records of Osprey that were obtained from the Regional reference sites at the Hardy Inlet. Another conservation significant bird, Masked Owl (southwest; P3), was recorded outside but near to the WFA, again only in low numbers (twice). One conservation significant bat species, Western False Pipistrelle, was recorded in the WFA, in this survey and Basic and Targeted fauna surveys Phoenix (2025a), from only 4 ultrasonic call detections.

Additional sites included in Year 2 of the BBRAS at the Hardy Inlet (Regional reference sites) recorded a further 7 conservation significant species (only at those sites), all Migratory. Five of these species were considered unlikely to occur within the WFA due to absence of suitable habitats and dietary preferences. The remaining 2 species, Sharp-tailed Sandpiper and Red-necked Stint may possibly occur in the WFA on occasion.

The likelihood of occurrence assessment for conservation significant species identified during the regional overview that were not detected during the surveys (see Section 5.3) determined an additional 2 conservation significant species to be likely to occur (1 Migratory species and one Priority species) on the basis of the proximity and recency of desktop records and presence of suitable habitat. Nine species were determined to possibly occur (all Migratory species, except for Australasian Bittern which is Endangered) and a further 10 were considered to possibly occur on rare occasion only.

In consideration of the survey records from 2 years of systematic bird surveys, the WFA supports few conservation significant bird species. Those that were recorded represent only a small portion of both the recorded bird assemblage and overall bird abundance. The various wetlands present, many of which retain water into the start of the migratory bird season were essentially absent Migratory species, with just the Wood Sandpiper being recorded, and only once. Banded Lapwing was the only 'shorebird' recorded (on 3 occasions) from wetland habitat; this species is not Migratory or otherwise conservation significant. Wetland habitats were instead found to support an array of ducks and

cormorants, and wading birds, such as Australian White Ibis, Straw-necked Ibis, and rarely Royal Spoonbill and Yellow-billed Spoonbill. The various remnant woodlands in the WFA, with their larger array of flowering plants were the habitats of primary value, as they support feeding for the 3 black cockatoo species.

As shown in section 5.1.2 the 10 most abundant species collectively represented 73.6% of the overall abundance of birds and the top 20 species represented 86.2%. Throughout the year Straw-necked Ibis and Australian White Ibis were pervasive, with small and large flocks regularly seen foraging in paddocks, or moving within, and in and out of, the WFA. Australian Raven was seen moving between sites and many nests were seen in degraded Peppermint woodlands and MJP woodland. Tree Martins, Australian Ringneck, Yellow-rumped Thornbill and Willie Wagtail dominated the records in open paddocks at or near ground-level often coming in close to observers. Pacific Black Duck and Australian Shelduck were commonly observed foraging in flooded paddocks over winter–spring months and in the wetlands for the remainder of the year. All 10 are species that are advantaged by modified habitats. Bird diversity and abundance did not correlate with seasons or the amount of standing water in the WFA (Figure 5-2).

Importantly, the wet period only partially overlaps the arrival of EAAF Migratory species, which start arriving in southwest WA in late spring, at which point the modified floodplain has dried (or is close to dry), but which would likely attract several Migratory species if it remained inundated. Further, despite the pronounced wet period where large areas of flooded grasslands are present, no overwintering Migratory bird species have been observed to date. Some of the basin wetlands (particularly those with a canopy of *Melaleuca* species) remain inundated through to early summer when Migratory species have arrived; however, they do not appear to be utilised by these species, with only a single species (Wood Sandpiper) being observed (3 individuals from single observation) during the Basic and Targeted fauna survey (Phoenix 2025a). It is considered most likely that the wetlands simply are not productive enough, or do not support the preferred food sources of many of the Migratory shorebirds.

Notwithstanding the above, minor incursions of Migratory species to the basin wetlands are likely to occur from time to time. The data therefore suggests that despite the abundance of 'wetland' habitats that could be expected to support a range of Migratory species, the inundation cycle, low productivity and available food sources precludes their presence, and instead the largely highly-modified environment favours species that respond positively to such environments, such as Pacific Black Duck, Australian Shelduck, Black Swan, and to a lesser extent species of cormorant and heron.

Bird flight height and direction of travel data was captured so that movements could be analysed within the context of the proposed turbine locations and modelled against the RSA airframe in support of any future collision risk modelling. The flight height and direction data however showed no clear trends, with movement N–S and E–W being fairly well balanced (Table 5-5). Further, movements, such as between habitat patches or into and out of the WFA were limited, being just 7.7% of all 2,634 observations. Therefore, the utility and importance of the WFA as a linkage between the large tracts of forest to the north and east, the Hardy Inlet at Augusta and the Proteaceous woodlands and shrublands to the south is not strongly supported. The data and general observations do however more strongly support the assumption that the habitats within the WFA, particularly the north-south chain of remnant bushland and wetlands (largely in the central area) act as internal stepping stones for small-moderate bush birds, such as Australian Raven, Australian Ringneck, Willie Wagtail, Australian Magpie, White-fronted Chat and Grey Butcherbird, which were regularly seen crossing paddocks from one remnant to the next. Raptors were observed hunting from <10 m to 800 m above ground-level, moving over open paddocks and remnants. Raptors comprised the two Orders most recorded within the RSA height range and had the highest mean flight height (Appendix 6). The importance of remnants in the maintenance of biodiversity and as stepping stones in agricultural landscapes for birds (and bats) is well documented (Arnold *et al.* 1987; Bentley & Catterall 1997;

Collard *et al.* 2009; Donald & Evans 2006; Fischer & Lindenmayer 2002a, b; Johnson *et al.* 2007; Major *et al.* 2001).

7.3 RISK ASSESSMENT

Four potential impacts to birds and bats arise from wind farms, including habitat loss, mortality or injury from collision with wind turbine blades, and alienation or displacement leading to disruption to feeding or breeding behaviour (Table 6-1). In consideration of these potential impacts a risk assessment was undertaken for all conservation significant species recorded or considered likely or potentially occurring (Table 6-2), as well as for all other potential species of concern, that is, non-conservation significant species that are particularly vulnerable to collision risk due to their morphology, behaviour, flight type and/or habitat use (i.e. birds of prey and bats; Table 6-3).

The assessment found no species to be at high risk from the Project, but 3 species to be at moderate risk, Forest Red-tailed Black Cockatoo, Baudin's Cockatoo and Carnaby's Cockatoo. The risk profile and reasoning was similar for all 3 black cockatoo species: all were recorded on multiple occasions in the WFA and within the RSA (except Baudin's Cockatoo), they all have small total population estimates, are slow breeding and display strong pair bonding. No mortality monitoring data was available for these species; however, the related *Zanda funerea* from south-eastern Australia, which may be considered a suitable surrogate due morphological, habitat and movement characteristics, had no reported mortalities from the reviewed literature sources. However, both Forest Red-tailed Black Cockatoo and Carnaby's Cockatoo were recorded flying at heights within the RSA of the WFA, but only twice each. This is similar to the results of (BCE 2025) which found just 1.9% of Carnaby's Cockatoo flights were above 18 m (within the original RSA) and that increasing the minimum rotor height to 50 m would reduce the number of flight within the RSA to 0.13%. (BCE 2025) also notes personal observations of Carnaby's Cockatoo adjusting flight heights as they approach turbines, perhaps suggested a learnt behaviour response.

While Baudin's Cockatoo was not recorded at RSA heights, it is suspected to reach RSA heights on occasion. Given that, and the lack of species-specific data on turbine strike risk for the 3 WA species, a precautionary assessment is warranted. It is noted that the RSA flight heights for Forest Red-tailed Black Cockatoo and Carnaby's Cockatoo were limited to the lowest RSA category of 26-50 m.

The mortality risk for the 3 black cockatoo species is reduced by the relatively low numbers recorded in the WFA, considering the number of sampling phases, survey effort and duration of the survey program. The abundance data indicates that their local populations are small and any mortality experienced is unlikely to have a significant impact on the total population, with the risk assessment finding potential for minor reduction in population viability for between one and 5 years from loss of individuals from turbine strike. The risk is also reduced by the lack of breeding or roosting sites within the WFA or wider BIA. While there is high and moderate quality foraging habitat in WFA, the proposed cleared of the small amount (<1 ha) of this habitat is unlikely to affect the local populations when extensive suitable foraging habitat is present outside the WFA.

Risk was assessed as negligible for the remaining 4 conservation significant bird species recorded in the WFA (Wood Sandpiper, Osprey, Peregrine Falcon) or wider BIA (Masked Owl (southwest)). Direct collision with turbine blades is considered the primary potential impact to these species but they are considered at negligible risk principally because they were recorded so rarely (once or twice each) and as single birds (Osprey, Peregrine Falcon, Masked Owl) or small groups (Wood Sandpiper, flock of 3), indicating likely only occasional occurrence in the WFA. Even for the 2 species recorded at RSA heights (Osprey and Peregrine Falcon), their limited presence and lack of breeding on site means the associated risk from the proposed wind farm is negligible.

The risk assessment for Western False Pipistrelle (P4), the only conservation significant bat species detected, determined that the proposed wind farm represents a low risk to this species. This species

was the least recorded bat species. Direct turbine blade strike is again considered the most likely impact from the Project; however, it is noted that the literature suggests it typically stays close to remnant vegetation, rarely venturing out into open paddocks. This is supported by the survey data, of the 6 recorded sites, only one is in open paddock, and was located between a cluster of remnants. The other 5 sites were in or at the edge of larger native remnants or roadside remnants. A precautionary approach has been taken as so little is known of this species, therefore, it has been assumed the species will fly at RSA heights and so has the potential to be at strike-risk, but due primarily to the lack of knowledge was determined to be at low risk, rather than negligible risk.

The Australasian Bittern (EN), which was also rated low risk. It was not recorded within the WFA or wider BIA, despite audio recordings taken at suitable habitat through the breeding season (Phoenix 2025a). However, it has been reported from Hardy Inlet (12 km west) and Gingilup/Quitchup/Jasper wetlands (~30 km SE) and limited information was available on the local population distribution. As the WA population of Australasian Bittern is very small, any loss of individuals may have a temporary impact on local population viability. Given this, and because of its potential to occasionally use the larger wetlands in the WFA and potentially fly within the height of the RSA, it was assigned a risk rating of low.

For the 2 undetected conservation significant species considered likely to occur (Blue-billed Duck, P4 and Common Greenshank, Mig.) the risk was determined to be negligible. For Blue-billed Duck there are no records from the WFA and no mortalities have been reported from carcass monitoring. Similarly, Common Greenshank has no records in the WFA, however suitable habitat is present in the form of flooded paddocks and wetlands. No mortalities have been reported in carcass monitoring and its population size means losses would be expected to be undetectable.

The risk to the 18 additional undetected conservation significant species considered to possibly occur, or possibly occur on rare occasion, was also found to be negligible. Most of these are Migratory shorebirds, many of which largely favour marine/intertidal habitats but cannot be discounted from occurring on occasion, with none considered likely to utilise the WFA on a regular basis during the Migratory shorebird season. The 2 non-shorebird species, Fork-tailed Swift and Grey Wagtail, are typically more northern species and their presence in the desktop is a function of 'modelled distribution' rather than actual records.

Curlew Sandpiper (CR, Mig.) Sharp-tailed Sandpiper (VU, Mig.) have not been recorded close to the WFA in a long time (1979/1980) from the adjacent artificial wetlands. All other records are from to the Hardy Inlet. Inland freshwater wetlands are not their preferred habitats, but they will use them on occasion in southwest WA. As such the risk to these two species is negligible.

For the non-significant bird species of concern (11 raptor species; Wedge-tailed Eagle, Swamp Harrier, Black-shouldered Kite, White-bellied Sea-Eagle, Whistling Kite, Little Eagle, Collared Sparrowhawk, Brown Goshawk, Brown Falcon, Australian Kestrel and Australian Hobby) the risk assessment found the risk to be low to negligible. While the likelihood of a collision for the majority of those 11 species ranged from potential to almost certain, the consequence of strike was considered insignificant to minor as the loss of small numbers of individuals is unlikely to impact local and regional populations. Those individuals would be readily replaced by individuals already occupying the abundant habitat available outside the WFA.

The preliminary risk assessment for non-significant bats found the risk to be negligible for 5 of the 7 species present (Gould's Wattled Bat, Chocolate Wattled Bat, Lesser Long-eared Bat, Holt's Long-eared Bat and Greater Long-eared Bat). Southern Forest Bat and White-striped Free-tailed bat were found to be at low risk. Similarly to the non-significant bird species of concern, the likelihood of collision for these species ranged from potential to almost certain; and the consequence of collisions was considered insignificant to minor. For the Southern Forest Bat and White-striped Free-tailed bat the

consequence was assessed as minor due to the combination of their higher activity level in the WFA and their high recorded mortality from reviewed sources.

Based on the flight heights recorded, the data suggests that increasing the minimum blade height to 50 m would reduce the total number of birds species recorded flying within the RSA from 52 to 24 species, a 54% reduction. This includes the 3 black cockatoos and Western False Pipistrelle but excludes raptors, which were often recorded flying above 50 m. Further, with the RSA minimum raised to 50 m, only 3.8% of all flight where height observations were recorded would be from within the RSA. As well as increasing the minimum RSA height, collision risk could be further reduced by limiting the concentration of turbines and increasing the separation distance of turbines from important habitat to maintain adequate open areas for bird and bat movement.

Site description - Sample no. 1 (24 May 2023)			
Paddock with autumn-early spring pools and small stream; completely degraded. Beenup constructed wetlands across the road to the West. Roadside vegetation condition weed infested and in completely degraded condition.			
Habitat	grassland		
Disturbance	large-scale clearing, grazing-high		
Vegetation condition	Completely Degraded	**Fire age**	long-unburnt (>10 years)
Total veg. cover (%)	100	**Litter distribution**	none
Tree cover (%)	0	**Litter depth (cm)**	0.0
Shrub cover (%)	0	**Litter cover (%)**	0
Grass cover (%)	100	**Herb cover (%)**	0

1	Site description	29 Sep 2024	29 Sep 2024

Site description - Sample no. 1 (29 Sep 2024)

Sandbar in Blackwood River channel, approximately 5km north of the river mouth. This bar holds abundant small to large waterbirds over the summer months, but overwintering birds are also common. It is often completely inundated on higher tides at which time only larger birds remain. Feeding and roosting/loading take place on mid-low tides.

Habitat	beach		
Disturbance	none		
Vegetation condition	Pristine	**Fire age**	long-unburnt (>10 years)
Total veg. cover (%)	0	**Litter distribution**	none

Site description - Sample no. 1 (29 Sep 2024)			
Sandbar 800 north of the Blackwood River mouth. As with others, this bar also holds abundant small to large waterbirds over the summer months, but overwintering birds are also common. It is often completely inundated on higher tides at which time only larger birds remain. Feeding and roosting/loading take place on mid-low tides.

[1]Species shaded in grey are pelagic seabirds and unlikely to occur in the study area. [2]PM – Protected Matters Database. [3]TPFA – Threatened and Priority Fauna Database. [4]Species only recorded at regional sites and not in study area in either the BBRAS or Basic and Targeted fauna survey. [5]Could represent red- or white-tailed black cockatoo as some desktop records predate taxonomic revision of Carnaby's and Baudins into *Zanda* genus.

Appendix 4 Profiles for conservation significant species of concern

Osprey (*Pandion cristatus*; Mig. EPBC & BC Acts)

Information gathered from Bierregaard (2020) and DCCEEW (2024f).

Behaviour

Ospreys primarily feed on fish, especially mullet, but may also eat molluscs, crustaceans, insects, reptiles, birds, and mammals. They mostly forage during the day, sometimes hunting at night, by soaring, quartering, or circling above water to locate prey. Once prey is spotted, they hover briefly before diving feet first to capture it. Hunting also occurs from perches when necessary. This behaviour is typical of their hunting style and is largely focused on locating fish near the surface of bodies of water.

Habitat

Ospreys occur in littoral and coastal habitats, as well as terrestrial wetlands across tropical and temperate Australia and offshore islands. They are found in a variety of wetland habitats, including inshore waters, reefs, bays, coastal cliffs, beaches, estuaries, mangrove swamps, exposed reeds, and along major rivers. They show a preference for coastal cliffs and elevated islands in some areas but may also inhabit low sandy, muddy, or rocky shores and coral cays. Additionally, they may travel through heath, woodland, or forest habitats when moving between foraging sites.

Movement

Ospreys are classified as migratory in some parts of the world, where they move north and south depending on weather conditions. However, the species is considered a resident in Australia. They do not typically migrate long distances within the country but may move locally in response to changes in weather or food availability.

Flight behaviour

Most flight occurs during the day during hunting and movement between nesting and foraging habitat. Ospreys generally search for prey by soaring, quartering or circling above a body of water (possibly within RSA height) and scanning below for fish. They occasionally search for prey by scanning from a perch. When a prey item is located while soaring or circling, they hover momentarily and then dive down, sometimes in stages.

Demographic factors

The Australian population size is unclear, but they are common and widely distribution in coastal regions across most of the country. There are estimated to be approximately 100,000–1,200,000 mature individuals globally.

Blue-billed Duck (*Oxyura australis*; P4 DBCA list)

Information gathered from Birdlife International (2024).

Habitat

Blue-billed Ducks occur in shallow freshwater marshes, swamps and lakes with extensive bordering reedbeds and other dense vegetation (e.g. Typha). Outside breeding season, they are also found on larger lakes, sewage ponds, lagoons and wide rivers, including saltwater bodies. They infrequently occur on marine waters.

Movement

Not truly migratory, though relatively dispersive as breeding grounds are generally abandoned after breeding is completed. They concentrate in a few favourable areas where they undergo moult and stay until just before the start of next breeding season. Widespread dispersal follows exceptional flooding events.

Behaviour

Breeding occurs between September – March. They feed on seeds and vegetative parts of aquatic plants and aquatic insects and their larvae, mostly by sieving bottom debris while (usually for <10 seconds). They also dabble on surface and strips seeds from overhanging plants.

Flight behaviour

Flight is mostly diurnal. They form large, loose flocks, especially in non-breeding season, and can travel long distances. This long distance flight is likely higher than normal flight, which is relatively low and direct over water.

Demographic factors

The population size in Australia is estimated to be between 11,000–19,000 with 15,000 mature individuals

Fork-tailed Swift (*Apus pacificus*; Mig. EPBC & BC Acts)

Information gathered from DAWE (2021a).

Habitat

In Australia, Fork-tailed Swifts are found across a variety of habitat. They mostly occur over inland plains but sometimes above foothills or in coastal areas, as well as over cliffs, beaches, islands and sometimes well out to sea. Over land, they mostly occur over dry or open habitats, including riparian woodland and tea-tree swamps, low scrub, heathland or saltmarsh. They also occur over settled areas.

Fork-tailed Swifts probably roost aerially but are occasionally observed to land. They were once recorded roosting in trees, using a bare exposed branch emergent above the foliage. Breeding does not occur in Australia.

Movement

Fork-tailed Swifts are a widespread migratory species that overwinters in Australia. They are transitory across all habitat types. In WA, there are sparsely scattered records of the Fork-tailed Swift along the south coast. They are widespread in coastal and subcoastal areas between on the lower and mid-west coast, including on nearshore and offshore islands.

Fork-tailed Swifts usually arrive in Australia around October; some rarely arriving early in September. Most observations of arrival occur in the south due to a lack of observers in the north of the country. Some birds have been sighted in WA arriving from Indonesia between October–November. In north and north-west WA, most have departed by the end of April.

They are highly mobile within Australia, and large flocks often precede or follow low pressure systems as they cross the country in search of food. In WA, they are common in Broome, with maximum numbers occurring in February.

Behaviour

Fork-tailed Swifts are exclusively aerial (1–300 m above ground). Foraging occurs in the air, often along the edge of low-pressure systems. Often occur in areas of updraughts, especially around cliffs.

Flight behaviour

Feeding flight is characterized by circular flight patterns throughout areas of high prey concentration, whilst dispersal flight is more direct. They feed in flocks ranging from 10–1,000 birds, but the largest recorded flock in Australia was 90,000 birds.

Demographic factors

The global population size has not been quantified, but they are reported to be generally common throughout most of the breeding range. The species is highly transitory, and the Australian population is estimated as at least in the tens of thousands.

Australasian Bittern (*Botaurus poiciloptilus*; EN EPBC & BC Acts)

Information gathered from DCCEEW (2022) and Marchant and Higgins (1990).

Habitat

Australasian Bitterns occur mainly in freshwater wetlands in the temperate southeast and southwest of Australia. They also rarely occur in estuaries or tidal wetlands. Their preferred habitat comprises wetlands with dense vegetation, especially where there is a mosaic of cover, from 0.5–3.5 m in height, where they forage in still, shallow water up to 0.3 m deep, often at the edges of pools or waterways, or from platforms or mats of vegetation over deep water. They favour freshwater habitats with permanent or seasonal water, particularly those dominated by sedges, rushes and/or reeds growing over a muddy or peaty substrate. In south-western Australia, they also occur in wetlands where thickets of wetland shrubs (e.g. *Melaleuca*, *Agonis* spp.).

Movement

Australasian Bitterns will move long distances between habitats when according to changes in suitability, but generally do not move seasonally. During wet years, they occur in high densities in temporary or infrequently filled wetlands and utilise ephemeral wetlands when moving from areas that are drying out. During non-breeding season from April to October, there are an influx of birds in regularly monitored wetlands in the Melbourne area.

Behaviour

The Australasian Bittern breeds from October to February in solitary pairs, or polygamously with up to three nesting females per booming male. Usually nocturnal. Feeds on tadpoles, frogs, fish and dragonfly larvae in wetland habitat.

Flight behaviour

The Australasian Bittern occurs solitarily, in pairs or dispersed aggregations of up to 34 birds. Flies with steady, slow wing-beats that are owl-like. Long-distance flight is likely higher than normal flight, though heights are unclear.

Demographic factors

The estimated number of mature individuals is <2,000 globally with approximately 1,300 (range 750–1,800) in Australia. The WA population is considered to comprise fewer than 100 individuals.

Pacific Golden Plover (*Pluvialis fulva*; Mig. EPBC & BC Acts)

Information gathered from DAWE (2021b); Geering *et al.* (2007); Newton (2008); Kloeckner *et al.* (1982); Johnson OWP *et al.* (2024) and Hansen *et al.* (2016).

Habitat

In non-breeding grounds in Australia, Pacific Golden Plovers usually inhabit coastal habitats and occasionally occurs around inland wetlands. They occur on beaches, mudflats, sandflats, mangroves, low saltmarsh, beds of seagrass in sheltered areas, harbours, estuaries, lagoons, and evaporation ponds in saltworks. They are also sometimes recorded on islands, sand and coral cays and exposed reefs and rocks. They are less common in terrestrial habitats, usually wetlands such as fresh, brackish or saline lakes, billabongs, pools, swamps and wet claypans. Other terrestrial habitats inhabited include short or long grass in paddocks, crops, airstrips, ploughed and recently burnt areas. They are very occasionally recorded well away from water.

Movement

Migratory. Pacific Golden Plovers occur at non-breeding grounds in Australia mostly between September and May, with highest numbers in eastern and south-eastern Australia. They generally arrive in the Kimberley coast in late September and in southern areas such as south-eastern South Australia in October and November. Those arriving in the Kimberley Division of WA occur on passage in October. Birds begin to migrate directly without stopping northwards along the east coast of Australia in late February and March. In northern WA, they occur on passage in February and March and leave the Kimberley Division in late April. Small numbers of birds remain in the non-breeding range throughout the Australian winter, though generally not in the extreme south of the country.

Behaviour

Pacific Golden Plovers are both diurnal and nocturnal. They feed on molluscs, polychaete worms, insects and insect larvae, spiders and crustaceans in non-breeding season, using a combination of picking and run-picking based on visual stimulus. Very occasionally eat seeds, leaves, lizards, birds' eggs and small fish.

Flight behaviour

Pacific Golden Plovers can forage in flocks of 100 or more, and also occur in mixed-species shorebird flocks. Flocks are usually of 20 to 50 birds, though single birds are sometimes seen. The species is capable of swift and extended flight, and are considered the fastest flying shorebirds. Tracking records suggest an average ground speed of around 50 kph during long transoceanic flights.

Migratory shorebirds usually fly at high altitudes during migration, with flight heights of 1,000–5,000 m reported as typical. Migratory flight heights are also variable based on weather systems and time of day, and the mean ground speed of migratory bird flights in one study from a pacific island was 63 kph.

Demographic factors

The EAAF population is estimated at 120,000 and the global population is estimated at about 170,000–220,000. The number of birds recorded in Australia can vary significantly between years.

Peregrine Falcon (*Falco peregrinus*; OS BC Act)

Information gathered from BirdLife Australia (2023); Debus (2012); Department for Environment and Heritage (2024); White (2024).

Habitat

Peregrine Falcons are highly adaptable, breeding across diverse habitats from the tropics to cold deserts and high-altitude areas up to 3300 m. They have been recorded flying up to 4,000 m during long-distance flight and can be found in various habitats. Preferred nesting sites include cliffs, ledges, rocky outcrops, and occasionally tall trees. Cliff edges and wooded watercourses are particularly favoured, with nests often placed on ledges or repurposed from other large bird species.

Movement

Peregrine Falcons display site specific behaviours, mainly appearing in areas during transitory flights or while foraging. They undergo long distance natal dispersal, though once a nest is established site fidelity is high. The Australian subspecies does not migrate.

Behaviour

As diurnal hunters, Peregrine Falcons display varied flight patterns based on feeding needs and conditions. Most prey are birds (around 75–100% of all prey). Hunting behaviours include aggressive pursuits, ambushes from perches, and even occasional ground approaches. They also often feed by ambushing from low perches in the morning and late afternoon. During the breeding season, it perches on cliffs or vantage points near nests, scanning large airspaces where other birds fly. From these perches, it can dive easily onto low-flying prey or climb to intercept high-flying birds. Aerial hunting is less common in poor weather, when perching-based hunts prove more successful.

Flight behaviour

The species typically hunts from high perches or while soaring to spot prey below. Flight altitude varies with seasonal factors and during localized migrations. They are known to soar several hundred metres high, enhancing their vantage over hunting grounds. Flight types used by the species include:

- Flapping Flight - During migration or travel between hunting areas, Peregrine Falcons use a normal cruising wing beat with speeds between 40–55 km/h and can reach altitudes up to 240 m. When pursuing prey, the wing beat becomes faster and more powerful. Pursuit may include low-altitude, contour-following flights or direct tail-chasing.
- Soaring - Static soaring is observed as young individuals begin to fledge, with wings held motionless while moving parallel to a cliff face or similar terrain, often at heights of 3–100 m. As they develop, young individuals soar on thermals within weeks of fledging, occasionally joined by adults.
- Stoop - The stoop is a high-speed dive where the birds fold their wings close to their bodies to reach maximum speeds, braking abruptly by rising or leveling out before striking prey. Their speeds depend on their mass and wing structure. Typical dives are executed from heights of 215–320 m.

Demographic factors

It is estimated that there are 6,000–10,000 individuals within Australia.

Forest Red-tailed Black Cockatoo (*Calyptorhynchus banksii* subsp. *naso*; VU EPBC & BC Acts)

Information gathered from DCCEEW (2024e); DAWE (2022) and Garnett and Baker (2021) .

Habitat

Forest Red-tailed Black Cockatoos inhabit the dense Jarrah, Karri and Marri forests of South-west WA, favouring forests receiving more than 600 mm average rainfall annually in the hilly interior. Although most records are in Jarrah-Marri forests, they have been observed in a range of other forest and woodland types. These include Blackbutt, Wandoo, Tuart, Albany Blackbutt, Yate and Flooded gum. They are also now seen feeding in more open agricultural areas and in the Perth metropolitan area, where they will also breed.

Breeding habitats are generally in woodland or forest but may also breed in partially cleared woodland or forest, including isolated trees. Nest in hollows in live or dead trees (many eucalypt species may provide suitable hollows), particularly Marri, Karri, Wandoo, Bullich, Blackbutt Tuart and Jarrah.

Movement

Forest Red-tailed Black Cockatoos roost in trees at night, leaving trees at sunrise before separating in smaller groups to bask and feed for 10–12 hours. They also travel between feeding habitat and water sources to drink. They return to their roost at dusk.

Forest Red-tailed Black Cockatoos are predicted to have a breeding home range of 116-187 ha. Their movements are generally influenced by available water and foraging resources. Changes in foraging preferences due to habitat alteration have led more regular movement of birds in the northern Darling plateau area onto the Swan Coastal Plain and around the Perth metropolitan area, to feed on cape lilac. Birds on the have also been recorded moving across the wheatbelt since 2010, possibly driven by lack of resources, where previously there had not been records.

Behaviour

Forest Red-tailed Black Cockatoos roost in any tall trees, but especially on tall Jarrah, Marri, Blackbutt Tuart and introduced eucalypt trees or large trees on the edges of forests. Breeding can occur in Autumn and Spring, sometimes twice in one year, with a single chick raised per breeding event. Around 90% of their diet consists of the seeds of Marri and Jarrah, and the species relies heavily on both trees during breeding periods. However, they also consume other native trees and have been increasingly observed feeding on Cape Lilac.

Flight behaviour

They usually occur in family flocks of 10 birds, though groups of 25 or more birds occasionally occur. Flight is mainly crepuscular, with travel between foraging and roosting habitat occurring during the dawn and dusk hours. However, movement throughout foraging habitat occurs throughout the day. Flight is often observed above canopy height, with deep flapping wingbeats.

Demographic factors

The subspecies' population is estimated to be around 17,000 birds. Population trends are unclear.

Baudin's Cockatoo (*Zanda baudinii*; EN EPBC & BC Acts)

Information gathered from Department of Agriculture (2021a); (Johnstone & Kirkby 2008) and (Garnett & Baker 2021).

Habitat

Baudin's Cockatoos' breeding habitat is generally in Jarrah, Marri and Karri woodland or forest of higher rainfall areas in south-west Western Australia. However, they may also breed in partially cleared woodland or forest, including isolated trees. They nest in hollows in live or dead trees (many eucalypt species may provide suitable hollows), particularly Karri, Marri, Jarrah, Wandoo, Bullich and Tuart. Night roosting habitat includes tall trees such as Jarrah, Flooded Gum, Blackbutt, Tuart and introduced eucalypts. These roosting habitats are ideally around riparian environments, natural water sources or artificial permanent water sources.

Movement

Baudin's Cockatoos breed in spring and into summer (October - January), primarily in the south of the range. Once breeding season ends in January, many birds depart from nesting areas and move northward, forming larger foraging flocks in response to changing food resources. In early February and March, the flocks arrive at non-breeding traditional roosts in the central and northern parts of the Darling plateau (from about Collie north to Mundaring). During non-breeding season, birds in the Perth hills districts move westward onto the southern Swan Coastal Plain in mid-August just before heading south to breed. By mid-October, most birds are either back in their breeding quarters in the south or heading there. Breeding adults that migrate probably return to the same nesting areas each year, though no pairs have been observed returning hollows in successive years.

Behaviour

They mainly feed on the seeds of Marri and rarely Jarrah, as well as seeds of native proteaceous plant species such as *Banksia* spp. and *Hakea* spp.). They also consume insects and insect larvae; pith of Kangaroo Paw ; tips of *Pinus* spp., tips of *Macadamia* spp., and almonds, pecans, seeds of apples, seeds of pears and seeds of persimmons from orchards. Marri is the primary food source with the birds using its seeds, flowers, nectar and buds. A single offspring is raised per breeding event.

Flight behaviour

Although flocks of up to 900 have been recorded, they most commonly move about in small groups of 3, consisting of the adult pair and a dependent juvenile. These flocks base themselves at roost sites and use the roosts to access the local foraging resources. Numbers tend to be largest at the roost site between dusk and dawn. Movement throughout foraging habitat occurs throughout the day. Flight is often observed above canopy height, with deep flapping wingbeats, though flight over long distances between foraging and breeding parts of the range may be higher.

Demographic factors

The total population of the species is estimated to be 5,000–8,000. It was estimated as 10,000–15,000 from 1995–2004 with a declining trend.

Carnaby's Cockatoo (*Zanda latirostris*; EN EPBC & BC Acts)

Information gathered from Department of Agriculture (2021b) and Garnett and Baker (2021).

Habitat

Breeding habitat of Carnaby Cockatoos is generally in heaths, woodland or forest of south-western Western Australia. They also breed in partially cleared woodland or forest, including isolated trees. Nesting habitat is inland, though increasing numbers are breeding closer to the coast due to habitat loss in the Wheatbelt. Nesting habitat includes in hollows in live or dead Eucalypts. Night roosting habitat includes tall trees such as Salmon Gum, Wandoo, Marri, Karri, Blackbutt, Tuart, introduced eucalypts and introduced pines. Roosting habitats ideally occur around riparian environments, natural permanent water sources and artificial permanent water sources. Birds will forage in woodlands used for breeding. Outside of breeding season, Carnaby's Cockatoos will feed in Banksia woodlands on the Swan Coastal Plain, the Perth area and in Banksia heath on the southern coast.

Movement

Carnaby's Cockatoos are partly resident and partly migratory. In high rainfall areas, with high quantities of native vegetation, they are resident. However, in areas that are drier or have been cleared, they become breeding migrants. Populations that breed in drier areas of the range arrive at breeding localities in late winter and spring. Once their summer breeding is complete, they move into areas of high rainfall. For example, birds breeding in Badgingarra, Dandaragan and Moora regions tend to move west after breeding, into higher rainfall areas especially near coastal banksia scrubs (e.g. at Wanagarren Nature Reserve, Nilgen Nature Reserve and Yanchep area), then south onto the southern Swan Coastal Plan, including the Perth Metropolitan Area, Lake Clifton and Myalup.

Behaviour

Carnaby's Cockatoos feed on seeds, flowers and nectar of native proteaceous plant species as well as *Callistemon* spp. and Marri. They will also feed on seeds of introduced species including Pines, *Erodium* spp., wild radish, canola, almonds, macadamia and pecan nuts; insects and insect larvae; occasionally apples and persimmons; and liquidambar. They have been reported to feed on canola crops. One chick is raised per breeding event, from eggs laid in large eucalypt hollows.

Flight behaviour

When not breeding, Carnaby's Cockatoos tend to aggregate in large flocks and move through the landscape in search of food. These flocks base themselves at roost sites, which are usually the tallest trees in an area and often located in or near riparian environments or permanent water. Different roosts may be used by birds during the non-breeding period and by non-breeding birds during the breeding period. Numbers tend to be largest at the roost site between dusk and dawn and surveys for roosts should occur at these times, as birds are leaving or returning to roost sites, over several days. Movement throughout foraging habitat occurs throughout the day. Flight is often observed above canopy height, with deep flapping wingbeats, though flight over long distances may be higher altitude.

Demographic factors

The population is estimated at around 35,000 birds. It was estimated at 40,000 in 2013, though the species is undergoing ongoing population decline.

Common Sandpiper (*Actitis hypoleucos*; Mig. EPBC & BC Acts)

Information gathered from DCCEEW (2024c); Hansen *et al.* (2016) and Geering *et al.* (2007).

Habitat

Common Sandpipers utilise a wide range of coastal wetlands and some inland wetlands of varying salinity. The species is mostly found around muddy margins or rocky shores and rarely on mudflats. They have been recorded in estuaries, deltas of streams, as well as on banks farther upstream, around lakes, pools, billabongs, reservoirs, dams, claypans, occasionally piers and jetties. The muddy margins utilised by the species are often narrow, and may be steep.

Foraging occurs in shallow water and on bare soft mud at the edges of wetlands; often where obstacles project from substrate, e.g. rocks or mangrove roots. However, they sometimes venture into grassy areas adjoining wetlands. Roost sites are typically on rocks or in roots or branches of vegetation, especially mangroves. They are known to perch on posts, jetties, moored boats and other artificial structures, and to sometimes rest on mud or loaf on rocks.

Behaviour

They are diurnal feeding shorebirds that feed on low-flying insects and terrestrial insects. They are very active and are often observed following prey bobbing their tail. The species is solitary and is most commonly observed alone or in small flocks.

Movement

Migratory. They breed in Eurasia and move south for the boreal winter. Post-breeding, the southward migration usually begins July–November, with individuals arriving from July onwards in South Australia, WA and the Northern Territory. The non-breeding movements of the species within Australia are poorly known.

Flight behaviour

Common Sandpipers do not form large flocks like other shorebirds during migration and are often found alone or in pairs. Flight during the southern migration passage is mostly diurnal, whereas the northern passage mainly occurs by night. Migratory shorebirds usually fly at high altitudes during migration, with flight heights of 1,000–5,000 m reported as typical. Migratory flight heights are also variable based on weather systems and time of day, and the mean ground speed of migratory bird flights in one study from a pacific island was 63 kph.

When flushed, they fly low over water often in direct straight lines.

Demographic factors

The East Asian-Australasian Flyway (EAAF) population is estimated as 190,000. The global population is estimated to number 4,950,000–7,500,000 individuals.

Ruddy Turnstone (*Arenaria interpres*; VU/Mig. EPBC Act; Mig. BC Act)

Information gathered from DCCEEW (2024g); Geering *et al.* (2007); Newton (2008); Kloeckner *et al.* (1982); Hansen *et al.* (2016) and Garnett and Baker (2021).

Habitat

Ruddy Turnstones occur in a wide variety of coastal habitats, including exposed rock coastlines, coral reefs, shallow tidal pools, beaches, estuaries, harbours, bays, coastal lagoons, low saltmarsh, exposed beds of seagrass, sewage ponds and mudflats. In northern Australia they may prefer wide mudflats. In southern Australia, they prefer rockier coastlines and are less numerous on large embayments with extensive mudflats.

Movement

Ruddy Turnstones are migratory, with 6 recognised populations. They move south to non-breeding areas with a partial overlap of populations on passage. There may be 2 routes of migration to Australia, with birds occurring in east Australia and New Zealand arriving from a migration south across the Pacific from east Asia and returning north via the east coast of Asia. The birds in the western areas of Australia may come from populations migrating south from east Asia who then return north via east Asia. The species enters Australia from August onwards, and movements into and through Australia continue until at least October. When returning to breeding grounds, Ruddy Turnstones leave sites in the south of Australia from mid-March. Some birds may fly over north Australia and/or touch down in north-west or north Australia though some adults in north-west Australia are thought to be capable of flying non-stop to the south coast of China.

Behaviour

Nocturnally and diurnally feed mainly on insects, worms, crustaceans, molluscs, and spiders. They have also been occasionally recorded feeding on eggs and carrion. During the non-breeding season, their only food source is maggots and larvae obtained from picking decomposing seaweed.

Flight behaviour

They are commonly seen singly or, more usually, in loose groups of 20–100 among mixed shorebird flocks, along coasts and occasionally inland. They tend to fly in tight coordinated flocks when moving locally, but in loose lines when migrating. Migratory shorebirds typically fly at high altitudes during migration, with flight heights of 1,000–5,000 m reported as typical. Migratory flight heights are also variable based on weather systems and time of day. Migratory flight heights are also variable based on weather. The mean ground speed of migratory bird flights passing a pacific island was 63 kph.

Demographic factors

The Australasian East Asian Flyway (EAAF) population is estimated at 30,000. The Australian population is estimated at ~19,000 based on extrapolation of the EAAF estimate and other data. The population is undergoing rapid decline.

Sharp-tailed Sandpiper (*Calidris acuminata*; VU/Mig. EPBC Act; Mig. BC Act)

Information sourced from DCCEEW (2024a); Mlodinow *et al.* (2024) Geering *et al.* (2007); Newton (2008); Kloeckner *et al.* (1982); Hansen *et al.* (2016) and Garnett and Baker (2021).

Habitat

Sharp-tailed Sandpipers forage in fresh and hypersaline environments, feeding along water edges on mudflats, coastal and inland wetlands, and sewage ponds. After rainfall, they may also feed on agricultural pastures. During migration, they roost and forage on rocky and sandy beaches, freshwater habitats, and inland saltwater areas.

Movement

Sharp-tailed Sandpipers breed in northern Siberia from June to August and migrate in flocks to their non-breeding areas south of the Equator. Small numbers arrive in Australia by mid-August and the majority by September. Their northward migration for the breeding season begins by April, and they are among the first migratory shorebirds to leave Australia. In wet years in northern Australia, inland birds do not migrate to southern Australian and remain in ephemeral wetlands.

Behaviour

Sharp-tailed Sandpipers are omnivorous, primarily feeding on seeds, worms, molluscs, crustaceans, and insects, which they hunt by pecking and jabbing their beak into the muddy substrate. They often form large mixed flocks with other migratory shorebirds in suitable foraging and roosting habitats.

Flight behaviour

Birds migrating from Siberia travel in flocks of fewer than 1,000 individuals. Migratory shorebirds usually fly at high altitudes during migration, with flight heights of 1,000–5,000 m reported as typical. Migratory flight heights are also variable based on weather systems and time of day, and the mean ground speed of migratory bird flights in one study from a pacific island was 63 kph.

In Australia, they form large mixed flocks with other shorebird species at wetlands and salt lakes which can disperse rapidly when disturbed. When flushed, they exhibit rapid, zigzag flight patterns. During migration or when changing feeding locations, their flight is more leisurely with loose, measured wing beats.

Demographic factors

Their estimated population in the East Asian - Australasian Flyway (EAAF) in 2016 was 85,000 birds, all believed to migrate to Australia. By 2020, the population was estimated to have decreased to ~73,000 mature individuals, based on extrapolation from 2016 data and trends from related studies.

Sanderling (*Calidris alba*; Mig. EPBC & BC Acts)

Information gathered from DCCEEW (2024h); Geering *et al.* (2007); Newton (2008); Kloeckner *et al.* (1982); Hansen *et al.* (2016) and Garnett and Baker (2021).

Habitat

In Australia, Sanderlings are usually found on the coast, mostly on open sandy beaches exposed to open sea-swell and on exposed sandbars and spits and shingle banks, where they forage in the wave-wash zone and amongst rotting seaweed. They also occur on beaches that may contain rocky outcrops. They more rarely occur on more sheltered sandy shorelines and in near coastal wetlands, such as lagoons, hypersaline lakes, salt ponds and samphire flats. There are also rare inland records from sandy shores of ephemeral brackish lakes and brackish river pools. They will roost on or behind bare sand high on the beach, clumps of washed-up kelp, coastal dunes, and on rocky reefs and ledges.

Movement

Migratory. Sanderlings breed in the holarctic region and move south to broad non-breeding areas. They arrive in Australia during September, mostly occurring in north-western Australia. They move through the northern regions in September–November and cross the continent to the south Australia coast. Small numbers regularly arrive during late August and early September at Rottnest Island, south-west WA. Between March to May, they depart the non-breeding range in south-east Australia. They apparently move west along the south coast of Australia and across the continent before moving north, with at least some birds stopping on the north coast. A few birds, particularly young birds, remain in Australia during winter with other non-breeding areas during the breeding season, though numbers may vary at a site between days indicating birds are nomadic at this time.

Behaviour

Sanderlings are omnivorous, foraging on plants, seeds, worms, crustaceans, spiders, insects, medusae, fish, larger molluscs and crustaceans. They are very active when foraging, often in tightly synchronised flocks, darting onto moist sand between breaking waves picking up food items from the surface of the wet beach. Foraging may also occur at the edges of shallow pools on sandspits and on nearby mudflats. Individuals may also defend a feeding territory during the non-breeding period.

Flight behaviour

Sanderlings tend to migrate in long flights, overflying large areas, typically in small flocks of less than a thousand. Migratory shorebirds usually fly at high altitudes during migration, with flight heights of 1,000 – 5,000 m reported as typical. Migratory flight heights are also variable based on weather systems and time of day, and the mean ground speed of migratory bird flights in one study from a pacific island was 63 kph. Normal, non-migratory flight is rapid and low.

Demographic factors

The East Asian-Australasian Flyway (EAAF) population is estimated to be 30,000. The number during the non-breeding period in Australia is estimated to be 10,000.

Curlew Sandpiper (*Calidris ferruginea*; CR/Mig. EPBC Act; Mig (BC Act)

Information is gathered from DCCEEW (2023); Hansen *et al.* (2016); Geering *et al.* (2007); Newton (2008); Hansen *et al.* (2016); Higgins and Davies (1996) and Garnett and Baker (2021).

Habitat

Curlew Sandpipers are found in brackish lagoons, estuaries, mudflats, sandflats, saltmarshes and to a lesser extent exposed coral, rocky shores and sandy beaches. Foraging occurs in mudflats and nearby shallow water, at the edges of shallow pools, drains and along sandy shores, often following the receding tide to feed near the water's edge. They also forage on mudflats that have been exposed for longer periods, typically in small groups. At high tide, they tend to forage in areas of low, sparse emergent vegetation, such as saltmarsh, and sometimes in flooded paddocks or inundated salt flats. Roosting typically occurs around intertidal mudflats in sheltered coastal areas, such as estuaries, bays, inlets, and lagoons. They also roost in non-tidal swamps, lakes, and lagoons near the coast. Occasionally, they are found near ponds in saltworks or sewage farms, and individuals are occasionally recorded inland around ephemeral and permanent water sources with bare mud or sand edges.

Movement

Curlew Sandpipers migrate from Siberia and occur in Australia from late August – April. Males arriving earlier than females to non-breeding habitat. In Australia, the first adults arrive in the northwest during mid-August and in the southeast during late August, and most adults have arrived by the end of September. The species begins its northward migration during early March, with most birds having departed by early April and nearly all migrants having left by the end of April. Many juveniles do not return to breeding territory in their first year of life, remaining in non-breeding locations. Within Australia in the non-breeding season, birds do not move long distances between habitat.

Behaviour

Curlew Sandpipers are gregarious, often found in large flocks in both fresh and brackish waters. They forage in mixed flocks with other shorebird species, pecking at invertebrates on the surface of mudflats or making shallow probes below the surface.

Flight behaviour

Curlew Sandpipers form large mixed flocks with other shorebird species, sometimes travelling in these large flocks between roosting and foraging habitats. Roosting and foraging flight activities occur during the day and night. Migratory shorebirds typically fly at high altitudes during migration, with flight heights of 1,000–5,000 m reported as typical. Migratory flight heights are also variable based on weather systems and time of day. Flight speed during migration has been estimated at 70–75 km per hour. When flushed, Curlew Sandpiper flight has been described as "swift and low".

Demographic factors

The estimated population in the East Asian-Australasian Flyway (EAAF) in 2016 was 90,000 birds, of which 45,500 were thought to come to Australia. The estimated Australian population in 2020 was ~40,000 mature individuals, with a rapidly declining population trajectory.

Pectoral Sandpiper (*Calidris melanotos*; Mig EPBC & BC Acts)

Information gathered from DCCEEW (2024c); Mlodinow *et al.* (2024); Wetlands International (2024); Geering *et al.* (2007); Newton (2008); Kloeckner *et al.* (1982); Higgins and Davies (1996) and Hansen *et al.* (2016).

Habitat

In Australasia, they forage and roosts in shallow wetlands, ranging from fresh to saline. They are typically found in coastal lagoons, estuaries, bays, swamps, lakes, inundated grasslands, saltmarshes, river pools, creeks, floodplains, and artificial wetlands. Breeding does not occur in Australia.

Movement

Migratory, present in Australia from September–June. One of the first species to depart breeding grounds, males leave before females and juveniles. Only a small proportion of the total population visits Australia, with most occurring in South America during the non-breeding season. Nearly all individuals travel north during the breeding season, with very few overwintering records.

Behaviour

Pectoral Sandpipers are omnivorous, consuming algae, seeds, crustaceans, arachnids and insects in shallow fresh to saline wetlands. While feeding, they move slowly, probing with rapid strokes. They form large mixed flocks in suitable foraging and roosting habitat with other migratory shorebirds.

Flight behaviour

Pectoral Sandpipers form large mixed flocks with other shorebird species in suitable habitats. The timing of flight between roosting and foraging areas is dependent on tides, and they roost and forage both during the day and at night. The exact timing of their migratory flight, whether diurnal or nocturnal, is unclear. Migratory shorebirds usually fly at high altitudes during migration, with flight heights of 1,000–5,000 m reported as typical. Migratory flight heights are also variable based on weather systems and time of day, and the mean ground speed of migratory bird flights in one study from a pacific island was 63 kph.

When flushed, Pectoral Sandpiper flight is rapid, characterized by many turns and a zigzag pattern, similar to snipe. However, when migrating or changing feeding locations, flight is more leisurely, with loose, measured wingbeats.

Demographic factors

The global population has been estimated to be around 25,000–100,000 individuals. Accurate population estimates do not exist for the EAAF pop.

Red-necked Stint (*Calidris ruficollis*; Mig. EPBC & BC Acts)

Information sourced from DCCEEW (2024j); (Geering *et al.* 2007); (Newton 2008); (Kloeckner *et al.* 1982); (Hansen *et al.* 2016); (Van Gils *et al.* 2020) and (Garnett & Baker 2021).

Habitat

Red-necked Stints primarily forage on bare wet mud in intertidal mudflats, sandflats, or in very shallow water, typically in areas with a thin film of surface water near the water's edge. During high tides, they may forage in non-tidal wetlands. They are also found foraging in samphire, though they tend to avoid seagrass beds, feeding along their edges instead. They sometimes forage in beach-cast seaweed on sandy ocean beaches and in flooded paddocks or freshly cropped lucerne paddocks near lagoons. For roosting, Red-necked Stints prefer sheltered beaches, spits, banks, or islets of sand, mud, coral, or shingle, and occasionally in saltmarsh or other vegetation. They may also roost on exposed reefs or shoals. Large numbers may roost on ocean beaches, although this is likely not a preferred habitat unless high numbers are present. They have also been recorded roosting up to 1.5 km from an inland lake, in close-cropped grass, and among beach-cast seaweed, clods of mud, or dried cow-pats. During very high tides, they may use sand dunes or claypans, with large groups recorded roosting at an inland claypan near Roebuck Bay in north-west Western Australia.

Movement

Present in Australia from August–April, likely moving in large flocks during migratory flight. AAustralia is reached by late August and arrivals continue until November, with departure mainly March and April. Immature birds usually remain in Australia throughout first year, often moving inland after rains fill wetlands. Adults show high fidelity between years to non-breeding sites.

Behaviour

Red-necked Stints are omnivorous and forage in intertidal and near coastal wetlands in Australia. They use their bill to jab and probe into soft mud to capture small invertebrates and gleans from plants in saltmarshes and water. They are often seen feeding in dense flocks, which spread out as the tide recedes, and frequently forage alongside other shorebird species.

Flight behaviour

Red-necked Stints travel in large flocks and has been observed feeding in dense groups. The timing of flights between roosting and foraging habitats is tide-dependent in marine environments, and the species roosts and forages both during the day and night. The exact diurnal or nocturnal timing of migratory flight is unclear, as is the size of the flocks migrating to and from Australia. Migratory shorebirds usually fly at high altitudes during migration, with flight heights of 1,000–5,000 m reported as typical. Migratory flight heights are also variable based on weather systems and time of day, and the mean ground speed of migratory bird flights in one study from a pacific island was 63 kph.

Demographic factors

Their estimated population in the East Asian-Australasian Flyway (EAAF) was 475,000 individuals as of 2016, of which 389,200 were expected to come to Australia. The estimated population as of 2020 was ~350,000 mature individuals in Australia, with a declining population trajectory.

Wood Sandpiper (*Tringa glareola*; Mig. EPBC & BC Acts)

Information gathered from DCCEEW (2024d); Hansen *et al.* (2016) and (Geering *et al.* 2007).

Habitat

Wood Sandpipers inhabit well-vegetated, shallow freshwater wetlands, swamps, billabongs, lakes, pools, and waterholes. These areas are typically associated with emergent aquatic plants or grasses and are often surrounded by tall fringing vegetation. They are also frequently found in inundated grasslands, short herbage, wooded floodplains, and irrigated crops, and are also known to appear in small wetlands as they dry out. They rarely visit brackish wetlands and dry stunted saltmarsh. They occur in artificial wetlands, such as open sewage ponds, reservoirs, large farm dams, and bore drains. In some wetlands in Western Australia, individuals are often observed near each other, concentrating at specific areas within the wetland.

Movement

Wood Sandpipers are a migratory species that breeds across Eurasia. It is likely that the Australian non-breeding population originates from eastern Siberia. Within Australia, they exhibit some dispersive movements between appropriate wetland habitat, though their movements within Australia remain largely unstudied. Although regularly observed at many sites in Australia, they also appear unpredictably in summer at inland storm pools.

Only a small portion of the Asian population reaches Australia, where most sightings occur between August and April. After arrival, some of them move southward across the continent. They are common in southwestern Western Australia, from summer to autumn.

Behaviour

Wood Sandpipers are observed either singly, in pairs, or in small flocks, and very occasionally in groups numbering in the hundreds. They often associate with other wader species and typically feed in loosely scattered groups. They tend to be wary, nervous, and excitable, especially in larger groups, although solitary individuals may sometimes allow a closer approach. They are carnivorous, feeding mainly on insects and molluscs in Australia. The species wades in shallow freshwater, often up to its belly, gleaning prey from the water's surface. They are also known to probe with their bill, sometimes submerging their head and neck, sweeping the bill side to side underwater in search of food.

Flight behaviour

When disturbed, Wood Sandpipers fly quickly in a zigzag pattern, gliding gracefully close to the ground. Their flight involves a swaying motion with rapid wingbeats, often rising high and moving at great speed when startled. Flight ecology during migration is more unclear. Migratory shorebirds usually fly at high altitudes during migration, with flight heights of 1,000–5,000 m reported as typical. Migratory flight heights are also variable based on weather systems and time of day. Migratory flight heights are also variable based on weather systems and time of day, and the mean ground speed of migratory bird flights passing a pacific island was 63 kph.

Demographic factors

The East Asian-Australasian Flyway (EAAF) population was estimated at approximately 130,000 in 2016.

Common Greenshank (*Tringa nebularia*; EN/Mig. EPBC Act; Mig. BC Act)

Information gathered from DCCEEW (2024b); Hansen *et al.* (2016); Geering *et al.* (2007); Newton (2008) and Kloeckner *et al.* (1982) .

Habitat

Common Greenshanks forage at the edges of wetlands, in soft mud on mudflats, in channels, or in shallow waters around the edges of waterbodies. These feeding areas are often located around mangroves or other sparse, emergent vegetation like sedges or saltmarsh. They may also occasionally feed in seagrass beds. They roost in a variety of coastal and inland habitats. These habitats include estuaries, mudflats, mangroves, lagoons, billabongs, swamps, sewage farms, and flooded crops.

Movement

Migratory. Common Greenshanks arrive in Australia from August, primarily passing through Western Australia and the Torres Strait. Numbers slowly increase at both inland and coastal sites between August and September. Common Greenshanks overwinter at a few selected locations, with numbers reaching expected wintering levels in late April and early May. The proportion of the population that overwinters in Australia can vary from year to year. During the non-breeding season, most of them do not appear to move long distances within Australia, although some dispersive movements may occur.

Behaviour

Common Greenshanks are carnivorous, with a diet that primarily consists of insects (such as beetles), along with crustaceans, annelids, molluscs, amphibians, small fish (such as mullet, clinids, and tilapia), and occasionally rodents. They are both diurnal and nocturnal. They feed by picking from the surface, probing, sweeping, and lunging at the edges of mudflats or shallow waters. They may also walk along shorelines and even chase small fish in shallow water. Breeding typically occurs in widely dispersed pairs. Males often build multiple nests, lining them with feathers and vegetation, from which the female will choose one.

Flight behaviour

During non-breeding season, Common Greenshanks do not seem to move long distances within Australia, although dispersive movements may occur. Normal flight when flushed is low, rapid and often zigzagging. Generally, migratory shorebirds fly at high altitudes during migration, with flight heights of 1,000–5,000 m reported as typical. Migratory flight heights are also variable based on weather systems and time of day, and the mean ground speed of migratory bird flights in one study from a pacific island was 63 kph.

Demographic factors

Their estimated population in the East Asian-Australasian Flyway (EAAF) in 2016 was 110,000 birds, of which 27,500 were thought to come to Australia. As of 2020, the total number of mature individuals is estimated to be 23,700 (range 16,300–33,400), with a declining trajectory.

Marsh Sandpiper (*Tringa stagnatilis*; Mig. EPBC Act)

Information gathered from (DCCEEW 2024i) and (Hansen *et al.* 2016).

Habitat

Marsh Sandpipers inhabit permanent and ephemeral wetlands of varying salinity. Wetlands include swamps, lagoons, billabongs, saltpans, saltmarshes, estuaries, pools on inundated floodplains, and intertidal mudflats. The species is also commonly found at sewage farms and saltworks, and is less frequently recorded at reservoirs, waterholes, soaks, bore-drain swamps, and flooded inland lakes. In northern Australia, they favour intertidal mudflats. Three of the 5 sites with the highest recorded numbers of Marsh Sandpipers are saltwater habitats, including Port Hedland saltworks in Western Australia, though generally in Western Australia they prefer freshwater environments.

Marsh Sandpipers typically forage in shallow water at the edges of wetlands, probing the wet mud of mudflats or feeding among marshy vegetation. They have also been recorded roosting or loafing on tidal mudflats, near low saltmarshes, and around inland swamps.

Movement

Migratory. Marsh Sandpipers depart from breeding grounds from the first half of July to early September. Birds arrive in Australia from September and apparently move south across the continent from September – December. In the Australian summer, some (possibly dispersive) movements have been observed. The species begins to migrate north in March–April. Within Australia, they may move away from coast after rains and, disperse among temporary inland wetlands.

Behaviour

Marsh Sandpipers are primarily carnivorous, feeding on insects, molluscs, and crustaceans. While plant material has occasionally been found in its stomach, it is likely ingested incidentally. The species typically feeds in shallow water, often wading deeper than the level of its tarsus. It walks briskly and steadily, or may dash about in half-circles, and sometimes swims. Marsh Sandpipers generally forage by picking at the surface of water or mud and may also glean food from vegetation. They feed both singly and in groups, and has been observed following ducks, egrets, and other waders to feed on prey disturbed by these birds.

Flight behaviour

Marsh Sandpipers are known to feed in groups as large as several hundreds and often flocks during migration. Migration typically occurs at high altitude to ensure energy efficiency, as they fly long distances with few stops during migration. Migratory shorebirds usually fly at high altitudes during migration, with flight heights of 1,000–5,000 m reported as typical. Migratory flight heights are also variable based on weather systems and time of day, and the mean ground speed of migratory bird flights in one study from a pacific island was 63 kph.

Demographic factors

The East Asian-Australasian Flyway (EAAF) population was estimated at around 130,000 in 2016.

Masked Owl (Southwest) (*Tyto novaehollandiae novaehollandiae*; P3 DBCA list)

Information gathered from Marks (2020).

Habitat

The Australian Masked Owl (southwest) inhabits tall open forest dominated by large trees suitable for nesting and roosting, favouring sites with access to more open areas. They occur in higher numbers where greatest local forest and woodland diversity occurs, such as forest types with dry, open understorey that provide a variety of ground cover. Smaller numbers are patchily distributed away from coastal regions in wooded farmland, riparian woodland and isolated stands of large trees. They also occur in pine plantations. In South Australia, relic populations of the species have adapted to treeless plains, using caves and rock clefts for nesting and roosting. When foraging, they are often found in and at the edge of small patches (<20 ha) of forest with little or no understorey.

Movement

Australian Masked Owls (southwest) are sedentary, with high site fidelity. Most movements may be post-breeding dispersal of juveniles, and opportunistic exploitation by adults of recently disturbed habitats or changes in prey abundance, including rodent plagues. In Southwest Australia, some records have been attributed to seasonal movements, but this is possibly due to post-breeding dispersal or unrecorded breeding. Their estimated territory size is 1,000–1,200 ha and foraging ranges have been found at 1,800–2,500 ha.

Behaviour

Australian Masked Owls generally are considered territorial and are usually observed as a single individual or occasionally in pairs. Nesting sites are large hollows 40–500 cm deep in living or dead trees, at heights of 12–25 m, usually in trunk but also in vertical branch spouts. They favour isolated trees or trees higher than surrounding ones, with same sites used for many years. They may breed at any time of year with most eggs being laid between March and July. The species is carnivorous, feeding on a wide range of prey such as large possums, mice, small to medium birds, reptiles, beetles and large moths. They prey on arboreal species, but most prey are captured on ground.

Flight behaviour

Flight is typically low and gliding above the ground or through trees. Hunting occurs both on wing and from perches. After dusk, hunting styles change from low hunting flights over open ground to perch-hunting.

Demographic factors

The population size of the subspecies is unclear.

Wedge-tailed Eagle (*Aquila audax*; not listed)

Information gathered from Cherriman (2024); Debus (2020) and (Nature Advisory 2023).

Habitat

Wedge-tailed Eagles occur over most terrestrial habitats, from sea level up to 2000 m, but avoid areas with dense human population, e.g. cities, intensive agriculture. They occupy open forest, woodland, scrub, savanna, plains and deserts, typically in rough or remote country, though avoid dense rainforest. Nesting occurs in all wooded habitats, provided sufficient distance from human activity. Roosts and nests usually are built in live or dead trees with commanding views, 2–73 m (typically 12–30 m) above ground, though often near ground in remote deserts; typically on a rise or hillside. Wedge-tailed Eagles also occasionally on cliff ledges, or among rocks, and even on ground on islands, in areas inaccessible to humans.

Movement

Most Wedge-tailed Eagles are highly faithful to their nesting sites, with high site fidelity. The same nest is often used year after year, potentially for decades. Juvenile Wedge-tailed Eagles, especially in Western Australia, can undertake long-distance dispersal to find territory, with satellite-tagged individuals travelling up to 1,200 km shortly after leaving their natal territories.

Behaviour

Wedge-tailed Eagles forage by low, slow quartering, high soaring or still-hunting from a perch. They seize prey on the ground or sometimes in tree canopies, after a swift, stealthy glide or dive which may become short chase. The species rarely takes prey in flight. Wedge-tailed Eagles occasionally remove mammals such as possums from tree hollows, and pairs or groups attack large prey cooperatively.

Flight behaviour

Wedge-tailed Eagles undertake mostly diurnal flight around peak raptor time (when reptile prey is active), at heights up to 2,000 m. They are known to fly within the Rotor Sweep Area and are hit by turbines regularly at wind farms on the eastern coast of Australia. The species is most exposed to collision risk due to a common habit of soaring and circling at height while foraging. Flight behaviour does not appear to be altered by wind farm development, with records of successful breeding as 200 m from operating wind turbines.

Demographic factors

The estimated population size varies depending on location and subspecies. However, it is one of the most widespread raptors in Australia and the national population is likely stable due to their extensive range across various habitats.

White-bellied Sea-Eagle (*Haliaeetus leucogaster*; not listed)

Information gathered from Birdlife Australia (2017); BirdLife International (2020); DCCEEW (2025); Marchant and Higgins (1993); NSW Office of Environment and Heritage (2019)

Habitat

Habitats of this species are characterised by the presence of large areas of open water, such as the ocean, larger rivers, lakes and swamps. Foraging habitat consists of coastal seas, rivers, fresh and saline lakes, lagoons and reservoirs. May also forage in adjacent terrestrial habitats such as grasslands.

Breeding habitat consists of mature open forest or woodland and swamp sclerophyll forest close to foraging habitat. Nest trees are typically large emergent eucalypts and often have emergent dead branches or large dead trees nearby which are used as 'guard roosts'. Nests are large structures built from sticks and lined with leaves or grass. May also nest in cliffs.

Movement

Resident. High site fidelity to successful nesting trees. Resident pairs are territorial and occupy territories of hundreds of hectares.

Behaviour

Diurnal. Hunts mainly aquatic animals, such as fish, turtles and waterbirds. Also feeds on mammals, reptiles and carrion. Will harass smaller birds to force them to drop their prey.

May be solitary or live in pairs or small family groups consisting of a pair of adults and dependent young. Birds form permanent pairs that inhabit territories throughout the year.

Flight behaviour

Highly maneuverable in flight. Hunts prey from a perch, whilst circling slowly in flight or gliding along 10–20 m above shorelines. Often catches a fish by flying low over the water and grasping it in its talons. May also dive at a 45-degree angle from its perch and briefly submerge to catch fish near the water surface. Prey is usually carried to a feeding platform or (if small) consumed in flight, but some items are eaten on the ground.

Demographic factors

Occurs throughout coastline regions in most of southeastern and eastern Asia. Distributed around the Australian coastline. Also occurs along some inland rivers in eastern Australia.

Whistling Kite is not globally or nationally threatened, however a 16% decline in reporting rate over the past two decades has been recorded nationally.

Not threatened. Population estimated between 2,600 and 41,000 mature individuals. In Australia, based on a population density of one pair per 40 km, the population is thought to number at least 500 pairs, but this is likely to be a significant underestimate.

Western False Pipistrelle (*Falsistrellus mackenziei*; P4 DBCA list)

Information gathered from Kitchener (1986); IUCN (2024) and (Woinarski *et al.* 2014).

Habitat

The Western False Pipistrelle occurs extensively in tall woodlands and wet or dry sclerophyll forest of south-western Australia. It is associated with Karri, Jarrah and Tuart old-growth forests. The species roosts in tree hollows, branches and stumps.

Movement

Site fidelity and movement patterns are unclear.

Behaviour

It occurs in roosting colonies of up to 30 bats. The species forages between the canopy and understory of tall trees. It is mainly insectivorous.

Flight behaviour

The behaviour of the species in flight is described as quick and straight. Most flight occurs approximately 15 m above ground. Echolocation calls end at low frequencies (30 kHz), with most energy at 32 – 34 kHz, and lasting for 12 ms.

Demographic factors

The population size is unknown. There is likely enough suitable habitat remaining in the area of occupancy to support more than 10,000 individuals.

EXECUTIVE SUMMARY

DNV has been commissioned by Urbis Ltd ("Urbis" or "the Customer") to independently assess the expected annual shadow flicker durations in the vicinity of the proposed Beenup Wind Farm ("the Project") in Western Australia. The results of the shadow flicker assessment are described in this document.

Background and methodology

DNV has assessed the expected annual shadow flicker durations for the Project against limits specified in the Draft National Wind Farm Development Guidelines (Draft National Guidelines) [1]. The methodology used in this assessment has been informed by these guidelines and various standard industry practices.

The Draft National Guidelines recommend limits of 30 hours per year on the theoretical shadow flicker duration, and 10 hours per year on the actual shadow flicker duration.

A Project layout consisting of 20 wind turbines with a maximum rotor diameter of 172 m and a hub height of 164 m has been considered in this assessment. The locations of 34 potentially sensitive shadow receptors in the vicinity of the Project have been provided by the Customer. For clarity, note that all potentially sensitive shadow receptors in this report will be referred to as dwellings, even though this list also includes a commercial premises ("dwelling" 12). The Customer has advised that 13 of these dwellings are "involved" dwellings, either as landowners or by commercial agreement, including four dwellings where it is agreed they won't be used for residential or accommodation purposes.

The theoretical shadow flicker durations at dwellings in the vicinity of the Project have been determined using a purely geometric analysis. The actual shadow flicker duration likely to be experienced at each dwelling has also been predicted by estimating the possible reduction in shadow flicker due to turbine orientation and cloud cover.

Outcomes of the assessment

Based on this assessment, two dwellings are expected to experience shadow flicker above a moderate level of intensity within 50 m of the dwelling. For the purposes of this assessment, shadow flicker above a moderate level of intensity is assumed to occur up to a distance of 10 rotor diameters from the wind turbines. Both of these dwellings are not involved with the Project.

Of these dwellings, one of them (dwelling number "12") is predicted to experience theoretical shadow flicker above a moderate level of intensity for durations above the recommended limit of 30 hours per year within 50 m of the dwelling. When considering the likely reduction in this shadow flicker due to cloud cover and rotor orientation, the predicted actual shadow flicker durations within 50 m of this dwelling reduce below the recommended limit of 10 hours per year. For the other dwelling (number "32"), the durations of theoretical and actual shadow flicker above a moderate level of intensity are predicted to be below the recommended limits.

The calculation of the predicted actual shadow flicker duration does not take into account other potential reductions due to low wind speed, vegetation, or other shielding effects around each house.

If required, the effects of shadow flicker may be reduced through a number of mitigation measures such as the removal or relocation of turbines, the use of smaller turbines, installation of screening

structures or planting of trees to block shadows cast by the turbines, or the use of turbine control strategies to shut down turbines when shadow flicker is likely to occur.

The effects of blade glint have not been quantified in this study as the Draft National Guidelines [1] do not provide any quantification methodology. The guidelines, however, recommend that the Customer ensures that the turbine blades used have a surface finish with a low reflectivity to avoid occurrences of blade glint.

1 INTRODUCTION

Urbis Ltd ("Urbis" or "the Customer") has commissioned DNV to independently assess the expected annual shadow flicker durations in the vicinity of the proposed Beenup Wind Farm ("the Project") in Western Australia. The results of this work are reported here. This document has been prepared in accordance with Urbis Sub Consultancy Agreement "Beenup Wind Farm Project: Provision of services by DNV Australia Pty Ltd", dated 11 October 2024, and is subject to the terms and conditions in that agreement.

This assessment evaluates the shadow flicker durations in the vicinity of the Project for the current proposed turbine layout and configuration in accordance with the Draft National Wind Farm Development Guidelines (Draft National Guidelines) [1]. The methodology used in this study has been informed by these guidelines and various standard industry practices.

2 DESCRIPTION OF THE SITE AND PROJECT

2.1 The site

The Project is located approximately 58 km south of Busselton and 12 km northeast of Augusta.

The terrain at the site is relatively simple with elevations ranging from approximately 10 m to 40 m above sea level. The site is comprised of mainly agricultural land with sparse pockets of shrubs throughout. A digital elevation model of the Project terrain was provided by the Customer [2] and was supplemented by a digital elevation model of the surrounding terrain, extending approximately 10 km from the site, derived from publicly available SRTM1 data [3].

2.2 The Project

2.2.1 Proposed wind farm layout

The Project is proposed to consist of 20 wind turbines [4]. A map of the site showing the turbine layout and terrain elevations considered in this assessment is shown in Figure 3, and the coordinates of the proposed turbine locations are given in Table 1.

DNV has modelled the shadow flicker based on a theoretical turbine model with a rotor diameter of 172 m and hub height of 164 m.

2.2.2 Dwelling locations

The locations of 34 dwellings in the vicinity of the Project have been provided by the Customer [5]. For clarity, all potentially sensitive shadow receptors will be referred to as dwellings in this report, even though this list includes a commercial premises ("dwelling" 12). The Customer has advised that 13 of these dwellings are "involved" dwellings, either as landowners or by commercial agreement, including a number of dwellings where it is agreed they won't be used for residential or accommodation purposes.

For the purposes of this assessment, 25 dwellings have been identified as having the potential to experience shadow flicker, based on their distances from the proposed turbine locations. Of those 25 dwellings, nine have been identified by the Customer as involved dwellings, including four where it is agreed they won't be used for residential or accommodation purposes.

The remaining nine dwellings are at locations that are considered unlikely to be impacted by shadow flicker at intensities typically considered sufficient to cause annoyance, as discussed further in Sections 3.1 and 4.1.2, and have not been considered further in this assessment.

The 25 dwellings considered in this assessment are shown in Figure 3 and presented in Table 2.

It should be noted that the scope of the work reported here does not include a comprehensive survey of dwellings in the vicinity of the Project, and so DNV is relying on dwelling information provided by the Customer.

3 REGULATORY REQUIREMENTS

3.1 Shadow flicker

The development of wind farms in Western Australia is governed by the Western Australian Planning Commission's Position Statement on renewable energy facilities ("the WA Position statement"), published in March 2020 [6]. However, the WA Position Statement does not address the potential for wind farms to cause shadow flicker impacts at nearby dwellings. Therefore DNV has relied on other suitable guidelines to assess the shadow flicker for the Project, as discussed below.

The Environment Protection and Heritage Council (EPHC), in conjunction with Local Governments and the Planning Ministers' Council, released a draft version of the National Wind Farm Development Guidelines in July 2010 (Draft National Guidelines) [1]. The Draft National Guidelines cover a range of issues across the different stages of wind farm development. In relation to shadow flicker, the Draft National Guidelines provide background information, a proposed methodology, recommended limits, and a suite of assumptions for assessing shadow flicker durations in the vicinity of a wind farm.

The Draft National Guidelines recommend that the modelled theoretical shadow flicker duration at any dwelling should not exceed 30 hours per year at any dwelling, and that the actual or measured shadow flicker duration should not exceed 10 hours per year. The Draft National Guidelines also recommend that the shadow flicker duration at a dwelling be assessed by calculating the maximum shadow flicker occurring within 50 m of the centre of the dwelling. These limits are assumed to apply to a single dwelling, and it is noted that there is no requirement under the Draft National Guidelines to assess shadow flicker durations at locations other than in the vicinity of dwellings.

The impact of shadow flicker is typically only significant up to a limited distance from the wind turbines. Beyond this distance limit the shadow is diffused such that the variation in light levels is not likely to be sufficient to cause annoyance. This issue is discussed in the Draft National Guidelines, where it is stated that:

> *"Shadow flicker can theoretically extend many kilometres from a wind turbine. However the intensity of the shadows decreases with distance. While acknowledging that different individuals have different levels of sensitivity and may be annoyed by different levels of shadow intensity, these guidelines limit assessment to moderate levels of intensity (i.e., well above the minimum theoretically detectable threshold) commensurate with the nature of the impact and the environment in which it is experienced."*

The Draft National Guidelines suggest a shadow flicker distance limit equal to 265 times the maximum blade chord length, which would correspond to approximately 1000 to 1600 m for modern wind turbines (which typically have maximum blade chord lengths of 4 to 6 m). However, the UK wind industry considers that a distance limit of around 10 rotor diameters from a turbine [7, 8] or approximately 1200 m to 1900 m for modern wind turbines (which typically have rotor diameters of 120 m to 190 m), is appropriate.

For the purposes of this assessment, DNV has considered the guidance and recommendations given in the Draft National Guidelines in relation to shadow flicker along with the shadow flicker distance limit applied by the UK wind industry, as discussed further in Section 4.1.2.

3.2 Blade glint

Blade glint involves the regular reflection of the sun off rotating turbine blades. Its occurrence depends on a combination of circumstances arising from the orientation of the nacelle, angle of the blade and the angle of the sun. The reflectiveness of the surface of the blades is also important. Blade glint is not generally a problem for modern wind turbines [1].

A methodology for the quantification of blade glint impacts as well as a regulatory limit are not provided by the Draft National Guidelines [9]. However, the Draft National Guidelines suggest that the Customer ensures the blades of the wind turbines have a finish with low reflectivity.

In relation to blade glint, guidance from the Draft National Guidelines [1] states that:

> *"Blade glint can be produced when the sun's light is reflected from the surface of wind turbine blades. Blade glint has potential to annoy people.*
>
> *All major wind turbine blade manufacturers currently finish their blades with a low reflectivity treatment. This prevents a potentially annoying reflective glint from the surface of the blades and the possibility of a strobing reflection when the turbine blades are spinning. Therefore the risk of blade glint from a new development is considered to be very low.*
>
> *Proponents should ensure that blades from their supplier are of low reflectivity."*

4 ASSESSMENT METHODOLOGY

4.1 Shadow flicker

4.1.1 Overview

Shadow flicker may occur under certain combinations of geographical position and time of day when the sun passes behind the rotating blades of a wind turbine and casts a moving shadow over neighbouring areas. When viewed from a stationary position the moving shadows cause periodic flickering of the light from the sun, giving rise to the phenomenon of 'shadow flicker'.

The effect is most noticeable inside buildings, where the flicker appears through a window opening. The likelihood and duration of the effect depends upon a number of factors, including:

- the direction of the property relative to the turbine
- the distance of the property from the turbine (the further the observer is from the turbine, the less pronounced the effect will be)
- the turbine height and rotor diameter
- the time of year and day (the position of the sun in the sky)
- the weather conditions (cloud cover reduces the occurrence of shadow flicker)
- the wind direction (the shape of the shadow will be determined by the position of the sun relative to the blades which will be oriented to face the wind).

Example photographs of wind turbines and associated shadows which have the potential to cause flicker are shown in Figure 1 below.

Figure 1 Examples of wind turbine shadows

4.1.2 Theoretical modelled duration

The theoretical number of hours of shadow flicker experienced annually at a given location can be calculated using a geometrical model which incorporates the sun path, topographic variation over the site area, and wind turbine details such as rotor diameter and hub height.

The wind turbines have been modelled assuming they are spherical objects, which is equivalent to assuming the turbines are always oriented perpendicular to the sun-turbine vector. This assumption will mean the model calculates the maximum duration for which there is potential for shadow flicker to occur, up to a specified distance limit.

In line with the methodology proposed in the Draft National Guidelines, DNV has assessed the shadow flicker at the provided dwellings and has determined the highest shadow flicker duration within 50 m of each of these locations.

In the absence of detailed dwelling height information, shadow flicker has been calculated at the dwellings at heights of 2 m, to represent ground floor windows, and 6 m, to represent second floor windows. The shadow receptors are simulated as fixed points, representing the worst-case scenario, as real windows could be facing a particular direction less affected by shadows cast from the turbines. The shadow flicker calculations for dwelling locations have been carried out with a temporal resolution of 1 minute. The shadow flicker map was generated using a temporal resolution of 5 minutes and a spatial resolution of 10 m to reduce computational requirements to acceptable levels.

As part of the shadow flicker assessment, it is necessary to make an assumption regarding the maximum length of a shadow cast by a wind turbine that is likely to cause annoyance due to shadow flicker. As noted in Section 3.1, the UK wind industry considers that 10 rotor diameters is appropriate [7, 8] while the Draft National Guidelines suggest a distance limit equivalent to 265 times the maximum blade chord [1].

For the current assessment, DNV has applied a maximum shadow length of 10 times the rotor diameter (10D), corresponding to a distance limit of 1720 m for the Project, which DNV considers is more appropriate than a limit of 265 times the maximum blade chord. Beyond this distance limit, it is assumed that any shadow flicker experienced will be below a "moderate level of intensity" and unlikely to cause annoyance. However, it is recognised that different people have different levels of sensitivity to shadow flicker and may therefore be affected by shadow flicker intensities below the "moderate level of intensity" assumed by this distance limit. To account for this possibility, DNV has also calculated the shadow flicker to a distance of up to 15 times the rotor diameter (15D), or 2580 m, which should include shadow flicker below a "moderate level of intensity".

In this assessment, shadow flicker of a moderate level of intensity or above is assumed to occur up to a distance of approximately 10D from the wind farm. Conversely, shadow flicker below a moderate level of intensity, described as "low intensity" shadow flicker in this report, is assumed to occur beyond a distance of 10D and up to a distance of approximately 15D from the wind farm.

The model also makes the following assumptions and simplifications:

- there are clear skies every day of the year
- the blades of the turbines are always perpendicular to the direction of the line of sight from the location of interest to the sun
- the turbines are always rotating.

The first two of these items are addressed in the calculation of the predicted actual shadow flicker duration as described in Section 4.1.4. The third item is not considered but is unlikely to have a significant impact on the results. The settings used to execute the model can be seen in Table 3.

To illustrate typical results, an indicative shadow flicker map for a turbine located in a flat area is shown in Figure 4. The geometry of the shadow flicker map can be characterised as a butterfly shape, with the four protruding lobes corresponding to slowing of solar north-south travel around the summer and winter solstices for morning and evening. The lobes to the north of the indicative turbine location result from the summer months and conversely the lobes to the south result from the winter months. The lobes to the west result from morning sun while the lobes to the east result from evening sun. When the sun is low in the sky, the length of shadows cast by the turbine increases, increasing the area around the turbine affected by shadow flicker.

4.1.3 Factors affecting duration

Shadow flicker duration calculated in this manner overestimates the annual number of hours of shadow flicker experienced at a specified location for several reasons, including:

1. The wind turbine will not always be oriented such that its rotor is in the worst-case position (i.e., perpendicular to the sun-turbine vector). Any other rotor orientation will reduce the area of the projected shadow and hence the shadow flicker duration.

   The wind speed frequency distribution or wind rose at the site can be used to determine probable turbine orientation and to calculate the resulting reduction in shadow flicker duration.

2. The occurrence of cloud cover has the potential to significantly reduce the number of hours of shadow flicker. Cloud cover measurements recorded at nearby meteorological stations may be used to estimate probable levels of cloud cover and to provide an indication of the resulting reduction in shadow flicker duration.

3. Aerosols (moisture, dust, smoke, etc.) in the atmosphere have the ability to influence shadows cast by a wind turbine. The length of the shadow cast by a wind turbine is dependent on the degree that direct sunlight is diffused, which is in turn dependent on the amount of dispersants (humidity, smoke, and other aerosols) in the path between the light source (sun) and the receiver.

4. The modelling of the wind turbine rotor as a sphere rather than individual blades results in an overestimation of the shadow flicker duration. Turbine blades are of non-uniform thickness with the thickest part of the blade (maximum chord) close to the hub and the thinnest part (minimum chord) at the tip. Diffusion of sunlight, as discussed above, results in a limit to the maximum distance that a shadow can be perceived. This maximum distance will also be dependent on the thickness of the turbine blade, and the human threshold for perception of light intensity variation. As such, a shadow cast by the blade tip will be shorter than the shadow cast by the thickest part of the blade.

5. The analysis does not consider that when the sun is positioned directly behind the wind turbine hub, there is no variation in light intensity at the receiver location and therefore no shadow flicker.

6. The presence of vegetation or other physical barriers around a shadow receptor location may shield the view of the wind turbine, and therefore reduce the incidence of shadow flicker.

7. Periods where the wind turbine is not in operation due to low winds, high winds, or for operational and maintenance reasons will also reduce the annual shadow flicker duration.

4.1.4 Predicted actual duration

As discussed above in Section 4.1.3, there are a number of factors which may reduce the incidence of shadow flicker that are not taken into account in the calculation of the theoretical shadow flicker duration. An attempt has been made to quantify the likely reduction in shadow flicker duration due to cloud cover and, therefore, produce a prediction of the actual shadow flicker duration likely to be experienced at a dwelling.

Cloud cover is typically measured in 'oktas', effectively eighths of the sky covered with cloud. DNV has obtained data from the following Bureau of Meteorology (BoM) stations:

- Cape Leeuwin (9518), located approximately 22 km southwest of the centre of the Project site [10]
- Jarrahwood (9842), located approximately 58 km northeast of the centre of the Project site [11]
- Pemberton (9592), located approximately 74 km southwest of the centre of the Project site [12]
- Manjimup (9573), located approximately 78 km east of the centre of the Project site [13].

The number of oktas of cloud cover visible across the sky at these stations is recorded twice daily, at 9 am and 3 pm, and the observations are provided as monthly averages. After averaging the 9 am and 3 pm observations for the stations considered, the results indicate that the average monthly cloud cover in the region ranges between 50% and 71%, and the average annual cloud cover is approximately 63%. This implies that on an average day, 63% of the sky in the vicinity of the wind farm is covered with clouds. Although it is not possible to definitively calculate the effect of cloud cover on shadow flicker duration, a reduction in the shadow flicker duration proportional to the amount of cloud cover is considered to be a reasonable assumption.

Similarly, turbine orientation can have an impact on the shadow flicker duration. The shadow flicker duration is greatest when the turbine rotor plane is approximately perpendicular to a line joining the sun and an observer, and a minimum when the rotor plane is approximately parallel to a line joining the sun and an observer. A wind direction frequency distribution at the site was derived from publicly available wind direction data [14] [15] [16] and used to estimate the reduction in shadow flicker duration due to rotor orientation. The resulting wind rose is shown overlaid on the indicative shadow flicker map in Figure 4. The assessment of the likely reduction in shadow flicker duration due to variation in turbine orientation was conducted on an annual basis.

It should be noted that the method prescribed by the Draft National Guidelines for assessing actual shadow flicker duration recommends that only reductions due to cloud cover, and not turbine orientation, be included. However, DNV considers that the additional reduction due to turbine orientation is appropriate as the projected area of the turbine, and therefore the expected shadow flicker duration, is reduced when the turbine rotor is not perpendicular to the line joining the sun and dwelling. Due to limitations in the availability of suitable cloud cover data, the methodology used in this assessment also deviates somewhat from the method recommended by the Draft National Guidelines for assessing the reduction in shadow flicker due to cloud cover. However, considering the available cloud cover data, the approach described above is deemed to provide a reasonable estimate of the likely impact of cloud cover on the shadow flicker duration.

While the calculation of the predicted actual shadow flicker duration considers the likely reductions due to cloud cover and rotor orientation, it does not take into account other potential reductions due to low wind speed (or turbine shutdown), vegetation, or other shielding effects around each dwelling.

4.2 Blade glint

Blade glint involves the regular reflection of sun off rotating turbine blades. Its occurrence depends on a combination of circumstances arising from the orientation of the nacelle, angle of the blade and the angle of the sun. The reflectiveness of the surface of the blades is also important. Blade glint is not generally a problem for modern wind turbines, provided the blades are coated with a non-reflective paint, and it is not considered further here.

5 ASSESSMENT RESULTS

5.1 Shadow flicker

5.1.1 Predicted shadow flicker durations

Shadow flicker predictions were generated at the provided dwelling locations, and the results are summarised in Table 4.

The results of the theoretical and predicted actual shadow flicker modelling are also shown in the form of shadow flicker maps in Figure 5 and Figure 6 respectively. The shadow flicker values presented in these maps represent the worst case between the results calculated at 2 m and 6 m above ground level for each modelled grid point.

Based on this assessment, two dwellings are expected to experience shadow flicker above a moderate level of intensity within 50 m of the dwelling. For the purposes of this assessment, shadow flicker above a moderate level of intensity is assumed to occur up to a distance of 10 rotor diameters from the wind turbines. Both of these dwellings are not involved with the Project.

Of these dwellings, one of them (dwelling 12) is predicted to experience theoretical shadow flicker above a moderate level of intensity for durations above the recommended limit of 30 hours per year within 50 m of the dwelling. When considering the likely reduction in this shadow flicker due to cloud cover and rotor orientation, the predicted actual shadow flicker durations within 50 m of this dwelling reduce below the recommended limit of 10 hours per year. For the other dwelling (number “32”), the durations of theoretical and actual shadow flicker above a moderate level of intensity are predicted to be below the recommended limits.

Beyond the 10D distance limit, it is assumed that any shadow flicker experienced will be below a moderate level of intensity and unlikely to cause annoyance. However, as discussed in Section 4.1.2, it is recognised that different people have different levels of sensitivity to shadow flicker and may therefore be affected by low intensity shadow flicker assumed by this distance limit. To inform the potential for this outcome, although not part of the methodology outlined in the Draft National Guidelines, DNV has also calculated the theoretical shadow flicker impacts for the Project for an increased distance limit of 15D that is intended to include shadow flicker of low intensity. The results of this additional assessment are also included in the map presented in Figure 5. These results indicate that, in addition to the dwellings expected to be affected by shadow flicker above a moderate level of intensity, 12 dwellings may have the potential to be exposed to low intensity shadow flicker. These dwellings are noted in Table 2.

5.1.2 Mitigation options

If required, the effects of shadow flicker may be reduced through a number of mitigation measures. These include the removal or relocation of turbines, the use of turbines with a smaller rotor diameter, installation of screening structures or planting of trees to block shadows cast by the turbines, or the use of turbine control strategies to shut down turbines when shadow flicker is likely to occur.

5.2 Blade glint

As discussed in Section 4.2, blade glint is not expected to be an issue for the Project provided that a non-reflective paint is applied to the wind turbine blades.

6 CONCLUSIONS

A shadow flicker assessment was carried out for dwelling locations in the vicinity of the Project.

For the purpose of this assessment, DNV has considered a layout consisting of 20 turbines with a rotor diameter of 172 m and a hub height of 164 m. These dimensions represent the maximum turbine dimensions currently under consideration for the Project.

Based on this assessment, two dwellings are expected to experience shadow flicker above a moderate level of intensity within 50 m of the dwelling. For the purposes of this assessment, shadow flicker above a moderate level of intensity is assumed to occur up to a distance of 10 rotor diameters from the wind turbines. Both of these dwellings are not involved with the Project.

Of these dwellings, one of them (dwelling number "12") is predicted to experience theoretical shadow flicker above a moderate level of intensity for durations above the recommended limit of 30 hours per year within 50 m of the dwelling. When considering the likely reduction in this shadow flicker due to cloud cover and rotor orientation, the predicted actual shadow flicker durations within 50 m of this dwelling reduce below the recommended limit of 10 hours per year. For the other dwelling (number "32"), the durations of theoretical and actual shadow flicker above a moderate level of intensity are predicted to be below the recommended limits.

It is recommended that the Customer ensures the turbine blades are coated with a non-reflective paint to avoid the occurrence of blade glint from the wind farm.

About DNV

DNV is the independent expert in risk management and assurance, operating in more than 100 countries. Through its broad experience and deep expertise DNV advances safety and sustainable performance, sets industry benchmarks, and inspires and invents solutions.

Whether assessing a new ship design, optimising the performance of a wind farm, analysing sensor data from a gas pipeline or certifying a food company's supply chain, DNV enables its customers and their stakeholders to make critical decisions with confidence.

Driven by its purpose, to safeguard life, property, and the environment, DNV helps tackle the challenges and global transformations facing its customers and the world today and is a trusted voice for many of the world's most successful and forward-thinking companies.

EXECUTIVE SUMMARY

DNV has been commissioned by Urbis Ltd ("Urbis" or "the Customer") to independently assess the expected annual shadow flicker durations in the vicinity of the proposed Beenup Wind Farm ("the Project") in Western Australia. The results of the shadow flicker assessment are described in this document.

Background and methodology

DNV has assessed the expected annual shadow flicker durations for the Project against limits specified in the Draft National Wind Farm Development Guidelines (Draft National Guidelines) [1]. The methodology used in this assessment has been informed by these guidelines and various standard industry practices.

The Draft National Guidelines recommend limits of 30 hours per year on the theoretical shadow flicker duration, and 10 hours per year on the actual shadow flicker duration.

A Project layout consisting of 20 wind turbines with a maximum rotor diameter of 172 m and a hub height of 164 m has been considered in this assessment. The locations of 34 potentially sensitive shadow receptors in the vicinity of the Project have been provided by the Customer. For clarity, note that all potentially sensitive shadow receptors in this report will be referred to as dwellings, even though this list also includes a commercial premises ("dwelling" 12). The Customer has advised that 13 of these dwellings are "involved" dwellings, either as landowners or by commercial agreement, including four dwellings where it is agreed they won't be used for residential or accommodation purposes.

The theoretical shadow flicker durations at dwellings in the vicinity of the Project have been determined using a purely geometric analysis. The actual shadow flicker duration likely to be experienced at each dwelling has also been predicted by estimating the possible reduction in shadow flicker due to turbine orientation and cloud cover.

Outcomes of the assessment

Based on this assessment, two dwellings are expected to experience shadow flicker above a moderate level of intensity within 50 m of the dwelling. For the purposes of this assessment, shadow flicker above a moderate level of intensity is assumed to occur up to a distance of 10 rotor diameters from the wind turbines. Both of these dwellings are not involved with the Project.

Of these dwellings, one of them (dwelling number "12") is predicted to experience theoretical shadow flicker above a moderate level of intensity for durations above the recommended limit of 30 hours per year within 50 m of the dwelling. When considering the likely reduction in this shadow flicker due to cloud cover and rotor orientation, the predicted actual shadow flicker durations within 50 m of this dwelling reduce below the recommended limit of 10 hours per year. For the other dwelling (number "32"), the durations of theoretical and actual shadow flicker above a moderate level of intensity are predicted to be below the recommended limits.

The calculation of the predicted actual shadow flicker duration does not take into account other potential reductions due to low wind speed, vegetation, or other shielding effects around each house.

If required, the effects of shadow flicker may be reduced through a number of mitigation measures such as the removal or relocation of turbines, the use of smaller turbines, installation of screening

structures or planting of trees to block shadows cast by the turbines, or the use of turbine control strategies to shut down turbines when shadow flicker is likely to occur.

The effects of blade glint have not been quantified in this study as the Draft National Guidelines [1] do not provide any quantification methodology. The guidelines, however, recommend that the Customer ensures that the turbine blades used have a surface finish with a low reflectivity to avoid occurrences of blade glint.

1 INTRODUCTION

Urbis Ltd ("Urbis" or "the Customer") has commissioned DNV to independently assess the expected annual shadow flicker durations in the vicinity of the proposed Beenup Wind Farm ("the Project") in Western Australia. The results of this work are reported here. This document has been prepared in accordance with Urbis Sub Consultancy Agreement "Beenup Wind Farm Project: Provision of services by DNV Australia Pty Ltd", dated 11 October 2024, and is subject to the terms and conditions in that agreement.

This assessment evaluates the shadow flicker durations in the vicinity of the Project for the current proposed turbine layout and configuration in accordance with the Draft National Wind Farm Development Guidelines (Draft National Guidelines) [1]. The methodology used in this study has been informed by these guidelines and various standard industry practices.

2 DESCRIPTION OF THE SITE AND PROJECT

2.1 The site

The Project is located approximately 58 km south of Busselton and 12 km northeast of Augusta.

The terrain at the site is relatively simple with elevations ranging from approximately 10 m to 40 m above sea level. The site is comprised of mainly agricultural land with sparse pockets of shrubs throughout. A digital elevation model of the Project terrain was provided by the Customer [2] and was supplemented by a digital elevation model of the surrounding terrain, extending approximately 10 km from the site, derived from publicly available SRTM1 data [3].

2.2 The Project

2.2.1 Proposed wind farm layout

The Project is proposed to consist of 20 wind turbines [4]. A map of the site showing the turbine layout and terrain elevations considered in this assessment is shown in Figure 3, and the coordinates of the proposed turbine locations are given in Table 1.

DNV has modelled the shadow flicker based on a theoretical turbine model with a rotor diameter of 172 m and hub height of 164 m.

2.2.2 Dwelling locations

The locations of 34 dwellings in the vicinity of the Project have been provided by the Customer [5]. For clarity, all potentially sensitive shadow receptors will be referred to as dwellings in this report, even though this list includes a commercial premises ("dwelling" 12). The Customer has advised that 13 of these dwellings are "involved" dwellings, either as landowners or by commercial agreement, including a number of dwellings where it is agreed they won't be used for residential or accommodation purposes.

For the purposes of this assessment, 25 dwellings have been identified as having the potential to experience shadow flicker, based on their distances from the proposed turbine locations. Of those 25 dwellings, nine have been identified by the Customer as involved dwellings, including four where it is agreed they won't be used for residential or accommodation purposes.

The remaining nine dwellings are at locations that are considered unlikely to be impacted by shadow flicker at intensities typically considered sufficient to cause annoyance, as discussed further in Sections 3.1 and 4.1.2, and have not been considered further in this assessment.

The 25 dwellings considered in this assessment are shown in Figure 3 and presented in Table 2.

It should be noted that the scope of the work reported here does not include a comprehensive survey of dwellings in the vicinity of the Project, and so DNV is relying on dwelling information provided by the Customer.

3 REGULATORY REQUIREMENTS

3.1 Shadow flicker

The development of wind farms in Western Australia is governed by the Western Australian Planning Commission's Position Statement on renewable energy facilities ("the WA Position

statement"), published in March 2020 [6]. However, the WA Position Statement does not address the potential for wind farms to cause shadow flicker impacts at nearby dwellings. Therefore DNV has relied on other suitable guidelines to assess the shadow flicker for the Project, as discussed below.

The Environment Protection and Heritage Council (EPHC), in conjunction with Local Governments and the Planning Ministers' Council, released a draft version of the National Wind Farm Development Guidelines in July 2010 (Draft National Guidelines) [1]. The Draft National Guidelines cover a range of issues across the different stages of wind farm development. In relation to shadow flicker, the Draft National Guidelines provide background information, a proposed methodology, recommended limits, and a suite of assumptions for assessing shadow flicker durations in the vicinity of a wind farm.

The Draft National Guidelines recommend that the modelled theoretical shadow flicker duration at any dwelling should not exceed 30 hours per year at any dwelling, and that the actual or measured shadow flicker duration should not exceed 10 hours per year. The Draft National Guidelines also recommend that the shadow flicker duration at a dwelling be assessed by calculating the maximum shadow flicker occurring within 50 m of the centre of the dwelling. These limits are assumed to apply to a single dwelling, and it is noted that there is no requirement under the Draft National Guidelines to assess shadow flicker durations at locations other than in the vicinity of dwellings.

The impact of shadow flicker is typically only significant up to a limited distance from the wind turbines. Beyond this distance limit the shadow is diffused such that the variation in light levels is not likely to be sufficient to cause annoyance. This issue is discussed in the Draft National Guidelines, where it is stated that:

> *"Shadow flicker can theoretically extend many kilometres from a wind turbine. However the intensity of the shadows decreases with distance. While acknowledging that different individuals have different levels of sensitivity and may be annoyed by different levels of shadow intensity, these guidelines limit assessment to moderate levels of intensity (i.e., well above the minimum theoretically detectable threshold) commensurate with the nature of the impact and the environment in which it is experienced."*

The Draft National Guidelines suggest a shadow flicker distance limit equal to 265 times the maximum blade chord length, which would correspond to approximately 1000 to 1600 m for modern wind turbines (which typically have maximum blade chord lengths of 4 to 6 m). However, the UK wind industry considers that a distance limit of around 10 rotor diameters from a turbine [7, 8] or approximately 1200 m to 1900 m for modern wind turbines (which typically have rotor diameters of 120 m to 190 m), is appropriate.

For the purposes of this assessment, DNV has considered the guidance and recommendations given in the Draft National Guidelines in relation to shadow flicker along with the shadow flicker distance limit applied by the UK wind industry, as discussed further in Section 4.1.2.

3.2 Blade glint

Blade glint involves the regular reflection of the sun off rotating turbine blades. Its occurrence depends on a combination of circumstances arising from the orientation of the nacelle, angle of the blade and the angle of the sun. The reflectiveness of the surface of the blades is also important. Blade glint is not generally a problem for modern wind turbines [1].

A methodology for the quantification of blade glint impacts as well as a regulatory limit are not provided by the Draft National Guidelines [9]. However, the Draft National Guidelines suggest that the Customer ensures the blades of the wind turbines have a finish with low reflectivity.

In relation to blade glint, guidance from the Draft National Guidelines [1] states that:

> *"Blade glint can be produced when the sun's light is reflected from the surface of wind turbine blades. Blade glint has potential to annoy people.*
>
> *All major wind turbine blade manufacturers currently finish their blades with a low reflectivity treatment. This prevents a potentially annoying reflective glint from the surface of the blades and the possibility of a strobing reflection when the turbine blades are spinning. Therefore the risk of blade glint from a new development is considered to be very low.*
>
> *Proponents should ensure that blades from their supplier are of low reflectivity."*

4 ASSESSMENT METHODOLOGY

4.1 Shadow flicker

4.1.1 Overview

Shadow flicker may occur under certain combinations of geographical position and time of day when the sun passes behind the rotating blades of a wind turbine and casts a moving shadow over neighbouring areas. When viewed from a stationary position the moving shadows cause periodic flickering of the light from the sun, giving rise to the phenomenon of 'shadow flicker'.

The effect is most noticeable inside buildings, where the flicker appears through a window opening. The likelihood and duration of the effect depends upon a number of factors, including:

- the direction of the property relative to the turbine
- the distance of the property from the turbine (the further the observer is from the turbine, the less pronounced the effect will be)
- the turbine height and rotor diameter
- the time of year and day (the position of the sun in the sky)
- the weather conditions (cloud cover reduces the occurrence of shadow flicker)
- the wind direction (the shape of the shadow will be determined by the position of the sun relative to the blades which will be oriented to face the wind).

Example photographs of wind turbines and associated shadows which have the potential to cause flicker are shown in Figure 1 below.

Figure 1 Examples of wind turbine shadows

4.1.2 Theoretical modelled duration

The theoretical number of hours of shadow flicker experienced annually at a given location can be calculated using a geometrical model which incorporates the sun path, topographic variation over the site area, and wind turbine details such as rotor diameter and hub height.

The wind turbines have been modelled assuming they are spherical objects, which is equivalent to assuming the turbines are always oriented perpendicular to the sun-turbine vector. This assumption will mean the model calculates the maximum duration for which there is potential for shadow flicker to occur, up to a specified distance limit.

In line with the methodology proposed in the Draft National Guidelines, DNV has assessed the shadow flicker at the provided dwellings and has determined the highest shadow flicker duration within 50 m of each of these locations.

In the absence of detailed dwelling height information, shadow flicker has been calculated at the dwellings at heights of 2 m, to represent ground floor windows, and 6 m, to represent second floor windows. The shadow receptors are simulated as fixed points, representing the worst-case scenario, as real windows could be facing a particular direction less affected by shadows cast from the turbines. The shadow flicker calculations for dwelling locations have been carried out with a temporal resolution of 1 minute. The shadow flicker map was generated using a temporal resolution of 5 minutes and a spatial resolution of 10 m to reduce computational requirements to acceptable levels.

As part of the shadow flicker assessment, it is necessary to make an assumption regarding the maximum length of a shadow cast by a wind turbine that is likely to cause annoyance due to shadow flicker. As noted in Section 3.1, the UK wind industry considers that 10 rotor diameters is appropriate [7, 8] while the Draft National Guidelines suggest a distance limit equivalent to 265 times the maximum blade chord [1].

For the current assessment, DNV has applied a maximum shadow length of 10 times the rotor diameter (10D), corresponding to a distance limit of 1720 m for the Project, which DNV considers is more appropriate than a limit of 265 times the maximum blade chord. Beyond this distance limit, it is assumed that any shadow flicker experienced will be below a “moderate level of intensity” and unlikely to cause annoyance. However, it is recognised that different people have different levels of sensitivity to shadow flicker and may therefore be affected by shadow flicker intensities below the “moderate level of intensity” assumed by this distance limit. To account for this possibility, DNV has also calculated the shadow flicker to a distance of up to 15 times the rotor diameter (15D), or 2580 m, which should include shadow flicker below a “moderate level of intensity”.

In this assessment, shadow flicker of a moderate level of intensity or above is assumed to occur up to a distance of approximately 10D from the wind farm. Conversely, shadow flicker below a moderate level of intensity, described as “low intensity” shadow flicker in this report, is assumed to occur beyond a distance of 10D and up to a distance of approximately 15D from the wind farm.

The model also makes the following assumptions and simplifications:

- there are clear skies every day of the year

- the blades of the turbines are always perpendicular to the direction of the line of sight from the location of interest to the sun
- the turbines are always rotating.

The first two of these items are addressed in the calculation of the predicted actual shadow flicker duration as described in Section 4.1.4. The third item is not considered but is unlikely to have a significant impact on the results. The settings used to execute the model can be seen in Table 3.

To illustrate typical results, an indicative shadow flicker map for a turbine located in a flat area is shown in Figure 4. The geometry of the shadow flicker map can be characterised as a butterfly shape, with the four protruding lobes corresponding to slowing of solar north-south travel around the summer and winter solstices for morning and evening. The lobes to the north of the indicative turbine location result from the summer months and conversely the lobes to the south result from the winter months. The lobes to the west result from morning sun while the lobes to the east result from evening sun. When the sun is low in the sky, the length of shadows cast by the turbine increases, increasing the area around the turbine affected by shadow flicker.

4.1.3 Factors affecting duration

Shadow flicker duration calculated in this manner overestimates the annual number of hours of shadow flicker experienced at a specified location for several reasons, including:

1. The wind turbine will not always be oriented such that its rotor is in the worst-case position (i.e., perpendicular to the sun-turbine vector). Any other rotor orientation will reduce the area of the projected shadow and hence the shadow flicker duration.

   The wind speed frequency distribution or wind rose at the site can be used to determine probable turbine orientation and to calculate the resulting reduction in shadow flicker duration.

2. The occurrence of cloud cover has the potential to significantly reduce the number of hours of shadow flicker. Cloud cover measurements recorded at nearby meteorological stations may be used to estimate probable levels of cloud cover and to provide an indication of the resulting reduction in shadow flicker duration.

3. Aerosols (moisture, dust, smoke, etc.) in the atmosphere have the ability to influence shadows cast by a wind turbine. The length of the shadow cast by a wind turbine is dependent on the degree that direct sunlight is diffused, which is in turn dependent on the amount of dispersants (humidity, smoke, and other aerosols) in the path between the light source (sun) and the receiver.

4. The modelling of the wind turbine rotor as a sphere rather than individual blades results in an overestimation of the shadow flicker duration. Turbine blades are of non-uniform thickness with the thickest part of the blade (maximum chord) close to the hub and the thinnest part (minimum chord) at the tip. Diffusion of sunlight, as discussed above, results in a limit to the maximum distance that a shadow can be perceived. This maximum distance will also be dependent on the thickness of the turbine blade, and the human threshold for perception of light intensity variation. As such, a shadow cast by the blade tip will be shorter than the shadow cast by the thickest part of the blade.

5. The analysis does not consider that when the sun is positioned directly behind the wind turbine hub, there is no variation in light intensity at the receiver location and therefore no shadow flicker.

6. The presence of vegetation or other physical barriers around a shadow receptor location may shield the view of the wind turbine, and therefore reduce the incidence of shadow flicker.

7. Periods where the wind turbine is not in operation due to low winds, high winds, or for operational and maintenance reasons will also reduce the annual shadow flicker duration.

4.1.4 Predicted actual duration

As discussed above in Section 4.1.3, there are a number of factors which may reduce the incidence of shadow flicker that are not taken into account in the calculation of the theoretical shadow flicker duration. An attempt has been made to quantify the likely reduction in shadow flicker duration due to cloud cover and, therefore, produce a prediction of the actual shadow flicker duration likely to be experienced at a dwelling.

Cloud cover is typically measured in 'oktas', effectively eighths of the sky covered with cloud. DNV has obtained data from the following Bureau of Meteorology (BoM) stations:

- Cape Leeuwin (9518), located approximately 22 km southwest of the centre of the Project site [10]
- Jarrahwood (9842), located approximately 58 km northeast of the centre of the Project site [11]
- Pemberton (9592), located approximately 74 km southwest of the centre of the Project site [12]
- Manjimup (9573), located approximately 78 km east of the centre of the Project site [13].

The number of oktas of cloud cover visible across the sky at these stations is recorded twice daily, at 9 am and 3 pm, and the observations are provided as monthly averages. After averaging the 9 am and 3 pm observations for the stations considered, the results indicate that the average monthly cloud cover in the region ranges between 50% and 71%, and the average annual cloud cover is approximately 63%. This implies that on an average day, 63% of the sky in the vicinity of the wind farm is covered with clouds. Although it is not possible to definitively calculate the effect of cloud cover on shadow flicker duration, a reduction in the shadow flicker duration proportional to the amount of cloud cover is considered to be a reasonable assumption.

Similarly, turbine orientation can have an impact on the shadow flicker duration. The shadow flicker duration is greatest when the turbine rotor plane is approximately perpendicular to a line joining the sun and an observer, and a minimum when the rotor plane is approximately parallel to a line joining the sun and an observer. A wind direction frequency distribution at the site was derived from publicly available wind direction data [14] [15] [16] and used to estimate the reduction in shadow flicker duration due to rotor orientation. The resulting wind rose is shown overlaid on the indicative shadow flicker map in Figure 4. The assessment of the likely reduction in shadow flicker duration due to variation in turbine orientation was conducted on an annual basis.

It should be noted that the method prescribed by the Draft National Guidelines for assessing actual shadow flicker duration recommends that only reductions due to cloud cover, and not turbine orientation, be included. However, DNV considers that the additional reduction due to turbine orientation is appropriate as the projected area of the turbine, and therefore the expected shadow flicker duration, is reduced when the turbine rotor is not perpendicular to the line joining the sun and dwelling. Due to limitations in the availability of suitable cloud cover data, the methodology used in this assessment also deviates somewhat from the method recommended by the Draft National Guidelines for assessing the reduction in shadow flicker due to cloud cover. However,

considering the available cloud cover data, the approach described above is deemed to provide a reasonable estimate of the likely impact of cloud cover on the shadow flicker duration.

While the calculation of the predicted actual shadow flicker duration considers the likely reductions due to cloud cover and rotor orientation, it does not take into account other potential reductions due to low wind speed (or turbine shutdown), vegetation, or other shielding effects around each dwelling.

4.2 Blade glint

Blade glint involves the regular reflection of sun off rotating turbine blades. Its occurrence depends on a combination of circumstances arising from the orientation of the nacelle, angle of the blade and the angle of the sun. The reflectiveness of the surface of the blades is also important. Blade glint is not generally a problem for modern wind turbines, provided the blades are coated with a non-reflective paint, and it is not considered further here.

5 ASSESSMENT RESULTS

5.1 Shadow flicker

5.1.1 Predicted shadow flicker durations

Shadow flicker predictions were generated at the provided dwelling locations, and the results are summarised in Table 4.

The results of the theoretical and predicted actual shadow flicker modelling are also shown in the form of shadow flicker maps in Figure 5 and Figure 6 respectively. The shadow flicker values presented in these maps represent the worst case between the results calculated at 2 m and 6 m above ground level for each modelled grid point.

Based on this assessment, two dwellings are expected to experience shadow flicker above a moderate level of intensity within 50 m of the dwelling. For the purposes of this assessment, shadow flicker above a moderate level of intensity is assumed to occur up to a distance of 10 rotor diameters from the wind turbines. Both of these dwellings are not involved with the Project.

Of these dwellings, one of them (dwelling 12) is predicted to experience theoretical shadow flicker above a moderate level of intensity for durations above the recommended limit of 30 hours per year within 50 m of the dwelling. When considering the likely reduction in this shadow flicker due to cloud cover and rotor orientation, the predicted actual shadow flicker durations within 50 m of this dwelling reduce below the recommended limit of 10 hours per year. For the other dwelling (number “32”), the durations of theoretical and actual shadow flicker above a moderate level of intensity are predicted to be below the recommended limits.

Beyond the 10D distance limit, it is assumed that any shadow flicker experienced will be below a moderate level of intensity and unlikely to cause annoyance. However, as discussed in Section 4.1.2, it is recognised that different people have different levels of sensitivity to shadow flicker and may therefore be affected by low intensity shadow flicker assumed by this distance limit. To inform the potential for this outcome, although not part of the methodology outlined in the Draft National Guidelines, DNV has also calculated the theoretical shadow flicker impacts for the Project for an increased distance limit of 15D that is intended to include shadow flicker of low intensity. The results of this additional assessment are also included in the map presented in Figure 5. These results indicate that, in addition to the dwellings expected to be affected by shadow flicker above a moderate level of intensity, 12 dwellings may have the potential to be exposed to low intensity shadow flicker. These dwellings are noted in Table 2.

5.1.2 Mitigation options

If required, the effects of shadow flicker may be reduced through a number of mitigation measures. These include the removal or relocation of turbines, the use of turbines with a smaller rotor diameter, installation of screening structures or planting of trees to block shadows cast by the turbines, or the use of turbine control strategies to shut down turbines when shadow flicker is likely to occur.

5.2 Blade glint

As discussed in Section 4.2, blade glint is not expected to be an issue for the Project provided that a non-reflective paint is applied to the wind turbine blades.

6 CONCLUSIONS

A shadow flicker assessment was carried out for dwelling locations in the vicinity of the Project.

For the purpose of this assessment, DNV has considered a layout consisting of 20 turbines with a rotor diameter of 172 m and a hub height of 164 m. These dimensions represent the maximum turbine dimensions currently under consideration for the Project.

Based on this assessment, two dwellings are expected to experience shadow flicker above a moderate level of intensity within 50 m of the dwelling. For the purposes of this assessment, shadow flicker above a moderate level of intensity is assumed to occur up to a distance of 10 rotor diameters from the wind turbines. Both of these dwellings are not involved with the Project.

Of these dwellings, one of them (dwelling number "12") is predicted to experience theoretical shadow flicker above a moderate level of intensity for durations above the recommended limit of 30 hours per year within 50 m of the dwelling. When considering the likely reduction in this shadow flicker due to cloud cover and rotor orientation, the predicted actual shadow flicker durations within 50 m of this dwelling reduce below the recommended limit of 10 hours per year. For the other dwelling (number "32"), the durations of theoretical and actual shadow flicker above a moderate level of intensity are predicted to be below the recommended limits.

It is recommended that the Customer ensures the turbine blades are coated with a non-reflective paint to avoid the occurrence of blade glint from the wind farm.

About DNV

DNV is the independent expert in risk management and assurance, operating in more than 100 countries. Through its broad experience and deep expertise DNV advances safety and sustainable performance, sets industry benchmarks, and inspires and invents solutions.

Whether assessing a new ship design, optimising the performance of a wind farm, analysing sensor data from a gas pipeline or certifying a food company's supply chain, DNV enables its customers and their stakeholders to make critical decisions with confidence.

Driven by its purpose, to safeguard life, property, and the environment, DNV helps tackle the challenges and global transformations facing its customers and the world today and is a trusted voice for many of the world's most successful and forward-thinking companies.

EXECUTIVE SUMMARY

Introduction

SynergyRED is preparing a proposal for the development of the proposed Beenup Wind Farm project, which is located in the Shire of Augusta Margaret River Local Government Area (LGA).

The current proposed layout includes 20 wind turbines.

SynergyRED has engaged Aviation Projects to prepare an Aviation Impact Assessment (AIA) to support the proposed application and formally consult with aviation agencies.

The Project requires an aviation impact assessment to be undertaken in accordance with the:

- Civil Aviation Safety Regulations 1998
- National Airspace Safeguarding Framework Guideline D: *Managing the Risk to aviation safety of wind turbine installations (wind farms)/Wind Monitoring Towers effective July 2012*
- Western Australia Government, Department of Planning, Lands and Heritage, *Position Statement: Renewable energy facilities, March 2020*
- Specific requirements as advised by Airservices Australia

This AIA assesses the potential aviation impacts, provides aviation safety advice in respect of relevant requirements of air safety regulations and procedures and informs and documents consultation with relevant aviation agencies.

This AIA report includes an Aviation Impact Statement (AIS) and a qualitative risk assessment to determine the need for obstacle lighting.

Project description

Beenup Wind Farm includes the following:

- Up to 20 wind turbine generators (WTGs) with a maximum tip height of 250 m AGL
- The ground elevation for the highest WTG location is 40 m AHD, which, with a 250 m WTG height, results in a maximum overall height of 290 m AHD (951.4 ft AMSL).

Conclusions

Based on a comprehensive analysis and assessment detailed in this report, the following conclusions were made:

Planning considerations

1. The Project, as proposed, satisfies the planning provisions of Shire of Augusta Margaret River's Planning Scheme 2024, *Shire of Augusta-Margaret River's* Local Planning Strategy, City of Busselton's Local Planning Strategy 2014 and will not create incompatible intrusions or compromise the safety of existing airports and associated navigation and communication facilities

Certified airports

2. The project site is located within 30 nm (55.56 km) of one certified airport – Busselton Airport (YBLN)
    a. The WTGs will infringe the YBLN PANS-OPS surfaces of the following procedures but will not change flight paths or descent gradients

i. 25 nm MSA surfaces, which need to be increased by 100 ft to 2000 ft or sectorised to exclude the Wind Farm

ii. GNSS Arrival Sector A approach surfaces.

- The initial approach minimum altitude needs to be increased to 2000 ft.
- The commencement altitude would need to be increased to meet the requirement of increasing the 25 nm MSA to 2000 ft.

Obstacle Limitation Surfaces

3. The Project is located outside the horizontal extent of obstacle limitation surfaces (OLS) of Busselton Airport (YBLN).

Uncertified Aerodromes

4. There are two uncertified aerodromes identified within 3 nm of the project site – Unknown Aerodrome 1 and Boley Aerodrome

- Unknown Aerodrome 1

i. The proposed wind farm would be considered potentially hazardous obstacles

ii. When the wind blows from the north, downstream wake turbulence from the closer WTGs will extend into the aerodrome's right side of the circuit area. Further consultation with the owner/operator of this aerodrome would be beneficial in understanding the potential extent of these impacts.

- Boley Aerodrome

- The proposed wind farm would be considered potentially hazardous obstacles
- When the wind blows from east, downstream wake turbulence from the closer WTGs will extend into the aerodrome's right side of the circuit area. Further consultation with the owner/operator of this aerodrome would be beneficial to understand the potential extent of these impacts.

Air Routes and Lowest Safe Altitude (LSALT)

5. The WTGs will not impact the Grid LSALT and any Air Route LSALT

Airspace

6. The project area is located within Class G airspace and outside all controlled airspace, Prohibited, Restricted and Danger areas.

Aviation Facilities

7. The WTGs will not penetrate any protection areas associated with aviation facilities.

ATC Surveillance Radar

8. The project site is located outside the area of interest to assess the potential impact of the development on surveillance radar. The Project will not impact the Perth Preliminary Surveillance Radar (PSR)/ Secondary Surveillance Radar (SSR) and Kalamunda Air Route Surveillance Radar (RSR).

Aviation Impact Statement (AIS)

9. Based on the proposed WTG layout and maximum blade tip height of 250 m AGL, the blade tip elevation of the highest wind turbine will not exceed 290 m (951.4 ft AMSL).

    a. There is one certified airport located within 30 nm (56 km) from the Project - Busselton Airport (YBLN)

        i. The WTGs will not impact on the OLS of YBLN

        ii. The WTGs will infringe the YBLN PANS-OPS surfaces of the following procedures but will not change flight paths or descent gradients

            - 25 nm MSA surfaces, which need to be increased by 100 ft to 2000 ft or sectorised to exclude the Wind Farm
            - GNSS Arrival Sector A approach surfaces.
                - The initial approach minimum altitude needs to be increased to 2000 ft.
                - The commencement altitude would need to be increased to meet the requirement of increasing the 25 nm MSA to 2000 ft.

    b. There are two uncertified aerodromes identified within 3 nm of the project site – Unknown Aerodrome 1 and Boley Aerodrome

        i. Unknown Aerodrome 1

            - The proposed wind farm would be considered potentially hazardous obstacles
            - When the wind blows from north, downstream wake turbulence from the closer WTGs will extend into the aerodrome's right side of the circuit area. Further consultation with the owner/operator of this aerodrome would be beneficial to understand the potential extent of these impacts

        ii. Boley Aerodrome

            - The proposed wind farm would be considered potentially hazardous obstacles
            - When the wind blows from east, downstream wake turbulence from the closer WTGs will extend into the aerodrome's right side of the circuit area. Further consultation with the owner/operator of this aerodrome would be beneficial to understand the potential extent of these impacts.

    c. The WTGs will not impact the Grid LSALT and any air route LSALT

    d. The project area is located within Class G airspace and outside all controlled airspace, Prohibited, Restricted and Danger areas.

    e. The WTGs will not impact the aviation facilities of nearby certified airports.

    f. The WTGs will not impact the closest radar installations.

    g. The WTGs must be reported to CASA, and construction details must be provided to Airservices.

    h. The closest WTG is approximately 1.2 km away from the boundary of the Scott National Park. Liaison with Western Australia Department of Biodiversity, Conservation and Attractions - Parks and Wildlife Service will be required regarding the buffer area of the boundary.

Obstacle lighting risk assessment

10. Aviation Projects has undertaken a safety risk assessment of the Project and concludes that the proposed WTGs would not require obstacle lighting to maintain an acceptable level of safety to aircraft.
11. Over the 12-year period between 2010-2022, no aircraft collided with a WTG or a WMT in Australia.
12. There is no regulatory requirement to mark or light power poles or overhead transmission lines.

Consultation

Refer to **Section 5** for detailed responses from relevant aviation stakeholders once received.

The consultation process will commence after approval of the Final Draft AIA and authorisation to proceed from the client. It will continue throughout the review of the Development Application.

The risk assessment will be updated, and this report will be finalised based on the feedback received during the consultation process. Feedback will be documented in this report.

Summary of key recommendations

Recommended actions resulting from the conduct of this assessment are provided below:

Notification and reporting

1. Details of WTGs exceeding 100 m AGL must be reported to CASA *as soon as practicable after forming the intention to construct or erect the proposed object or structure,* in accordance with CASR Part 139.165(1)(2).
2. 'As constructed' details of WTG coordinates and elevation should be provided to Airservices Australia, by submitting the form at this webpage: https://www.airservicesaustralia.com/wp-content/uploads/ATS-FORM-0085_Vertical_Obstruction_Data_Form.pdf to the following email address: vod@airservicesaustralia.com
3. Any obstacles above 100 m AGL (including temporary construction equipment) should be reported to Airservices Australia NOTAM office until they are incorporated in published operational documents. With respect to crane operations during the construction of the Project, a notification to the NOTAM office may include, for example, the following details:
    a. The planned operational timeframe and maximum height of the crane; and
    b. Either the general area within which the crane will operate and/or the planned route with timelines that crane operations will follow.
4. Details of the wind farm should be provided to local and regional aircraft operators prior to construction in order for them to consider the potential impact of the wind farm on their operations.
5. To facilitate the flight planning of aerial application operators, details of the Project, including the 'as constructed' location and height information of WTGs and overhead transmission lines should be provided to landowners so that, when asked for hazard information on their property, the landowner may provide the aerial application pilot with all relevant information.
6. The closest WTG is approximately 1.2 km from the boundary of Scott National Park. Regarding the buffer area of the boundary, liaison with the Western Australia Department of Biodiversity, Conservation and Attractions—Parks and Wildlife Service will be required.

Marking of WTGs

7. The rotor blades, nacelle, and supporting mast of the WTGs should be painted white, as is typical of most WTGs operational in Australia. No additional marking measures are required for WTGs.

Lighting of WTGs

8. CASA will determine whether obstacle lighting is recommended for the WTGs. Lighting the WTGs is not a formal requirement.

Micrositing

9. Providing the micrositing is within 100 m of the WTGs, it will not likely result in a change in the maximum overall blade tip height of the Project. No further assessment is likely to be required from micrositing and the conclusions of this AIA would remain the same.

Aerial firefighting

10. The developer or operator should consider the guidance contained in the National Council for Fire and Emergency Services, Wind Farms and Bushfire Operations to ensure:
    a. Liaison with the relevant fire and land management agencies is ongoing and effective
    b. Access is available to the wind farm site by emergency services for on-ground firefighting operations.

Triggers for review

11. Triggers for review of this risk assessment are provided for consideration:
    a. Prior to construction to ensure the regulatory framework has not changed
    b. Following any significant changes to the context in which the assessment was prepared
    c. Following any near miss, incident or accident associated with operations considered in this risk assessment.

1. INTRODUCTION

1.1. Situation

SynergyRED is preparing a proposal for the development of the proposed Beenup Wind Farm project, which is located in the Shire of Augusta Margaret River Local Government Area (LGA).

The current proposed layout includes 20 wind turbines.

SynergyRED has engaged Aviation Projects to prepare an Aviation Impact Assessment (AIA) to support the proposed application and formally consult with aviation agencies.

1.2. Purpose and Scope

The purpose and scope of the work are to prepare an AIA for consideration by Airservices Australia, CASA, and the Department of Defence and support the development application.

The AIA specifically responds to the following key legislation, approvals, and guidance material:

- Civil Aviation Safety Regulations 1998
- National Airspace Safeguarding Framework Guideline D: *Managing the Risk to aviation safety of wind turbine installations (wind farms)/Wind Monitoring Towers effective July 2012*
- Western Australia Government, Department of Planning, Lands and Heritage, *Position Statement: Renewable energy facilities, March 2020*
- Specific requirements as advised by Airservices Australia

1.3. Methodology

Aviation Projects conducted the task in accordance with the following methodology:

- Confirm the scope and deliverables
- Review client material
- Conduct a site visit to properly investigate aviation safety aspects of the proposed project site
- Review relevant regulatory requirements and information sources
- Identify and assess any likely impacts to:
    - Certified aerodromes within 30 nm (55.5 km) of the project
    - Uncertified aerodromes within 5 nm (9.3 km) of the project
    - Military aerodromes and associated Special Use Airspace (SUA)
    - Other SUA in the vicinity of the project.
- Prepare a draft aviation impact assessment and supporting technical data that provides evidence and analysis for the planning application to demonstrate that appropriate risk mitigation strategies have been identified. The draft aviation impact assessment report will include an Aviation Impact Statement (AIS) and a qualitative risk assessment to determine need for obstacle lighting and of applicable aspects for client review and acceptance before submission to external aviation regulators

- Identify risk mitigation strategies that provide an acceptable alternative to night lighting. The risk assessment will be completed following the guidelines in *ISO 31000:2018 Risk Management – Guidelines*
- Consult with aviation regulators, consisting of Airservices Australia (and other Part 173 procedure designers if applicable), and the Department of Defence
- Consult with relevant Council (s), and aerodrome operators of the nearby aerodrome/s to seek endorsement of the proposal to change instrument procedures (if applicable)
- Consult/engage with stakeholders (including RFDS) to negotiate acceptable outcomes (if required)
- Finalise the aviation impact assessment report when responses are received from stakeholders for client review and acceptance.

1.4. Aviation Impact Statement (AIS)

The AIS included in this report (see Section 6) includes the following specific requirements as advised by Airservices Australia:

Aerodromes:

- Specify all certified aerodromes that are located within 30 nm (55.6 km) of the project site
- Nominate all instrument approach and landing procedures at these aerodromes
- Review the potential effect of project operations on the operational airspace of the aerodrome(s).

Air Routes:

- Nominate air routes published in ERC-L & ERC-H which are located near/over the project site and review potential impacts of project operations on aircraft using those air routes.

Airspace:

- Nominate the airspace classification – A, C, D, E, G etc where the project site is located.

Navigation/Radar:

- Nominate aviation navigation systems in proximity to the project site.

1.5. Material reviewed

The material provided by the Proponent for the preparation of this assessment includes:

- 00039_BNWFCadastral.pdf
- 00040_BNWFProposedRoad.pdf
- 00041_BNWF.pdf
- 00043_BNWF.pdf
- Beenup - 29.06.2024 - DA development layout 20 WTG with Roads.kmz
- Ground elevation and coordinates in email (received on 30 July 2024 from Wilson Mandisodza)

2. BACKGROUND

2.1. Site Overview

The project site boundary is approximately 13.5 km northeast of Augusta, within the Shire of Augusta Margaret River Local Government Area (LGA).

An overview of the site relative to Augusta is provided in Figure 1 (source: SynergyRED, Google Earth).

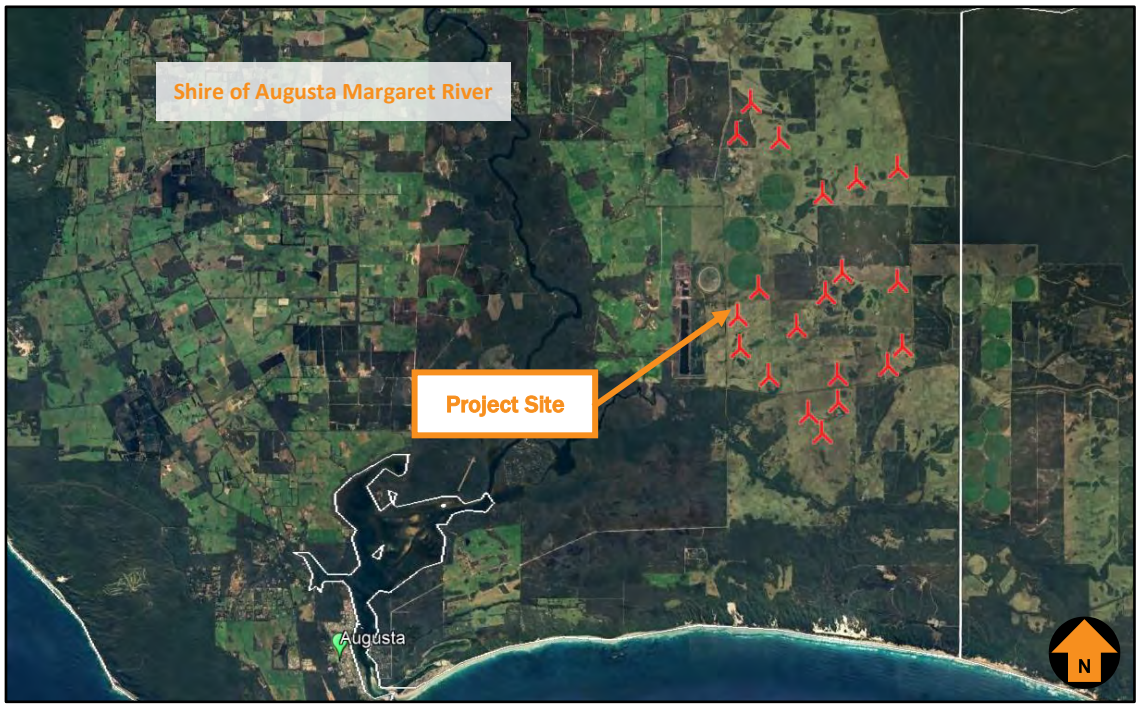

Figure 1 Project site overview

2.2. Project Description

The Project involves constructing, operating, maintaining and decommissioning the Beenup Wind Farm, including a final layout of up to 20 wind turbine generators (WTGs).

The WTGs will have a rotor diameter of approximately 180 m, with a maximum tip height of 250 m AGL.

The ground elevation for the highest WTG location is 40 m AHD, which, with a 250 m WTG height, results in a maximum overall height of 290 m AHD (951.4 ft AMSL).

3. EXTERNAL CONTEXT

3.1. National Airports Safeguarding Framework

The National Airports Safeguarding Advisory Group (NASAG) was established by Commonwealth Department of Infrastructure and Transport to develop a national land use planning framework called the National Airports Safeguarding Framework (NASF). The purpose of the NASF is to enhance the current and future safety, viability, and growth of aviation operations at Australian airports through:

- The implementation of best practice in relation to land use assessment and decision making in the vicinity of airports
- Assurance of community safety and amenity near airports
- Better understanding and recognition of aviation safety requirements and aircraft noise impacts in land use and related planning decisions
- The provision of greater certainty and clarity for developers and landowners
- Improvements to regulatory certainty and efficiency
- The publication and dissemination of information on best practice in land use and related planning that supports the safe and efficient operation of airports.

NASF Guideline D: *Managing the Risk to Aviation Safety of Wind Turbine Installations (Wind Farms)/Wind Monitoring Towers*, provides guidance to State/Territory and local government decision makers, airport operators and developers of wind farms to jointly address the risk to civil aviation arising from the development, presence and use of wind farms and WMTs.

The methodology for preparing the risk assessment is contained in the NASF Guideline D.

The risk assessment will have regard to all potential aviation activities within the vicinity of the project site including recreation, commercial, civil (including for agricultural purposes) and military operations.

NASF Guideline D strongly encourages consultation with aviation stakeholders in the early stages of wind farm development planning, including with aerodrome owners and operators, regional aircraft operators and CASA and Airservices.

3.2. Western Australia Government, Department of Planning, Lands and Heritage

The Western Australian Planning Commission administers responsibility for approving renewable energy facilities through local councils. The Department of Planning, Lands and Heritage has published *Position Statement: Renewable energy facilities* (March 2020) on behalf the Western Australia Planning Commission. These guidelines provide advice to inform planning decisions about a wind energy facility proposal.

The intent of this position statement is to:

- Outline the Western Australian Planning Commission (WAPC) requirements to support the consistent consideration and provision of renewable energy facilities within Western Australia
- Identify assessment measures to facilitate appropriate development of renewable energy facilities.

The position statement applies to the preparation and assessment of planning instruments including regional and local planning schemes and strategies.

The position statement supersedes Planning Bulletin 67 Guidelines for Wind Farm Development (2004).

Section 5.3.1 *Community Consultation* and Section 5.3.5 *Public and Aviation safety* are relevant to this assessment and are extracted below:

> ***Section 5.3.1 Community Consultation***
>
> *Early consultation with the community and stakeholders by the proponents is encouraged to ensure that the proposal is compatible with existing land uses on and near the site. The local government should be consulted with respect to the community consultation program. Relevant stakeholders may include:*
>
> - *Air Services Australia*
> - *Australian Wind Alliance*
> - *Civil Aviation Safety Authority*
>
> ***5.3.5 Public and aviation safety***
>
> *Proponents of wind turbine proposals should refer to the National Airports Safeguarding Framework (NASF) Guideline D: Managing the Risk to Aviation Safety of Wind Turbine Installation (Wind Farms) / Wind Monitoring Towers to determine any potential aviation safety risks and possible mitigation measures.*
>
> *Any potential aviation safety risks identified require consultation with Civil Aviation Safety Authority (CASA), Air Services Australia and/or the Commonwealth Department of Defence.*

The position paper defines Renewable energy facility as premises used to generate energy from a renewable energy source and includes any building or other structure used in, or relating to, the generation of energy by a renewable resource. It does not include renewable energy electricity generation where the energy produced principally supplies a domestic and/or business premises and any on selling to the grid is secondary.

An aviation impact assessment would include consultation with relevant aviation stakeholders and address aviation-related matters included in the Position Statement

3.3. Shire of Augusta-Margaret River Planning Scheme

The Project will be subject to Shire of Augusta-Margaret River's planning scheme, amended May 2024. Section 1.5 of the scheme provides the purpose of the scheme, including to:

a) Set out the local government's planning aims and intentions for the Scheme area;

b) Set aside land for public purposes;

c) Zone land within the Scheme area for the purposes defined in the Scheme;

d) *Control and guide land use and development;*

e) *Set out procedures for the assessment and determination of planning applications;*

f) *Make provisions for the administration and enforcement of the Scheme; and*

g) *Address other matters set out in the Schedule 7 to the Planning and Development Act 2005;*

3.4. Shire of Augusta-Margaret River Planning Strategy

The Shire of Augusta-Margaret River's Local Planning Strategy was endorsed by the Western Australia Planning Commission *on* 18 January 2022. The strategy *sets a vision for the size, look and feel of the Shire's neighbourhoods, towns and natural areas over a 10 to15-year period*.

The Local Planning Strategy identifies the Busselton Margaret Rive Airport (Busselton Airport), located in the City of Busselton LGA, referencing the 2018 major works that were undertaken on the airport to facilitate tourism and economic growth by accommodating larger passenger aircraft types.

Public and private landing strips are also referenced in the planning strategy:

> *Two dedicated public landing strips are located at Margaret River and Augusta (see Figure 5), providing opportunities for limited recreational and commercial air transport, together with facilities for the Royal Flying Doctor Service. A number of private landing strips are also located within the Shire, which have limited impacts owing to the low level of airport operations in the Shire.*

There is no specific aerodrome safeguarding policy or framework established in the planning strategy. This assessment considers that the Project is not affected by the Shire of Augusta-Margaret River Planning Strategy in relation to aviation impacts. Based on the proposed WTG layout (where there is no WTG located within 30 nm of the NDB or ARP of Busselton Airport), there is no impact to Busselton airport caused by the Project.

3.5. City of Busselton

The City of Busselton's Local Planning Strategy was endorsed by the Western Australia Planning Commission on 15 October 2014.

> *5.8 AIRPORT PROTECTION AREA (Amendment No. 46 - GG. 30 July 2021)*
>
> *5.8.1 Development within the Airport Protection Area requires the prior development approval of the local government.*
>
> *5.8.2 The Airport Protection area generally contains all lands likely to be within the predicted 55dB(A)Ldn noise contour for the Busselton Regional Airport.*
>
> *5.8.3 The local government will not grant development approval for uses in the Airport Protection area that involve residential use, schools, hospitals, overnight tourist accommodation or other habitable buildings unless those uses are ancillary to the operations of the Busselton Regional Airport and/or where the proponent for the use can demonstrate that the design of buildings is such that noise not louder than 55dB(A)Ldn will be experienced by residents or occupants of those buildings.*
>
> *5.8.4 Notwithstanding any other provisions of this Scheme, the local government shall not grant development approval for any development unless it is satisfied that such development will not constitute an obstruction, hazard or potential hazard to aircraft flying in the vicinity and may consult with and consider the advice of the Civil Aviation Safety Authority in making such determination.*

3.6. Aircraft operations at non-controlled aerodromes

There are several uncontrolled aerodromes in the vicinity of the project area. Advisory Circulars (ACs) provide advice and guidance from CASA to illustrate a means, but not necessarily the only means, of complying with the regulations, or to explain certain regulatory requirements. Advisory Circular (AC) 91-10 v1.1 *Operations in the vicinity of non-controlled aerodromes* provides guidance for pilots flying at or in the vicinity of non-controlled aerodromes, with respect to CASR 91.

3.7. Civil Aviation Safety Authority (CASA)

CASA provides the following guidance to inform pilots of their obligations at non-certified aerodromes.

3.7.1. Advisory Circular (AC) 91-02 V1.2, Guidelines for aeroplanes with MTOW not exceeding 5700 kg – suitable places to take off and land, dated November 2022

This Advisory Circular (AC) provides guidance for pilots of:

- Aeroplanes with maximum take-off weight (MTOW) not exceeding 5700 kg that are operated under Part 91 of CASR, including experimental aircraft, and
- Light sport aircraft (LSA) under Part 103 of CASR.

Purpose

This AC provides guidance to assist aeroplane pilots when determining the suitability of a place to safely take off and land. It provides an overview of pilot responsibilities, discusses the relevant circumstances recommended to be considered and includes general information and advice to enhance the safety of taking off and landing at any place.

2 Introduction

2.2 Use of Aerodromes

2.2.1 Regulation 91.410 authorises a place for use as an aerodrome if: (i) it is suitable for the landing and taking-off of aircraft; and (ii) an aircraft can land at or take off from the place safely, having regard to all the circumstances of the proposed landing or take-off (including the prevailing weather conditions).

4.2.4 The examples below are two of many possible considerations:

- the obstacles surrounding the aerodrome have been accurately described and are still current (e.g. have the trees on final grown taller since last reported), and

– the information provided enables the pilot to judge whether or not a landing approach can be made from both runway directions.

3.7.2. AC 91-10 v1.1, Operations in the vicinity of non-controlled aerodromes, dated November 2021

This AC provides guidance on procedures that, when followed, will improve situational awareness and safety for all pilots when flying at, or in the vicinity of, non-controlled aerodromes.

7.2 Traffic circuit direction

7.2.1 The standard aerodrome traffic circuit facilitates the orderly flow. Unless an alternative requirement for an aerodrome is stated in the ERSA or NOTAMs, all turns must be made to the left (regulation 91.385).

7.2.2 When arriving at an aerodrome to land, the pilot will normally join the circuit on upwind, crosswind (midfield), or at or before mid-downwind. Landings and take-offs should be made on the active runway or the runway most closely aligned into wind.

7.4.2 During initial climb-out, the turn onto crosswind should be appropriate to the performance of the aircraft but, in any case, not less than 500 ft above terrain so as to be at circuit height when turning downwind (regulation 91.390). Pilots may vary the size of the circuit depending on:

– the performance of the aircraft

– *AFM/Pilot's Operating Handbook requirements*

– *company standard operating procedures*

– *other safety reasons.*

7.7 Final approach

7.7.1 The turn onto final approach should be:

– *completed by a distance and height that is common to all operations at the aerodrome*

– *commensurate with the speed flown in the circuit for all aircraft of the same type.*

Illustrations of the standard aerodrome traffic circuit procedures provided in AC 91-10 v1.1. are shown in Figure 3 and Figure 2.

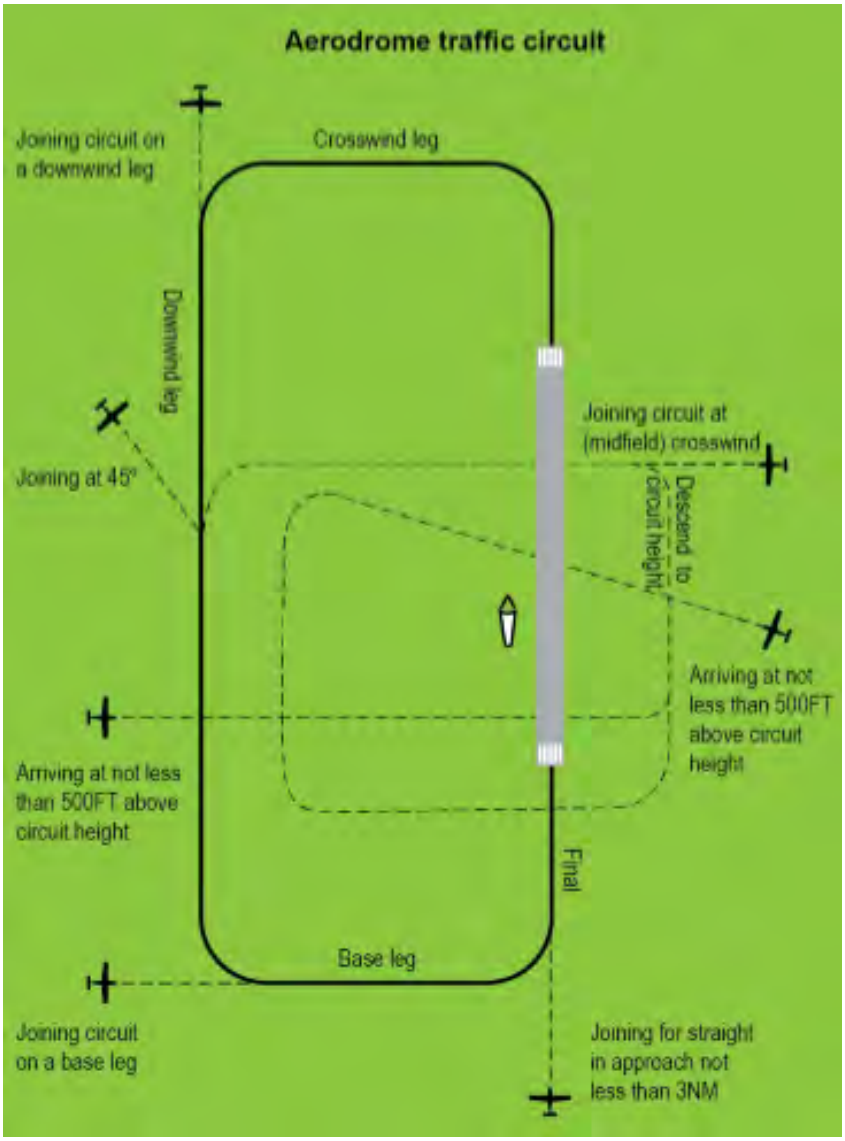

Figure 2 Aerodrome standard traffic circuit, showing arrival and joining procedures.

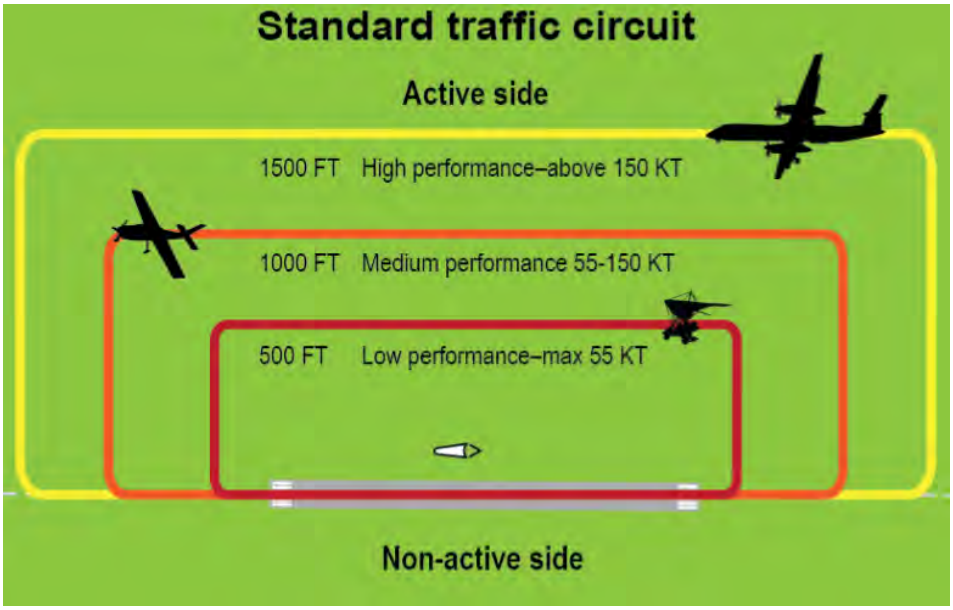

Figure 3 Lateral and vertical separation in the standard aerodrome traffic circuit

AC 91-10 v1.1. paragraph 7.10 refers to a distance that is "normally" well outside the circuit area and where no traffic conflict exists, which is at least 3 nm. The paragraph is copied below:

> *7.10 Departing the circuit area*
>
> *7.10.1 Aircraft should depart the aerodrome circuit area by extending one of the standard circuit legs or climbing to depart overhead. However, the aircraft should not execute a turn to fly against the circuit direction unless the aircraft is well outside the circuit area and no traffic conflict exists. This will normally be at least 3 NM from the departure end of the runway but may be less for aircraft with high climb performance. In all cases, the distance should be based on the pilot's awareness of traffic and the ability of the aircraft to climb above and clear of the circuit area.*

3.8. Rules of flight

3.8.1. Flight under Day Visual Flight Rules (Day VFR)

According to Australia's Aeronautical Information Package (AIP) the meteorological conditions required for visual flight in the applicable (class G) airspace at or below 3,000 ft AMSL or 1,000 ft AGL (whichever is the higher) are: 5,000 m visibility, clear of clouds and in sight of ground or water.

CASR 91.267 (Minimum height rules—other areas) prescribes the minimum height for flight. Generally speaking, and unless otherwise approved, aircraft are restricted to a minimum height of 500 ft AGL above the highest point of the terrain and any object on it within a radius of 300 m in visual flight during the day when not in the vicinity of built-up areas, and 1000 ft AGL over built up areas (within a horizontal radius of 600 m of the point on the ground or water immediately below the aeroplane).

These height restrictions do not apply if through stress of weather or any other unavoidable cause it is essential that a lower flying height be maintained.

Flight below these height restrictions is also permitted in certain other circumstances.

3.8.2. Flight under Night Visual Flight Rules (Night VFR)

With respect to flight under the VFR at night CASR 91.277 requires that the pilot in command of an aircraft flying VFR at night must not fly below the appropriate lowest safe altitude (unless during take-off and landing operations, within 3 nm of an aerodrome).

3.8.3. Flight under Instrument Flight Rules (Day or Night) (IFR)

According to CASR 91, flight under the instrument flight rules (IFR) requires an aircraft to be operated at a height clear of obstacles that is calculated according to an approved method.

Obstacle lights on structures not within the vicinity of an aerodrome are effectively redundant to an aircraft being operated under the IFR.

3.9. Aircraft operator characteristics

Flying training may be conducted under either the instrument flying rules (IFR) or visual flying rules (VFR). Other general aviation operations under either IFR or VFR are also likely to be conducted at various aerodromes in the area.

Flight under day VFR is conducted above 500 ft above the highest point of the terrain within a 300 m radius unless the operation is approved to operate below 500 ft above the highest point of the terrain.

It is expected that the proposed WTGs will be sufficiently visually conspicuous to pilots conducting VFR operations within the vicinity of the project area to enable appropriate obstacle avoidance manoeuvring.

IFR and Night VFR (which are required to conform to IFR applicable altitude requirements) aircraft operations are addressed in Section 6.

3.10. Passenger transport operations

Scheduled and non-scheduled passenger transport operations are generally operated under the IFR.

3.11. Private operations

Private operations are generally conducted under day or night VFR, with some IFR. Flight under day VFR is conducted above 500 ft AGL in areas outside city and township built-up areas.

3.12. Military operations

There may be some high-speed low-level military jet aircraft and helicopter operations conducted in the area. Military operations are conducted under separate but compatible regulations and standards, including obstacle separation requirements.

Refer to Section 5 for a detailed response from the Department of Defence.

3.13. Aerial application operations

Aerial application operations including such activities as fertiliser, pest and crop spraying are generally conducted under day VFR below 500 ft AGL: usually between 6.5 ft and 100 ft AGL.

The low flight operations conducted by NSW National Parks and Wildlife Service (NPWS) in Goodiman State Conservation Area are often concentrated along the boundaries of the park.

Due to the nature of the operations conducted, aerial agriculture pilots are subject to rigorous training and assessment requirements to obtain and maintain their licence to operate under these conditions.

The Aerial Application Association of Australia (AAAA) has a formal risk management program (which is recommended for use by its members) to assess the risks associated with their operations and implement applicable treatments to ensure an acceptable level of safety can be maintained.

The impact of the proposed WTGs on the safe and efficient aerial application of agricultural fertilisers and pesticides in the vicinity of the site was assessed.

3.13.1. Aerial Agricultural Association of Australia (AAAA)

In previous consultation with the AAAA, Aviation Projects has been directed to the AAAA Windfarm Policy (dated March 2011), now superseded by the AAAA Tall Structures Policy dated March 2024, which states in part:

> *The development of tall structures in agricultural and bush fire prone areas can pose a direct threat to aviation safety, particularly where fixed and rotary aircraft may be requested to operate for agricultural or bush/grass fire control.*
> *The absence of historical aircraft use in an area is considered an insufficient reason to discount the threat to Aviation Operations.*
>
> *The AAAA will oppose any development application or similar process unless the proponent has:*
> - *Identified the structure as posing a low-level flying risk that needs to be managed on an ongoing basis*
> - *Consulted honestly and in detail with local aerial application operators or the AAAA where a local operator cannot be identified*
> - *Consulted with adjoining landowners regarding the impact on adjacent properties*
> - *Included appropriate lighting and marking in the development proposal, consistent with providing a warning to low level flying*
> - *Identified the process for advising of the location height and presence of the structure to the relevant authorities, and*

Ensure that the proposal is in keeping with CASA requirements for structures near aerodromes, including temporary landing areas.

3.13.2. Local aerial application operators

Local aerial application operators consulted in previous studies undertaken by Aviation Projects have stated that a wind farm would, in all likelihood, prevent aerial agricultural operations in that particular area, but that properties adjacent to the wind farm would have to be assessed on an individual basis.

Aerial application operators generally align their positions with the AAAA policies.

Based on previous studies for other wind farm projects undertaken by Aviation Projects, and the results of consultation with AAAA and local aerial application operators, it is reasonable to conclude that safe aerial application operations would be possible on properties within the project site and on neighbouring properties, subject to final WTG locations and by implementing recommendations provided in this report at Section 11.

To facilitate the flight planning of aerial application operators, details of the Project, including location and height information of WTGs, wind monitor towers (WMTs) and overhead powerlines should be provided to landowners so that, when asked for hazard information on their property, the landowner may provide the aerial application pilot with all relevant information.

The use of helicopters enables aerial application operations to be conducted in closer proximity to obstacles than would be possible with fixed wing aircraft due to their greater manoeuvrability.

3.14. Emergency services

3.14.1. Royal Flying Doctor Service

Royal Flying Doctor Service (RFDS) and other emergency services operations are generally conducted under the IFR, except when arriving/departing a destination that is not serviced by instrument approach aids or procedures, in which case they would be operating day or night VFR.

Most emergency aviation services organisations have formal risk management programs to assess the risks associated with their operations and implement applicable treatments to ensure an acceptable level of safety can be maintained.

For example, pilots and crew require specific training and approvals, additional equipment is installed in the aircraft, and special procedures are developed.

3.14.2. Aerial firefighting

Aerial firefighting operations (firebombing in particular) are conducted under Day VFR, sometimes below 500 ft AGL. Under certain conditions visibility may be reduced/limited by smoke/haze.

Most aerial firefighting organisations have formal risk management programs to assess the risks associated with their operations and implement applicable treatments to ensure an acceptable level of safety can be maintained. For example, pilots require specific training and approvals, additional equipment is installed in the aircraft, and special procedures are developed.

The Australasian Fire and Emergency Services Council (AFAC) has developed a national position on wind farms, their development and operations in relation to bushfire prevention, preparedness, response and recovery, set out in the document titled *Wind Farms and Bushfire Operations*, version 3.0, dated 25 October 2018.

Of specific interest in this document is the section extracted from under the 'Response' heading, copied below:

> *Wind farm operators should be responsible for ensuring that the relevant emergency protocols and plans are properly executed in an emergency event. During an emergency, operators need to react quickly to ensure they can assist and intervene in accordance with their planned procedures.*
>
> *The developer or operator should ensure that:*
>
> - *liaison with the relevant fire and land management agencies is ongoing and effective*
> - *access is available to the wind farm site by emergency services response for on-ground firefighting operations*
> - *wind turbines are shut down immediately during emergency operations – where possible, blades should be stopped in the 'Y' or 'rabbit ear' position, as this positioning allows for the maximum airspace for aircraft to manoeuvre underneath the blades and removes one of the blades as a potential obstacle.*
>
> *Aerial personnel should assess risks posed by aerial obstacles, wake turbulence and moving blades in accordance with routine procedures.*

4. INTERNAL CONTEXT

4.1. Wind farm site description

The project site boundary is approximately 13.5 km northeast of Augusta, within the Shire of Augusta Margaret River Local Government Area (LGA).

Figure 4 and Figure 5 show a few roadside views of the Project site. (Source: Aviation Projects).

Figure 4 Project Site roadside view 1

Figure 5 Project Site roadside view 2

4.2. Wind turbine generator (WTG) description

The project site will comprise up to 20 WTGs, with a maximum blade tip height of 250 m above ground level (AGL).

The ground elevation for the highest WTG location is 40 m AHD, which, with a 250 m WTG height, results in a maximum overall height of 290 m AHD (951.4 ft AMSL).

Figure 6 Illustrates the project layout identifying the highest WTGs' location (source: Google Earth).

'Micrositing' of WTGs means an alteration to the siting of a WTG by not more than 100 m and any consequential changes to access tracks and internal power cable routes. The potential micrositing of the WTGs has been considered in the assessment. The estimate of the overall maximum height being based on the highest ground level is within 100 m of the nominal WTG position. The micrositing of the WTGs is not likely to result in a change in the Project's maximum overall blade tip height. This AIA assumes a maximum blade tip height of 250 m AGL is implemented at all WTG locations.

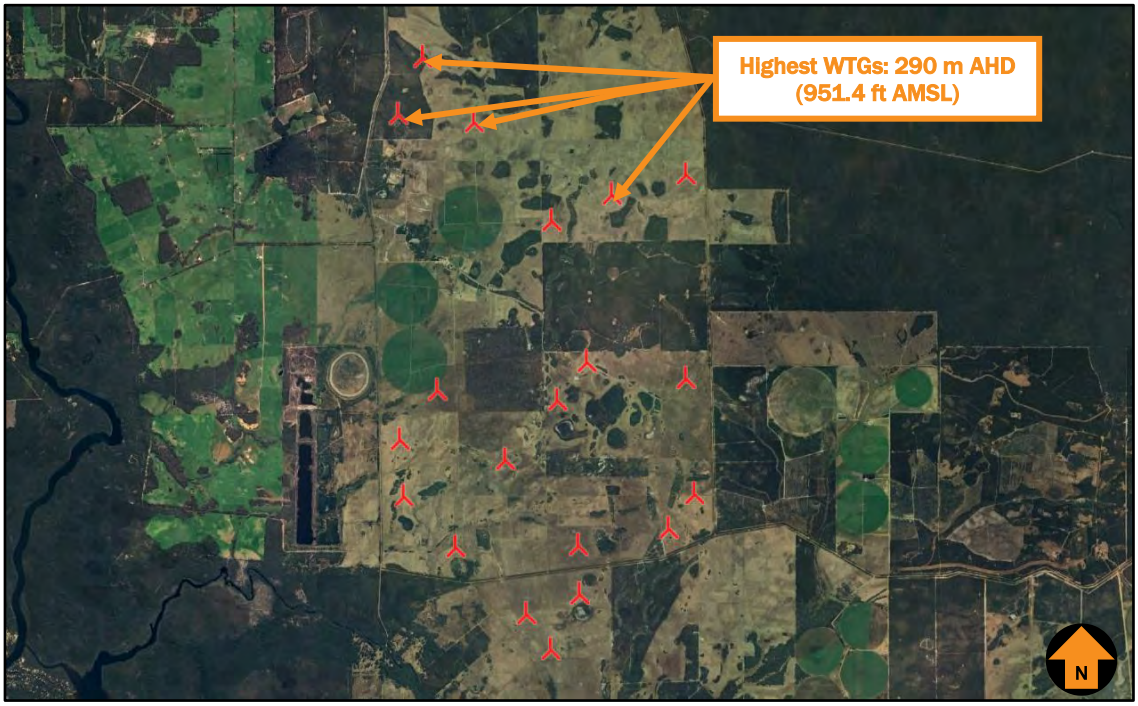

Figure 6 Project layout and highest WTG location

5. CONSULTATION

The following list of stakeholders were identified as requiring consultation:

1. Airservices Australia
2. Department of Defence
3. Shire of Augusta Margaret River
4. City of Busselton
5. Global Airspace Solutions
6. Western Australia Department of Biodiversity, Conservation and Attractions - Parks and Wildlife Service
7. Royal Flying Doctor Service
8. St John WA
9. Western Australia Department of Fire and Emergency Services
10. Western Australia Police Force.

Details and results of the consultation activities are provided in Table 1.

Table 1 Stakeholder consultation details

Agency/Contact	*Activity/Date*	*Response/ Date*	*Issues Raised During Consultation*	*Action Proposed*
Airservices Australia	Email sent on 06 November 2024 to Airservices Australia	Email received on 25 February 2025 from Airport Development & Protection	**Airspace Procedures** With respect to procedures designed by Airservices in accordance with ICAO PANS-OPS and Doc 9905, at a maximum 290 m (952 ft) AHD the wind farm will affect the minimum sector altitude and GNSS arrival instrument procedures at Busselton aerodrome. In order to accommodate the wind farm the minimum sector altitude and GNSS arrival SECTOR A instrument procedures will need to be re-designed. The maximum height of wind farm without affecting any procedures at Busselton aerodrome is 274.3m (900ft) AHD. Note: Procedures not designed by Airservices at Busselton aerodrome were not considered in this assessment. **Communications/Navigation/Surveillance (CNS) Facilities** We have assessed the proposed activity to the above specified height for any impacts to Airservices Precision/Non-Precision Navigation Aids, Anemometers, HF/VHF/UHF Communications, A-SMGCS, Radar, PRM, ADS-B, WAM or Satellite/Links and have no objections to it proceeding. Note: Meteorological instruments not owned by Airservices were not considered in this assessment.	Please consult with the aerodrome and aviation operators to ensure that they accept the proposed changes. We need confirmation from the aerodrome operator before we will make any changes. All amendments to airspace procedures are made on a commercial basis. **Vertical Obstacle Notification** As this proposed activity is more than 30m (99ft) AGL, please follow the below notification process: 1. Complete the Vertical Obstacle Notification Form: ATS-FORM-0085_Vertical_Obstruction_Data_Form.pdf (airservicesaustralia.com) 2. Submit completed form to: VOD@airservicesaustralia.com as soon as the development reaches the maximum height. For further information regarding the reporting of tall structures, please contact the VOD team: • Phone - (02) 6268 5622 • Email - VOD@airservicesaustralia.com

Agency/Contact	Activity/Date	Response/ Date	Issues Raised During Consultation	Action Proposed
			Please consult with the Bureau of Meteorology to ensure that the proposed activity does not adversely impact their equipment. **Air Traffic Control (ATC) Operations** There are no additional instructions or concerns from ATC. **Summary – permanent impact (WF)** The proposed activity will penetrate the current Airservices-designed airspace procedures and/or impact CNS facilities or ATC operations at Busselton aerodrome. Please consult with the aerodrome and aviation operators to ensure that they accept the proposed changes. We need confirmation from the aerodrome operator before we will make any changes. All amendments to airspace procedures are made on a commercial basis.	• Or refer to: Civil Aviation Safety Regulation Part 175 — Airservices and You - Airservices (airservicesaustralia.com)
Department of Defence	Email sent on 06 November 2024 to Department of Defence	Email received on 09 January 2025 from Anthony Deutschmann (Assistant Director)	The Department of Defence (Defence) has conducted an assessment of the proposed Beenup Wind Farm Project for potential impacts on the safety of military low flying operations as well as possible interference to Defence communications and radar. As the proposed wind farm meets the requirement for reporting tall structures, Defence requests that you provide Air Services Australia (AsA) with vertical obstacle notification. Marking tall structures on aeronautical charts assists pilot navigation and enhances flight safety. Airservices Australia (ASA) is responsible for recording the location	Defence therefore requests that the following processes to be followed: 1. Complete the Vertical Obstacle Notification Form: ATS-FORM-0085_Vertical_Obstruction_Data_Form.pdf (airservicesaustralia.com) 2. Submit completed form to: VOD@airservicesaustralia.com as soon as the development reaches the maximum height.

Agency/Contact	Activity/Date	Response/ Date	Issues Raised During Consultation	Action Proposed
			and height of tall structures. The information is held in a central database managed by ASA and relates to the erection, extension, or dismantling of tall structures, the top of which is above: a. 30 metres AGL, that are within 30 kilometres of an aerodrome; and b. 45 metres AGL elsewhere for RAAF.	For further information regarding the reporting of tall structures, please contact the VOD team: • Phone - (02) 6268 5622 • Email - VOD@airservicesaustralia.com • Or refer to: Civil Aviation Safety Regulation Part 175 — Airservices and You - Airservices (airservicesaustralia.com)
Shire of Augusta Margaret River	Email sent on 06 November 2024 to Shire of Augusta Margaret River	Email received on 28 February 2025 from Nick Logan (Director Sustainable Development and Infrastructure)	We don't have anything to add at this point. We have a statutory function in assessing the complete form of the formal application against a number of criteria and will give full consideration if it progresses to that point. Just to note that: • The AMR Shire Tallinup Augusta Aerodrome is used relatively consistently and more so than Margaret River. • Aerial bushfire suppression is used in this area from time to time	No Action Required
City of Busselton	Email sent on 06 November 2024 to City of Busselton	Email received on 13 March 2025 from Bonnie Allen (Senior Airport Administration Officer)	The City of Busselton acknowledges receipt of the AIA of the Beenup WF and authorises Airservices Australia to make the required changes to the 25 nm MSA and GNSS Arrival.	The approval letter was sent to Airservices Australia, and in Annexure 6

Agency/Contact	*Activity/Date*	*Response/ Date*	*Issues Raised During Consultation*	*Action Proposed*
Global Airspace Solutions	Email sent on 11 March 2025 to Global Airspace Solutions	Email received on 11 March 2025 from Bas Smeulders (Chief Designer)	• Airservices probably did not provide you with the information of the other IFPs, because AsA only assesses the IFPs under their responsibility. • The NDB RWY 21 MSA is certainly affected by the one wind turbine, because the MSA centre-point is the NDB. Aircraft OPS not impacted, but the plate is. • Every IFP plate is affected by the one wind turbine located within the MSA PANS-OPS surfaces with the NDB as the centre-point. Even if the ARP is the centre-point and the MSA surfaces are not overlapping the one wind turbine, the western sector has to be revised to 2000 ft, to maintain the same MSA values on all IFP plates. We do not publish different MSA values for the same aerodrome. • There is no impact on aircraft ops, but there is an impact on the IFP plates and changing them would probably come with a cost.	There is no impact on aircraft ops, but there is an impact on the IFP plates and changing them would probably come with a cost.
Royal Flying Doctor Service	Email sent on 06 November 2024 to Royal Flying Doctor Service	No Response received by 14 April 2025		
St John WA	Email sent on 06 November 2024 to St John WA	No Response received by 14 April 2025		

Agency/Contact	*Activity/Date*	*Response/ Date*	*Issues Raised During Consultation*	*Action Proposed*
Western Australia Department of Fire and Emergency Services / Western Australia Department of Biodiversity, Conservation and Attractions - Parks and Wildlife Service	Email sent on 06 November 2024 to Western Australia Department of Fire and Emergency Services and Western Australia Department of Biodiversity, Conservation and Attractions - Parks and Wildlife Service	Email received on 09 December 2024 from Mathew Wansborough (Regional Coordinator) and Email received on 21 March 2025 from Ray Buchan (Superintendent – Aviation Services)	A few meetings have been set up, and further communication will continue. Meeting Summary – 17 February 2025: • Aerial fire suppression activities are not prohibited within wind farms. There are currently no procedures specific to aerial fire suppression operations around wind farms. • Aerial firefighting around wind farms is not treated any differently to other aerial firefighting i.e. the same risk assessment processes are undertaken to ensure the aerial fire suppression operation can be undertaken safely as for all fires. • Aerial operations are via contractors, and they will have their own Standard Operating Procedures and risk assessment processes that form part of their Safety Management System. • Pilots will take the wind turbines into consideration in their risk assessments and will make a determination on the day whether it is safe to operate inside the wind farm envelope. • If the wind farm is operating during a bushfire, suppression operations will be modified or suspended. • If the wind farm is able to be shutdown / paused remotely (i.e. blades moving at approx. 1 RPM), then suppression operations will be considered	• Synergy will notify CASA, Air Services Australia, DBCA and DFES notification of all turbine locations • Turbines at least 300 metres apart • Meteorological masts and guy wires to be marked to ensure visibility to aircraft as per CASA regulations • Synergy will investigate lighting for wind turbines (for rescue helicopters) • Synergy will not oppose shutting down the wind farm in the case of an emergency • Synergy will provide data in the preferred format for DBCA and DFES to inform their risk assessment. • Synergy will provide opportunities for site familiarisation and orientations • Should the project go ahead, the preferred turbine technology will have a fire suppression system. • Synergy to provide a detailed BMP / EMP which includes emergency contacts (Detail slides are in Annexure 7)

Agency/Contact	Activity/Date	Response/ Date	Issues Raised During Consultation	Action Proposed
			based on a risk assessment and conditions on the day. • DFES acknowledges that due to the rapid onset of bushfires it is very difficult to achieve a Y position, it is assumed that it cannot be achieved in a timely manner. However, pausing turbines to approx. 1 RPM is recommended. • DFES will prioritise static fresh water supplies over salt or brackish water i.e. preference is to not take salt water for firefighting • While aerial firefighting only operates during the day, rescue services operate day and night – 24/7/365 • DFES recommends medium intensity lighting on wind turbines for rescue purposes due to operating at night. Refer to 2017 NSW CASA guidance. • Emphasised the significance of operator and DFES/DBCA Incident Controllers in the decision-making process for firefighting operations near wind farms. • Provision of information regarding tall objects within the wind farm at the point of construction is critical in being able to assess the risk during a bushfire emergency.	

Agency/Contact	Activity/Date	Response/ Date	Issues Raised During Consultation	Action Proposed
			• Emphasised importance of local/regional involvement in the planning and development of the wind farm. • Emergency Response Plan to be developed and shared with DFES. Must have contact details for wind farm and available 24/7 to first responders and Incident Controllers. Meeting Summary - 24 February 2025 • Aerial fire suppression and pest control operate under daytime VFR (visual flight rules). No rescue services operated by DBCA. • Aerial fire suppression will consider the risk on the day and location, will be at the pilot's discretion. Dispatch operators will always flag the coordinates of any obstacles / tall objects (such as wind turbines). • DBCA also acknowledges that due to the rapid onset of bushfires it is very difficult to achieve a Y position, it is assumed that it cannot be achieved in a timely manner. • There are currently no procedures specific to wind farms. • Need to confirm secondary airstrips have been assessed. • Feedback from DBCA forum with Chief pilots is that there is no special consideration for wind	

Agency/Contact	Activity/Date	Response/ Date	Issues Raised During Consultation	Action Proposed
			farms but as the decision to is at the pilot's discretion.	
Western Australia Police Force	Email sent on 06 November 2024 to Western Australia Police Force	No Response received by 14 April 2025		

6. AVIATION IMPACT STATEMENT

6.1. Overview

Potential safety risks include (but are not limited to) impacts on flight procedures and aviation communications, navigation, and surveillance (CNS) facilities, which require assessment by Airservices Australia.

To facilitate these assessments, all wind farm proposals submitted to Airservices Australia must include an Aviation Impact Statement (AIS).

This analysis considers the aeronautical impact of the WTGs on the following:

- The operation of certified aerodromes within 30 nm of the wind farm
- The operation of nearby aircraft landing areas within 3 nm of the wind farm
- Grid and air route Lowest Safe Altitudes (LSALTs)
- Airspace protection
- Aviation navigation facilities
- ATC surveillance radar installations
- Local aircraft operations.

6.2. Nearby certified aerodromes

One airport, Busselton Airport (YBLN), is certified by the CASA under CASR Part 139 and is located within 30 nm of the proposed site.

The location of the project site relative to Busselton (YBLN) is shown in Figure 7 (Source: SynergyRED, Google Earth). The orange circle around Busselton Airport represents a distance of 30 nm from the airport's aerodrome reference point (ARP). The green circle represents a distance of 30 nm from the Non-Directional Beacon (NDB). There is one WTG within the 30 nm from NDB.

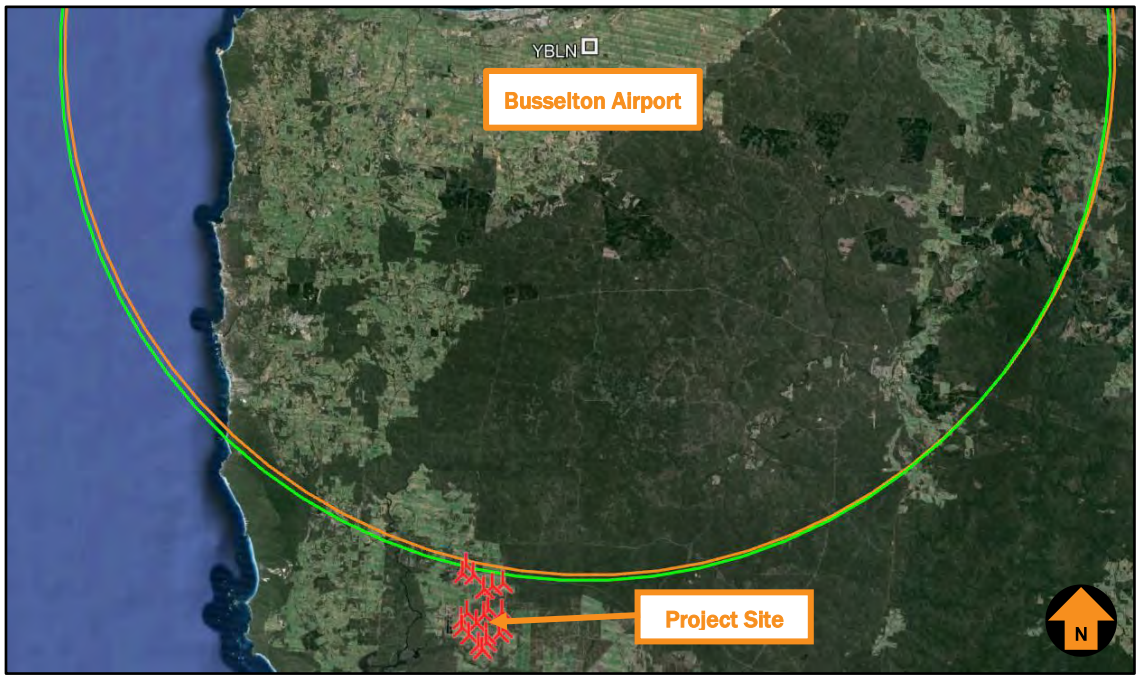

Figure 7 Location of Certified Airports in relation to Project Area

6.3. Obstacle Limitation Surfaces

Obstacle Limitation Surfaces (OLS) are established for each certified aerodrome runway.

For the Code 4 non-precision runway at Busselton Airport, the maximum lateral extent of the OLS is up to 6 km for the conical surface and 15 km for the take-off and approach surfaces.

The closest WTG in the project area is approximately 56 km south of Busselton Airport's aerodrome reference point, which is beyond the horizontal extent of the obstacle limitation surfaces of Busselton Aerodromes.

6.4. Busselton Airport (YBLN)

Busselton Airport is a certified aerodrome operated by the City of Busselton. Its published aerodrome elevation is 17 m AHD (56 ft AMSL) (source: AIP, effective 28 November 2024).

Busselton Airport's aerodrome reference point (ARP) coordinates published in Airservices Australia's Designated Airspace Handbook (DAH) are Latitude 33°41'14" S and Longitude 115°24'01" E (Source: AIP, effective 28 November 2024).

6.4.1. Instrument approach and departure procedures

A check of the Aeronautical Information Package (AIP) via the Airservices Australia website showed that Busselton Airport is served by non-precision instrument flight procedures for each runway (source: AIP, effective 28 November 2024).

Table 2 Identifies the aerodrome and procedure charts for Busselton Airport, which were designed by AsA and Global Airspace Solution (GAS) as indicated.

Table 2 Busselton Airport (YBLN) aerodrome and procedure charts

Chart name	*Effective date*
AERODROME CHART (AsA)	13 June 2024 (Am 179)
SID Busselton one departure (GAS)	17 June 2021 (Am 167)
GNSS Arrival (AsA)	23 May 2019 (Am 159)
RNP Z RWY 03 (GAS)	07 September 2023 (Am 176)
RNP X RWY 03 (AR) (GAS)	07 September 2023 (Am 176)
RNP W RWY 03 (AR) (GAS)	07 September 2023 (Am 176)
NDB RWY 03 (GAS)	25 March 2021 (Am 166)
RNP RWY 21 (GAS)	07 September 2023 (Am 176)
RNP RWY 21 (AR) (GAS)	07 September 2023 (Am 176)
NDB RWY 21 (GAS)	21 March 2024 (Am 178)

6.4.2. PANS-OPS Surfaces

A detailed assessment of the PANS-OPS surfaces associated with the published instrument approach procedures was undertaken:

- MSA Surfaces
- IFR Circling Areas
- PANS-OPS Approach and Departure Procedure Surfaces.

MSA surfaces

The minimum sector altitude (MSA) applies to each instrument approach procedure at Busselton Airport. Images of the MSA published for Busselton Airport are shown in Figure 8 (source: AIP, effective 28 November 2024).

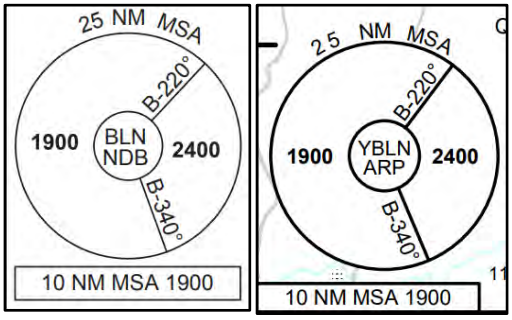

Figure 8 MSA at Busselton Airport

The CASR Part 173 MOS requires a minimum obstacle clearance (MOC) of 984 ft to be applied above the highest terrain or obstacle within the applicable segment.

Obstacles within the 25 nm MSA of Busselton Airport's ARP or NDB define the minimum height at which an IFR aircraft can fly when within 25 nm of the airport when not in visual flight conditions.

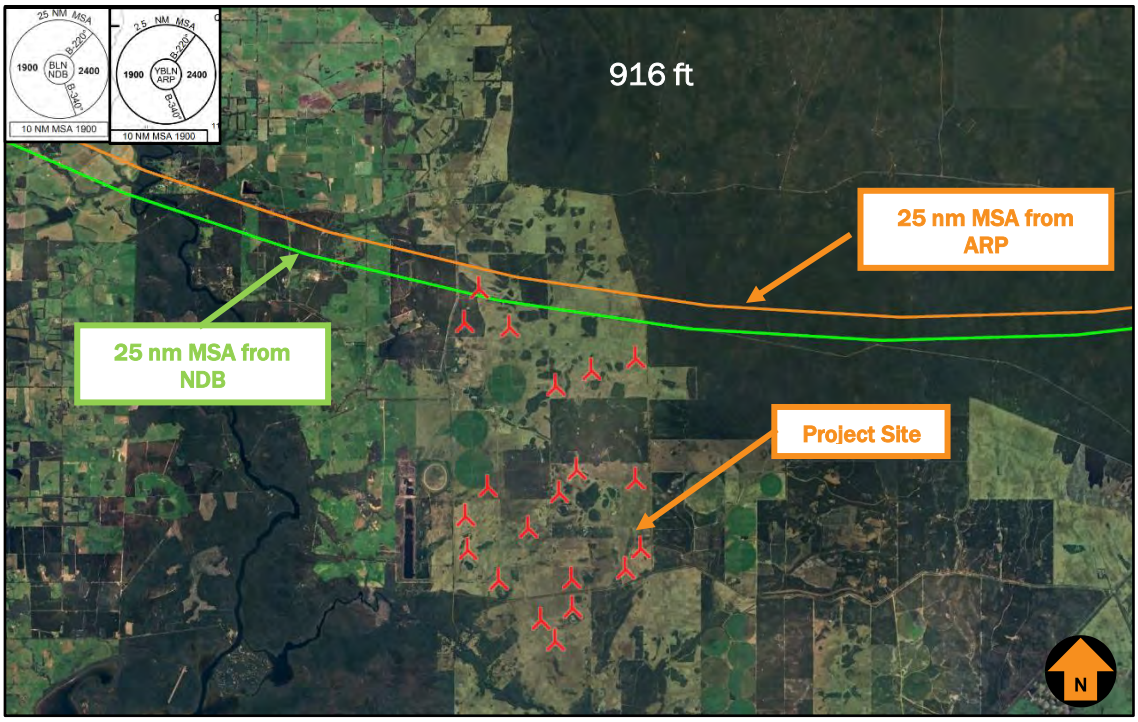

Figure 9 Busselton Airport MSA

One of the highest WTGs will be within Busselton Airport's 25 nm MSA western sector. Figure 9 (Source: SynergyRED, Google Earth) shows Busselton Airport's 25 nm MSA from ARP (orange) and NDB (green) and their related PANS-OPS surface heights (ft AMSL).

The 25 nm MSA western sector's minimum altitude is 579 m AHD (1900 ft AMSL), with a PANS-OPS surface elevation of 279 m AHD (916 ft AMSL). An impact analysis of Busselton Airport's MSA is provided in Table 3.

Table 3 Busselton Airport MSA Impact Analysis

MSA	*Minimum altitude (ft AMSL)*	*PANS-OPS surface (ft AMSL)*	*Impact on airspace design*	*Potential solution*	*Impact on aircraft ops*
10 nm MSA	1900	916	Nil – outside the protection surface	N/A	N/A
25 nm MSA – Eastern Sector	2400	1416	Nil – outside the protection surface	N/A	N/A
25 nm MSA – Western Sector	1900	916	The highest WTG is higher than the PANS-OPS surface by 35.4 ft	Increase minimum altitude by 100 ft or sectorise to exclude the WF	Minor. No change to flight paths.

There is only one WTG within the MSA surface, and its height is 290 m AHD (951.4 ft AMSL). It will be higher than Busselton Airport's 25 nm MSA western sector by 10.8 m (35.4ft).

The Project will impact Busselton Airport's 25 nm MSA western sector surfaces, which will need to be increased by 100 ft to 2000 ft or sectorised to exclude the wind farm.

The increase to the 25 nm MSA will require a proportional increase in the commencement altitude and the minimum holding altitude for the GNSS Arrival approach procedures. There is sufficient distance between the procedures' initial approach fixes to accommodate the minimum altitude increase without affecting aircraft operations or efficiency.

IFR Circling areas.

A circling approach is an extension of an instrument approach to the specified circling minima (lowest altitude permitted without visual reference to the ground) at which point the pilot will visually manoeuvre the aircraft to align with the runway for landing. Typically, a circling approach is only conducted where there is no runway-aligned instrument procedure or if the runway used for the approach procedure is not suitable for landing.

Circling areas are established by the instrument flight procedure designer based on ICAO specifications related to the performance category of the designed aircraft. The circling area is determined by drawing an arc centred on the threshold of each usable runway and joining these arcs by tangents. Category D is the most demanding aircraft category provided for in Busselton Airport's instrument flight procedures.

The radii for each relevant category of aircraft are provided below:

- Category A – 1.68 nm / 3.11 km
- Category B – 2.66 nm / 4.93 km
- Category C – 4.20 nm / 7.78 km
- Category D – 5.28 nm / 9.78 km

The closed WTG is 29.5 nm / 54.7 km from Runway 03's threshold and beyond the circling area for all runway ends at Busselton Airport.

The Project will not impact circling areas established for instrument flight procedures.

PANS-OPS Approach Procedure Surfaces

A detailed assessment of the PANS-OPS surfaces associated with the published instrument approach procedures was undertaken. Table 4 Details the assessment for each instrument approach procedure.

Table 4 Busselton Airport PANS-OPS Assessment

Busselton Airport Instrument Approach Title	*Minimum Altitude over Project (ft AMSL)*	*PANS-OPS Surface (ft AMSL)*	*Impact on the procedure by WTGs*	*Potential solution*	*Impact on aircraft ops*
SID Busselton one departure	Nil	Nil	Nil – outside the protection surface	N/A	N/A
GNSS Arrival – Sector A	1900	900	Yes – penetrate the initial approach protection surface	Need to raise by 100 ft	Minor. No change to flight paths.
GNSS Arrival – Sector B	2400 (MSA)	1416	Nil – underneath protection surface	N/A	N/A
RNP Z RWY 03	2400 (MSA)	1416	Nil – Outside protection surface	N/A	N/A
RNP X RWY 03 (AR)	2400 (MSA)	1416	Nil – Outside protection surface	N/A	N/A
RNP W RWY 03 (AR)	2400 (MSA)	1416	Nil – Outside protection surface	N/A	N/A
NDB RWY 03	2400 (MSA)	1416	Nil – Outside protection surface	N/A	N/A
RNP RWY 21	2400 (MSA)	1416	Nil – Outside protection surface	N/A	N/A
RNP RWY 21 (AR)	2400 (MSA)	1416	Nil – Outside protection surface	N/A	N/A
NDB RWY 21	2400 (MSA)	1416	Nil – Outside protection surface	N/A	N/A

GNSS Arrival

A DME/GPS arrival procedure is designed to permit an aircraft to descend from an en-route altitude at or above the lowest safe altitude to a minimum altitude at an aerodrome using DME or GPS distance measurement and ground based azimuth guidance facilities. The procedure is prescribed for particular tracks or sectors and takes the form of a series of descending steps at appropriate distances.

DME/GPS arrivals are instrument approach procedures. DME and DME/GPS arrival procedures are not included in ICAO DOC 8168 – OPS/611 Volume II, but are designed using the criteria contained in that document applicable to non-precision approaches and therefore have initial, intermediate and final approach segments. To account for control area steps, the step information is frequently extended beyond the initial approach fix (IAF) into the en-route segment.

Minimum obstacle clearance is as follows:

- Initial approach and en-route segments – 1,000 ft;
- Intermediate approach segment – 500 ft;
- Final approach segment – 300 ft.

Figure 10 Shows Busselton Airport GNSS Arrival Sector A display (Source: AsA: GNSS Arrival Procedures – 23 May 2019).

The only WTG within the GNSS Arrival—Sector A will infringe on the initial approach area's minimum altitude. The WTG will be 290 m AHD (951.4 ft AMSL), which is 51.4 ft higher than the minimum altitude. The minimum altitude for the initial approach area will need to be increased from 1900 ft to 2000 ft.

The commencement altitude would need to be increased due to the requirement to increase the 25 nm MSA to 2000 ft. However, the flight path gradient will not change.

This procedure will need to be amended, and the procedure designer will make a detailed assessment.

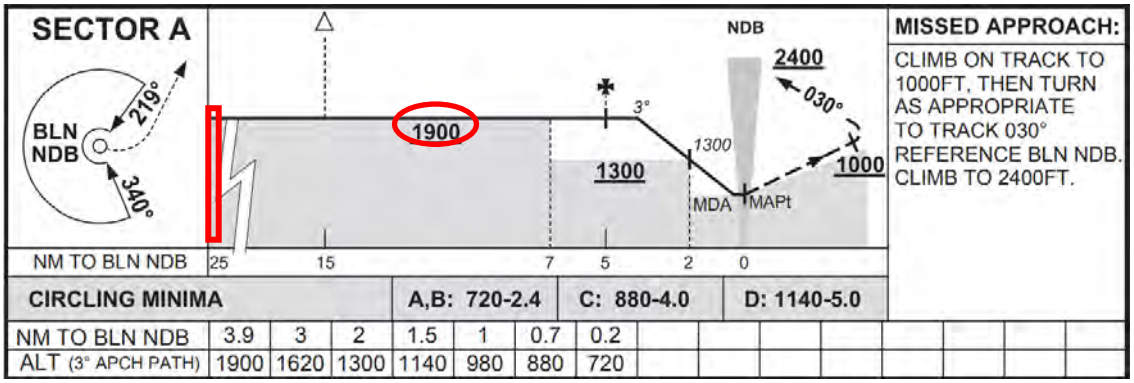

Figure 10 Busselton Airport GNSS Arrival – Sector A

Rest Procedures:

All procedures need the same MSA values to reflect the 2000ft in the western sector. Therefore, all other procedures will need to be updated.

6.5. Nearby uncertified aerodrome

A search of various aviation datasets identified uncertified aerodromes in proximity to the project area. These are non-certified aerodromes and are not subject to CASR Part 139 regulations.

The aviation datasets used for the search are:

- AIP aeronautical charts effective 05 September 2024
- OzRunways - which sources its data from Airservices Australia (AIP). The aeronautical data provided by OzRunways is approved under CASA CASR Part 175
- Australian Government National Map online.

As a guide, an area of interest within a 3 nm radius of an uncertified aerodrome is used to assess the potential impacts of proposed developments on aircraft operations at or within the vicinity of the uncertified aerodrome.

Figure 11 Shows the location of nearby uncertified aerodromes relative to the project site and a nominal 3 nm buffer from the closer uncertified aerodromes (source: Google Earth).

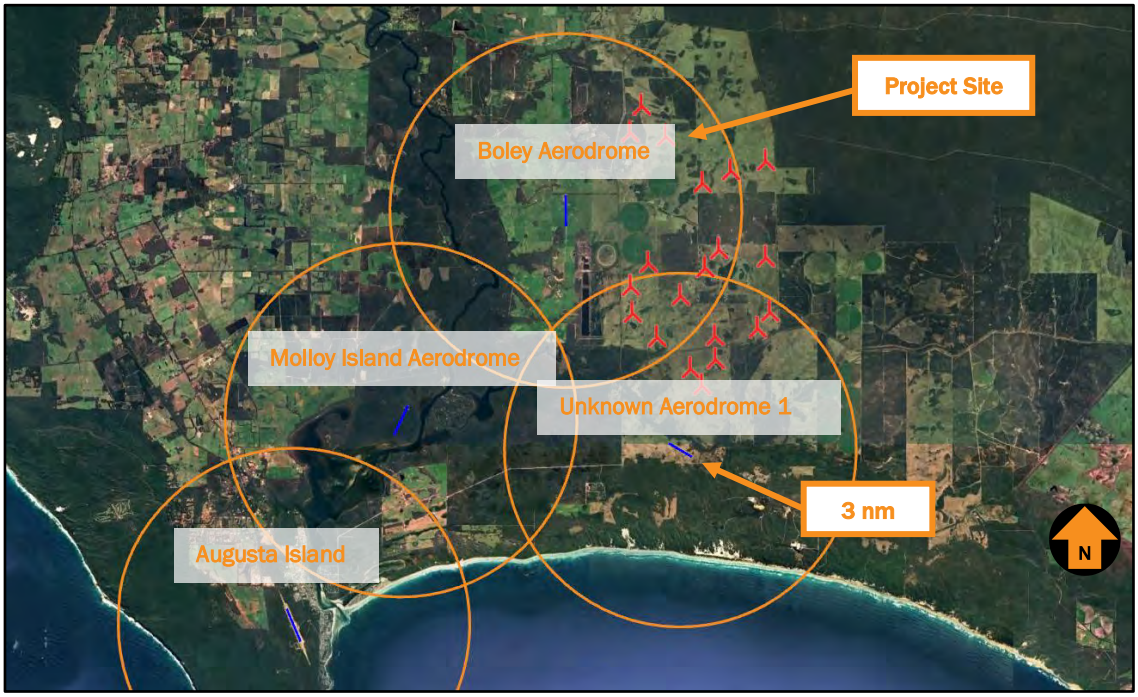

Figure 11 Uncertified Aerodromes in the vicinity of the project site

Unknown uncertified aerodromes 1 and Boley Aerodrome are the closest in relation to the Project. The Project is located within a radius of 3 nm of those uncertified aerodromes.

6.5.1. Unknown Aerodrome 1

The Unknown Aerodrome 1 is approximately 2 km south of the closest WTG. Limited published information about the aerodrome is available. Satellite imaging shows a prepared runway, as shown in Figure 12 (Source: Google Earth).

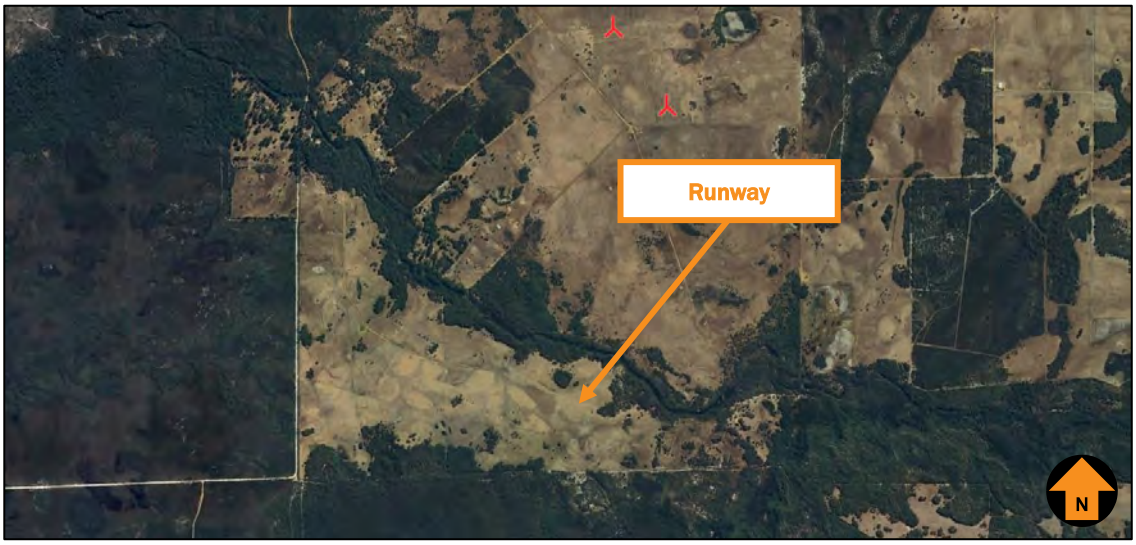

Figure 12 Close-up Google Earth image of Unknown Aerodrome 1's runway

Approximately 10 WTGs are proposed to be located within 3 nm of this aerodrome, as shown in Figure 13 (Source: SynergyRED, Google Earth).

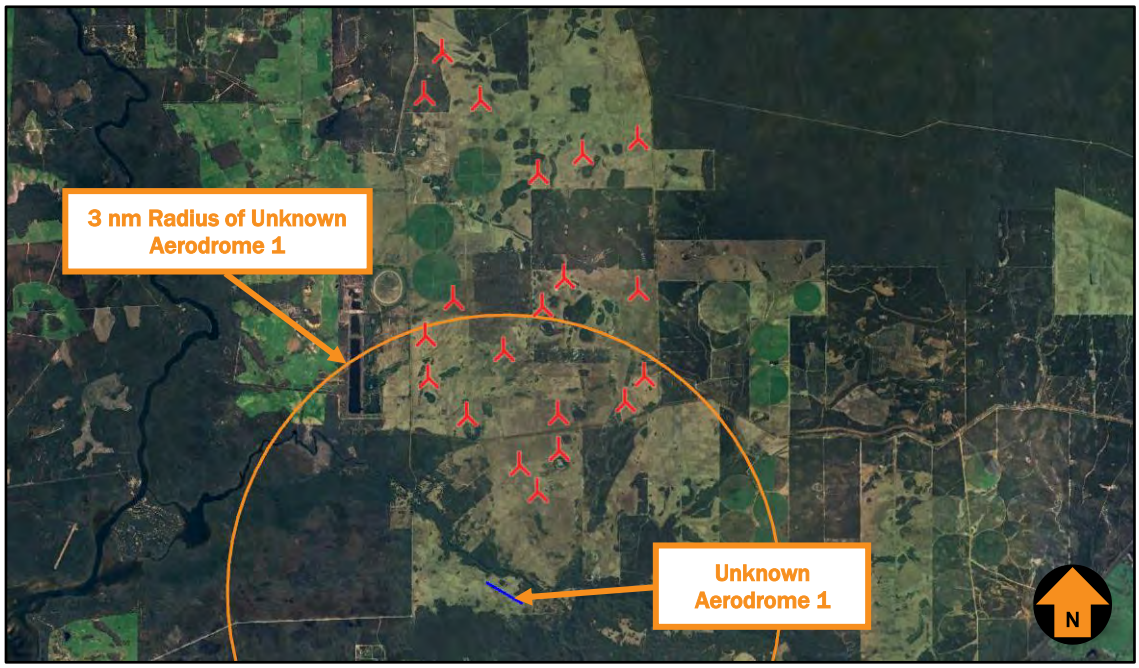

Figure 13 Unknown Aerodrome 1 in relation to The Project

Aircraft typically operate in circuit patterns when arriving and departing from an aerodrome. AC 91-10 '*Operations in the vicinity of non-controlled aerodromes*' describes the standard traffic circuit and heights at which aircraft should fly. This is shown in Figure 3 (Section 3.7.2).

In addition, various entry and departure procedures for aircraft joining and departing a standard traffic circuit are described. Figure 2 in Section 3.7.2 shows the standard arrival and joining procedures for a standard traffic circuit.

By regulation and for safety reasons, aircraft are required to conduct left-hand circuits when operating at an aerodrome unless otherwise not available due to terrain or populous areas, etc., and they are notified in AIP. Left-hand circuits after take-off and landing on the runways would need to fly above the proposed wind farm. WTGs within 3nm of Unknown Aerodrome 1 that would be considered potentially hazardous obstacles, shown in Figure 14 (Source: SynergyRED, Google Earth).

Uncertified aerodromes do not have the same regulatory status and protections as certified aerodromes. Potential impacts upon a private aerodrome caused by a wind farm would not preclude the regulatory approval of the wind farm under the Position Statement. However, it is highly recommended that any wind farm be designed to avoid, minimise, and/or mitigate impact(s) on private aerodromes.

During the site visit, the aerodrome is unlikely to be activity. The status of the aerodrome needs to be confirmed with the owner.

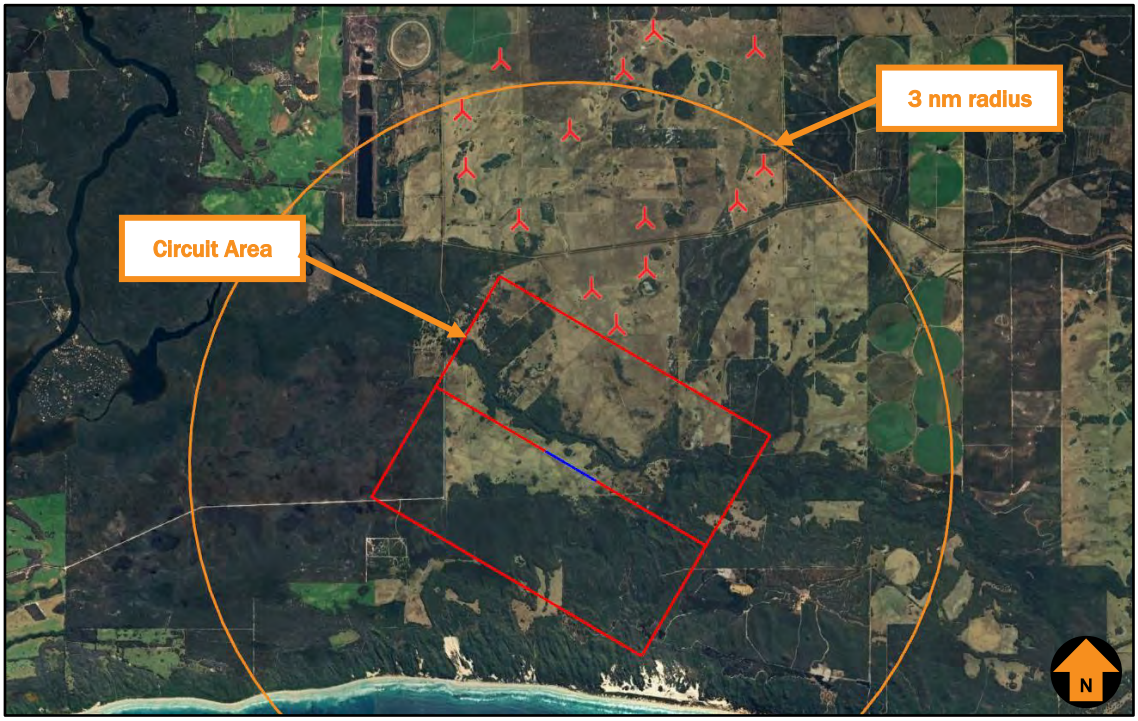

Figure 14 WTGs in relation to circuit operation of Unknown Aerodrome 1

6.5.2. Boley Aerodrome

The Boley Aerodrome is approximately 2.7 km west of the closest WTG. Limited published information about the aerodrome is available. Satellite imaging shows a prepared runway, as shown in Figure 15 (Source: Google Earth).

Figure 15 Close-up Google Earth image of aerodrome's runway

Approximately 12 WTGs are proposed to be located within 3 nm of this aerodrome, as shown in Figure 16 (Source: SynergyRED, Google Earth).

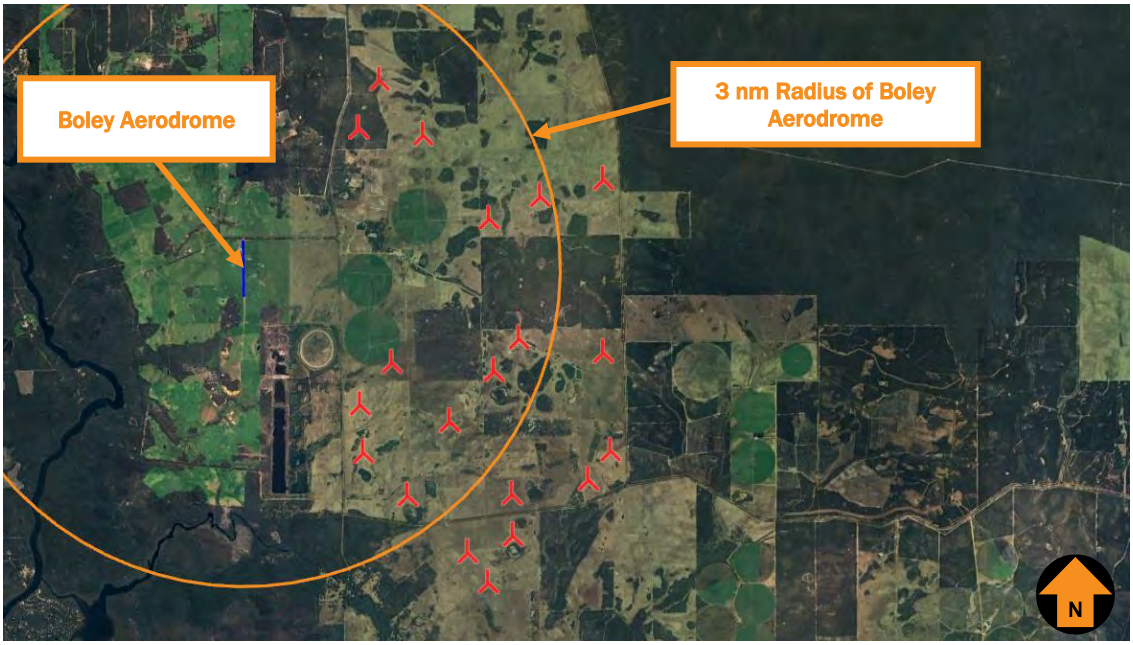

Figure 16 Boley Aerodrome in relation to The Project

WTGs within 3 nm of Boley Aerodrome that would be considered potentially hazardous obstacles, shown in Figure 17 (Source: SynergyRED, Google Earth).

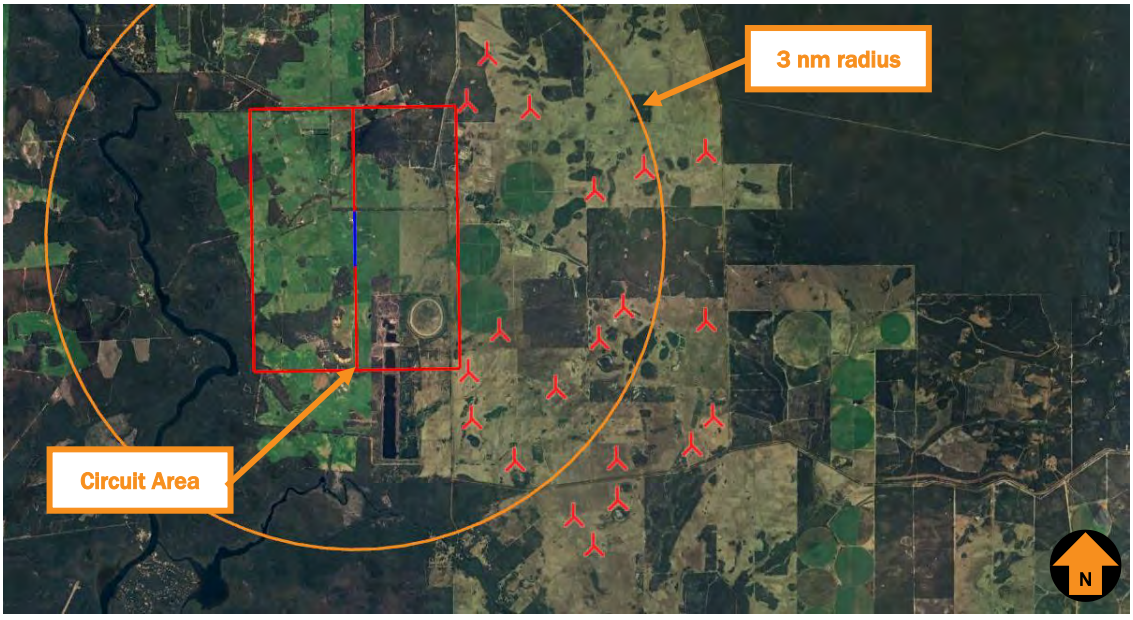

Figure 17 WTGs in relation to circuit operation of Boley Aerodrome

6.6. Potential wake turbulence impacts

National Airports Safeguarding Framework (NASF) Guideline D – *Managing the Risk to Aviation Safety of Wind Turbine Installations (Wind Farms)/Wind Monitoring Towers* provides guidance to State/Territory and local government decision makers, airport operators and developers of wind farms to jointly address the risk to civil aviation arising from the development, presence and use of wind farms and WMTs.

NASF Guideline D provides guidance regarding WTG wake turbulence which states:

> *Wind farm operators should be aware that wind turbines may create turbulence which noticeable up to 16 rotor diameters from the turbine. In the case of one of the larger wind turbines with a diameter of 150 metres, turbulence may be present two kilometres downstream. At this time, the effect of this level of turbulence on aircraft in the vicinity is not known with certainty. However, wind farm operators should be conscious of their duty of care to communicate this risk to aviation operators in the vicinity of the wind farm…*

The key wording in the NASF guidance is "*noticeable*" and that "*the level of turbulence in the vicinity is not known with certainty.*"

There are many situations in aviation where pilots "notice" their aircraft moving away from the desired flight path or altitude and take appropriate action to maintain control of the aircraft with minimal input.

Pilot training standards are regulated by CASA to ensure that all qualified pilots have demonstrated to a suitably qualified and authorised check pilot that they can maintain control of their aircraft along the chosen flight path, across a significant range of atmospheric conditions that cause the aircraft to deviate from the pilot's chosen flight path.

Aircraft are designed to withstand a significant variation in atmospheric disturbances to ensure airframe integrity is maintained. The limits of the airframe's integrity are known by the pilot and considered in every flight activity. Significant weather events such as thunderstorms are avoided because of the likelihood of airframe limits being exceeded by the strong wind shear type conditions within, beneath and surrounding thunderstorm cells.

Wind turbines have been assessed in a limited number of studies, in which the highest classification of hazard is considered to be medium only within approximately 7 rotor diameters (RD) downwind of the wind turbine. There are no assessments that consider that the downwind turbulence is significant and outside the ability of the aircraft to endure the impacts and for the pilot to be able to control the aircraft using normal control inputs.

There also have been no reported aircraft accidents or incidents involving an aircraft encounter with the turbulence downwind of a wind turbine.

Assessment

A 180 m rotor diameter has been used for the wake turbulence analysis. Based on this scenario, NASF Guideline D suggests the effects of wake turbulence could be noticeable from the WTGs within 2880 m of the runway and the nominal circuit area, depending on wind direction.

Based on the results of published scientific studies which indicate that any medium level of turbulence would in most circumstances be confined to within 7 rotor diameters of a wind turbine generator (WTG), Aviation Projects considers that a conservative area of 10 rotor diameters is likely to be the maximum area where wake turbulence from WTGs would be noticed by pilots of light aircraft operating downstream of a WTG.

These studies also indicated that where any such turbulence is experienced, the pilot would be able to control the aircraft using normal control inputs.

Two of those studies are referred to below.

The *European Academy of Wind Energy* published an open access report titled "*Do wind turbines pose roll hazards to light aircraft?*" dated 2 November 2018. This study concluded:

> *In neutral conditions, the largest of these hazards are classified as medium hazards and exist 6.5 D downwind of the turbine in the bottom-left portion of the rotor disk. The highest hazards in the stable case also remained within the medium threshold and are located in two separate regions of the wake: approximately 4 D downwind in the bottom-right quadrant of the rotor and 6 D downwind in the top-left quadrant of the rotor.*

The United Kingdom (UK) Civil Aviation Authority commissioned the University of Liverpool to conduct a *Wind Turbine Wake Encounter Study*, the results of which were published in March 2015.

> *At University of Liverpool, a full CFD method [4] was used with the HMB solver to study wind turbine wakes. The CFD results showed good agreement for the blade surface pressure distributions and flow field velocities with the wind tunnel measurements. The wake was then solved on a very fine mesh able to capture the wake vortices up to 8 radii downstream of the blades on the MEXICO wind turbine rotor.*
>
> *In general, the LIDAR measurements captured the regular wake mean velocity patterns. Statistic LIDAR data indicate that the effects of wind turbine rotor wake, in term of velocity deficit, are limited within a downwind distance of 5D. This is generally in agreement with the results of the full CFD method and the velocity deficit models.*
>
> *For a wind turbine with size similar to the WTN250, and using the Beddoes circulation formula, the off-line simulation results indicate that the wind turbine wake did not pose any hazards to the encountering aircraft 5 diameters further from the wind turbine. The dominant upset that the wake generated is a yawing moment on the aircraft. The wake generated crosswind, is smaller than the maximum crosswind of 17.75 ft/s for an airport (codes A-I or B-I) that is expected to accommodate single engine aircraft. These conclusions are in line with that found in the piloted flight simulation.*

These two studies are the only major studies of their kind.

Wind farm designers and developers recognise the impact of downwind changes in wind strength and direction when designing the overall wind farm to ensure that the turbines are located at minimum distances from each other in order to prevent turbulence from one or more turbines affecting the operational efficiency of a downwind turbine or causing damage to the downwind turbine blades. The minimum distance between turbines typical wind farms is approximately 800 m, a significantly shorter distance than either 16 RD or 10 RD presents.

The turbulence from a wind turbine could be described as a shear type turbulence which is caused by the difference of the free flow wind speed at the edge of the turbine rotor (the blade tip) being disrupted by the turbine blade being rotated by the wind and altering the wind speed within the rotor diameter moving downwind from the turbine. This shear type turbulence descends and weakens as it gets further away from the turbine. It is not a stream of turbulence being generated by the blades being turned by a mechanical force such as occurs with an aircraft propellor or ceiling fan in a house or factory.

The WTG blades change pitch, dependent on the wind strength, to maintain a constant rotor speed. They interfere with the natural wind flow and cause some degree of turbulence downwind of the WTG. A consistent theme among the studies was that the higher turbulence exists very close to the WTG and rapidly dissipates due to the effect of convection, mechanical turbulence from other sources such as the wind flowing over trees, buildings and terrain undulations.

The studies indicate that turbulence is likely to dissipate below a level that could be felt by pilots within 7 rotor diameters (RD) from the WTG. Aviation Projects considers that a more conservative value of 10 RD is best used

to assess areas where the likely turbulence created downwind of a WTG will not be felt by or impact pilots of light aircraft.

The studies referenced above also indicate that aircraft controllability is maintained when experiencing the likely turbulence when the aircraft is approximately 6 RD from a WTG.

Table 5 Wake Turbulence Distances

1 RD (m)	*16 RD (m)*	*10 RD (m)*	*7 RD (m)*
180	2880	1800	1260

In conditions of high wind speed the WTGs are "parked" with the blades in a "feathered" condition to reduce the wind impact upon them. Turbulence from the "feathered" blades still exists but would be less than when the turbine is rotating. Other mechanical turbulence generated by trees, hills and other objects during high winds would significantly exceed and break up any minor turbulence from a stationary WTG.

Aircraft are designed to withstand significant turbulence according to aviation meteorological standards that are recognised and accepted worldwide. Even in recent circumstances with an airliner experiencing severe turbulence which injured passengers, the aircraft was controllable (except for the first part of the event where it descended rapidly) and has not suffered any significant damage (although it will undergo a major inspection). It was an encounter with severe turbulence far greater than normally experienced and is avoided wherever areas of severe turbulence is forecast or known to exist.

The downwind turbulence from WTGs beyond 7RD may be felt by the pilot of a light aircraft but the pilot will only need to make minor control adjustments to maintain control of the aircraft's attitude, altitude and heading. Such turbulence is likely to be classified as Light on an intensity scale published by the Australian Bureau of Meteorology shown in Figure 18.

Within the 7 RD boundary the turbulence is considered to create a medium hazard which is likely to equate to pilots experiencing "Moderate" turbulence in which the *"Pilot remains in control at all times."* (Figure 18)

Intensity	Airspeed Fluctuat-ions (kt/s)	Vertical Gust (ft/s)	G Load	Aircraft Reaction	Reaction Inside Aircraft
Light	5 – 14	5 - 19	0.15 – 0.49	Momentary slight and erratic changes in attitude and/or altitude. Rhythmic bumpiness.	Little effect on loose objects.
Moderate	15 – 24	20 - 35	0.50 – 0.99	Appreciable changes in attitude and/or altitude. Pilot remains in control at all times. Rapid bumps or jolts.	Unsecured objects move. Appreciable strain on seatbelts.
Severe	≥ 25	36 -49	1.0 – 1.99	Large abrupt changes in attitude and/or altitude. Momentary loss of control.	Unsecured objects are tossed about. Occupants violently forced against seatbelts.
Extreme	≥ 25	≥ 50	> 2.0	Very difficult to control aircraft. May cause structural damage.	

Figure 18 Turbulence intensities[1]

[1] Bureau of Meteorology – Hazardous Weather Phenomena – Turbulence

Light and moderate turbulence can be generated by lines of trees near runways.

> *Turbulence may disturb an aircraft's attitude about its major axis, and cause rapid bumps or jolts to be experienced, but in most cases it does not significantly alter the aircraft's flight path.* [2]

Adverse turbulence from any source is most critical during initial climb after take-off until the aircraft is established in a climb and at the appropriate speed, and during final approach where the aircraft is configured for landing and operating at a slow speed prior to landing. The research studies indicate that adverse or severe turbulence is not created by wind turbines outside the 5 RD distance.

6.6.1. Unknown Aerodrome 1

Figure 19 Shows 10 times (1800 m) around the relevant boundary WTGs in relation to the Unknown Aerodrome 1 (sources: Google Earth).

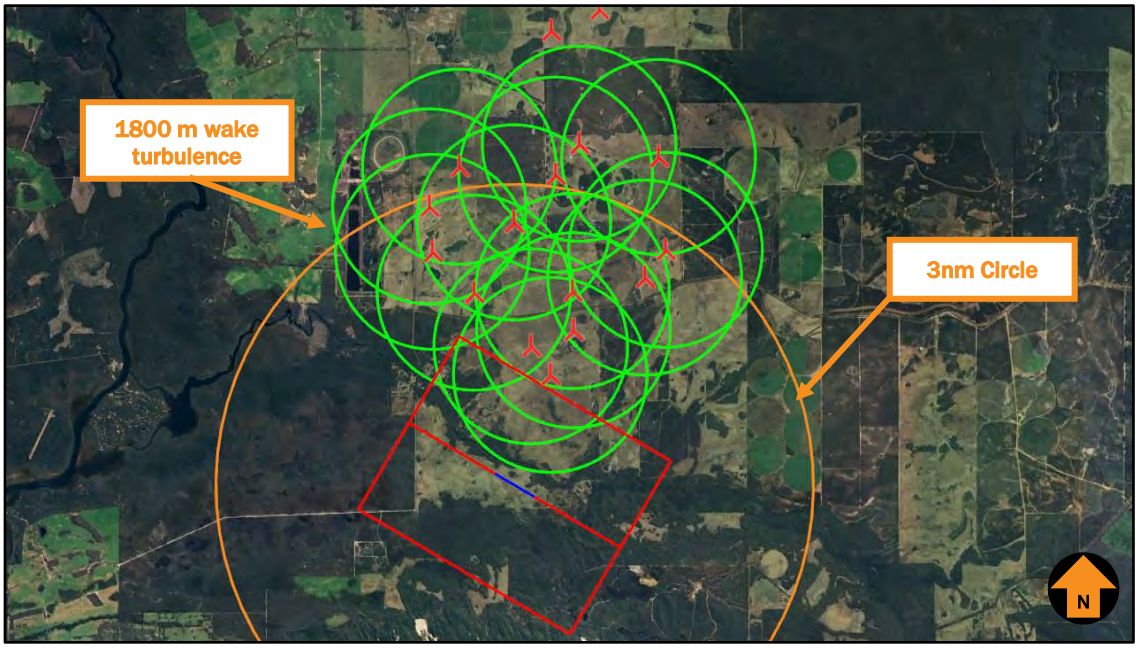

Figure 19 Possible extent of wake turbulence from WTGs to Unknown Aerodrome 2

When the wind blows from the north, downstream wake turbulence from the closer WTGs will extend into the aerodrome's right side of the circuit area.

Further consultation with the owner/operator of this aerodrome would be beneficial to understand the potential extent of these impacts

6.6.2. Boley Aerodrome

Figure 20 Shows 10 times (1800 m) around the relevant boundary WTGs in relation to the Boley Aerodrome (sources: Google Earth).

When the wind blows from the east, downstream wake turbulence from the closer WTGs will extend into the aerodrome's right side of the circuit area.

[2] Bureau of Meteorology – Hazardous Weather Phenomena – Turbulence

Further consultation with the owner/operator of this aerodrome would be beneficial to understand the potential extent of these impacts.

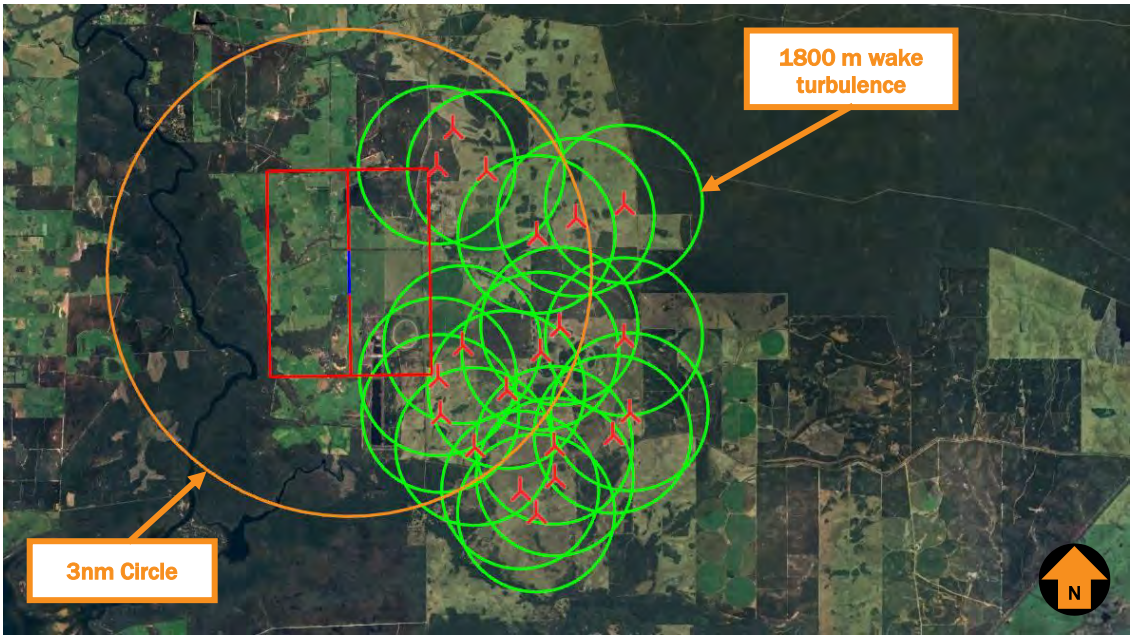

Figure 20 Possible extent of wake turbulence from WTGs to Boley Aerodrome

6.7. Grid and Air routes LSALT

CASR Part 173 MOS requires the published LSALT for a particular airspace grid or air route to provide a minimum of 1000 ft clearance above the controlling (highest) obstacle within the relevant airspace grid or air route tolerances.

6.7.1. Grid LSALT

The project site is located within an airspace grid with LSALT of 2600 ft AMSL, which provides clearance above obstacles with heights up to 1600 ft AMSL.

Figure 21 shows the grid LSALT in proximity to the project site (source: ERC Low National, OzRunways, October 2024, Google Earth).

The highest WTG is 290 m AHD (951.4 ft AMSL), below the 1600 ft obstacle height limit.

Therefore, the WTGs will not impact the 2600 Grid LSALT.

Figure 21 Grid LSALT in proximity to the project site

6.7.2. Air Route LSALTs

A protection area of 7 nm laterally on either side of an air route is used to assess the LSALT for the air route.

There is no air route within 7 nm of the project site. Therefore, the WTGs will not impact any Air Route LSALT.

6.8. Airspace Protection

The project site is located outside of controlled airspace (wholly within Class G airspace) and is not located in any Prohibited, Restricted and Danger areas.

The Project will not have an impact on controlled or designated airspace.

6.9. Aviation facilities

NASF Guideline G, *Protection of Aviation Facilities - Communication, Navigation and Surveillance (CNS)* and CASR Part 139 MOS specify the area where development of buildings and structures has the potential to cause unacceptable interference to CNS facilities.

The project site is located a sufficient distance away from nearby certified airports and aviation facilities and will not have an impact.

6.10. ATC Surveillance Radar installations

Airservices Australia requires an assessment of the potential for the WTGs that may affect radar line of sight. The three closest radar facilities to the project site are:

- Perth Preliminary Surveillance Radar (PSR) and Secondary Surveillance Radar (SSR), which is located approximately 260 km south of the project site.
- Kalamunda Air Route Surveillance Radar (RSR), which is located approximately 256 km south of the project site.

EUROCONTROL guidelines for assessing the potential impact on wind turbines on radar surveillance sensors stipulate the following assessment requirements:

Primary Surveillance Radar (PSR)

- Zone 1 0-500 m: Not permitted
- Zone 2 500 m – 15 km: Detailed assessment
- Zone 3: Further than 15 km but within maximum instrumented range and in radar line of sight: Simple assessment
- Zone 4: Anywhere within maximum instrumented range but not in radar line of sight or outside the maximum instrumented range: No assessment.

Secondary Surveillance Radar (SSR)

- Zone 1: 0 - 500 m: Not permitted
- Zone 2: 500 m - 16 km but within maximum instrumented range and in radar line of sight: Detailed assessment
- Zone 4: Further than 16 km or not in radar line of sight: No assessment

(Zone 3 is not established for secondary surveillance radar)

The project site is outside the line-of-sight range of Perth PSR/SSR and Kalamunda RSR radars and will not impact these facilities.

6.11. Western Australia Department of Biodiversity, Conservation and Attractions - Parks and Wildlife Service

Scott National Park is only 1.2 km from the project's boundary. Some low-level flight operations might occur in Scott National Park, which will require a safe flight corridor without turbines along the park's boundaries.

Figure 22 (Source: Google Earth) shows the park boundary in relation to the Project. The closest WTG is approximately 1.2 km away from the boundary of the Scott National Park. Liaison with Western Australia Department of Biodiversity, Conservation and Attractions - Parks and Wildlife Service will be required regarding the buffer area of the boundary.

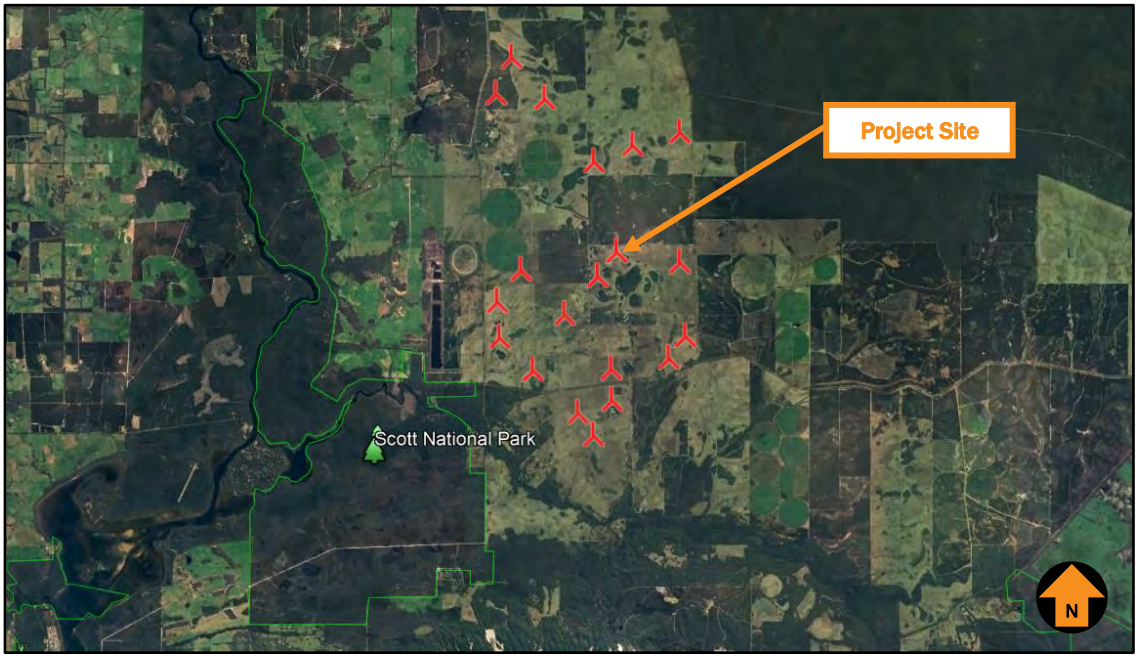

Figure 22 National Park boundary related to WTGs

6.12. AIS Summary

Based on the WTG layout and maximum blade tip height of up to 250 m AGL, the blade tip elevation of the highest WTG, will not exceed 290 m AHD (951.4 ft AMSL) and;

- There is one certified airport located within 30 nm (56 km) from the Project - Busselton Airport (YBLN)
  - The WTGs will not impact on the OLS of YBLN
  - The WTGs will infringe the YBLN PANS-OPS surfaces of the following procedures but will not change flight paths or descent gradients
    - 25 nm MSA surfaces, which need to be increased by 100 ft to 2000 ft or sectorised to exclude the Wind Farm
    - GNSS Arrival Sector A approach surfaces.
      - The initial approach minimum altitude needs to be increased to 2000 ft.
      - The commencement altitude would need to be increased to meet the requirement of increasing the 25 nm MSA to 2000 ft.
- There are two uncertified aerodromes identified within 3 nm of the project site – Unknown Aerodrome 1 and Boley Aerodrome .
  - Unknown Aerodrome 1
    - The proposed wind farm would be considered potentially hazardous obstacles
    - When the wind blows from north, downstream wake turbulence from the closer WTGs will extend into the aerodrome's right side of the circuit area. Further

consultation with the owner/operator of this aerodrome would be beneficial to understand the potential extent of these impacts.

- Boley Aerodrome
  - The proposed wind farm would be considered potentially hazardous obstacles
  - When the wind blows from east, downstream wake turbulence from the closer WTGs will extend into the aerodrome's right side of the circuit area. Further consultation with the owner/operator of this aerodrome would be beneficial to understand the potential extent of these impacts.

- The WTGs will not impact the Grid LSALT and any air route LSALT
- The project area is located within Class G airspace and outside all controlled airspace, Prohibited Restricted and Danger areas.
- The WTGs will not impact the aviation navigation facilities.
- The WTGs will not impact the closest ATC surveillance radar installations.
- The WTGs must be reported to CASA, and construction details must be provided to Airservices.
- The closest WTG is approximately 1.2 km away from the boundary of the Scott National Park. Liaison with Western Australia Department of Biodiversity, Conservation and Attractions - Parks and Wildlife Service will be required regarding the buffer area of the boundary.

6.13. Assessment recommendations

Recommended actions resulting from the conduct of this assessment are provided below.

1. Details of WTGs exceeding 100 m AGL must be reported to CASA *as soon as practicable after forming the intention to construct or erect the proposed object or structure,* in accordance with CASR 139.165(1)(2).
2. 'As constructed' details of WTG coordinates and elevation should be provided to Airservices Australia, by submitting the form at this webpage: https://www.airservicesaustralia.com/wp-content/uploads/ATS-FORM-0085_Vertical_Obstruction_Data_Form.pdf to the following email address: vod@airservicesaustralia.com
3. Any obstacles above 100 m AGL (including temporary construction equipment) should be reported to Airservices Australia NOTAM office until they are incorporated in published operational documents. With respect to crane operations during the construction of the Project, a notification to the NOTAM office may include, for example, the following details:
   a. The planned operational timeframe and maximum height of the crane; and
   b. Either the general area within which the crane will operate and/or the planned route with timelines that crane operations will follow.
4. Details of the wind farm should be provided to local and regional aircraft operators prior to construction in order for them to consider the potential impact of the wind farm on their operations.
5. To facilitate the flight planning of aerial application operators, details of the Project, including the 'as constructed' location and height information of WTGs and overhead transmission lines should be provided to landowners so that, when asked for hazard information on their property, the landowner may provide the aerial application pilot with all relevant information.

6. Consultation with Western Australia Department of Biodiversity, Conservation and Attractions - Parks and Wildlife Service will be required regarding the buffer area of the boundary

Marking of WTGs

7. The rotor blades, nacelle, and supporting mast of the WTGs should be painted white, as is typical of most WTGs operational in Australia. No additional marking measures are required for WTGs.

Lighting of WTGs

8. CASA will determine whether obstacle lighting is recommended for the WTGs. Lighting the WTGs is not a formal requirement.

Micrositing

9. Providing the microsite is within 100 m of the planned WTGs, it is not likely to change the project's maximum overall blade tip height. No further assessment is likely to be required from the microsite, and the conclusions of this AIA would remain the same.

Aerial firefighting

10. The developer or operator should consider the guidance contained in the National Council for Fire and Emergency Services, Wind Farms and Bushfire Operations to ensure:
    a. Liaison with the relevant fire and land management agencies is ongoing and effective
    b. Access is available to the wind farm site by emergency services for on-ground firefighting operations.

Triggers for review

11. Triggers for review of this risk assessment are provided for consideration:
    a. Prior to construction to ensure the regulatory framework has not changed
    b. Following any significant changes to the context in which the assessment was prepared, including the regulatory framework
    c. Following any near miss, incident or accident associated with operations considered in this risk assessment.

7. HAZARD LIGHTING AND MARKING

Based on the risk assessment set out in Section 9 It is concluded that aviation lighting is not likely to be required.

For completeness, relevant lighting standards and guidelines are summarised in **Annexure 3.**

Once the details of the wind farm, along with this report, are provided by the planning authority to CASA, CASA is likely to recommend obstacle lighting be fitted to sufficient obstacles to delineate the outline of the wind farm and the highest WTGs within it.

8. ACCIDENT STATISTICS

This section establishes the external context to ensure that stakeholders and their objectives are considered when developing risk management criteria and that externally generated threats and opportunities are properly considered.

8.1. General aviation operations

The general aviation (GA) activity group is considered by the Australian Transport Safety Bureau (ATSB) to be all flying activities that do not involve commercial air transport (activity group), which includes scheduled (RPT) and non-scheduled (charter) passenger and freight type. It may involve Australian civil (VH–) registered aircraft, or aircraft registered outside of Australia. General aviation/recreational encompasses:

- Aerial work (activity type). Includes activity subtypes: agricultural mustering, agricultural spreading/spraying, other agricultural flying, photography, policing, firefighting, construction – sling loads, other construction, search and rescue, observation and patrol, power/pipeline surveying, other surveying, advertising, and other aerial work.
- Own business travel (activity type).
- Instructional flying (activity type). Includes activity subtypes: solo and dual flying training, and other instructional flying.
- Sport and pleasure flying (activity type). Includes activity subtypes: pleasure and personal transport, glider towing, aerobatics, community service flights, parachute dropping, and other sport and pleasure flying.
- Other general aviation flying (activity type). Includes activity subtypes: test flights, ferry flights and other flying.

8.2. ATSB occurrence taxonomy

The ATSB uses a taxonomy of occurrence sub-type. Of specific relevance to the subject assessment are terms associated with **terrain collision**. Definitions sourced from the ATSB website are provided below:

- **Collision with terrain**: Occurrences involving a collision between an airborne aircraft and the ground or water, where the flight crew were aware of the terrain prior to the collision.
- **Controlled flight into terrain (CFIT):** Occurrences where a serviceable aircraft, under flight crew control, is inadvertently flown into terrain, obstacles, or water without either sufficient or timely awareness by the flight crew to prevent the event.
- **Ground strike:** Occurrences where a part of the aircraft drags on, or strikes, the ground or water while the aircraft is in flight, or during take-off or landing.
- **Wirestrike:** Occurrences where an aircraft strikes a wire, such as a powerline, telephone wire, or guy wire, during normal operations.

8.3. National aviation occurrence statistics 2010-2019

The Australian Transport Safety Bureau (ATSB) published a summary of aviation occurrence statistics for the period 2010-2019 (AR-2020-047, Final - 4 November 2020).

According to the report, there were no fatalities in high or low capacity RPT operations during the period 2010-2019. In 2019, 220 aircraft were involved in accidents in Australia, and a further 154 aircraft involved in serious incidents (an incident with a high probability of becoming an accident). In 2019 there were 35 fatalities from 22 fatal accidents. There have been no fatalities in scheduled commercial air transport in Australia since 2005.

Of the 326 fatalities recorded in the 10-year period, almost two thirds (175 or 53.68%) occurred in the general aviation segment. On average, there were 1.51 fatalities per aircraft associated with a fatality in this segment. The fatalities to aircraft ratio ranges from 1.09 to 177:1. Whilst it can be inferred from the data that the majority of fatal accidents are single person fatalities, it is reasonable to assert that the worst credible effect of an aircraft accident in the general aviation category will be multiple fatalities.

A breakdown of aircraft and fatalities by general aviation sub-categories is provided in Table 6 (source: ATSB).

Table 6 Number of fatalities by General Aviation sub-category – 2010 to 2019

Sub-category	*Aircraft assoc. with fatality*	*Fatalities*	*Fatalities to aircraft ratio*
Aerial work	37	44	1.18:1
Instructional flying	11	19	1.72:1
Own business travel	3	5	1.6:1
Sport and pleasure flying	53	94	1.77:1
Other general aviation flying	11	12	1.09:1
Totals	115	174	1.51:1

Figure 23 refers to Fatal Accident Rate by operation type per million departures over the 6-year period (source: ATSB). Note the rates presented are not the full year range of the study (2010–2019). This was due to the availability of exposure data (departures and hours flown) which was only available between these years. According to the ATSB report, the number of fatal accidents per million departures for GA aircraft over the 6-year reporting period ranged between 6.6 in 2014 and 4.9 in 2019.

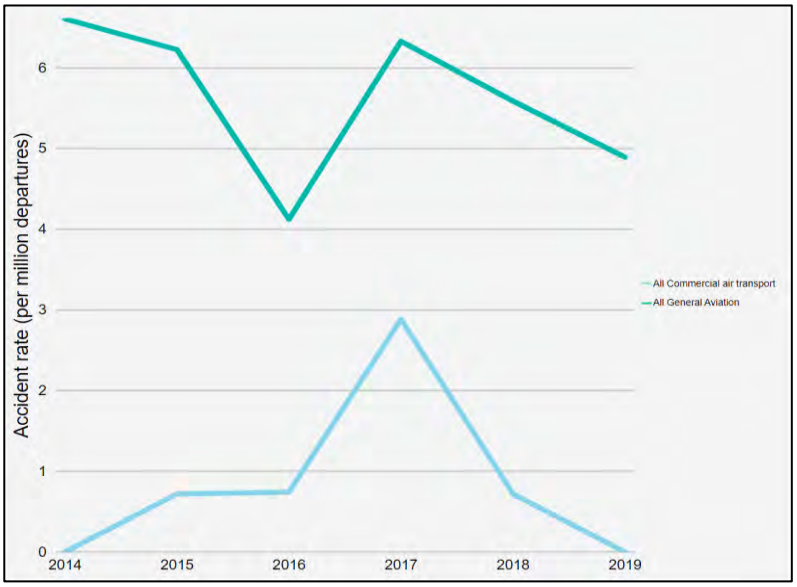

Figure 23 Fatal Accident Rate (per million departures) by Operation Type

In 2018, there were 9 fatal accidents and 9 fatalities involving GA aircraft, resulting in a rate of 5.6 fatal accidents per million departures and 7.7 fatal accidents per million hours flown.

In 2019, there were 1,760,000 landings, and 1,320,000 hours flown by VH-registered general aviation aircraft in Australia, with 8 fatal accidents and 17 fatalities. Based on these results, in 2019 there were 4.9 fatal accidents per million departures and 6.4 fatal accidents per million hours flown. A summary of fatal accidents from 2010-2019 by GA sub-category is provided in Table 7 (source: ATSB).

Table 7 Fatal accidents by GA sub-category – 2010 -2019

Sub-category	*Fatal accidents*	*Fatalities*
Agricultural spreading/spraying	13	13
Agricultural mustering	11	12
Other agricultural	1	1
Survey and photographic	5	10
Search and rescue	2	2
Firefighting	2	2
Other aerial work	3	4
Instructional flying	11	19
Own business travel	3	5
Sport and pleasure flying	53	94
Other general aviation flying	11	12
Total	**115**	**174**

Over the 10-year period, no aircraft collided with a WTG or a WMT in Australia.

Of the 20,529 incidents, serious incidents and accidents in GA operations in the 10-year period, 1,404 (6.83%) were terrain collisions.

The underlying fatality rate for GA operations discussed above is considered tolerable within Australia's regulatory and social context.

8.4. Worldwide accidents involving wind farms

Worldwide since aviation accident statistics have been recorded, there have been a total of 5 aviation accidents involving a wind farm (i.e. where WTGs were erected). To provide some perspective on the likelihood of a VFR aircraft colliding with a WTG, a summary of the 5 accidents and the relevant factors applicable to this assessment is incorporated in this section.

Based on the statistics set out in the Global Wind Energy Council (GWEC) report 2023, approximately 77.6 GW of wind power had been installed worldwide around the world at the end of 2022.

Based on the Australia's Clean Energy Council statistics there were 110 wind farms in Australia at 2023. Aviation Projects has researched public sources of information, accessible via the world wide web, regarding aviation safety occurrences associated with wind farms. Occurrence information published by Australia, Canada, Europe (Belgium, Denmark, France, Germany, Norway, Sweden and The Netherlands), New Zealand, the United Kingdom and the United States of America was reviewed.

The 5 recorded aviation accidents involving a wind farm are summarised as follows:

- One accident occurred in Texas, United States in October 2019 resulting in minor aircraft damage no injury to the pilot and significant injury to a person on the ground. The aircraft, an Air Tractor AT502, was returning from a local aerial application flight and was flown deliberately at low-level in close vicinity to a wind turbine generator (WTG) because the pilot believed his friend was working on the turbine. The aircraft collided with a tagline rope that was attached to a blade of the WTG and which was being held by a person working on the ground. The worker was thrown about 20 ft in the air and experienced significant non-life-threatening injuries. The aircraft sustained minor damage however the pilot landed the aircraft without further incident.
- One accident, which resulted in 2 fatalities, occurred in Palm Springs in 2001. This accident involved a wind farm but was not caused by the wind farm. The cause of the accident was the inflight separation of the majority of the right canard and all of the right elevator resulting from a failure of the builder to balance the elevators per the kit manufacturer's instructions. The accident occurred above a wind farm, and the aircraft struck a WTG on its descent and therefore the cause of the accident was not attributable to the wind farm and not applicable to this AIA.
- Two accidents involving collision with a WTG were during the day, as follows:
    - One accident occurred in Melle, Germany in 2017 as the result of a collision with a WTG mounted on a steel lattice tower at a very low altitude during the day with good visibility and no cloud. The accident resulted in one fatality. If the tower was solid and painted white, as is standard on contemporary wind farms, then it more than likely would have been more visible than if it were to be equipped with an obstacle light which in all likelihood would not have been operating during daylight with good visibility conditions.
    - One accident occurred in Plouguin, France in 2008 when the pilot decided to descend below cloud in an attempt to find the destination aerodrome. The aircraft was flying in conditions of significantly reduced horizontal visibility in fog where the top of the WTGs were obscured by cloud. The WTGs became visible too late for avoidance manoeuvring and the aircraft

made contact with two WTGs. The aircraft was damaged but landed safely. No fatalities were recorded.

- In both of the above cases, it is difficult to conclude that obstacle lighting would have prevented the accidents.

- One fatal accident, near Highmore, South Dakota in 2014 occurred at night in Instrument Meteorological Conditions (IMC).

There is one other accident mentioned in a database compiled by an anti-wind farm lobby group (wind-watch.org), which suggests a Cessna 182 collided with a WTG near Baraboo, Wisconsin, on 29 July 2000. The NTSB database records details of an accident involving a Cessna 182 that occurred on 28 July 2000 in the same area. For this particular accident, NTSB found that the probable cause of the accident was VFR flight into IMC encountered by the pilot and exceeding the design limits of the aircraft. A factor was flight to a destination alternate not performed by the pilot. No mention in the NTSB database is made of WTGs or a wind farm.Based on the statistics set out in the Global Wind Energy Council (GWEC) report 2016, there were 341,320 WTGs operating around the world at the end of 2016. In 2019, approximately 60.4 GW of wind power had been installed worldwide.

A summary of the 4 accidents is provided in Table 8.

Table 8 Summary of accidents involving collision with a WTG

ID	Description	Date	Location	Fatalities	Flight rules	WTG height	Obstacle lighting	Cause of accident	Relevant to obstacle lighting at night
1	Air Tractor AT502 N9143F collided with a tagline rope attached to wind turbine generator blade while being flown deliberately in close proximity to the WTG.	22 October 2019	Dawson County, Texas	0	Day VFR	Not specified	Not specified	The pilot's improper decision to manoeuvre at a low altitude and in close proximity to a wind turbine undergoing maintenance, which resulted in a collision with a tagline rope being held by a worker on the ground and serious injury to the worker.	Not applicable
2	Diamond DA320-A1 D-EJAR Collided with a WTG approximately 20 m above the ground, during the day in good visibility. The mast was grey steel lattice, rather than white, although the blades were painted in white and red bands.	02 Feb 2017	Melle, Germany	1	Day VFR No cloud and good visibility	Not specified	Not specified	Not specified	Not applicable

ID	Description	Date	Location	Fatalities	Flight rules	WTG height	Obstacle lighting	Cause of accident	Relevant to obstacle lighting at night
3	The Piper PA-32R-300, N8700E, was destroyed during an impact with the blades of a WTG, at night in IMC. The wind farm was not marked on either sectional chart covering the accident location; however, the pilot was reportedly aware of the presence of the wind farm.	27 Apr 2014	10 miles south of Highmore, South Dakota	4	Night IMC Low cloud and rain	420 ft AGL overall	Fitted but reportedly not operational on the WTG that was struck	The NTSB determined the probable cause(s) of this accident to be the pilot's decision to continue the flight into known deteriorating weather conditions at a low altitude and his subsequent failure to remain clear of an unlit WTG. Contributing to the accident was the inoperative obstacle light on the WTG, which prevented the pilot from visually identifying the WTG.	An operational obstacle light may have prevented the accident.

ID	Description	Date	Location	Fatalities	Flight rules	WTG height	Obstacle lighting	Cause of accident	Relevant to obstacle lighting at night
4	Beechcraft B55 The pilot was attempting to remain in VMC by descending the aircraft through a break in the clouds. The pilot, distracted by trying to visually locate the aerodrome, flew into an area of known presence of WTGs. After sighting the WTGs he was unable to avoid them. The tip of the left wing struck the first WTG blade, followed by the tip of the right wing striking the blade of a second WTG. The pilot was able to maintain control of the aircraft and landed safely.	04 Apr 2008	Plouguin, France	0	Day VFR The weather in the area of the WTGs had deteriorated to an overcast of stratus cloud, with a base between 100 ft to 350 ft and tops of 500 ft.	328 ft AGL hub height, 393 ft AGL overall	Not specified	This pilot reported having been distracted by a troubling personal matter which he had learned of before departing for the flight. The wind farm was annotated on aeronautical charts.	Not applicable

ID	Description	Date	Location	Fatalities	Flight rules	WTG height	Obstacle lighting	Cause of accident	Relevant to obstacle lighting at night
5	VariEze N25063 The aircraft collided with a WTG following in-flight separation of the majority of the right canard and all of the right elevator.	20 July 2001	Palm Springs, USA	2	Day VFR	N/A	N/A	The failure of the builder to balance the elevators per the kit manufacturer's instructions. The cause of this accident is not attributable to the wind farm.	Not applicable

9. RISK ASSESSMENT

A risk management framework comprises likelihood and consequence descriptors, a matrix used to derive a level of risk, and actions required of management according to the level of risk.

The risk assessment framework used by Aviation Projects and risk event description is provided in **Annexure 4.**

9.1. Risk Identification

The primary risk being assessed is that of aviation safety associated with the height and location of WTGs and WMTs proposed by the Project.

Based on an extensive review of accident statistics data (see summary in Section 8 above) and stakeholders who were consulted during the preparation of this AIA (see Section 5), 5 identified risk events associated with WTGs and WMTs relate to aviation safety or potential visual impact, and are listed as follows:

1. Potential for an aircraft to collide with a WTG, controlled flight into terrain (CFIT) (related to aviation safety).
2. Potential for a pilot to initiate manoeuvring in order to avoid colliding with a WTG or WMT resulting in collision with terrain (related to aviation safety).
3. Potential for the hazards associated with the Project to invoke operational limitations or procedures on operating crew (related to aviation safety).
4. Potential effect of obstacle lighting on neighbours (related to potential visual impact).

It should be noted that according to guidance provided by the Commonwealth Department of Infrastructure Transport, Regional Development, Communications and the Arts (Airspace and Air Traffic Management Risk Management Policy Statement). and in line with generally accepted practice, the risk to be assessed should primarily be associated with passenger transport services. Therefore, the risk being assessed herein is primarily associated with smaller aircraft likely to be flying under the VFR, and so the maximum number of passengers exposed to the nominated consequences is likely to be limited.

The five risk events identified here are assessed in detail in the following section.

9.2. Risk Analysis, Evaluation and Treatment

For the purpose of considering applicable consequences, the concept of worst credible effect has been used. Untreated risk is first evaluated, then, if the resulting level of risk is unacceptable, further treatments are identified to reduce the residual level of risk to an acceptable level.

A summary of the level of risk associated with the Project, under the proposed treatment regime, with specific consideration of the effect of obstacle lighting, is provided in Table 9 through to Table 12.

Table 9 Aircraft collision with wind turbine generator (WTG)

Risk ID:	1. Aircraft collision with wind turbine generator (WTG) (CFIT)
Discussion An aircraft collision with a WTG would result in harm to people and damage to property. Property could include the aircraft itself, as well as the WTG. There have been 5 reported occurrences worldwide of aircraft collisions with a component of a WTG structure since the year 2000 as discussed in Section 8. These reports show a range of situations where pilots were conducting various flying operations at low level and in the vicinity of wind farms in both IMC and VMC. No reports of aircraft collisions with wind farms in Australia have been found. In consideration of the circumstances that would lead to a collision with a WTG: • GA VFR aircraft operators generally don't individually fly a significant number of hours in total, let alone in the area in question • There is a very small chance that a pilot, suffering the stress of weather, will continue into poor weather conditions (contrary to the rules of flight) rather than divert away from it, is not aware of the wind farm, will not consider it or will not be able to accurately navigate around it. • If the aircraft was flown through the wind farm, there is still a very small chance that it would hit a WTG. Refer to the discussion of worldwide accidents in Section 8. There are no known aerial application operations conducted at night in the vicinity of the Project site. If a proposed object or structure is identified as likely to be an obstacle, details of the relevant proposal must be referred to CASA for CASA to determine, in writing: (a) whether the object or structure will be a hazard to aircraft operations (b) whether it requires an obstacle light that is essential for the safety of aircraft operations The Project site is clear of the obstacle limitation surfaces (OLS) of any aerodrome.	
Consequence If an aircraft collided with a WTG, the worst credible effect would be multiple fatalities and damage beyond repair. This would be a Catastrophic consequence.	
Consequence	Catastrophic
Untreated Likelihood There have been 5 reports of aircraft collisions with WTGs worldwide, which have resulted in a range of consequences, where aircraft occupants sustained minor injury in some cases and fatal injuries in others (see Section 8). Similarly, aircraft damage sustained ranged from minor to catastrophic. One of these accidents resulted from structural failure of the aircraft before the collision with the WTG. Only two relevant accidents occurred during the day, and only one resulted in a single fatality. It is assessed that collision with a WTG resulting in multiple fatalities and damage beyond repair is unlikely to occur, but possible (has occurred rarely), which is classified as Possible.	
Untreated Likelihood	Possible

- ***Current Treatments (without lighting)***
- The Project site is clear of the obstacle limitation surfaces (OLS) of any certified aerodrome.
- Aircraft are restricted to a minimum height of 500 ft (152.4 m) AGL above the highest point of the terrain and any object on it within a radius of 300 m in visual flight during the day when not in the vicinity of built-up areas. The proposed WTGs will be a maximum height of 250 m (820.2 ft) AGL at the top of the blade tip. The rotor blade at its maximum height will be approximately 97.6 m (320.2 ft) above aircraft flying at the minimum altitude of 152.4 m AGL (500 ft).
- In the event that descending cloud forces an aircraft lower than 500 ft (152.4 m) AGL, the minimum visibility of 5,000 m required for visual flight during the day should provide adequate time for pilots to observe and manoeuvre their aircraft clear of WTGs.
- Aircraft are restricted to a minimum height of 304.8 m (1,000 ft) above obstacles (including terrain) which are within 10 nm of the aircraft in visual flight at night and potentially even higher during instrument flight (day or night).
- Aircraft authorised to intentionally fly below 152.4 m (500 ft) AGL (day) or below safety height (night) are operated in accordance with procedures developed as an outcome of thorough risk management activities undertaken specifically for and prior to undertaking such authorised flights. Any obstacle including WTGs in the path of the authorised flight would be specifically risk assessed during that process.
- The WTGs are typically coloured white so they should be visible to pilots during the day.
- The 'as constructed' details of WTGs are required to be notified to Airservices Australia so that the location and height of all WTGs can be noted on aeronautical maps and charts.
- Because the Project WTGs are proposed to be above 100 m AGL, there is a statutory requirement to report the WTGs to CASA and notified to Airservices Australia prior to construction.

Level of Risk

The level of risk associated with a Possible likelihood of a Catastrophic consequence is 8 (Unacceptable).

Current Level of Risk	8 - Unacceptable

Risk Decision

A risk level of 8 is classified as Unacceptable: Immediate action required by either treating or avoiding risk. Refer to executive management.

Risk Decision	Unacceptable

Recommended Treatments

The following treatments which can be implemented at little cost will provide an acceptable level of safety:

- Details of the Project should be communicated to local and regional aircraft operators prior to construction to heighten their awareness of its location and so that they can plan their operations accordingly. Specifically:

a. Engage with local aerial agricultural and aerial firefighting operators to develop procedures, which may include, for example, stopping the rotation of the WTG blades prior to the commencement of the subject aircraft operations within the Project site. b. Arrangements should be made to publish details of the Project in ERSA for surrounding aerodromes, which would involve notification to Airservices Australia.	
Residual Risk With the implementation of the Recommended Treatments listed above, the likelihood of an aircraft collision with a WTG resulting in multiple fatalities and damage beyond repair will be **Unlikely**, and the consequence remains **Catastrophic**, resulting in an overall risk level of **7 - Tolerable**. It is considered that the significant cost of obstacle lighting (which is not a preventative control), may only slightly reduce the likelihood of a collision given that the pilot is already in a highly undesirable situation (and not in all situations – such as where the obstacle light may be obscured by cloud) and hence is not justified. In the circumstances, the level of risk under the proposed treatment plan is considered **as low as reasonably practicable (ALARP)**. **It is our assessment that there will be an acceptable level of aviation safety risk associated with the potential for an aircraft collision with a wind turbine, without obstacle lighting on the turbines of the Project.**	
Residual Risk	7 - Tolerable

Table 10 Harsh manoeuvring leading to controlled flight into terrain

Risk ID:	2. Harsh manoeuvring leads to controlled flight into terrain (CFIT)

Discussion

An aircraft colliding with terrain as a result of manoeuvring to avoid colliding with a WTG would result in harm to people and damage to property.

There are a few ground collision accidents resulting from manoeuvring to avoid wind farms, but none in Australia, and all were during the day.

The Project is clear of the OLS of any aerodrome.

Aircraft are restricted to a minimum height of 152.4 m (500 ft) above the highest point of the terrain and any object on it within a radius of 300 m in visual flight during the day when not in the vicinity of built up areas.

The proposed WTGs will be a maximum of 250 m (820.2 ft) AGL at the top of the blade tip. The rotor blade at its maximum height will be approximately 97.6 m (320.2 ft) above aircraft flying at the minimum altitude of 152.4 m (500 ft) AGL.

Nevertheless, the minimum visibility of 5000 m required for visual flight during the day should provide adequate time for pilots to observe and manoeuvre their aircraft clear of WTGs.

If cloud descends below the WTG hub, obstacle lighting would be obscured and therefore ineffective.

Aircraft are restricted to a minimum height of 304.8 m (1000 ft) above obstacles within 10 nm of the aircraft in visual flight at night and potentially even higher during instrument flight (day or night).

Aircraft authorised to intentionally fly below 152.4 m (500 ft) AGL (day) or below safety height (night) are operated in accordance with procedures developed as an outcome of thorough risk management activities.

Assumed risk treatments

- The WTGs are typically coloured white so they should be visible during the day.
- The 'as constructed' details of WTGs are required to be notified to Airservices Australia so that the location and height of WTGs can be noted on aeronautical maps and charts.
- Since the WTGs will be higher than 100 m AGL, there is a statutory requirement to report the WTG to CASA.

Consequence

If an aircraft collided with terrain, the worst credible effect would be multiple fatalities and damage beyond repair. This would be a Catastrophic consequence.

Consequence	Catastrophic

Untreated Likelihood

There are a few ground collision accidents resulting from manoeuvring to avoid WTGs, but none in Australia, and all were during the day (see Section 8). It is assessed that a ground collision accident following manoeuvring to avoid a WTG is unlikely to occur, but possible (has occurred rarely), which is classified as Possible.

Untreated Likelihood	Possible

Current Treatments (without lighting)

- The Project is clear of the OLS of any aerodrome.

- Aircraft are restricted to a minimum height of 152.4 m (500 ft) above the highest point of the terrain and any object on it within a radius of 300 m in visual flight during the day when not in the vicinity of built-up areas.
- WTGs will be a maximum of 250 m (820.2 ft) AGL at the top of the blade tip. The rotor blade at its maximum height will be approximately 97.6 m (320.2 ft) above aircraft flying at the minimum altitude of 152.4 m AGL (500 ft).
- Nevertheless, the minimum visibility of 5000 m required for visual flight during the day should provide adequate time for pilots to observe and manoeuvre their aircraft clear of WTGs.
- The WTGs and masts will be shown on aeronautical charts at the next publication cycle date available and NOTAMS prior to the publication date. This allows pilots to be aware of the existence of the wind farm at the pre-flight planning stage and during flight with reference to the aeronautical chart.
- If cloud descends below the WTG hub, obstacle lighting would be obscured and therefore ineffective.
- Aircraft are restricted to a minimum height of 304.8 m (1000 ft) above obstacles within 10 nm of the aircraft in visual flight at night and potentially even higher during instrument flight (day or night).
- Aircraft authorised to intentionally fly below 152.4 m AGL (500 ft) (day) or below safety height (night) are operated in accordance with procedures developed as an outcome of thorough risk management activities.
- The WTGs are typically coloured white, typical of most WTGs operational in Australia, so they should be visible during the day.
- The 'as constructed' details of WTGs are required to be notified to Airservices Australia so that the location and height of wind farms can be noted on aeronautical maps and charts.
- Since the WTGs will be higher than 100 m AGL, there is a statutory requirement to report the WTGs to CASA.

Level of Risk

The level of risk associated with a Possible likelihood of a Catastrophic consequence is 8.

Current Level of Risk	8 – Unacceptable

Risk Decision

A risk level of 8 is classified as Unacceptable: Immediate action required by either treating or avoiding risk. Refer to executive management.

Risk Decision	Unacceptable

Recommended Treatments

The following treatments which can be implemented at little cost will provide an acceptable level of safety:

- Ensure details of the Project WTGs have been communicated to Airservices Australia, and local and regional aerodrome and aircraft operators prior to construction.

• Although there is no requirement to do so, the Proponent may consider engaging with local aerial agricultural and aerial firefighting operators to develop procedures for their safe operation within the Project site.	
With the additional recommended treatments, the likelihood of ground collision resulting from manoeuvring to avoid a wind turbine resulting in multiple fatalities and damage beyond repair will be **Unlikely**, and the consequence remains **Catastrophic**, resulting in an overall risk level of **7 – Tolerable**. It is considered that the significant cost of obstacle lighting (which is not a preventative control), may only slightly reduce the likelihood of a collision given that the pilot is already in a highly undesirable situation (and not in all situations – such as where the obstacle light may be obscured by cloud) and hence is not justified. In the circumstances, the level of risk under the proposed treatment plan is considered **ALARP**. **It is our assessment that there is an acceptable level of aviation safety risk associated with the potential for ground collision resulting from manoeuvring to avoid a wind turbine, without obstacle lighting on the turbines of the Project.**	
Residual Risk	7 – Tolerable

Table 11 Effect of the Project on operating crew

Risk ID:	**3. Effect of the Project on operating crew**
Discussion Introduction or imposition of additional operating procedures or limitations can affect an aircraft's operating crew. There are no known aerial application operations conducted at night in the vicinity of the Project site.	
Consequence The worst credible effect a wind farm could have on flight crew would be the imposition of operational limitations, and in some cases, the potential for use of emergency procedures. This would be a Minor consequence.	
Consequence	Minor
Untreated Likelihood The imposition of operational limitations is unlikely to occur, but possible (has occurred rarely), which is classified as Possible.	
Untreated Likelihood	Possible
Current Treatments • The Project is clear of the OLS of any aerodrome. • Aircraft are restricted to a minimum height of 152.4 m (500 ft) above the highest point of the terrain and any object on it within a radius of 300 m in visual flight during the day when not in the vicinity of built-up areas. • The WTGs and masts will be shown on aeronautical charts at the next publication cycle date available and NOTAMS prior to the publication date. This allows pilots to be aware of the existence of the wind farm at the pre-flight planning stage and during flight with reference to the aeronautical chart. • WTGs will be a maximum of 250 m (820.2 ft) AGL at the top of the blade tip. The rotor blade at its maximum height will be approximately 97.6 m (320.2 ft) above aircraft flying at the minimum altitude of 152.4 m AGL (500 ft). • In the event that descending cloud forces an aircraft lower than 500 ft (152.4 m) AGL, the minimum visibility of 5000 m required for visual flight during the day should provide adequate time for pilots to observe and manoeuvre their aircraft clear of WTGs. • Nevertheless, the minimum visibility of 5000 m required for visual flight during the day should provide adequate time for pilots to observe and manoeuvre their aircraft clear of WTGs. • If cloud descends below the WTG hub, obstacle lighting would be obscured and therefore ineffective. • Aircraft are restricted to a minimum height of 304.8 m (1000 ft) above obstacles within 10 nm of the aircraft in visual flight at night and potentially even higher during instrument flight (day or night).	

- Aircraft authorised to intentionally fly below 152.4 m AGL (500 ft) (day) or below safety height (night) are operated in accordance with procedures developed as an outcome of thorough risk management activities.
- The WTGs are typically coloured white so they should be visible during the day.
- The 'as constructed' details of WTGs are required to be notified to Airservices Australia so that the location and height of wind farms can be noted on aeronautical maps and charts.
- Since the WTGs will be higher than 100 m AGL, there is a statutory requirement to report the WTGs to CASA.

Level of Risk

The level of risk associated with a Possible likelihood of a Moderate consequence is 5.

Current Level of Risk	5 - Tolerable

Risk Decision

A risk level of 6 is classified as Tolerable: Treatment action possibly required to achieve ALARP - conduct cost/benefit analysis. Relevant manager to consider for appropriate action.

Risk Decision	Accept, conduct cost benefit analysis

Recommended Treatments

WMTs installed prior to WTG installation and those that are not in relatively close proximity to a WTG should be lit to ensure they are visible in low light and deteriorating atmospheric conditions

The following additional treatments will provide an additional margin of safety:

- Ensure details of the Project WTGs and WMTs have been communicated to Airservices Australia, and local and regional aerodrome and aircraft operators prior to construction.
- Although there is no requirement to do so, the Proponent may consider engaging with local aerial agricultural and aerial firefighting operators to develop procedures for such aircraft operations in the vicinity of the Project site.

Residual Risk

Notwithstanding the current level of risk is considered **Tolerable,** the additional Recommended Treatments listed above will enhance aviation safety. The likelihood remains **Possible**, and consequence remains **Minor**. In the circumstances, the risk level of 5 is considered **Tolerable.**

It is our assessment that there is an acceptable level of aviation safety risk associated with the potential for operational limitations to affect aircraft operating crew, without obstacle lighting on the Project WTGs and Permanent WMTs in close proximity to a WTG, and with obstacle lighting for temporary WMTs installed prior to WTG installation and WMTs that are not in close proximity to a WTG.

Residual Risk	5 – Tolerable

Table 12 Effect of obstacle lighting on neighbours

Risk ID:	***4.*** **Effect of obstacle lighting on neighbours**

Discussion

This scenario discusses the consequential impact of a decision to install obstacle lighting on the wind farm.

Installation and operation of obstacle lighting on WTGs or WMT can have an effect on neighbours' visual amenity and enjoyment, specifically at night and in good visibility conditions.

If a proposed object or structure is identified as likely to be an obstacle, details of the relevant proposal must be referred to CASA for CASA to determine, in writing:

(a) whether the object or structure will be a hazard to aircraft operations

(b) whether it requires an obstacle light that is essential for the safety of aircraft operations.

In general, objects outside an OLS and above 100 m would require obstacle lighting unless CASA, in an aeronautical study, assesses it is shielded by another lit object or it is of no operational significance.

Consequence

The worst credible effect of obstacle lighting specifically at night in good visibility conditions would be:

- Moderate site impact, minimal local impact, important consideration at local or regional level, possible long-term cumulative effect. Not likely to be decision making issues. Design and mitigation measures may ameliorate some consequences.

This would be a Moderate consequence.

Consequence	Moderate

Untreated Likelihood

The likelihood of moderate site impact, minimal local impact is Almost certain - the event is likely to occur many times (has occurred frequently).

Untreated Likelihood	Almost certain

Current Treatments

If the WTGs or WMTs will be higher than 150 m (492 ft) AGL, they must be regarded as obstacles unless CASA assess otherwise. In general, objects outside an OLS and above 100 m would require obstacle lighting unless CASA, in an aeronautical study, assesses it is shielded by another lit object or it is of no operational significance.

Level of Risk

The level of risk associated with an Almost certain likelihood of a Moderate consequence is 8.

Current Level of Risk	8 - Unacceptable

Risk Decision

A risk level of 8 is classified as Unacceptable: Immediate action required by either treating or avoiding risk. Refer to executive management.

Risk Decision	Unacceptable

Recommended Treatments

Not installing obstacle lighting would completely remove the source of the impact.

As per the above safety risk assessment, the provision of lighting for the WTGs and permanent WMTs is not necessary to provide an acceptable level of safety. For temporary WMTs installed prior to WTG installation and WMTs that are not in close proximity to a WTG, obstacle lighting is recommended to ensure visibility in low light and deteriorating atmospheric conditions.

If CASA or a planning authority decide that obstacle lighting is required there are impact reduction measures that can be implemented to reduce the impact of lighting on surrounding neighbours, including:

- reducing the number of WTGs with obstacle lights
- specifying an obstacle light that minimises light intensity at ground level
- specifying an obstacle light that matches light intensity to meteorological visibility
- mitigating light glare from obstacle lighting through measures such as baffling.

These measures are designed to optimise the benefit of the obstacle lights to pilots while minimising the visual impact to residents within and around the Project site.

Consideration may be given to activating the obstacle lighting via a pilot activated lighting system.

An option is to consider using Aircraft Detection Lighting Systems (referred in the United States Federal Aviation Administration Advisory Circular AC70/7460-1L CHG1 – *Obstruction Marking and Lighting*). Such a system would only activate the lights when an aircraft is detected in the near vicinity and deactivate the lighting once the aircraft has passed. This technology reduces the impact of night lighting on nearby communities and migratory birds and extends the life expectancy of obstruction lights.

Residual Risk

Not installing obstacle lights would clearly be an acceptable outcome to those potentially affected by visual impact.

If lighting is required, consideration of visual impact in the lighting design should enable installation of lighting that reduces the impact to neighbours.

The likelihood of a **Moderate** consequence remains **Likely**, with a resulting risk level of **7 – Tolerable**.

It is our assessment that visual impact from obstacle lights can be negated if they are not installed. If obstacle lights are to be installed, they can be designed so that there is an acceptable risk of visual impact to neighbours.

Residual Risk	**7 - Tolerable**

10. CONCLUSIONS

The key conclusions of this AIA are summarised as follows:

10.1. Planning considerations

The Project, as proposed, satisfies the planning provisions of Shire of Augusta Margaret River's Planning Scheme 2024, *Shire of Augusta-Margaret River's* Local Planning Strategy, City of Busselton's Local Planning Strategy 2014 and will not create incompatible intrusions or compromise the safety of existing airports and associated navigation and communication facilities.

10.2. Aviation Impact Statement

Based on the WTG layout and maximum blade tip height of 250 m AGL, the blade tip elevation of the highest WTG will not exceed 290 m AHD (951.4 ft AMSL) and:

- There is one certified airport located within 30 nm (56 km) from the Project - Busselton Airport (YBLN)
    - The WTGs will not impact on the OLS of YBLN
    - The WTGs will infringe the YBLN PANS-OPS surfaces of the following procedures but will not change flight paths or descent gradients
        - 25 nm MSA surfaces, which need to be increased by 100 ft to 2000 ft or sectorised to exclude the Wind Farm
        - GNSS Arrival Sector A approach surfaces.
            - The initial approach minimum altitude needs to be increased to 2000 ft.
            - The commencement altitude would need to be increased to meet the requirement of increasing the 25 nm MSA to 2000 ft.
- There are two uncertified aerodromes identified within 3 nm of the project site – Unknown Aerodrome 1 and Boley Aerodrome .
    - Unknown Aerodrome 1
        - The proposed wind farm would be considered potentially hazardous obstacles
        - When the wind blows from north, downstream wake turbulence from the closer WTGs will extend into the aerodrome's right side of the circuit area. Further consultation with the owner/operator of this aerodrome would be beneficial to understand the potential extent of these impacts.
    - Boley Aerodrome
        - The proposed wind farm would be considered potentially hazardous obstacles
        - When the wind blows from east, downstream wake turbulence from the closer WTGs will extend into the aerodrome's right side of the circuit area. Further consultation with the owner/operator of this aerodrome would be beneficial to understand the potential extent of these impacts.
- The WTGs will not impact the Grid LSALT and any air route LSALT

- The project area is located within Class G airspace and outside all controlled airspace, Prohibited Restricted and Danger areas..
- The WTGs will not impact the aviation navigation facilities.
- The WTGs will not impact the closest ATC surveillance radar installations.
- The WTGs must be reported to CASA, and construction details must be provided to Airservices.
- The closest WTG is approximately 1.2 km away from the boundary of the Scott National Park. Liaison with Western Australia Department of Biodiversity, Conservation and Attractions - Parks and Wildlife Service will be required regarding the buffer area of the boundary.

10.3. Aircraft operator characteristics

Aircraft will be required to navigate around the project site in low cloud conditions where aircraft need to fly at 500 ft AGL.

Aircraft flying at night in visual conditions are permitted to descend or climb to or from an appropriate minimum altitude only when within 3 nm of the aerodrome.

WTGs are generally not a safety concern to aerial agricultural operators.

The closest WTG is approximately 1.2 km away from the boundary of the Scott National Park. Liaison with Western Australia Department of Biodiversity, Conservation and Attractions - Parks and Wildlife Service will be required regarding the buffer area of the boundary.

10.4. Hazard marking and lighting

The following conclusions apply to hazard marking and lighting:

- With respect to CASR Part 139 Division 139.E., the proposed WTGs must be reported to CASA.
- CASA will review the proposed WTG development and make a recommendation for obstacle lighting if required.
- With respect to marking of WTGs, a white colour will provide sufficient contrast with the surrounding environment to maintain an acceptable level of safety while lowering visual impact to the neighbouring residents.

10.5. Summary of risks

A summary of the level of residual risk associated with the Project with the Recommended Treatments implemented is provided in Table 13.

Table 13 Summary of Residual Risks

Identified Risk	*Consequence*	*Likelihood*	*Risk*	*Actions Required*
Aircraft collision with wind turbine generator (WTG)	Catastrophic	Unlikely	7	**Acceptable without obstacle lighting (ALARP).** Communicate details of the Project WTGs to local and regional operators and make arrangements to publish details in ERSA for surrounding

Identified Risk	*Consequence*	*Likelihood*	*Risk*	*Actions Required*
				aerodromes before, during and following construction.
Avoidance manoeuvring leads to ground collision	Catastrophic	Unlikely	7	**Acceptable without obstacle lighting (ALARP).** Communicate details of the Project WTGs and WMTs to local and regional operators and make arrangements to publish details in ERSA for surrounding aerodromes before, during and following construction.
Effect on crew	Minor	Possible	5	**Acceptable without obstacle lighting (ALARP)** Communicate details of the Project WTGs and WMTs to local and regional operators and make arrangements to publish details in ERSA for surrounding aerodromes before, during and following construction.
Visual impact from obstacle lights	Moderate	Likely	7	**Acceptable without obstacle lighting** (zero risk of visual impact from obstacle lighting). If lights are installed, design to minimise impact.

11. RECOMMENDATIONS

Recommended actions resulting from the conduct of this assessment are provided below.

Notification and reporting

1. Details of WTGs exceeding 100 m AGL must be reported to CASA *as soon as practicable after forming the intention to construct or erect the proposed object or structure,* in accordance with CASR Part 139.165(1)(2).
2. 'As constructed' details of WTG coordinates and elevation should be provided to Airservices Australia, by submitting the form at this webpage: https://www.airservicesaustralia.com/wp-content/uploads/ATS-FORM-0085_Vertical_Obstruction_Data_Form.pdf to the following email address: vod@airservicesaustralia.com
3. Any obstacles above 100 m AGL (including temporary construction equipment) should be reported to Airservices Australia NOTAM office until they are incorporated in published operational documents. With respect to crane operations during the construction of the Project, a notification to the NOTAM office may include, for example, the following details:
    a. The planned operational timeframe and maximum height of the crane; and
    b. Either the general area within which the crane will operate and/or the planned route with timelines that crane operations will follow.
4. Details of the wind farm should be provided to local and regional aircraft operators prior to construction in order for them to consider the potential impact of the wind farm on their operations.
5. To facilitate the flight planning of aerial application operators, details of the Project, including the 'as constructed' location and height information of WTGs and overhead transmission lines should be provided to landowners so that, when asked for hazard information on their property, the landowner may provide the aerial application pilot with all relevant information.
6. The closest WTG is approximately 1.2 km away from the boundary of the Scott National Park. Liaison with Western Australia Department of Biodiversity, Conservation and Attractions - Parks and Wildlife Service will be required regarding the buffer area of the boundary.

Marking of WTGs

7. The rotor blades, nacelle and the supporting mast of the WTGs should be painted white, typical of most WTGs operational in Australia. No additional marking measures are required for WTGs.

Lighting of WTGs

8. CASA will determine whether obstacle lighting is recommended for the WTGs. It is not a formal requirement to light the WTGs.

Micrositing

9. Providing the micrositing is within 100 m of the planned WTGs it is not likely to result in a change in the maximum overall blade tip height of the Project. No further assessment is likely to be required from micrositing and the conclusions of this AIA would remain the same.

Aerial firefighting

10. The developer or operator should consider the guidance contained in the National Council for Fire and Emergency Services, Wind Farms and Bushfire Operations to ensure:

a. Liaison with the relevant fire and land management agencies is ongoing and effective

b. Access is available to the wind farm site by emergency services for on-ground firefighting operations

Triggers for review

11. Triggers for review of this risk assessment are provided for consideration:

    a. Prior to construction to ensure the regulatory framework has not changed

    b. Following any significant changes to the context in which the assessment was prepared

    c. Following any near miss, incident or accident associated with operations considered in this risk assessment.

ANNEXURE 2 – DEFINITIONS

Term	*Definition*
Aerial Agricultural Operator	Specialist pilot and/or company who are required to have a commercial pilot's licence, an agricultural rating and a chemical distributor's licence
Aerodrome	A defined area on land or water (including any buildings, installations, and equipment) intended to be used either wholly or in part for the arrival, departure, and surface movement of aircraft.
Aerodrome facilities	Physical things at an aerodrome which could include: a. the physical characteristics of any movement area including runways, taxiways, taxilanes, shoulders, aprons, primary and secondary parking positions, runway strips and taxiway strips; b. infrastructure, structures, equipment, earthing points, cables, lighting, signage, markings, visual approach slope indicators.
Aerodrome reference point (ARP)	The designated geographical location of an aerodrome.
Aeronautical Information Publication (AIP)	Details of regulations, procedures, and other information pertinent to the operation of aircraft
Aeronautical Information Publication En-route Supplement Australia (AIP ERSA)	Contains information vital for planning a flight and for the pilot in flight as well as pictorial presentations of all licensed aerodromes
Civil Aviation Safety Regulations 1998 (CASR)	Contain the mandatory requirements in relation to airworthiness, operational, licensing, enforcement.
Instrument meteorological conditions (IMC)	Meteorological conditions expressed in terms of visibility, distance from cloud, and ceiling, less than the minimum specified for visual meteorological conditions.
Manual of Standards (MOS)	The means CASA uses in meeting its responsibilities under the Act for promulgating aviation safety standards
National Airports Safeguarding Framework (NASF)	The Framework has the objective of developing a consistent and effective national framework to safeguard both airports and communities from inappropriate on and off airport developments.
Obstacles	All fixed (whether temporary or permanent) and mobile objects, or parts thereof, that are located on an area intended for the surface movement of aircraft or that extend above a defined surface intended to protect aircraft in flight.

Term	*Definition*
Runway	A defined rectangular area on a land aerodrome prepared for the landing and take-off of aircraft.
Runway strip	A defined area including the runway and stopway, if provided, intended: a. to reduce the risk of damage to aircraft running off a runway; and b. to protect aircraft flying over it during take-off or landing operations.
Safety Management System	A systematic approach to managing safety, including organisational structures, accountabilities, policies and procedures.

ANNEXURE 3 – CASA REGULATORY REQUIREMENTS – LIGHTING AND MARKING

In considering the need for aviation hazard lighting and marking, the applicable regulatory context was determined.

The Civil Aviation Safety Authority (CASA) regulates aviation activities in Australia. Applicable requirements include the Civil Aviation Regulations 1988 (CAR), Civil Aviation Safety Regulations 1998 (CASR) and associated Manual of Standards (MOS) and other guidance material. Relevant provisions are outlined in further detail in the following section.

Civil Aviation Safety Regulations 1998, Part 139—Aerodromes

CASR 139.165 requires the owner of a structure (or proponents of a structure) that will be 100 m or more above ground level to inform CASA. This must be given in written notice and contain information on the proposal, the height and location(s) of the object(s) and the proposed timeframe for construction. This is to allow CASA to assess the effect of the structure on aircraft operations and determine whether the structure will be hazardous to aircraft operations.

Manual of Standards Part 139—Aerodromes

Chapter 9 sets out the standards applicable to Visual Aids Provided by Aerodrome Lighting.

Section 9.30 provides guidance on Types of Obstacle Lighting and Their Use:

1. *The following types of obstacle lights must be used, in accordance with this MOS, to light hazardous obstacles:*
    a. *low-intensity;*
    b. *medium-intensity;*
    c. *high-intensity;*
    d. *a combination of low, medium or high-intensity.*
2. *Low-intensity obstacle lights:*
    a. *are steady red lights; and*
    b. *must be used on non-extensive objects or structures whose height above the surrounding ground is less than 45 m.*
3. *Medium-intensity obstacle lights must be:*
    a. *flashing white lights; or*
    b. *flashing red lights; or*
    c. *steady red lights.*

    Note CASA recommends the use of flashing red medium-intensity obstacle lights.
4. *Medium-intensity obstacle lights must be used if:*
    a. *the object or structure is an extensive one; or*

b. *the top of the object or structure is at least 45 m but not more than 150 m above the surrounding ground; or*

c. *CASA determines in writing that early warning to pilots of the presence of the object or structure is desirable in the interests of aviation safety.*

Note For example, a group of trees or buildings is regarded as an extensive object.

5. *For subsection (4), low-intensity and medium-intensity obstacle lights may be used in combination.*

6. *High-intensity obstacle lights:*

a. *must be used on objects or structures whose height exceeds 150 m; and*

b. *must be flashing white lights.*

7. *Despite paragraph (6) (b), a medium-intensity flashing red light may be used if necessary, to avoid an adverse environmental impact on the local community.*

Sections 9.31 (8) and (9) provide guidance on obstacle lighting specific to wind farms:

8. *Subject to subsection (9), for wind turbines in a wind farm, medium-intensity obstacle lights must:*

a. *mark the highest point reached by the rotating blades; and*

b. *be provided on a sufficient number of individual wind turbines to indicate the general definition and extent of the wind farm, but such that intervals between lit turbines do not exceed 900 m; and*

c. *all be synchronised to flash simultaneously; and*

d. *be seen from every angle in azimuth.*

Note: This is to prevent obstacle light shielding by the rotating blades of a wind turbine and may require more than 1 obstacle light to be fitted.

9. *If it is physically impossible to light the rotating blades of a wind turbine:*

a. *the obstacle lights must be placed on top of the generator housing; and*

b. *a note must be published in the AIP-ERSA indicating that the obstacle lights are not at the highest position on the wind turbines.*

10. *If the top of an object or structure is more than 45 m above:*

a. *the surrounding ground (ground level); or*

b. *the top of the tallest nearby building (building level); then the top lights must be medium-intensity lights, and additional low-intensity lights must be:*

c. *provided at lower levels to indicate the full height of the structure; and*

d. *spaced as equally as possible between the top lights and the ground level or building level, but not so as to exceed 45 m between lights.*

Advisory Circular 139.E-01 v1.0—Reporting of Tall Structures

In Advisory Circular (AC) 139.E-01 v1.0—Reporting of Tall Structures, CASA provides guidance to those

authorities and persons involved in the planning, approval, erection, extension or dismantling of tall structures so that they may understand the vital nature of the information they provide.

Airservices Australia has been assigned the task of maintaining a database of tall structures. RAAF and Airservices Australia require information on structures which are:

a) 30 metres or more above ground level—within 30 kilometres of an aerodrome; or

b) 45 metres or more above ground level elsewhere for the RAAF, or

c) 30 m or more above ground level elsewhere for Airservices Australia.

The purpose of notifying Airservices Australia of these structures is to enable their details to be provided in aeronautical information databases and maps/charts etc used by pilots, so that the obstacles can be avoided.

The proposed WTGs must be reported to Airservices Australia. This action should occur once the final layout after micrositing is confirmed and prior to construction.

International Civil Aviation Organisation

Australia, as a contracting State to the International Civil Aviation Organisation (ICAO) and signatory to the Chicago Convention on International Civil Aviation (the Convention), has an obligation to implement ICAO's standards and recommended practices (SARPs) as published in the various annexes to the Convention.

Annex 14 to the Convention — *Aerodromes, Volume 1,* Section 6.2.4 provides SARPs for the obstacle lighting and marking of WTGs, which is copied below:

> *6.2.4 Wind turbines*
>
> *6.2.4.1 A wind turbine shall be marked and/or lighted if it is determined to be an obstacle.*
>
> *Note 1. — Additional lighting or markings may be provided where in the opinion of the State such lighting or markings are deemed necessary.*
>
> *Note 2. — See 4.3.1 and 4.3.2*
>
> *Markings*
>
> *6.2.4.2 Recommendation. — The rotor blades, nacelle and upper 2/3 of the supporting mast of wind turbines should be painted white, unless otherwise indicated by an aeronautical study.*
>
> *Lighting*
>
> *6.2.4.3 Recommendation. — When lighting is deemed necessary, in the case of a wind farm, i.e. a group of two or more wind turbines, the wind farm should be regarded as an extensive object and the lights should be installed:*
>
> > *a) to identify the perimeter of the wind farm;*
> >
> > *b) respecting the maximum spacing, in accordance with 6.2.3.15, between the lights along the perimeter, unless a dedicated assessment shows that a greater spacing can be used;*
> >
> > *c) so that, where flashing lights are used, they flash simultaneously throughout the wind farm;*
> >
> > *d) so that, within a wind farm, any wind turbines of significantly higher elevation are also identified wherever they are located; and*
> >
> > *e) at locations prescribed in a), b) and d), respecting the following criteria:*

i) for wind turbines of less than 150 m in overall height (hub height plus vertical blade height), medium-intensity lighting on the nacelle should be provided;

ii) for wind turbines from 150 m to 315 m in overall height, in addition to the medium-intensity light installed on the nacelle, a second light serving as an alternate should be provided in case of failure of the operating light. The lights should be installed to assure that the output of either light is not blocked by the other; and

iii) in addition, for wind turbines from 150 m to 315 m in overall height, an intermediate level at half the nacelle height of at least three low-intensity Type E lights, as specified in 6.2.1.3, should be provided. If an aeronautical study shows that low-intensity Type E lights are not suitable, low-intensity Type A or B lights may be used.

Note. — The above 6.2.4.3 e) does not address wind turbines of more than 315 m of overall height. For such wind turbines, additional marking and lighting may be required as determined by an aeronautical study.

6.2.4.4 Recommendation. — The obstacle lights should be installed on the nacelle in such a manner as to provide an unobstructed view for aircraft approaching from any direction.

6.2.4.5 Recommendation. — Where lighting is deemed necessary for a single wind turbine or short line of wind turbines, the installation should be in accordance with 6.2.4.3 e) or as determined by an aeronautical study.

As referenced in Section 6.2.4.3(e)(iii), Section 6.2.1.3 is copied below:

6.2.1.3 The number and arrangement of low-, medium- or high-intensity obstacle lights at each level to be marked shall be such that the object is indicated from every angle in azimuth. Where a light is shielded in any direction by another part of the object, or by an adjacent object, additional lights shall be provided on that adjacent object or the part of the object that is shielding the light, in such a way as to retain the general definition of the object to be lighted. If the shielded light does not contribute to the definition of the object to be lighted, it may be omitted.

As referenced in Section 6.2.4.3(b), Section 6.2.3.15 is copied below:

6.2.3.15 Where lights are applied to display the general definition of an extensive object or a group of closely spaced objects, and

a) low-intensity lights are used, they shall be spaced at longitudinal intervals not exceeding 45 m; and

b) medium-intensity lights are used, they shall be spaced at longitudinal intervals not exceeding 900 m.

Section 4.3 Objects outside the OLS states the following:

4.3.1 Recommendation.— Arrangements should be made to enable the appropriate authority to be consulted concerning proposed construction beyond the limits of the obstacle limitation surfaces that extend above a height established by that authority, in order to permit an aeronautical study of the effect of such construction on the operation of aeroplanes.

4.3.2 Recommendation. — In areas beyond the limits of the obstacle limitation surfaces, at least those objects which extend to a height of 150 m or more above ground elevation should be regarded

as obstacles, unless a special aeronautical study indicates that they do not constitute a hazard to aeroplanes.

Note. — This study may have regard to the nature of operations concerned and may distinguish between day and night operations.

ICAO Doc 9774 Manual on Certification *of Airports* defines an aeronautical study as:

An aeronautical study is a study of an aeronautical problem to identify potential solutions and select a solution that is acceptable without degrading safety.

Light characteristics

If obstacle lighting is required, installed lights should be designed according to the criteria set out in the applicable regulatory material and taking CASA's recommendations into consideration in the case that CASA has reviewed this risk assessment and provided recommendations.

The characteristics of the obstacle lights should be in accordance with the applicable standards in Part 139 MOS 2019.

The characteristics of low and medium intensity obstacle lights specified in Part 139 MOS 2019, Chapter 9, are provided below.

CASR Part 139 MOS 2019 Chapter 9 Division 4 – Obstacle Lighting section 9.32 outlines Characteristics of Low Intensity Obstacle Lights.

1. *Low-intensity obstacle lights must have the following:*
    a. *fixed lights showing red;*
    b. *a horizontal beam spread that results in 360-degree coverage around the obstacle;*
    c. *a minimum intensity of 100 candela (cd);*
    d. *a vertical beam spread (to 50% of peak intensity) of 10 degrees;*
    e. *a vertical distribution with 50 cd minimum at +6 degrees and +10 degrees above the horizontal;*
    f. *not less than 10 cd at all elevation angles between –3 degrees and +90 degrees above the horizontal.*

    Note: The intensity requirement in paragraph (c) may be met using a double-bodied light fitting. CASA recommends that double-bodied light fittings, if used, should be orientated so that they show the maximum illuminated surface towards the predominant, or more critical, direction of aircraft approach.

2. *To indicate the following:*
    a. *taxiway obstacles;*
    b. *unserviceable areas of the movement area; low-intensity obstacle lights must have a peak intensity of at least 10 cd.*

Part 139 MOS 2019 Chapter 9 Division 4 – Obstacle Lighting section 9.33 outlines Characteristics of Medium Intensity Obstacle Lights.

1. *Medium-intensity obstacle lights must:*

a. *be visible in all directions in azimuth; and*

b. *if flashing — have a flash frequency of between 20 and 60 flashes per minute.*

2. *The peak effective intensity of medium-intensity obstacle lights must be 2 000 ☐ 25% cd with a vertical distribution as follows:*

a. *for vertical beam spread — a minimum of 3 degrees;*

b. *at -1-degree elevation — a minimum of 50% of the lower tolerance value of the peak intensity;*

c. *at 0 degrees elevation — a minimum of 100% of the lower tolerance value of the peak intensity.*

3. *For subsection (2), vertical beam spread means the angle between 2 directions in a plane for which the intensity is equal to 50% of the lower tolerance value of the peak intensity.*

4. *If, instead of obstacle marking, a flashing white light is used during the day to indicate temporary obstacles in the vicinity of an aerodrome, the peak effective intensity of the light must be increased to 20 000 ± 25% cd when the background luminance is 50 cd/m² or greater.*

Visual impact of night lighting

Annex 14 Section 6.2.4 and Part 139 MOS 2019 Chapter 9 are specifically intended for WTGs and recommends that medium intensity lighting is installed.

Generally accepted considerations regarding minimisation of visual impact are provided below for consideration in this aeronautical study:

- To minimise the visual impact on the environment, some shielding of the obstacle lights is permitted, provided it does not compromise their operational effectiveness;
- Shielding may be provided to restrict the downward component of light to either, or both, of the following:
    - such that no more than 5% of the nominal intensity is emitted at or below 5 degrees below horizontal; and
    - such that no light is emitted at or below 10 degrees below horizontal;
- If a light would be shielded in any direction by an adjacent object or structure, the light so shielded may be omitted, provided that such additional lights are used as are necessary to retain the general definition of the object or structure.
- If flashing obstacle lighting is required, all obstacle lights on a wind farm should be synchronised so that they flash simultaneously; and
- A relatively small area on the back of each blade near the rotor hub may be treated with a different colour or surface treatment, to reduce reflection from the rotor blades of light from the obstacle lights, without compromising the daytime visibility of the overall WTG.

Marking of WTGs

ICAO Annex 14 Vol 1 Section 6.2.4.2 recommends that the rotor blades, nacelle and upper 2/3 of the supporting mast of the WTGs should be painted a shade of white, unless otherwise indicated by an aeronautical study.

It is generally accepted that a shade of white colour will provide sufficient contrast with the surrounding environment to maintain an acceptable level of safety while lowering visual impact to the neighbouring residents.

ANNEXURE 4 – RISK FRAMEWORK

A risk management framework is comprised of likelihood and consequence descriptors, a matrix used to derive a level of risk, and actions required of management according to the level of risk.

The risk assessment framework used by Aviation Projects has been developed in consideration of ISO 31000:2018 *Risk management—Guidelines* and the guidance provided by CASA in its Safety Management System (SMS) for Aviation guidance material, which is aligned with the guidance provided by the International Civil Aviation Organization (ICAO) in Doc 9589 *Safety Management Manual*, Third Edition, 2013. Doc 9589 is intended to provide States (including Australia) with guidance on the development and implementation of a State Safety Programme (SSP), in accordance with the International SARPs, and is therefore adopted as the primary reference for aviation safety risk management in the context of the subject assessment.

Section 2.1 of the ICAO Doc 9589 *The concept of safety* defines safety as follows [author's underlining]:

> *2.1.1 Within the context of aviation, safety is "the state in which the possibility of harm to persons or of property damage is reduced to, and maintained at or below, an acceptable level through a continuing process of hazard identification and safety risk management."*

Likelihood

Likelihood is defined in ISO 31000:2018 as the chance of something happening. Likelihood descriptors used in this report are as indicated in Table 1.

Table 1 Likelihood Descriptors

No	*Descriptor*	*Description*
1	Rare	It is almost inconceivable that this event will occur
2	Unlikely	The event is very unlikely to occur (not known to have occurred)
3	Possible	The event is unlikely to occur, but possible (has occurred rarely)
4	Likely	The event is likely to occur sometimes (has occurred infrequently)
5	Almost certain	The event is likely to occur many times (has occurred frequently)

Consequence

Consequence is defined as the outcome of an event affecting objectives, which in this case is the safe and efficient operation of aircraft, and the visual amenity and enjoyment of local residents.

Consequence descriptors used in this report are as indicated in Table 2.

Table 2 Consequence Descriptors

No	Descriptor	People Safety	Property/Equipment	Effect on Crew	Environment
1	Insignificant	Minor injury – first aid treatment	Superficial damage	Nuisance	No effects or effects below level of perception
2	Minor	Significant injury – outpatient treatment	Moderate repairable damage – property still performs intended functions	Operations limitation imposed. Emergency procedures used.	Minimal site impact – easily controlled. Effects raised as local issues, unlikely to influence decision making. May enhance design and mitigation measures.
3	Moderate	Serious injury - hospitalisation	Major repairable damage – property performs intended functions with some short-term rectifications	Significant reduction in safety margins. Reduced capability of aircraft/crew to cope with conditions. High workload/stress on crew. Critical incident stress on crew.	Moderate site impact, minimal local impact, and important consideration at local or regional level, possible long-term cumulative effect. Not likely to be decision making issues. Design and mitigation measures may ameliorate some consequences.
4	Major	Permanent injury	Major damage rendering property ineffective in achieving design functions without major repairs	Large reduction in safety margins. Crew workload increased to point of performance decrement. Serious injury to small number of occupants. Intense critical incident stress.	High site impact, moderate local impact, important consideration at state level. Minor long-term cumulative effect. Design and mitigation measures unlikely to remove all effects.
5	Catastrophic	Multiple Fatalities	Damaged beyond repair	Conditions preventing continued safe flight and landing. Multiple deaths with loss of aircraft	Catastrophic site impact, high local impact, national importance. Serious long-term cumulative effect. Mitigation measures unlikely to remove effects.

Risk matrix

The risk matrix, which correlates likelihood and consequence to determine a level of risk, used in this report is shown in Table 3.

Table 3 Risk Matrix

		CONSEQUENCE				
		INSIGNIFICANT 1	MINOR 2	MODERATE 3	MAJOR 4	CATASTROPHIC
LIKELIHOOD	ALMOST CERTAIN 5	6	7	8	9	10
	LIKELY 4	5	6	7	8	9
	POSSIBLE 3	4	5	6	7	8
	UNLIKELY 2	3	4	5	6	7
	RARE 1	2	3	4	5	6

Actions required

Actions required according to the derived level of risk are shown in Table 4.

Table 4 Actions Required

8-10	**Unacceptable Risk**	Immediate action required by either treating or avoiding risk. Refer to executive management.
5-7	**Tolerable Risk**	Treatment action possibly required to achieve As Low As Reasonably Practicable (ALARP) - conduct cost/benefit analysis. Relevant manager to consider for appropriate action.
0-4/5	**Broadly Acceptable Risk**	Managed by routine procedures, and can be accepted with no action.

ANNEXURE 7 – AGREED PRESENTATION SLIDE FOR DFES AND DBCA FEEDBACK – AERIAL FIREFIGHTING

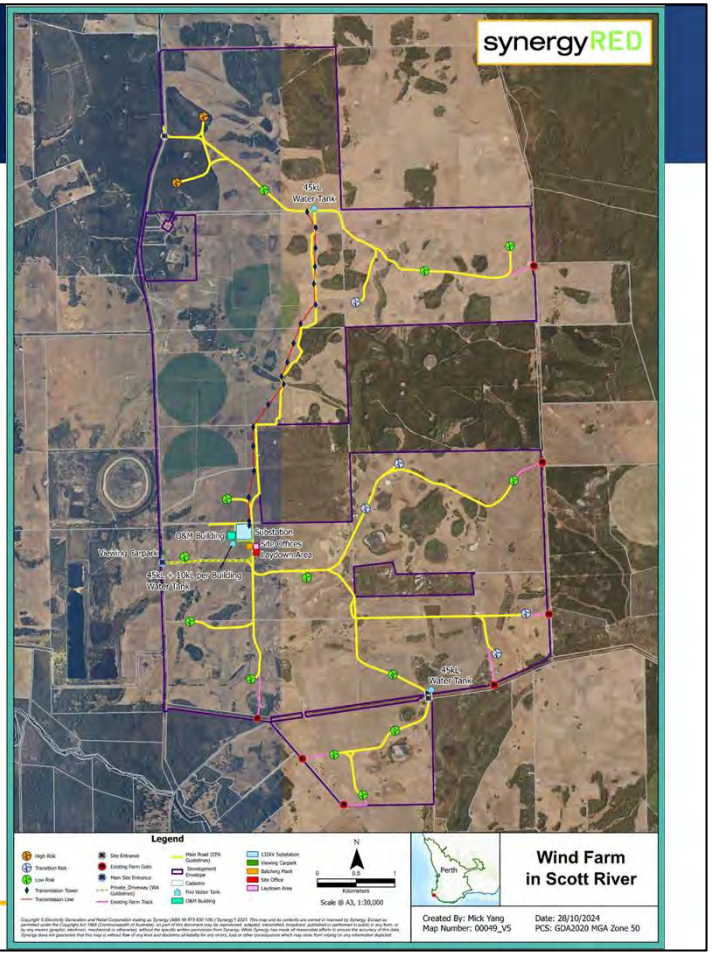
Potential wind farm – Scott River

Proposed facility

- Up to 20 turbines
- 132 kV transmission line, connection into existing Manjimup to Beenup 132 kV line
- Meteorological mast(s) and Substation
- Operations and maintenance (O&M) building / workshop
- Access tracks suitable for firefighting appliances
- Firewater tank(s)

Guidelines referenced

- SPP 3.7 Planning in bushfire prone areas
- CFA (2023) Design Guidelines and Model Requirements: Renewable Energy Facilities
- AFAC (2018) Guideline - Wind farms and bushfire operations



Department of Fire and Emergency Services (DFES)

synergyRED

Meeting summary - 17 February 2025

- **DFES - Ray Buchan – Superintendent Aviation Services; Steven Sartain – Manager Emergency Rescue and Helicopter Services**
- **Synergy – Chris Binstead, Emma Jones and Wilson Mandisodza**
- Aerial fire suppression activities are not prohibited within wind farms. There are currently no procedures specific to aerial fire suppression operations around wind farms.
- Aerial firefighting around wind farms is not treated any differently to other aerial firefighting i.e. the same risk assessment processes are undertaken to ensure the aerial fire suppression operation can be undertaken safely as for all fires.
- Aerial operations are via contractors, and they will have their own Standard Operating Procedures and risk assessment processes that form part of their Safety Management System.
- Pilots will take the wind turbines into consideration in their risk assessments and will make a determination on the day whether it is safe to operate inside the wind farm envelope.
- If the wind farm is operating during a bushfire, suppression operations will be modified or suspended.
- If the wind farm is able to be shutdown / paused remotely (i.e. blades moving at approx. 1 RPM), then suppression operations will be considered based on a risk assessment and conditions on the day.
- DFES acknowledges that due to the rapid onset of bushfires it is very difficult to achieve a Y position, it is assumed that it cannot be achieved in a timely manner. However, pausing turbines to approx. 1 RPM is recommended.
- DFES will prioritise static fresh water supplies over salt or brackish water i.e. preference is to not take salt water for firefighting
- While aerial firefighting only operates during the day, rescue services operate day and night – 24/7/365
- DFES recommends medium intensity lighting on wind turbines for rescue purposes due to operating at night. Refer to 2017 NSW CASA guidance.
- Emphasised the significance of operator and DFES/DBCA Incident Controllers in the decision-making process for firefighting operations near wind farms.
- Provision of information regarding tall objects within the wind farm at the point of construction is critical in being able to assess the risk during a bushfire emergency.
- Emphasised importance of local/regional involvement in the planning and development of the wind farm.
- Emergency Response Plan to be developed and shared with DFES. Must have contact details for wind farm and available 24/7 to first responders and Incident Controllers.

Commercial in confidence

Department of Biodiversity, Conservation and Attractions (DBCA)

synergyRED

Meeting held 24 February 2025

- DBCA - Erin Tassel – Fire Aviation Manager
- Synergy – Chris Binstead, Emma Jones and Wilson Mandisodza
- DBCA and DFES share similar fire suppression contractors.
- Aerial fire suppression and pest control operate under daytime VFR (visual flight rules). No rescue services operated by DBCA.
- Aerial fire suppression will consider the risk on the day and location, will be at the pilot's discretion. Dispatch operators will always flag the coordinates of any obstacles / tall objects (such as wind turbines).
- DBCA also acknowledges that due to the rapid onset of bushfires it is very difficult to achieve a Y position, it is assumed that it cannot be achieved in a timely manner.
- There are currently no procedures specific to wind farms.
- Need to confirm secondary airstrips have been assessed.
- Feedback from DBCA forum with Chief pilots is that there is no special consideration for wind farms but as the decision to is at the pilot's discretion.

Pre flight risk assessment (DFES)

synergyRED

DFES and DBCA Process

- Operator and incident control decision making operation
- Pilot's pre-briefing
- Risk assessment by operator at site taking into account the conditions on the day
- AOC to determine operating procedures
- DFES and DBCA procedures may not be the same as Operator procedures.

Commercial in confidence

Shutdown of turbines in the event of a fire

synergyRED

DFES Process

- Synergy is not opposed to shutting down the wind farm if required (i.e. pausing the turbine blades)
- Synergy can reduce the ????
- Typically, a wind farm would continue to operate based on the guidance from AEMO, Western Power and other bodies.
- Decision making needs to include DFES as the decisions will influence operator and incident control decision making
- DFES open to some turbines being shut down or sector management if required.

Synergy's commitments

synergyRED

- Synergy will notify CASA, Air Services Australia, DBCA and DFES notification of all turbine locations
- Turbines at least 300 metres apart
- Meteorological masts and guy wires to be marked to ensure visibility to aircraft as per CASA regulations
- Synergy will investigate lighting for wind turbines (for rescue helicopters)
- Synergy will not oppose shutting down the wind farm in the case of an emergency
- Synergy will provide data in the preferred format for DBCA and DFES to inform their risk assessment.
- Synergy will provide opportunities for site familiarisation and orientations
- Should the project go ahead, the preferred turbine technology will have a fire suppression system.
- Synergy to provide a detailed BMP / EMP which includes emergency contacts

Commercial in confidence

Next steps
synergyRED

Next steps

synergyRED

- Synergy will obtain feedback from DBCA's forum with the Chief Pilots – this can include Chief Pilots for DFES Air Operations contractors as there are combined DFES / DBCA Chief Pilots meetings
- Synergy will finalise the BMP
- If any additional detail or differences arise, Synergy to organise a meeting between Synergy, DFES and DBCA.

Commercial in confidence

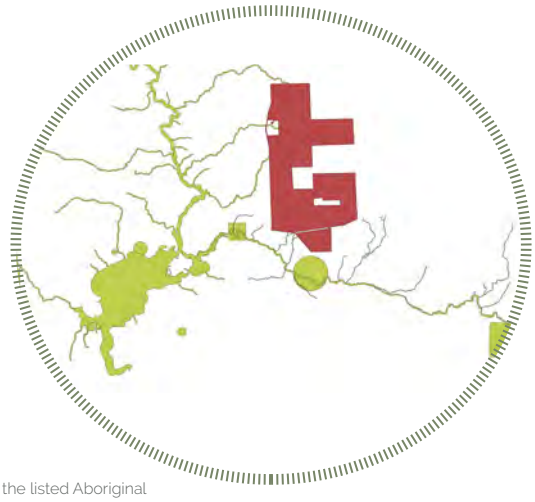
Social Values Assessment

SYNERGYRED SCOTT RIVER WIND FARM FEASIBILITY

SOCIAL VALUES ASSESSMENT REPORT

January 2025 Update

ID.



The adjacent figure shows in green the listed Aboriginal Heritage Sites, 2024 and the waterways that mark the ancient borders of this country.
Source: DPLH Heritage Data QGIS

We acknowledge the Whadjuk people of the Noongar nation as the Traditional Owners of this place and pay our respects to the elders past and present who have cared for this country and its people, and upon which we have the opportunity to learn and work.

The area for this study sits on the traditional lands of the Wardandi and Bibulumin/Piblemen Peoples of the Noongar Nation. We acknowledge and pay our respects to the elders of these peoples and acknowledge their ongoing connection to these lands and waters.

1. BACKGROUND

Synergy Renewable Energy Developments (SynergyRED), a wholly owned subsidiary of Synergy, is in the process of investigating and developing future renewable energy assets with the intent of helping the WA Government to transition to net zero emissions by 2050. SynergyRED has delivered a range of renewable projects for both Synergy and Bright Energy Investments (BEI)*, including the Warradarge Wind Farm and Greenough River Solar Farm expansion.

In the lead up to the retirement of the Collie Power Station in late 2027 and Muja Power Station in 2029, SynergyRED is investigating the feasibility of developing a wind farm in Scott River, Western Australia, with the intent to connect to the South-West Interconnected System (SWIS).

Electricity from the proposed wind farm would feed into the Beenup substation in Scott River, which connects to homes and businesses in Augusta, Scott River, Molloy Island, Alexandra Bridge, Karridale, Hamelin Bay, East Augusta, and Forest Grove. The remaining electricity from the proposed wind farm would flow along the transmission line to Manjimup, Collie and the rest of the energy grid.

This proposal would see the construction and operation of up to 20 wind turbine generators up to a final tip height of 250m, and associated infrastructure.

The area chosen sits on the traditional lands of the Wardandi and Bibulumin/Piblemen Peoples of the Noongar Nation. The site is in proximity to the recently rehabilitated BHP Beenup Titanium Minerals site, in the catchment of the Scott and Blackwood rivers, and in cattle grazing, and dry land dairy farming areas.

The low-lying Scott Coastal Plain is a gently undulating landscape with a high winter water table and sandy/duplex soils that serve to create a Palusplain and series of scattered wetlands through the area.

The findings of this report are based on the project description of the proposed wind farm in Scott River provided by SynergyRED.

Considerable work has been done by BHP, Syrinx Environmental and several leading universities to define the "stocks of natural assets" in Scott River. These references have been drawn up to provide some initial context into what the likely impacts, challenges and opportunities maybe for this proposed project in this location.

Further secondary research included desktop analysis of State Government registers, DataWA GIS Databases, published reports and ABS Census Data 2021.

This analysis is supplemented by a series of qualitative in-depth interviews with community members representing local organisations and subject matter experts, and the findings of a publicly available digital survey. This survey was also offered in hard copy at all SynergyRED community consultation sessions.

This report summarises the findings of the independent Social Values Assessment, in line with global best practice and Synergy's Social Value Framework, for the proposed wind farm in Scott River.

2. STUDY OBJECTIVES

In March 2024, SynergyRED commissioned Place.ID to undertake a Social Values Assessment to deliver to the intent of Synergy's Social Value Framework and to support the engagement and decision making for the feasibility stage of the proposed wind farm in Scott River.

The Social Values Assessment Process will help guide future engagement (sharing and listening) and understanding of the local and regional context (as illustrated in Figure 1a). These are crucial steps to establish a baseline for the social licence throughout the life of the project.

The objectives of the Scott River Wind Farm Social Values Assessment are to:

- summarise research and evidence gathered to identify key social impacts (both negative and positive) that may result from the proposal, specifically:
  - community and stakeholder engagement perceptions
  - workforce management
  - housing and accommodation
  - local business and industry procurement
  - community health & wellbeing
- prepare a consistent, comprehensive and suitable summary of social values suitable for the anticipated regulatory submissions.

*'BEI is a joint venture between Synergy, Construction and Building Unions Superannuation, and DIF Capital Partners.'

3. METHODOLOGY

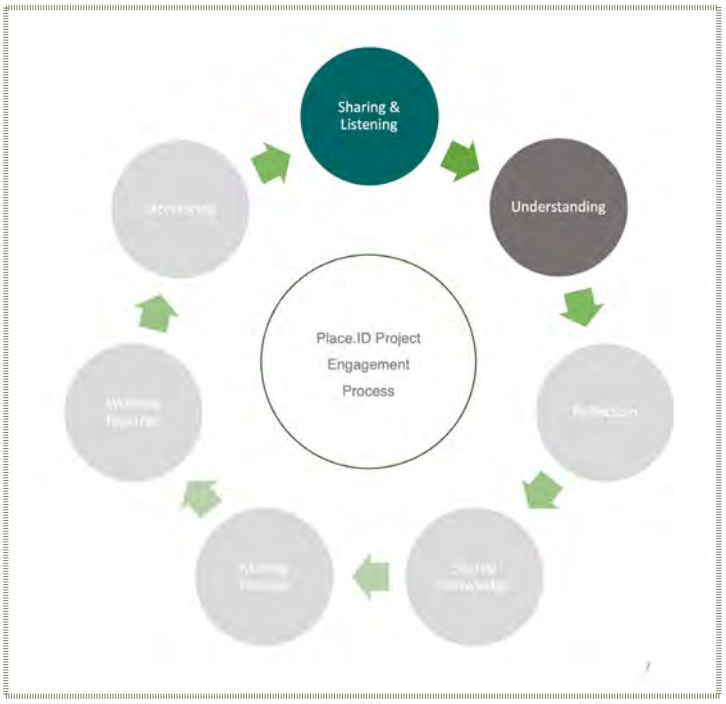

Figure 1a. Place.ID's Project Engagement Process

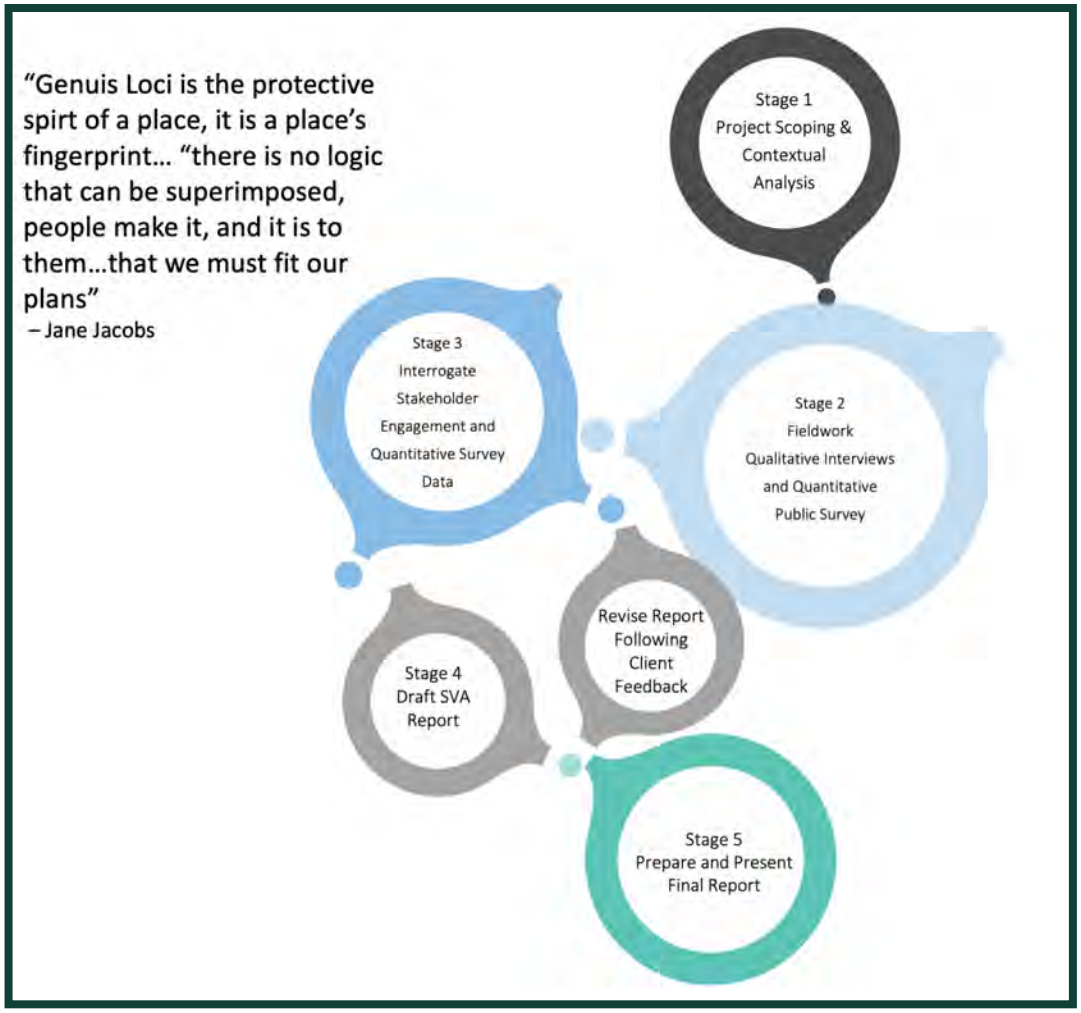

Figure 1b:. Project Methodology

The methodology for this social values assessment uses qualitative and quantitative research techniques, supported by secondary research, to provide a suitable evidence base for decision-making.

The stages undertaken across this project are outlined in Figure 1b and described on the following pages.

3.1. Determine the Context

An initial site orientation and a community profile update (including ABS Census 2021 profiling, geospatial assessment, secondary research, project and qualitative data) was conducted to set the context for the assessment. This provided valuable demographic data that will help determine actual community impacts (illustrated in Appendix 2). This also served as a useful comparison to how the various stakeholders and community define themselves and their perceived needs.

A workshop was also held with the SynergyRED project team leaders to gauge project understanding, status, identified opportunities and constraints, and define the project's key stakeholders and associated communities within the study area.

3.2. Engagement

An engagement strategy was established, in close consultation with SynergyRED and their representatives, to actively recruit and involve property owners and represented stakeholders in the study. This included identification of community leaders and relevant associations, stakeholder mapping, collateral development, and channel confirmation to introduce the study and invite participation.

The stakeholder mapping exercise was conducted of part of the initial scoping workshop to ensure there was a diversity in opinion, background, interests and landholdings. Additional stakeholders who specifically asked to be interviewed for the study were also included. A full list of study invitees and participants is attached as Appendix 1.

A publicly accessible digital survey was developed and ran live from 15 March 2024 to 30 April 2024. A QR code linking to this survey was promoted online, through social media, at all SynergyRED community consultations, to the project's email database, and on a project brochure that was sent to 5,000 homes in the Augusta-Scott River area. The survey was also available in hard copy format at all SynergyRED community consultation sessions.

Engagement in this context related to engagement around the Social Values Assessment component of work (in line with Place.ID's project engagement process (illustrated in Figure 1a), and was established to complement the existing and ongoing engagement work being conducted by SynergyRED.

3.3. The Survey Instruments

A qualitative in-depth discussion guide (attached in Appendix 3) and a publicly available quantitative survey (attached in Appendix 4) was designed to incorporate a set series of identified social value indicators relevant to this proposed project. These were developed following a review of relevant national guidelines, the SynergyRED's Project Leaders workshop, context analysis, desktop research on likely project impacts, and consideration of Synergy's Social Value Framework.

Questions within the survey instruments focused on delivering a holistic and comprehensive assessment of how perceptions around the energy transition, the importance placed on certain social value indicators and confidence in SynergyRED's ability to deliver benefit or mitigate any potential impacts to drive project decisions into the future.

These questions were complemented by a digital geo-spatial questionnaire tool, which was set up to help define nodes/clusters of perceived values and likely impacts and benefits.

3.4. Fieldwork

Following stakeholder identification and mapping, a cross selection of stakeholders was identified to ensure a representative viewpoint of the identified indicators could be achieved. A list of 30 stakeholder organisations were determined and approached to involve a key spokesperson from each representative group, with the objective of achieving a total of 20 in-depth interviews (IDIs).

A total of 20 in-depth interviews were achieved from the initial sample of 30. In addition, a workshop meeting was held with 8 volunteer fire brigade members (representing a range of landowners and local business leaders).

The quantifiable perception survey achieved a statistically significant sample at the 95% confidence level, with a less than 5% margin of error. This framework allows for future tracking of perception data and comparison over time. A total of 257 stakeholders visited the survey site, with a statistically significant response rate of 125 fully completed surveys achieved. Up to a total 156 respondents completed the overall project ratings and indicator questions, and then opted out of completing the full survey. This provided a confidence interval at 0.074 with a standard error of 0.04.

The publicly available survey was complemented by an observational study of the proposed site location and study area during the week starting 22 April 2024.

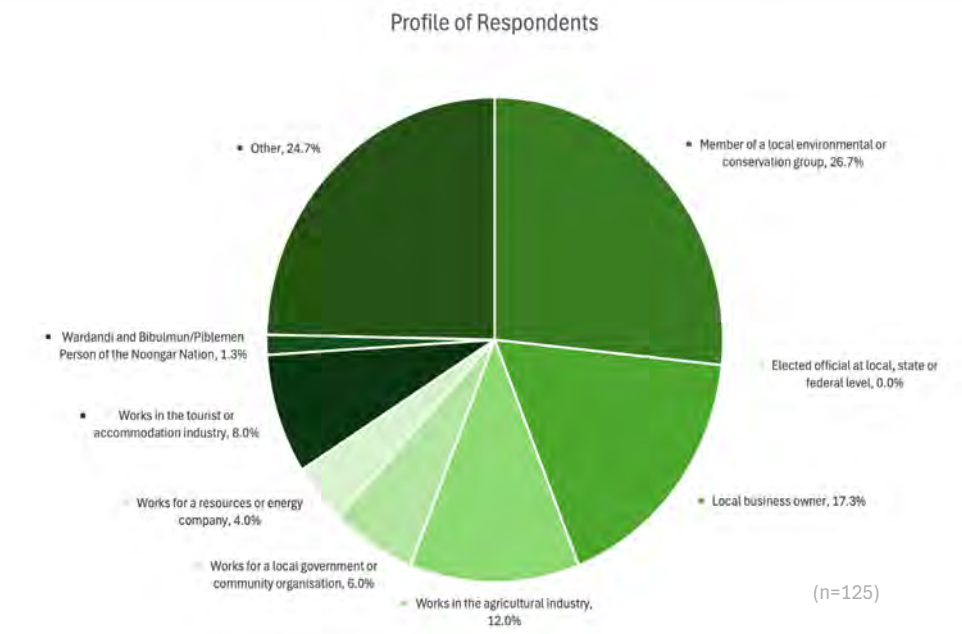
3.5. Analysis

Once all aspects of the fieldwork were complete, qualitative and quantitative analysis was undertaken using appropriate data entry, coding and analysis processes, as guided by the Market Research Society of Australia, IPA2, Social Impact Assessment Guidelines QLD and the Department of Planning and Environment NSW.

This analysis included identification of the social values associated with the study area, in relation to the proposed wind farm in Scott River. As this social values assessment is established as an initial baseline, the primary purpose of the considerations is designed to inform project decisions during the feasibility stage, recognising that many of the project decisions and therefore quantitative input data to complete a full social impact assessment are yet to be finalised.

This social values assessment report is a baseline, based on desktop research and community engagement including fieldwork. At the time of writing this report several elements of Synergy's environmental, technical and heritage assessments are still underway, and therefore have not been considered in this report. Recommendations made in this report are based on the findings of the fieldwork and secondary research for further interrogation as project considerations progress and further decisions are made.

It is recommended that this social values assessment baseline be updated in the subsequent phases of project development.



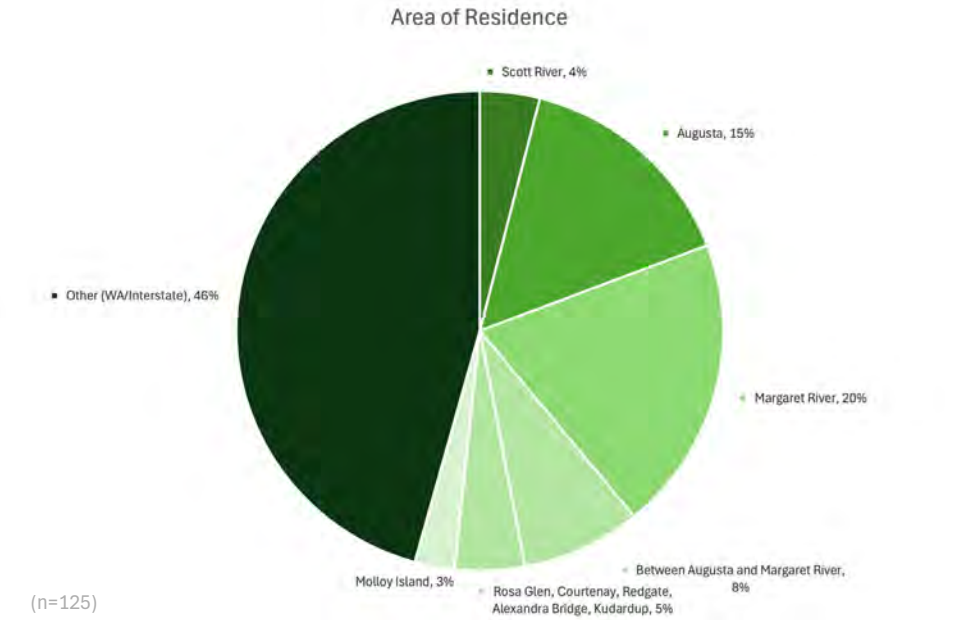


Figure 2a + b Survey Respondent Profiles

4. SOCIAL PERORMANCE GUIDING FRAMEWORK AND APPROACH

Social value is one of Synergy's corporate strategic pillars, formalised with the launch of the organisation's first internal Social Value Framework in late 2023. A full list of Synergy's Social Performance Commitments and Approach, as provided by the organisation on 31 July 2024, is outlined in Section 4.1.

The Framework provides a structured approach to integrating social value considerations into SynergyRED's decision-making processes. In the context of future energy projects, Synergy aspires not only to comply with regulatory standards but actively seeks to contribute to net positive social, environmental and economic outcomes for the people of Western Australia; that is, to deliver social value.

This social values assessment is a strategic tool which aims to provide insights into the unique set of values that contribute to a community or place identity, the net benefit that a project may bring to different stakeholders. It also ensures the social baseline of the project area and broader implications are understood to address any community concerns. It is intended to act as a resource and guide that can be updated as project decisions are firmed up into the future.

This report is structured in the light of the primary project driver being positive energy provision and regeneration for the State of Western Australia, the local contextual drivers, and the communities' expressed priorities in terms of their perceptions around social values of the area, and their confidence in SynergyRED's ability to manage any potential impacts on these values.

It is intended that this structure help appropriately guide decision-making within the context of SynergyRED's proposed project and Synergy's Social Value Framework. That said, the generic indicators of the standard Social Impact Guidelines, for example as per the requirements set out by the NSW and Queensland Governments, have also been considered and included as part of this assessment.

The key social values considered and described within this report are:

- Decarbonisation and the energy transition, i.e. the social value associated with the project's contribution to Synergy's strategy and decarbonisation goals, including energy affordability and equity,
- Community population, demographics and cohesion,
- Environmental stewardship – as the environmental values that drive attachment to place. In the social context, environmental values as considered in terms of how a community derives their income, how they perceive themselves and the world around them, and associated activities relating to experiencing and understanding the natural environment. In this instance, socio-environmental impacts include impacts on tourism, recreation and access to nature. It also addresses the priority issues raised in the fieldwork in terms of expressed values of local importance around water, flora and biodiversity, fauna, soils, fire and sense of place.
- Cultural and Indigenous heritage i.e. heritage as it pertains to registered heritage sites, along with relevant contextual comments provided by local historians, community leaders and community members participating in the study.
- Resilient, prosperous communities in terms of decision-making systems, land tenure, roads and transport, power and telecommunications, community service provision and way of life.
- Thriving, diverse, equitable, and inclusive community and workforce in terms of industry sectors, employment, ability to derive an income, and fair and ethical supply chains.

In addition, this report considers and addresses as appropriate Synergy's Social Value Framework, Environmental Factor Guideline – Social Surroundings (EPA, 2023), Position Statement: Renewable Energy Facilities (WA Planning Commission, March 2020), Social Impact Assessment Guideline and supplementary material (Queensland Government, 2018), Social Impact Assessment Guideline and Technical Supplement (DPHI, 2023) and Social Impact Assessment: Guidance for Assessing and Managing the Social Impacts of Projects (International Association for Impact Assessment, 2015).

Although not strictly required under approval conditions, this social values assessment is being completed as best practice to firstly understand, and subsequently manage/mitigate impacts and improve benefit return, to the communities within which SynergyRED operates.

It is recommended that performance against these commitments and framework is reported annually within Synergy's Annual Report.

4.1. SUMMARY OF SYNERGY'S SOCIAL PERFORMANCE APPROACH

Provided by SynergyRED on 31 July 2024

Social performance is the way Synergy maximises the benefits communities experience during project planning, construction and operation, while minimising disruptions. The social performance approach aligns with Synergy's social value strategic pillar and internal Social Value Framework. This framework identifies Synergy's social value priorities and provides a structured approach to integrating social value considerations into Synergy's decision-making processes.

In the context of this project, Synergy not only aims to mitigate any negative impacts, as described throughout this document, but to contribute to net positive social, environmental, and economic outcomes for the people of Western Australia. Positive outcomes are partially realised through activities such as social procurement, local employment, social investment and stakeholder engagement.

Social procurement
Social procurement involves making procurement decisions that benefit Synergy and society, by taking into consideration environmental, social and economic impacts over the entire life cycle of a product or service.

Synergy has developed an internal Social Procurement Standard which sets out requirements for incorporating social procurement considerations into all procurement activities. This standard aligns to Synergy's social value framework and the Western Australian government's Social Procurement Framework. Additionally, as a Government Trading Enterprise, Synergy complies with the requirements of the WA Government's Aboriginal Procurement Policy (APP) and Western Australian Industry Participation Strategy (WAIPS).

WAIPS requires Synergy to request participation plans (PPs) from contractors for procurement activities over $1 million in metropolitan areas or $500,000 in regional areas. Tenders above these thresholds require tenderers to submit a PP as part of their response. Tenderers must identify how fulfilment of a contract will generate designed economic benefits and demonstrate the means for provision of a full, fair and reasonable opportunity to local industry. Unless an exemption is obtained, the PP requirement must be included in Synergy's evaluation criteria, weighted at a minimum of 10% of the qualitative evaluation criteria. Synergy has also incorporated aspects of the Western Australian Buy Local Policy 2020 (WABLP) into its procurement processes, including providing mechanisms to source directly from regional businesses and allowing tenderers to apply regional price preferences.

The APP sets a target of awarding four per cent of new contracts or stand-alone purchase orders ($50,000 or more) to Aboriginal owned businesses. Synergy is committed to providing employment pathways and subcontracting opportunities for small to medium Aboriginal owned businesses in the delivery of Synergy contracts. Conditions and targets are attached to applicable contracts to ensure these opportunities are realised. Our second Reconciliation Action Plan (RAP) outlines and advances these commitments to increase Aboriginal and Torres Strait Islander supplier diversity to support improved economic and social outcomes.

In addition to local and Aboriginal supply chain opportunities, Synergy is committed to encouraging procurement from social enterprises and women-owned businesses.

Local employment
Synergy is committed to maximising local employment opportunities while mitigating any negative impacts on local labour draw or skills shortages. Synergy adheres to the Priority Start Policy (PSP), a WA state government policy that applies to Synergy's sourcing activities and contracts for building construction, civil constriction and maintenance with a value of $5 million (including GST).

The PSP supports the WA government's Plan for Jobs commitment to maximise opportunities for apprentices and trainees on all major state government funded building, construction and maintenance contracts. It ensures a sustainable construction trades workforce for WA by increasing the overall numbers of apprentices and trainees in the building and construction industry. Contractors awarded a PSP-applicable contract must meet a target training rate across the combined Western Australian construction trades workforce of their company and all sub-contractors used for the contract.

Social investment
Synergy recognises the importance of social investment in creating positive value for communities. The internal Social Investment Standard outlines requirements for community investment and social purpose partnerships. Social investment initiatives relevant to the project include:

1. Community Giving Fund: An annual program offering grants of up to $10,000 for initiatives that align with Synergy's social value Priorities and positively impact the communities in which they operate. Initiatives in the project area are strongly encouraged to apply.
2. Volunteering: Synergy staff can apply for two days volunteer leave annually. Groups and teams may also volunteer with Synergy's social purpose partnerships, community giving fund recipients, or Synergy spirit charities.

In addition to initiatives which are most relevant to the project, Synergy's social investment activities extend to benefit Western Australia as a whole, including the following:

1. Synergy Spirit: Synergy's employee charity program, allowing employees to make pre-tax contributions to up to four chosen charities. Synergy provides an annual financial contribution to the four charities.
2. Social Purpose Partnerships: Synergy has established long-term, collaborative commitments with not-for-profit organisations such as the STARS Foundation, which aims to improve the health, education and employment outcomes for Indigenous girls and young women in Western Australia.

Stakeholder engagement
Synergy's vision for stakeholders is to provide a consistent, fact-based, and transparent engagement process. To achieve this, Synergy's people need to be proactive, accessible, present, collaborative, and consultative.

Synergy has appointed a highly skilled stakeholder engagement team that supports the future energy projects, including this project. Synergy adheres to the IAP2 (International Association for Public Participation) guidelines, widely considered best practice. The IAP2 Public Participation Spectrum defines the public's role in community engagement programs. It recognises that different levels of participation are legitimate based on various factors, such as goals, time frames, resources, and decision concerns.

The spectrum is applied by Synergy's stakeholder engagement team to this project as follows:

1. **Inform**: Share project details, impact assessments, and benefits with the community.
2. **Consult:** Seek feedback on turbine locations, visual impact, and noise concerns.
3. **Involve:** Collaborate on Mitigation strategies, wildlife protection, and community benefits.
4. **Collaborate**: Work jointly on design, land use planning, and economic opportunities.
5. **Empower:** Involve stakeholders in decision-making regarding project aspects, where feasible.

5. STUDY AREA

The *genius loc*i of place, and the social values of a community, are deeply linked to its specific locality and the social, economic and environmental attributes that drive human activity. Defining the study area assists to clarify this spatial context for both analysis purposes and understanding.

The study area for this assessment sits directly within the Scott River and Blackwood River Catchments area, which cover a total area of approximately 64,276 ha. The catchment areas stretch from Molloy Island to Jangardup Road north-west of Lake Jasper.

Approximately 43% of the total catchment area is farmland which includes dairy, beef, sheep and blue gum plantations. The remaining area of this catchment is comprised of reserves (53%) and unallocated crown land, identified as rich in biodiversity (The Scott River Action Plan 2020).

Figure 3 highlights the current area identified for the location of the proposed wind farm in Scott River. This area, as evidenced by the ariel photographs in Figure 3 and 4, and DPIRD land capability definitions in Figure 15, is an established rural agricultural area, sitting in low lying country between two significant reserves – The Scott River National Park and Pagett Nature Reserve.

The proposed wind farm in Scott River is located south of the Brockman Highway between Scott River Road, Dennis Road and north of the Scott River. This site is being investigated by SynergyRED due to the strong south-westerly winds, that blow during the evening periods and the warmer months when electricity demand is high, the existing transmission line from the Beenup substation, and the pre-existence of substantially cleared land.

The adjacent human populations sit primarily outside this catchment. These include the settlements of Scott River (within the catchments), East Augusta, Augusta, Molloy Island and Kudardup. These communities are governed by the Local Government jurisdiction of Augusta-Margaret River. This jurisdiction is considered the broader community for regional context.

This location is evident in both Figure 3 and 4. Figure 3 shows the proposed turbine locations across land boundaries. Figure 4 shows the total proposed project area overlaid across the aerial photograph of the region. Here, it is evident that the project sits on primarily cleared agricultural land, between forested areas and natural watercourses.

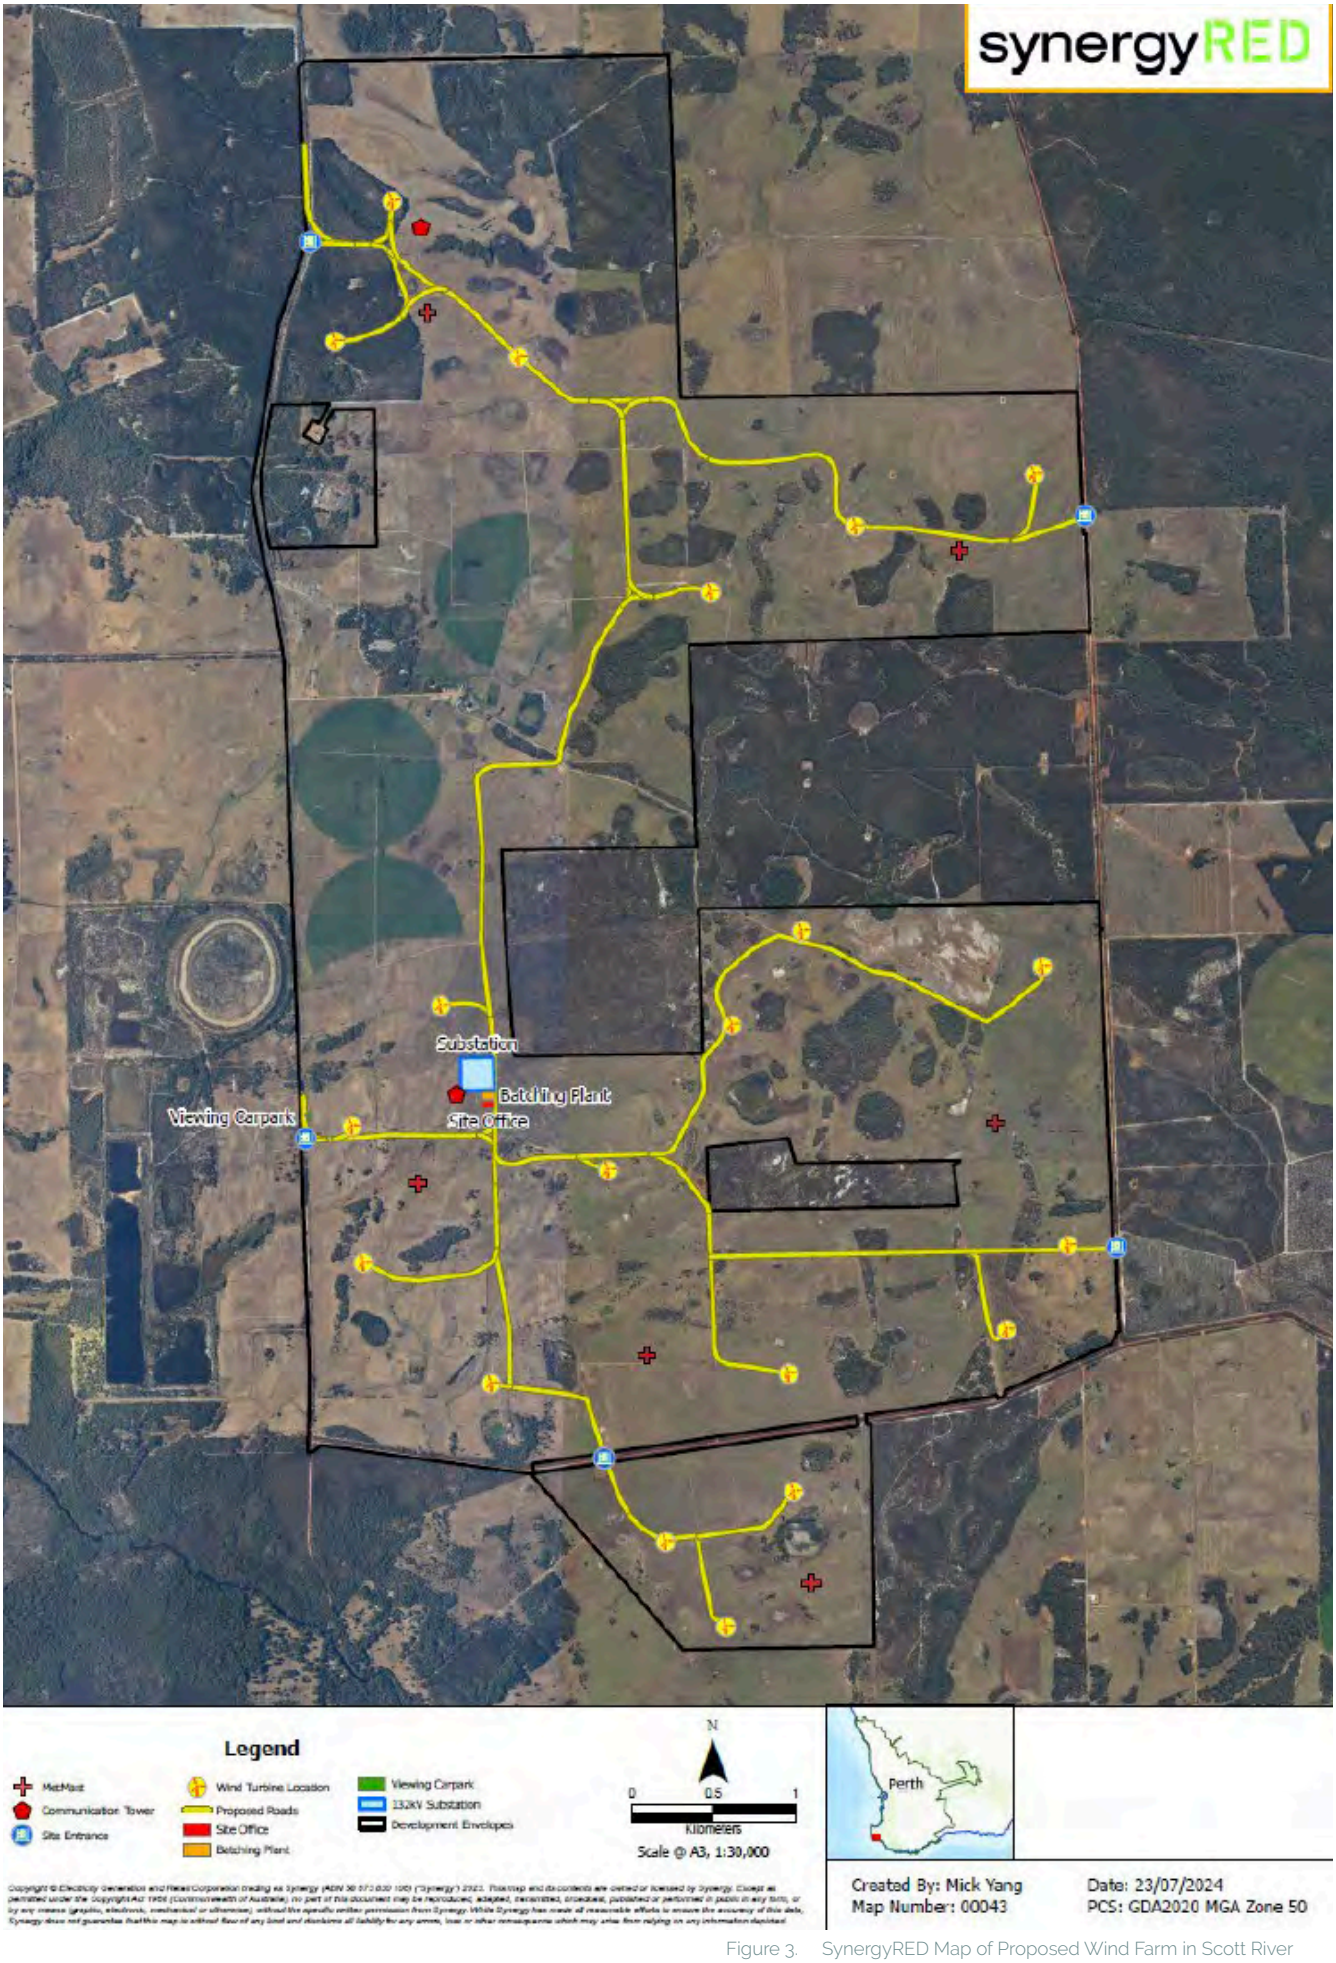

Figure 3. SynergyRED Map of Proposed Wind Farm in Scott River

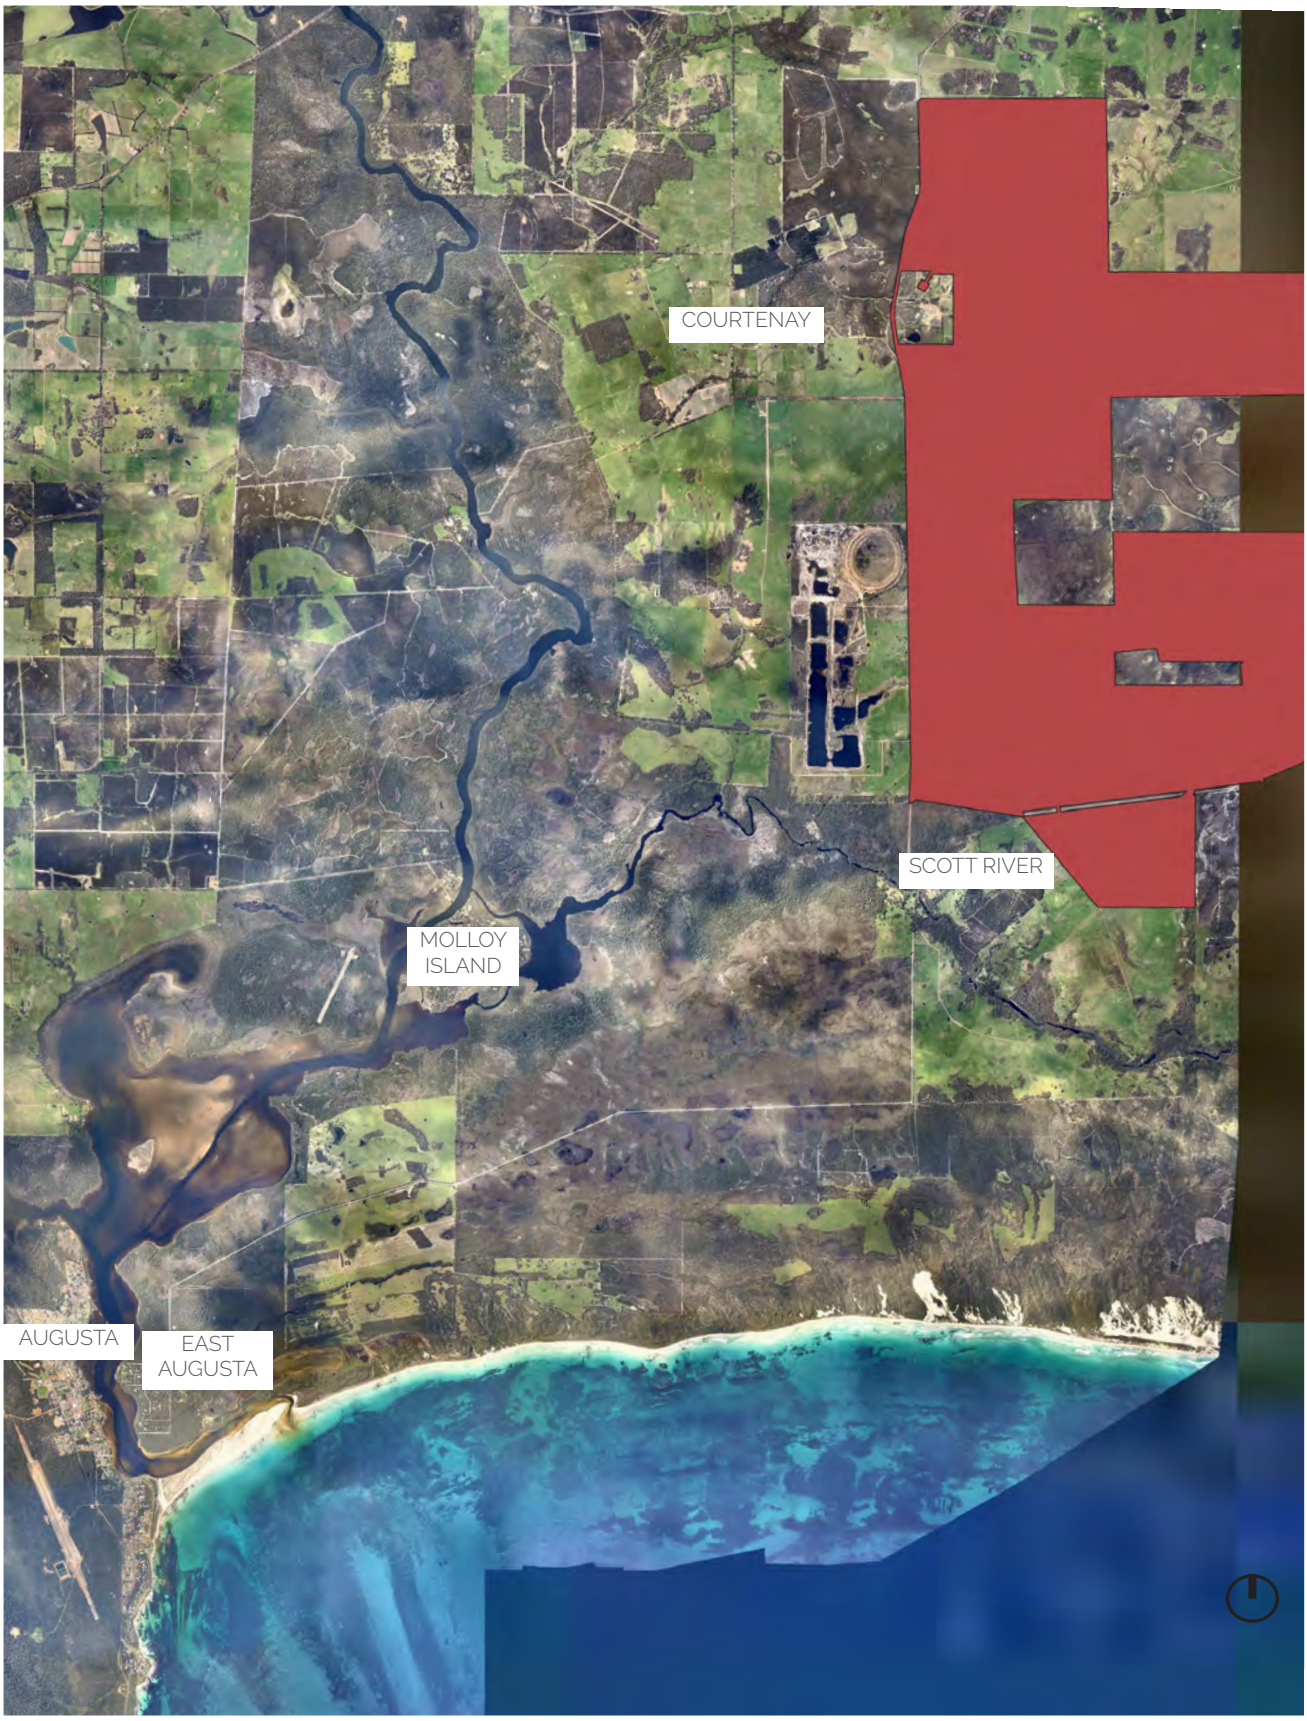

Figure 4. Project Study Area and Identified Communities of Consideration

Scale 1:50000 @A2

6. DESCRIPTION OF SOCIAL VALUES & COMMUNITY ATTITUDES

The Place.ID model of assessing social values and community attitudes tests community perceptions across a series of core social, economic and environmental value indicators/attributes. This enables determination of:

- the most important perceived social values for this region,
- differences in attitudes between different communities, and stakeholder groups, and to
- identify any perceived gaps between the social values identified (as high on the importance scale) and community perceptions in SynergyRED's ability to manage these to their benefit, or detriment.

The Place.ID Social Values Matrix provides a useful overview to set priorities for assessment and decision making. It also sets a baseline in terms of stakeholder confidence that can be measured over time.

The matrix set out as Figure 5, highlights the most important perceived social values to the outside of the chart. All these values are marked by the average score of out of 5, where 1= not at all important and 5=extremely important.

The region's biodiversity of native flora and fauna, water values (such as rivers, wetlands and swamps), unique bird life, preserving what is unique about the area, being able to visit the forest and national parks, environmental conservation and restoration of cleared land, peace and quiet, and being able to see the clouds, horizon and sky were all marked with an average of greater than 4 out of 5. These responses reflect the environmental locality between the nature reserves and water catchments, its isolation and scenic viewpoints.

The Social Values Matrix also shows the community's confidence in SynergyRED's ability to manage any impacts on these social values to their benefit. Generally, an average level of confidence was seen with most values scoring an average of between 2.92 and 3.41 out of 5 (where 1 is not manageable at all and to the community's detriment and 5 is extremely well to community benefit). The lowest scoring social values in terms of confidence to manage were preserving what is unique about this area, unique bird life, peace and quiet and Aboriginal history and culture.

Creation of local employment opportunities, water management and access to the forests and national parks were seen as indicators that SynergyRED was more likely to be able to be managed positively.

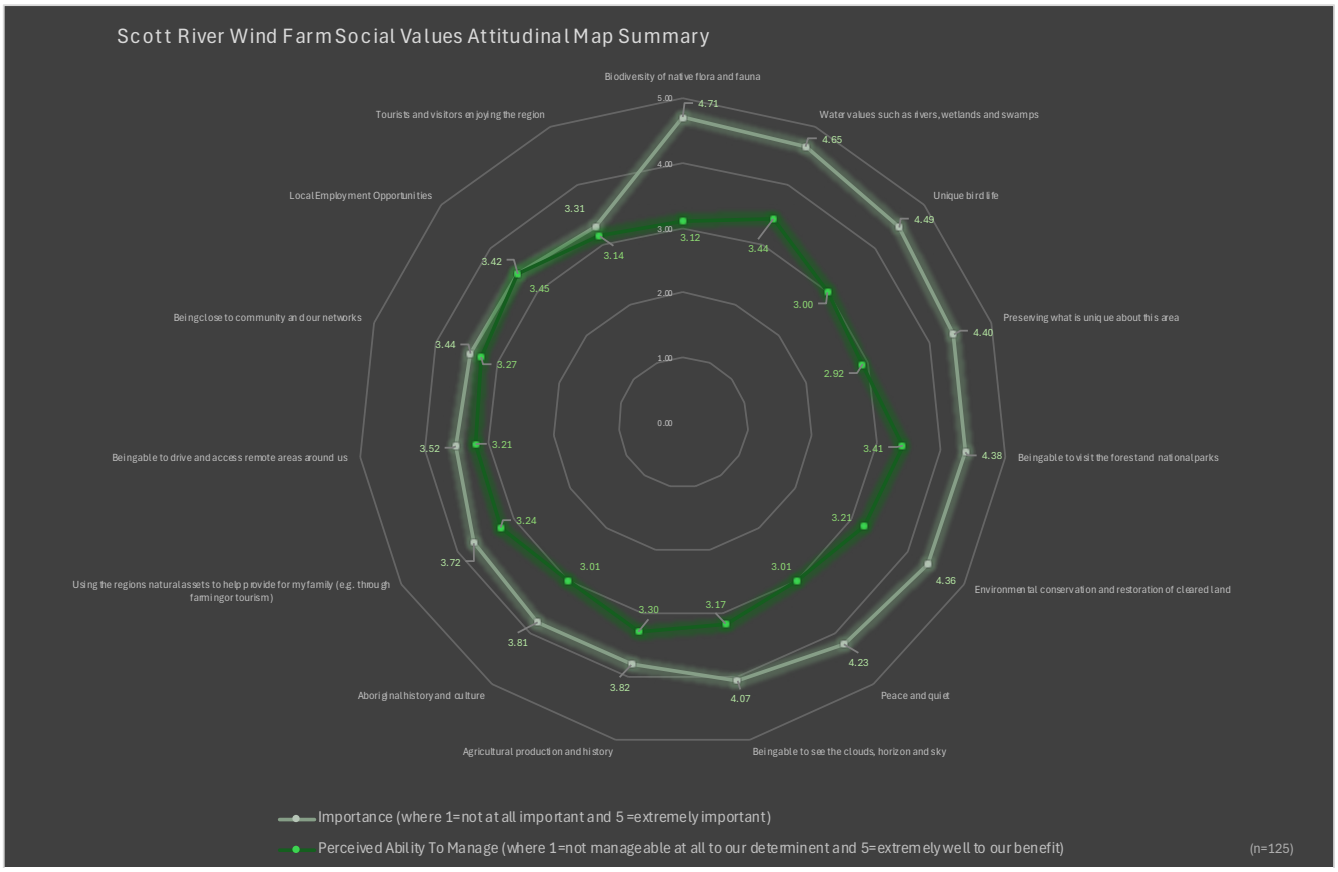

Figure 5. Scott River Wind Farm Social Values Attitudinal Map Summary

6.1. VALUING THE ENERGY TRANSITION

The contribution of the proposed wind farm project in Scott River to a positive energy transition and more sustainable future is its core social deliverable for Western Australia. However, the perceived value of that energy transition by the associated communities within the study area is currently quite a polarising issue, as evidenced in both the qualitative and quantitative fieldwork results.

Half (50.3%) of the quantitative survey respondents were extremely supportive of the proposed wind farm project in Scott River understanding and commenting on its value and need. At the opposite end of this support, were around a third (32.5%) of remaining respondents who were primarily not supportive (rating at a level of support between 0 and 2 out of 10). This is illustrated in Figure 6.

Figure 7 shows how these ratings also differ across the differing communities – with those closer to the project showing a lower positive rating than respondents who lived further afield.

Those who fully support a transition to renewables voiced support for SynergyRED's proposed investment in renewables as part of the decarbonisation journey and saw this project as an important part of this transition with strong sustainable benefits. Those who reject climate change as a principal were vocal in their position with similar comments being consistently cited, for example there is "*no need for renewable energy..this proposal represents an unnecessary investment, power will be further unreliable, inconsistent and is driven by a piece of large physical infrastructure that is a nonrenewable resource with no clear link to recovery of cost.*" (IDI, 2024)

In addition to the transition, access to a reliable power source for the future was raised as a significant local issue driving perceptions. For the remote communities of Scott River, Molloy Island and East Augusta obtaining access to a consistent and suitable power source was cited by both the local government representatives, community members and landowners. This was evident in the community desire for a direct and tangible offset benefit of the energy transition at a local level. Suggestions included requests for a rebate, or actual uplift to local power infrastructure direct to residents and landowners in the region as an offset for the installation of the wind farm in the area.

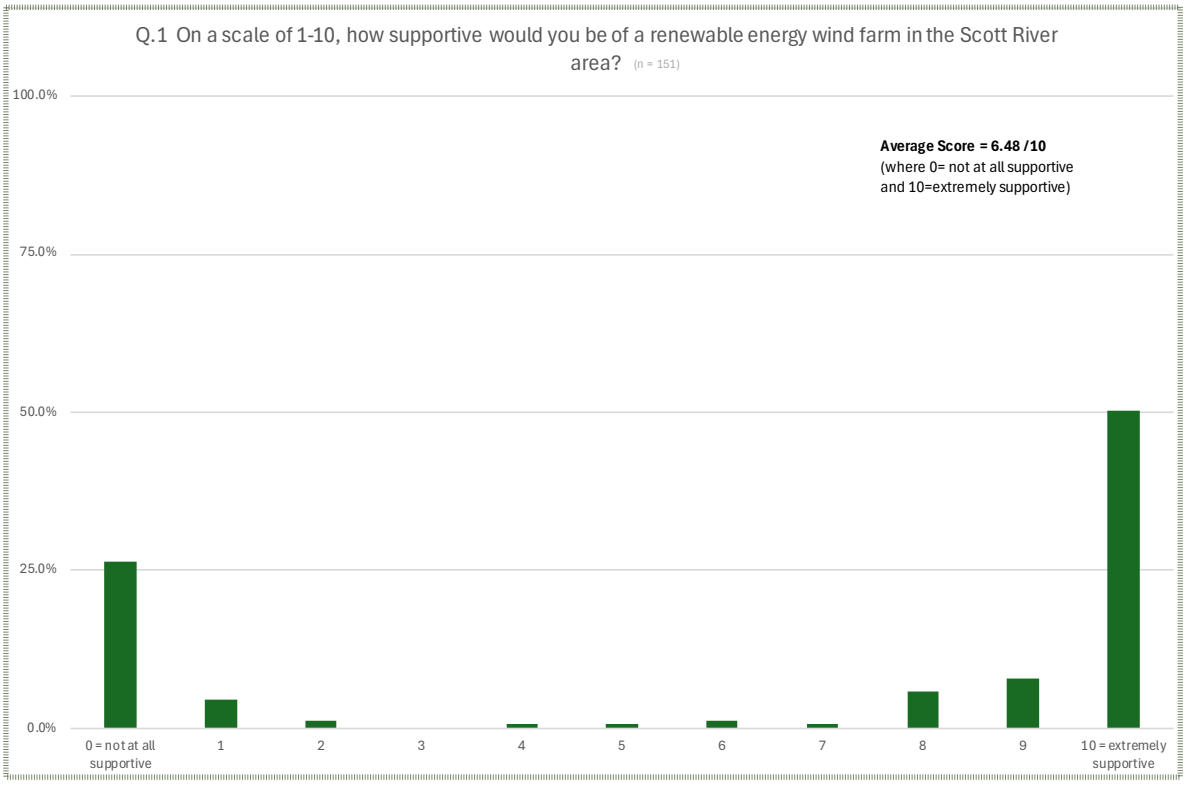

Figure 6. Scott River Wind Farm Overall Support for the Project

"This region produces the milk, the beer, the wool, the timber, and produce for the whole State, producing the electricity from the wind around us creates a positive warm feeling. It's about putting back and sharing the resources around us." (IDI 2024)

"This community is a small footprint producing a lot for the State, the power requirements should be delivered to benefit this community, rather than us trying to fuel the whole State."
In-depth Interview (IDI) Participant 2024

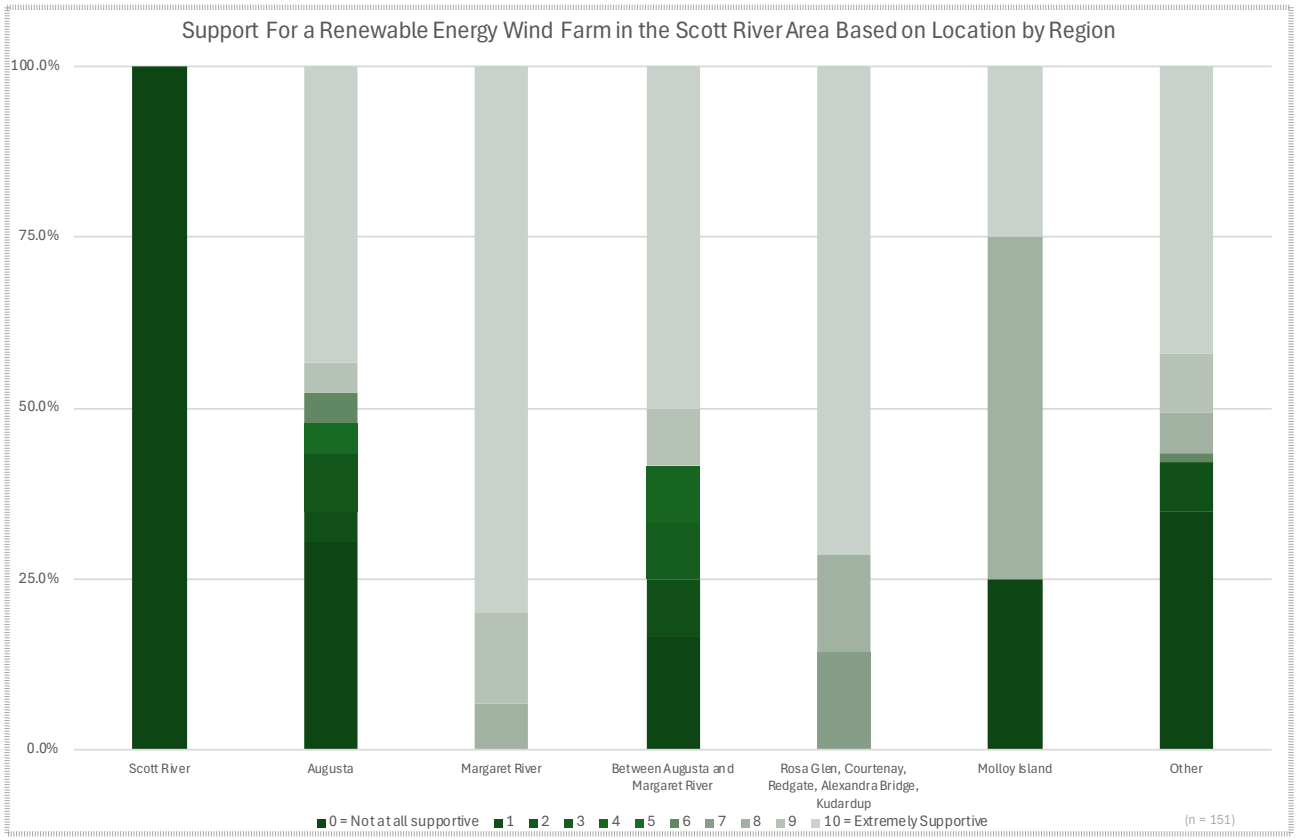

Figure 7. Scott River Wind Farm Overall Support for the Project by Locality

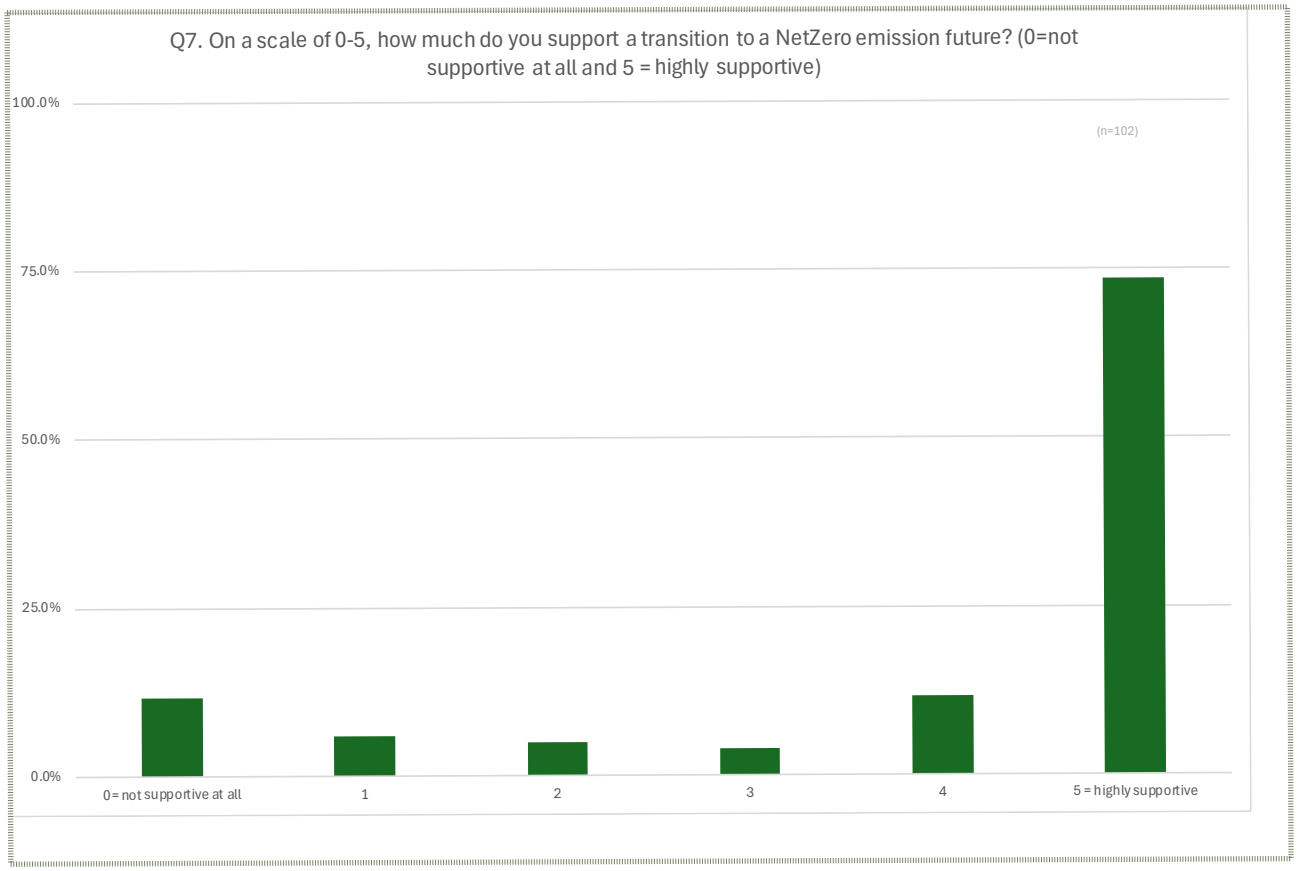

Figure 8. Support for a NET Zero Energy Transition

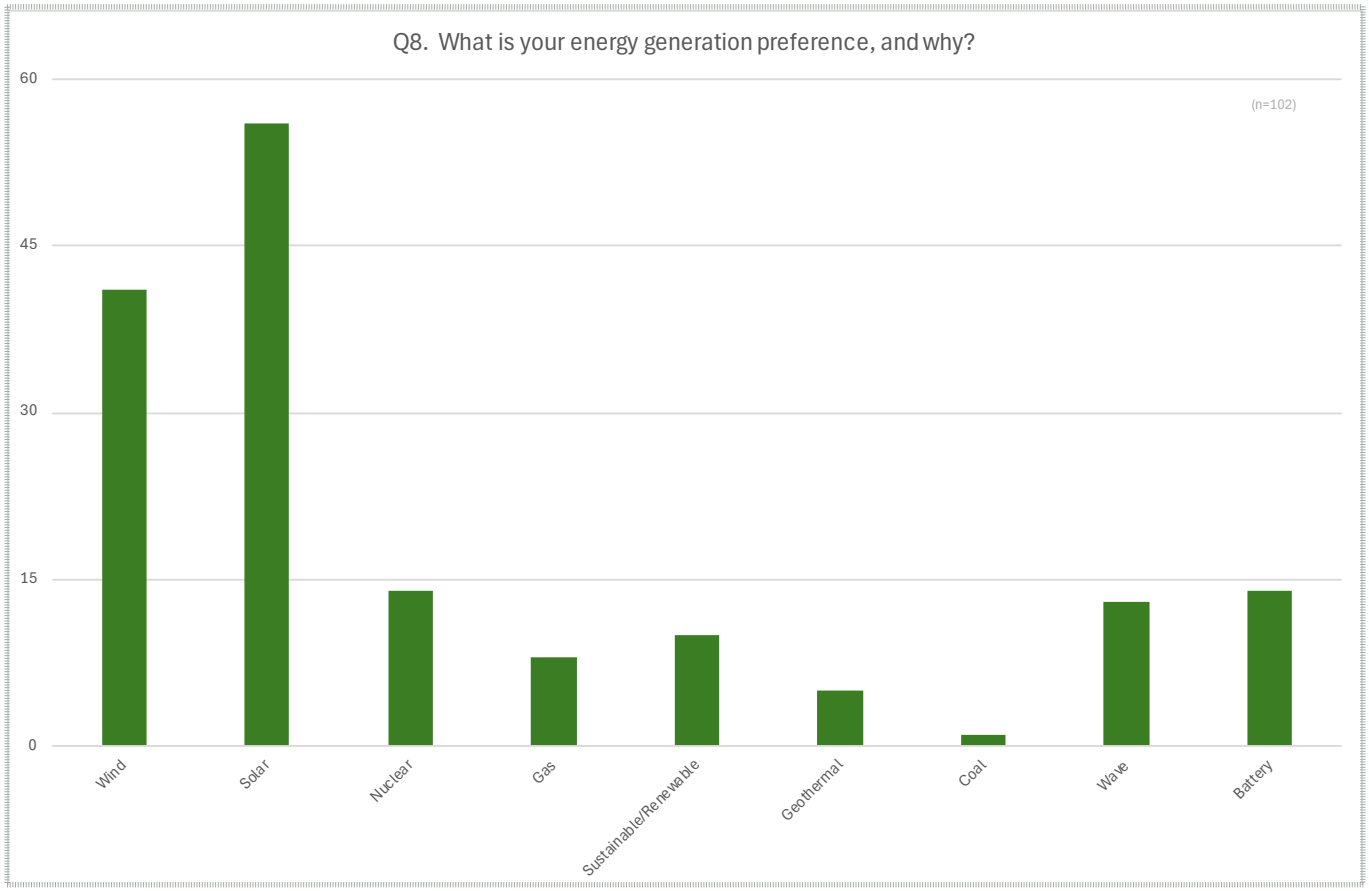

Figure 9. Overall Energy Preferences

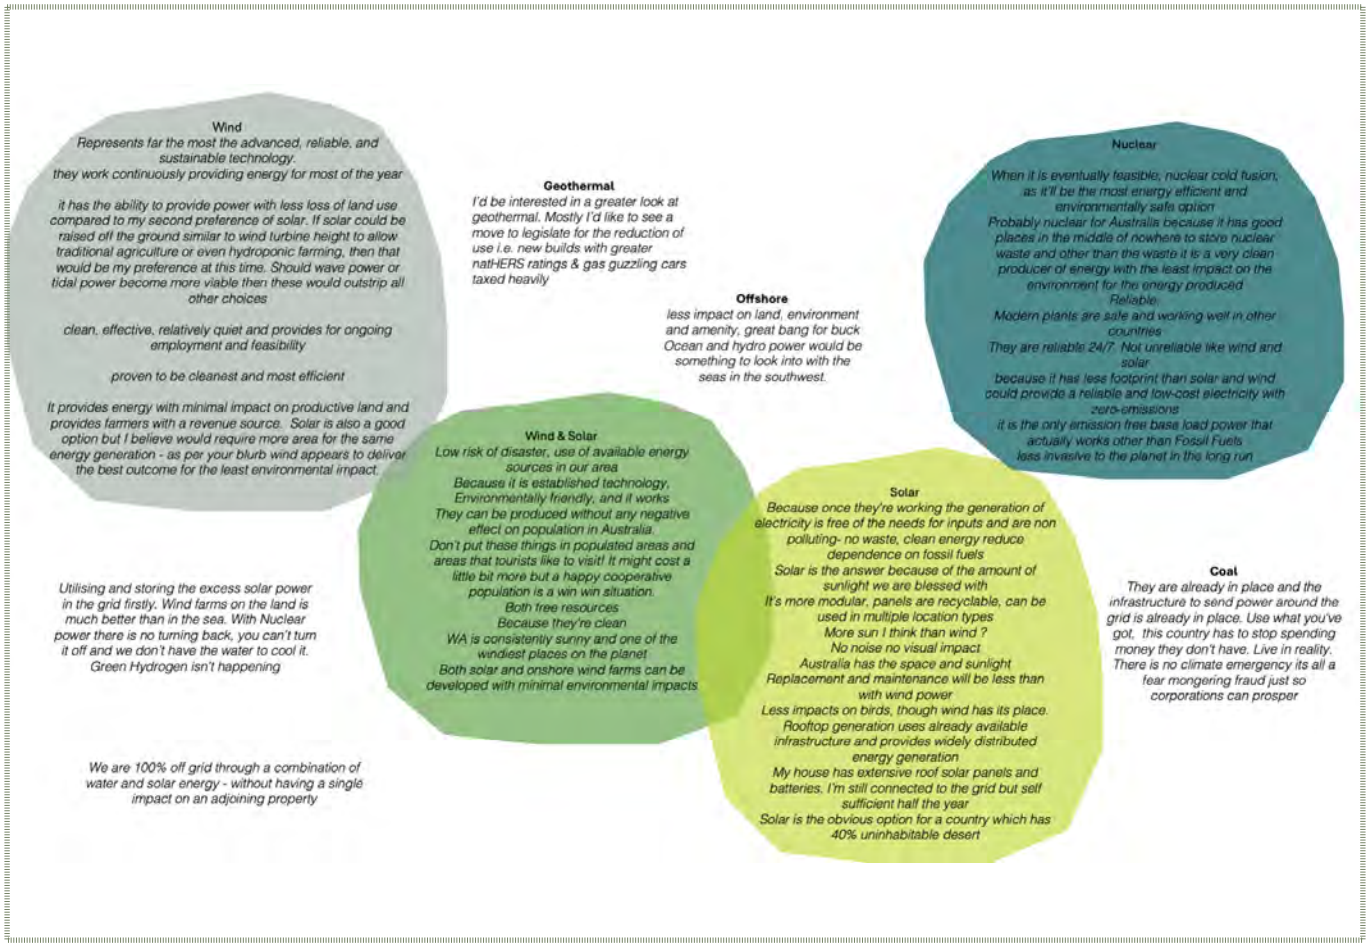

Figure 10. Reason for Energy Preference

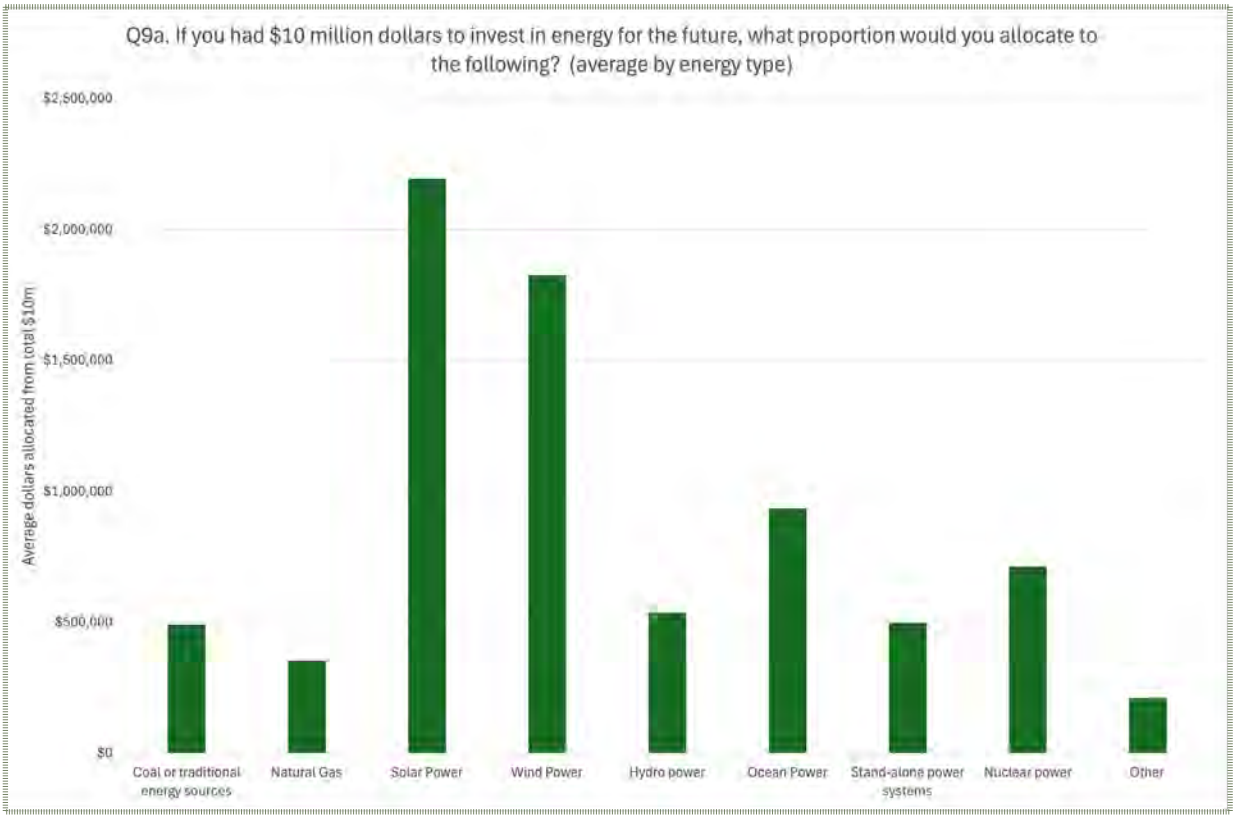

Figure 11a. Investing in Energy for The Future

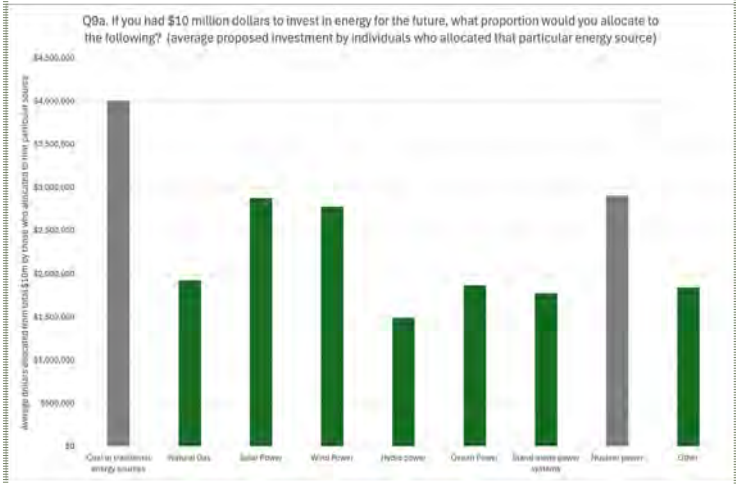

Figure 11b. Investing in Energy for The Future

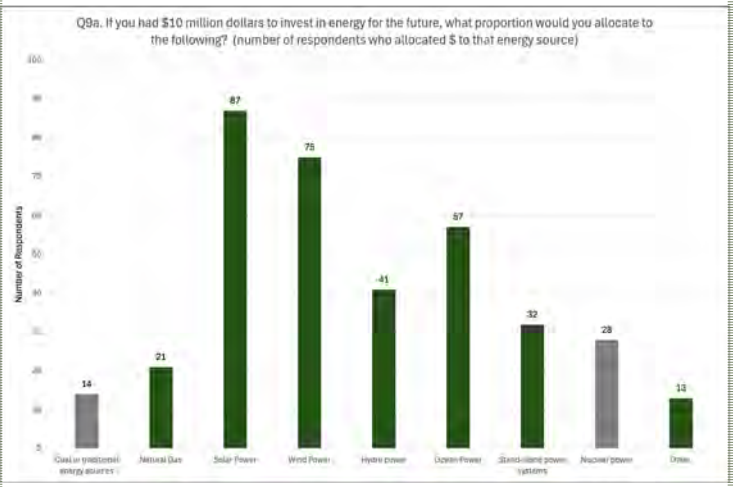

Figure 11c:. Investing in Energy for The Future

Note: Figure 11a-c were designed as an illustrative exercise to highlight preferences for energy sources for the future and consider the impact this preference had on attitudes. This was determined by requesting an allocation of an amount they would personally invest in a particular energy source from a total of $10 million.

Figure 11a shows the results to this question by the average imaginary dollars allocated to each energy type across all respondents.
Figure 11b refers to the average dollars allocated by individuals who had allocated some imaginary dollars to that particular energy source.
Figure 11c illustrates this number of individuals who chose to allocate imaginary dollars to the particular energy source.

The figures show a strong preference for investing in renewable energy for the future, however this preference is often spread across a number of different renewable energy sources - noted as "*not putting all eggs in one basket*" (IDI 2024). While those who chose to invest in more traditional energy sources, such as coal and nuclear, tend to allocate their preferred investment dollars exclusively to these traditional sources.

6.2. THE COMMUNITY – POPULATION & DEMOGRAPHICS

"The community here is changing a lot, particularly in last 10-20 years, it is much more diverse, a growing population, academically trained, less willing to listen to outspoken opinions or aspects of those opinions that are more practical." (IDI 2024)

The demographic profile of a community and the movement of individuals in and out of a community is a strong determinant of community stability, cohesion and social values. The Augusta-Margaret River region has experienced an 18% growth in population between the ABS Census in 2016 and 2021. This has implications for not only infrastructure, accommodation and service provision to meet this growing demand, but also how the community define and see themselves, their lifestyle and their sense of cohesion.

Scott River itself has a small and relatively isolated population of around 46 residents. The area, originally populated by the Wardandi and Bibulumin/Piblemen Peoples of the Noongar Nation, was colonised around 1830 by Thomas Turner and other colonial settlers. Many of these earlier settlers abandoned the region due its isolation (Augusta Historical Society 2001).

Many of the current Scott River landowners are the decedents of post war allocations, and the subsequent drive into the region for agricultural industry development during the 1960s and 1970s. During interviews the current landowners note that their families are intergenerational farmers whose identity is very much linked to the nature of how they derive their income i.e. dairy and beef grazing, plantation timber and horticulture.

Currently each land holding in Scott River houses an average of 3-4 accommodation units on each property. The residents tend to be members of the landowners' families or from nearby properties, representing up to 35 total contractor and permanent employees. (IDI 2024)

Adjacent to the Scott River region sit a further two relatively isolated communities in East Augusta (population 41) and Molloy Island (population 163). These communities have around 54 and 150 permanent private dwellings respectively. Molloy Island is only accessible by a local barge, which contributes to its isolation. The island is said to contain around 275 rural blocks (around 225 houses, half of which are not permanently occupied) (IDI 2024).

Unlike Scott River residents for these two adjacent communities, their identity is not derived from how they draw their income, rather their choice of lifestyle in a remote part of the world. This lifestyle, the positive climate and the natural environment are also said to be driving the population growth across the broader region, as evidenced in the quote below from the qualitative fieldwork.

"The sense of community and its connectedness is so important. You see this through high levels of volunteering, the engaged community from one end of the spectrum of views to the other, and the diversity of the community from so many international travellers, migrants, families, and all those people who come, attracted to the natural beauty of this region." (IDI 2024)

This emphasis on the natural environment, its climate, and the lifestyle it offers is evident in the high importance placed by respondents on environmental values such as water, forests, flora, fauna and preserving what is unique to this area, as illustrated in Figure 5. The close link between social values, identity and the natural environment are explored in next section. This link has implications for both SynergyRED's project decisions, but also the projects engagement strategy, its perceived transparency, and the communities' expressed desire for involvement in decision-making and environmental studies/monitoring/activity.

Across the inlet, the township of Augusta is the closest regional center, home to around 1,211 individuals. The profile of Augusta shows a community of primarily elderly residents (with 42% of the population aged over 70 years), and a slightly higher proportion of female residents than the other townsite communities. This community is described by its residents as "*community-minded, volunteer-orientated and willing to work together – whether it is to fight a fire, join a club activity or fixing up the main street. It is just the way they are!*" (IDI 2024).

It is clear, from the in-depth interviews and qualitative feedback in the publicly available survey, that there are expectations in the Augusta community around active participation, whether that is seen to be part of the community through the establishment of an office in the town or building close networks. These expectations are relevant considerations for SynergyRED's community giving and employee volunteering programs.

The age and gender profile, the growing population and associated pressure on local infrastructure, and the industries from which the population derive their income, are also an important consideration for project decisions around accommodation for the construction workforce.

Table 1 provides a summary profile from the latest census data of the communities under consideration, based on the full profile provided as Appendix 2. Figure 12 illustrates the population density across these potentially impacted communities. This figure shows a low population density around Scott River, and surrounds, with population density concentrated at Molloy Island, Augusta and Margaret River.

Table 1: Summary of Population and Demographic Indictors for Potentially Impacted Communities

	Scott River	East Augusta	Molloy Island	Augusta (townsite)	Augusta. Margaret River. Local Governmen t Area	Residents identifying as Indigenous with the Augusta-Margaret River Local Government Area
Total Population	**46**	**41**	**163**	**1,211**	**16,791**	**231**
Median Age	34	52	63	63	42	26
Gender Ratio (M: F)	1: 0.9	1: 0.8	1: 0.9	1: 1.1	1: 1	1: 1
Median Personal Income (weekly)	843	474	486	541	785	599
Median Family Income (weekly)	1,874	1,125	1,075	1,145	1,871	1,609
Median Rent (weekly) [1]	$200	$150	$275	$280	$350	$350
% Unemployed	9.4%	12.5%	4.0%	1.3%	2.8%	7.8%
Permanency - Lived at same address 5 years ago	46%	41%	90%	59%	58%	40%
Average Household Size	1.9	2.1	1.7	1.9	2.5	2.9
Indigenous %	0	0	0	1.0%	1.3%	

ABS 2021 Community Census Data

Notes:

- Forty-Two Percent (42%) of the population of Augusta are aged over 70 years.
- Domain Real Estate Data shows a year-on-year annual increase in median rentals of 19.3% in the Augusta-Margaret River Region, with March 2024 median rent sitting at $680 per week.

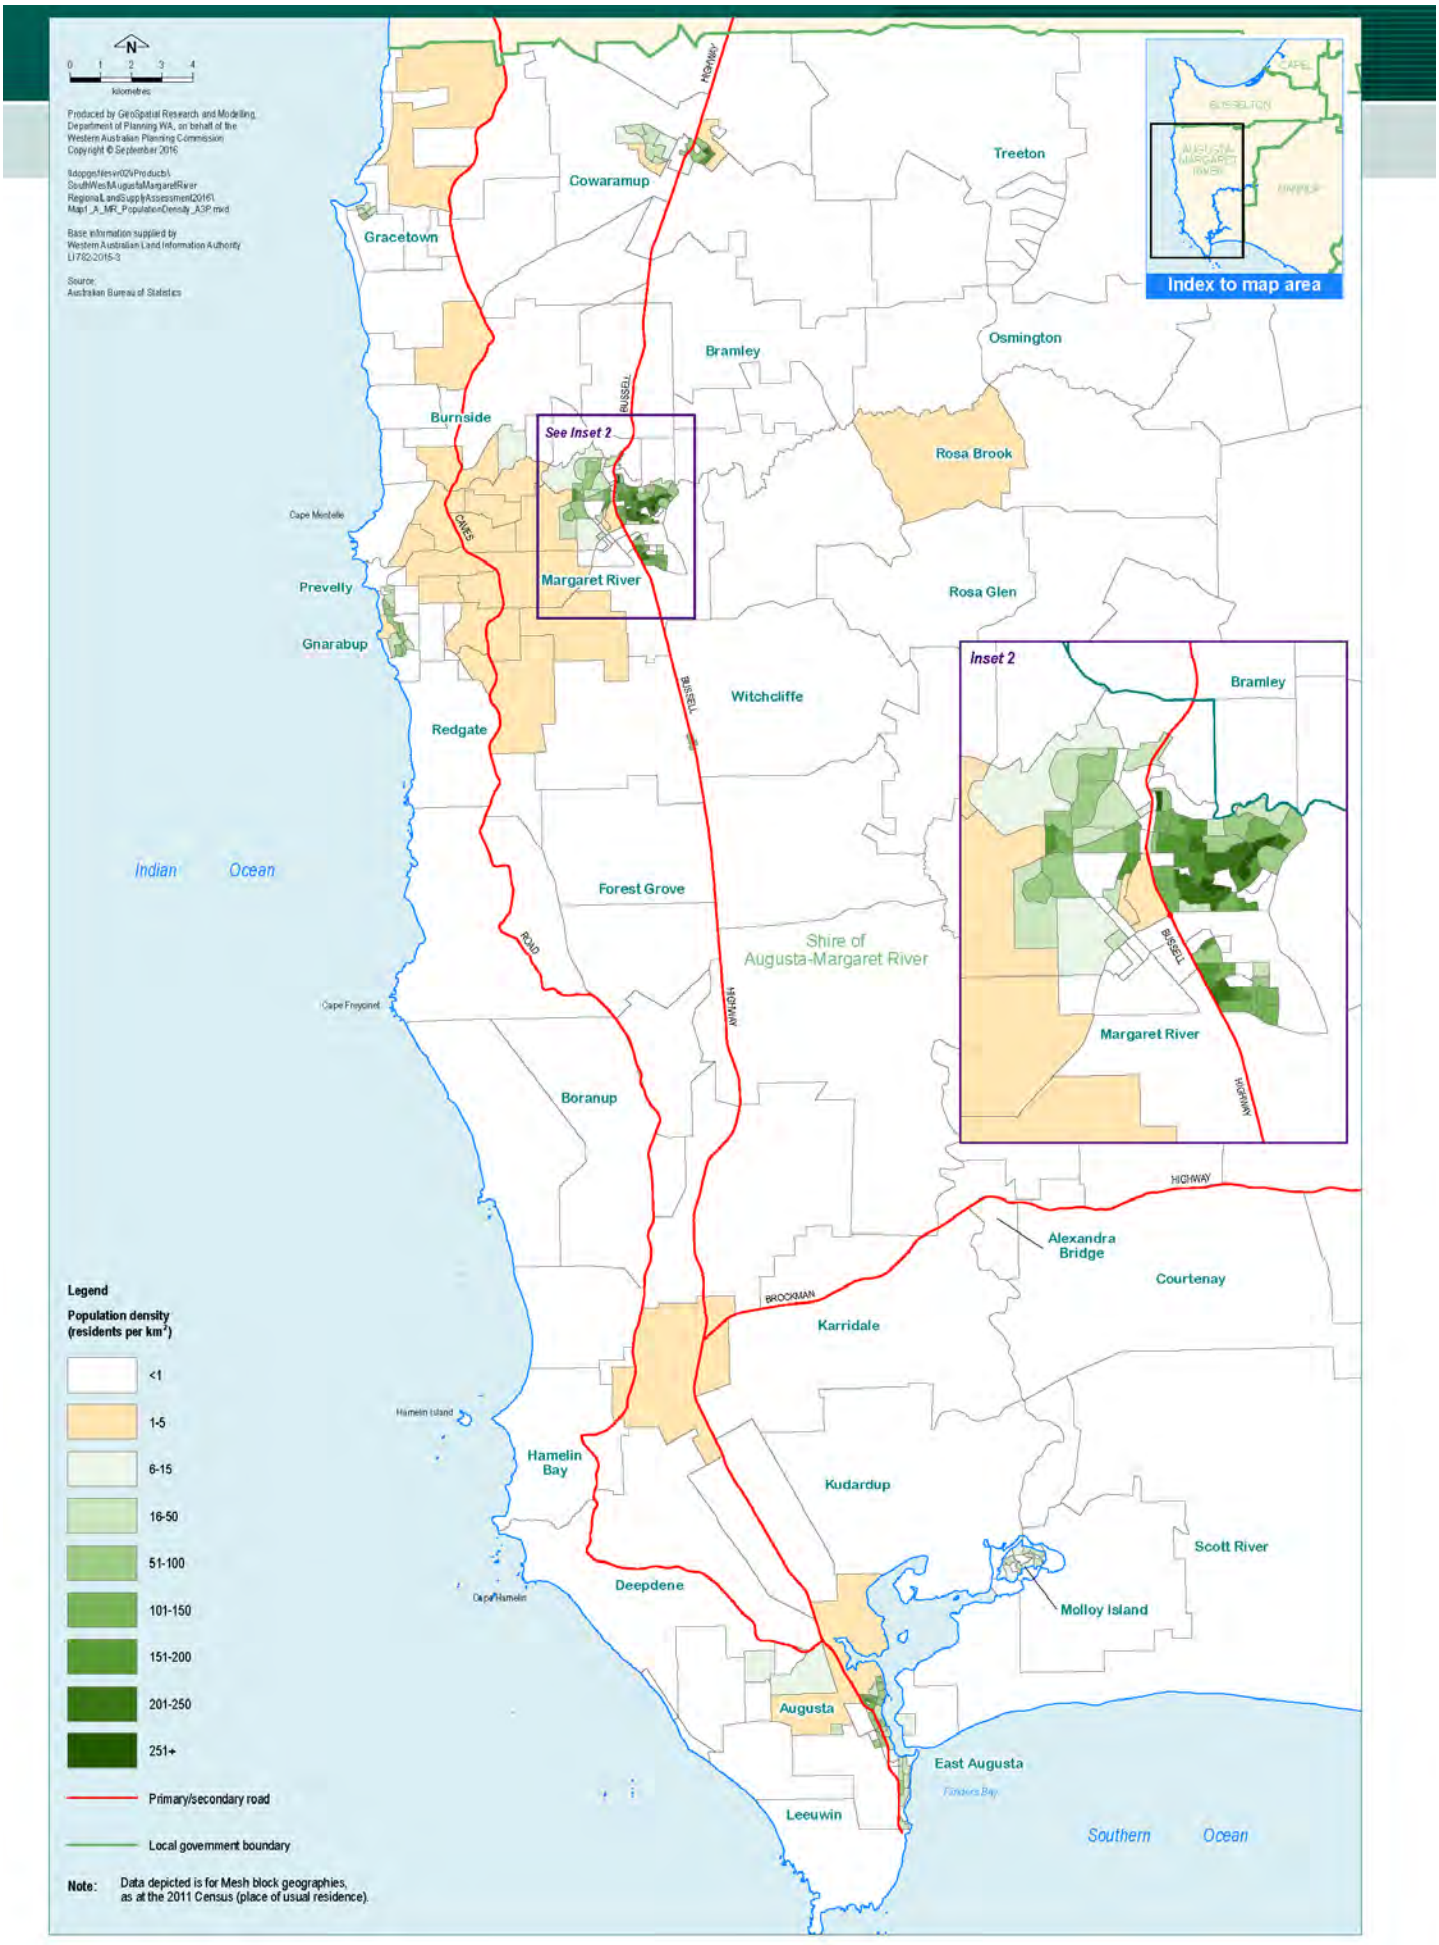

Figure 12. Map of Regional Density

6.3. ENVIRONMENTAL VALUES

"The environment out here is magic, quiet, beautiful waterways, where there is nothing but the sound of birds, you can't change that." (IDI 2024)

The International Association for Impact Assessment notes that good practice of social impact assessment accepts that social, economic and biophysical impacts are inherently and inextricably interconnected. This report considers environmental values and sense of place in the context of how they feed into the social identity of the human population, as discussed in Section 6.2, the way the individuals within the community derive their income and the opportunities to experience nature or participate in cultural and recreational activities.

In the case of this region, the environmental values contained within the natural landscape, its forests, flora, fauna and water networks are cited as the important values for this human population, and drivers of both attachments to place and visitation. This is evident in the secondary research, qualitative and quantitative fieldwork. The high level of attachment to these values indicate that any actual or perceived impact on these environment values will be the most challenging for the project to manage into the future.

The compatibility between particular social and/or ecological goals will have distributive implications for whose interests are realised in environmental decision-making, particularly where the perceived risks to producing goals are not actually aligned with the nuanced aspirations of the community. This process of bounding social aspirations into impacts is an inclusive and deliberative exercise to provide evidence against the values of a human community to make claims about which people's priorities are being represented (or not) in environmental decision-making.

For example - the value of a river for swimming, relates to both the social and biophysical attributes of a river, such as water clarity, water depth, and the number of swimmers per year, the tourists it attracts, the promotion or recognition of it when describing the region as part of its identity, and the sense of visual amenity or calm it provides. Any actual environmental impact on the river must be considered from all these social perspectives, and not just the biophysical. This example from the International Association for Impact Assessment, is relevant in both the role and perceived value of water, the views and landscape, the forests, the flora and fauna of this region in terms of tourism visitation, calm and peace and quiet provided to its residents and visitors, and sense of place for both Indigenous and non-Indigenous community members.

The broader region is situated within the Southwest of Australia, which is one of 36 internationally recognised biodiversity hotspots (Shire of Augusta Margaret River Annual Report 2024). A biodiversity hotspot that has at least 1,500 native vascular plant species found nowhere else on Earth, with around 70% of this original vegetation already lost. The Shire of Augusta Margaret River's Community Strategic Plan 2033 (2015) identifies "*valuing the natural environment*" as one of its key goals with a subsequent outcome being "*healthy waterways and foreshores*" and a key strategy identified as developing "*partnerships to maintain and improve the quality of beaches, waterways, rivers, and wetlands*" (AMRS, 2015 p. 20). Qualitative interviews with the Shire and other stakeholders confirm the critical environmental values of the region as its biodiversity (flora and fauna), its fertile soils, its waterways and wetlands and the way these contribute to a unique sense of place. The adjacent Shire of Nannup's Community Strategic Plan 2017-2027 (Shire of Nannup 2017) also identifies a key focus action item around protecting "*our amazing nature, magnificent forests, managed bushland, rivers, agriculture and our pristine coastline*".

The localised environment of the proposed wind farm in Scott River consists of predominantly undulating to near flat land that has been cleared for agricultural use. However, it is also known to contain a State and Nationally listed Threatened Ecological Communities, known as the Scott River Ironstone Association, that will need to be managed, primarily along the road reserves and in some small clusters on private properties. This is discussed further in Section 6.3.2.

The local area's geomorphic wetlands, ironstone floral communities, rivers and waterways are directly valued by this community and provide a level of benefit in each of the traditionally identified eco-system services. This is despite the area's remoteness and the shared understanding of the flow-on effects or endpoints, as evidenced by the secondary research, qualitative and quantitative fieldwork.

The legacy of the BHP Beenup Titanium Mineral Sands mine is evident in its profile among participants in the qualitative and quantitative fieldwork. In some ways, it appears to have raised understanding of the natural values in the region. However, the short-lived mine has also created some skepticism that significant developments could have a greater impact than initially anticipated or shared by the developer. For many fieldwork participants, it is cited as a cautionary tale of misunderstanding the area's acid sulfate soils and changing market conditions following significant infrastructure construction, or investment.

The Beenup Case Study on the restored wetlands, established in collaboration with the WA Botanical Gardens and Park Authority, Syrinx Environmental, and the community representatives that were part of the Beenup Consultative Group, draws attention to the localised natural environment in Scott River, its wetlands and bird life. This case study points to the opportunity to create values following the negative impact to the local ecosystem created by the mine construction and associated infrastructure (Meney, K et al 2023).

6.3.1 WATER

"From the cooling effect of the Southern oceans to the surface water that makes our soils rich, to the ground water and aquifers, and the inlet and rivers, water is what makes this region so special." (IDI 2024)

Over three quarters (77%) of respondents in the online survey rate water values, such as rivers, wetlands and swamps, as extremely important. This was the second highest importance score in the online survey results after biodiversity.

The qualitative fieldwork indicated that this is being driven by an increased recognition of water as a critical resource in a drying climate, a noticeable drop in ground aquifers "*that just aren't recharging*" and exacerbated attention across the recent dry summer that has seen water being ported into new subdivisions, like Witchcliffe, and localised heath and shrubland being so impacted.

Water is seen as both a natural asset and an important resource for both the local community and the associated agricultural activity. The Scott River and its associated water catchment is cited in the secondary research, qualitative and quantitative fieldwork as a significantly high environmental value in terms of provisioning, regulating, cultural and support services.

The DPIRD 2001 report notes that these areas across the broader Scott River Plain are highly valued for the diversity of functions and values that they provide including the provision of habitat for flora and fauna, biofiltering of sediments and nutrients, flood mitigation, groundwater discharge and erosion control and form corridors that link areas of native vegetation with conservation values (DPRID 2001).

Culturally, the waterways of the region hold significant attachment to the local Indigenous, Traditional Owners and non-Indigenous residents. The waterways serve as sources of amenity, cultural recreation, and home to the natural values of flora and fauna that are consistently rated as high on the importance scale of social values in the region.

The proposed location for the project would be in a high-water table location, subject to seasonal inundation. There is an expressed concern around potential failure of footings which is seen to potentially cause infrastructure failing and subsequently impact access to agricultural properties in the region.

Local landowners suggest dewatering maybe needed during construction to install foundations. They gave examples of fence posts requiring installation in waterlogged soils requiring a depth of 3-4m.

Water is an expressed emotive issue for the local communities, and a detailed water management plan and associated considerations will be required for the project to address this environmental value moving forward.

6.3.2 FLORA

Biodiversity of native flora and fauna received the highest impact score in the quantitative online survey, with 78% of respondents citing it as 5/5 extremely important. In addition, when considering the gap between how important the attribute is to the community and the perceived ability to manage any negative impacts, this gap was the largest of all the indicators assessed.

In the area, there are three vegetation associations (open Jarrah, Marri, Paperbark woodlands, sedgelands/grasslands and heath) with less than 30% of their pre-European extent remaining. As noted in Section 6.2, the Scott River Plain contains two Threatened Ecological Communities, that being the Scott River Ironstone Association Threatened Ecological Community, and the Federal Coastal Saltmarsh Threatened Ecological Community (also a State Priority Ecological Community - and one Priority Ecological Community (salt marsh).

Ironstone occurrences tend to be along the roadsides or on private properties across Price Road, Payne Road, Tutunp Road, Oates Road, Williamson Road, Dennis Road and Governor-Broome Road (Groundwater Consulting Services 2008).

The ironstone communities are closely related to groundwater. The periodic inundation prevents locally occurring plant communities from growing, and results in the specialised community having dominance. The major threats to the community are vegetation clearing, grazing by introduced herbivores, weed invasion, hydrological change, too frequent fire, and dieback disease caused by Phytophthora species (DBCA Facts Sheet).

Additional threats include pumping of groundwater that induces groundwater levels to fall in the aquifer beneath the ironstone, and changes in water quality (salinity or contaminants) in areas up-gradient from a community, such that poorer quality groundwater flows beneath the community (Groundwater Consulting Services, 2008 for Department of Conservation and Land Management).

Vegetation and biodiversity are a key value held by survey participants. Any potential impacts to these values should be a key priority for the project to consider and manage.

"We have to do our best to preserve what little is left, and a significant amount of what is left is on the private properties in Scott River." (IDI 2024)

6.3.3 SOILS

Fertile soil is a critical issue for the local community, and the success of their agricultural pursuits in Scott River. Much of the Scott River Coastal Plain is identified as having a high to moderate risk of Acid Sulfate Soils, occurring within 3m of the natural surface.

Although Acid Sulfate Soils are naturally occurring soils, when they are disturbed and exposed to the air, they can cause issues associated with acidification. These soils are commonly found in low-lying land bordering the coast or estuarine and saline wetlands and freshwater groundwater-dependent wetlands throughout Western Australia.

This issue was raised in both the qualitative and quantitative fieldwork, with suggestions to give due consideration to the peatland areas, water table and soils, for access road design, foundations, drain blocking and re-wetting areas.

The depth of a wind turbine foundation is dependent on soil conditions, geotechnical assessment and design requirements, but is likely to be approximately five metres deep. Anecdotal evidence from local landowners is that this depth is likely to be below the high-water table, and close to the swamp and valley floor.

"The fertility of the local soils on the Scott River Coastal Plain is what has drawn many agricultural landowners to the region and driven the attention around more intensive horticulture and agriculture in the region." (IDI 2024)

6.3.4 FAUNA - BIRDS & BATS

"So many critters out there, there are those tiny sugar possums, the plovers, the black swans and all those wetland birds." (IDI 2024)

The online survey highlights the importance of local fauna to the community identity and sense of place – in particular concern for birds and bats were highlighted by interview respondents. Seventy percent (70%) of respondents in the online survey cited the unique bird life as one of the most important attributes of the Scott River Region, rating it 5/5 on the importance scale.

Attachment to local fauna is cited as an important social value for the community, and local conservation groups in the area. The Scott River Action Plan also highlights the importance of protection of local fauna within the study area to maintaining a sense of place. Some 26 species of fauna are listed as threatened, priority or under protection within the Catchment. Threatened and priority fauna species in the area, as referenced in The Scott River Action Plan, include three Black Cockatoo species, the Rainbow Bee-eater, the Australian Fairy Tern, the Western Ringtail Possum and the White-bellied Creek Frog.

There are several local community and conservation action groups within the region dedicated to the protection of black cockatoos and any potential impacts on these species, and others, and this will need to be managed carefully.

Feedback from the two interviews with Bird Life Australia scientists note that impacts of wind turbines on birds will depend on the surrounding habitat complexity, typography, wind flow, arrangement and nature of turbines and the associated species in the area (IDI 2024). These are currently being explored by SynergyRED in independent Environmental Impact Assessments, and some suggestions for mitigation from Bird Life Australia have been provided in Section 8.7.

6.3.5 FIRE

Concern over fire in the Scott River area was raised in both the qualitative and quantitative components of the study. Reference was made to the area being a fire risk area, with references to the 1961 fires, and losses also experienced in the 1986 and 2018 fires. The low lying sedgelands, cleared paddocks and dry grasses are seen to exacerbate fire spread and fuel load. Access for water planes during a fire incident and storage of water onsite were raised by not only the local fire brigade members but also other participants in the qualitative and quantitative fieldwork.

"Fire roars through those plains and flatlands, we need to understand how close we can get... the strip between the River and the Turbines will be important to ensure we can get air support in close and have permission to fight fires in that low shrubland if we need it." (IDI 2024)

6.3.6 SENSE OF PLACE

Sense of place is defined by "the lens through which people experience and make meaning of their experience in and with place." It can refer to positive bonds of comfort, safety and wellbeing engendered by a place, a home and a dwelling, as well as fear or dysphoria in other contexts. It also includes the distinctiveness or unique character of particular localities and regions" (Foote, K, Azaryahu, M 2009).

As noted in Section 5 and Section 6 the qualitative and quantitative fieldwork shows that the draw to the immediate proposed project area is the agricultural activity, along with its remoteness, silence, its flora/forests, fauna and its quiet water. Its flatness, openness and wide skies are a significant part of the unique character of place. For some interviewed, this openness does create a sense of fear or isolation, but in the main those who call it home are attached to this social value. These are similar attributes found amongst the residents surveyed from Molloy Island.

For those in the larger community centres, such as Augusta, the sense of place described is more closely associated with the people, the community cohesion and activities. The clubs, the ocean for swimming, or watching whales, the inlet for fishing and boating, the built form, the places that people gather, its colonial history and the forests for driving through or adventuring were all mentioned as important social values that contribute to a sense of place.

Those interviewed and those participating in the survey rated peace and quiet (55%) and preserving what is unique about this place (62%) as 5/5 being extremely important attributes of the region. While 35% and 41 % respectively of respondents indicated these could not be managed at all (1/5) or managed to the region's detriment.

Preserving what is unique about the area, and its sense of place will be one of the most challenging areas for SynergyRED to positively manage its social impacts moving forward. The supporting qualitative in-depth interview analysis suggested this is primarily driven by perceived impacts on amenity – both visual and noise. Figure 13a and b show the areas of perceived value, while the verbatim responses provided in relation to why respondents selected and pined these points. These spatial illustrations and comments serve to reinforce the findings of this section.

The Albany Wind Farm is noted as an example by some respondents as having impacted the sense of place, in a positive rather than negative way. It was stated in the context of creating a positive tourism asset, and positively contributed to a unique sense of place on the hill in Albany. This could be a positive reference for this proposed project.

Work is being done by SynergyRED to profile both the visual and noise impacts of the project. Participants in both the qualitative and quantitative stages of the study, highlight a strong interest in viewing the outcomes of these studies. In particularly, noise and light impacts for residents of Molloy Island, and visual impacts from the Hill View Road Lookout in Augusta, the Augusta Hotel and other local and tourist viewing areas.

This perceived impact is exacerbated by the fact that one of the core values noted in the study is the attraction of the area due to its "*openness,*" "*remoteness,*" "*quiet*" and "*night sky*".

Suggestions of how this could be mitigated were provided by respondents to the quantitative online survey and in the qualitative fieldwork. These are listed under Section 8.

"The uniqueness of this area – the whole lot – there is a lot of get your head around, looking out over the Scott River National Park, you may not see it all but when you are out in the field a lot you are so aware of the environment, how special it is and how it needs protection." (IDI 2024)

Note: Verbatim comments listed in the text boxes adjacent to Figure 13a and 13b were provided by the digital online survey respondents as the reason for why they placed a pin of value on the spatial map. The comments in the upper text box relate to the heat map that shows the density of pins dropped in a certain location in the vicinty of the project area, while the comments in the lower text box relate to the green dots provide the points at a broadscale.

"My Important Places" are marked with a point any areas that have an important value to respondents with a qualitative description associated with each point.

Blackwood and Scott River. Recreational, spiritual and environmental value
Camping areas
Wetlands of heightened environmental sensitivity.
Molloy island community
Old BHP mine
Significant tree
The river is an important biodiverse area for native flora and fauna, local wildlife and the agricultural uses for the surrounding areas.
Molloy island, bird migration
Do not feel sufficiently qualified to comment DBCA have mapped rare flora & fauna in the area
Aboriginal groups know of historically significant sites
Farmers know of productive farm land area
Place of beauty and historical value .
I live, farm, breathe, look, walk, swim, shop and relax at the marked areas in peace.
These are places where I feel calm and connected to my home
The whole place is important with significant connection to the land.
I spent time at all these places with work or in my own time on days off and have the potential to at some point live in a few of these places
It is where I live and where our business is located
Best beaches, surfing, fishing and forest in the world!
This is where I live, work and play
The beautiful clear view across the countryside
A place frequently visited
Many memories made by the ocean with family
We want our adult children to be part of the last remaining farming communities left in the Augusta Margaret River shire.
These are locations I regularly find Wedge-tailed Eagles and all 3 Species of Black Cockatoos to photograph.

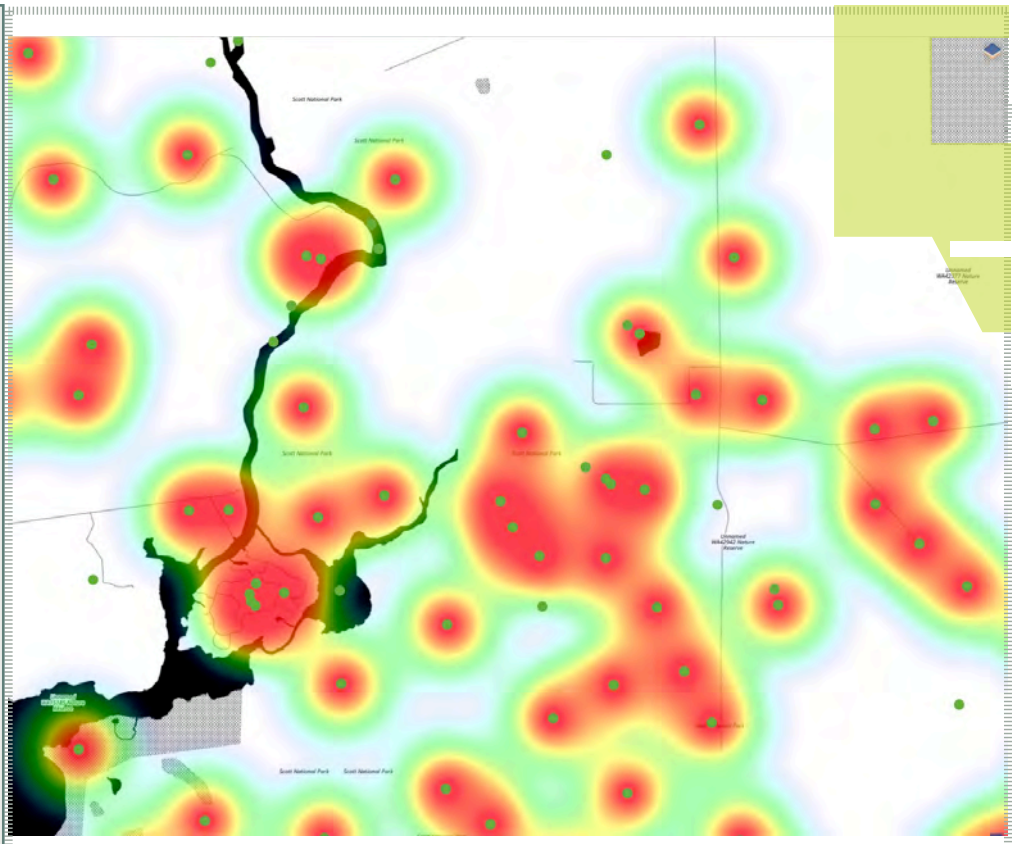

Figure 13 a.Community Survey Spatial Analysis on Places of Perceived Value in the vicinity of the project area

The coastal heath is relatively untouched and important for biodiversity.
The Blackwood and Scott Rivers are important to the region and past use has led to deterioration.
The view from Augusta hotel and the view from Hillview lookout are important places to view the area from, and where, no doubt, the turbines will be most prominently viewed from in Augusta.
Prevelly and Redgate are my favourite beaches
Augusta Light Station is registered on the National Heritage List
White Point and Black Point are beautiful wild places
They are where I regularly go
Love swimming and snorkling/Walking in forests
National Parks along Leeuwin Coast, Blackwood River & remnant forests. Important as they are integral to our living as well as that of the flora and fauna.
Generally natural bushland including rivers and streams are important to rehabilitate and maintain.
The places chosen around Augusta are because of their extreme beauty of natural coastlines
We live in this area, own properties in locations where the pins have been dropped and also spend significant time and recreate in other locations.
Corner of Brockman Highway and Scott River Road. Remnant bushland.
The whole of the Leeuwin-Naturaliste National Park and coastline
Cape to Cape is important to me in terms of conservation, biodiversity and recreation.
Spiritual, environmental cultural significance
The Scott National Park and Scott River system are important habitat for wildlife.
The whole coastline, Capes, forest areas, bush corridors, remnant vegetation - protect biodiversity.
That's where we live/Home
Our forests are unique and under threat from dramatic climate changes and we must protect them
All these places offer scenic views, access to our clean seas, walking trails and recreational activities
Forest & beaches

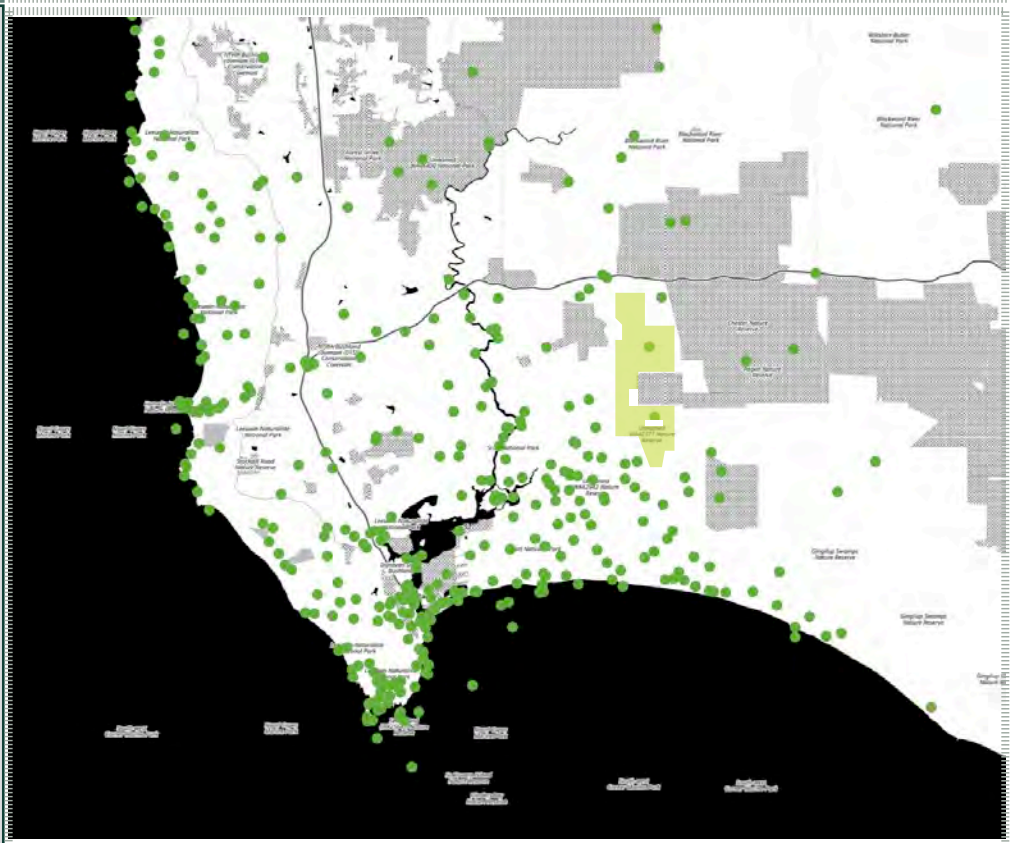

Figure 13 b. Community Survey Spatial Analysis on Places of Perceived Value across the region

Proposed location area for Scott River Wind Farm

6.4. CULTURE & HERITAGE

6.4.1 INDIGENOUS CONNECTIONS

Almost half (46.7%) of respondents to the quantitative survey noted Aboriginal heritage and culture as an extremely important local value.

The Wardandi and Bibulumin / Piblemen Peoples of the Noongar nation are the Traditional Owners of the Scott River Catchment. The area is covered by the South West Boojarah Indigenous Land Use Agreement as part of the South West Native Title Settlement, which formally recognises Noongar people as the Traditional Owners of the south-west region. The South West Boojarah region is supported by the Karri Karrak Aboriginal Corporation and umbrella group, the South West Aboriginal Land and Sea Council.

The Traditional Owners west of the Blackwood River are the Wardandi and east of the Blackwood (including Scott River) are the Pibelmen. Archaeological evidence suggests that humans were in the area by 48,000 BP. Hearths, bones, stone artefacts, campsites, painted hand stencils, a Peppermint 'killing stick', the Kybra rock engravings, and several other Aboriginal sites on the Scott Plain reveal the culture of the first inhabitants in the region (The Scott River Action Plan 2020).

Under the Settlement process led by the South-West Aboriginal Land and Sea Council (SWALSC), the Southwest Boojarah #2 Indigenous Land Use Agreement has been negotiated with the Wardandi-Pibelmen people. The Undalup Association and the Bibelmen Mia Aboriginal Corporation (BMAC) are two current Aboriginal entities that speak culturally on behalf of this Country (The Scott River Action Plan 2020).

A register of Aboriginal cultural heritage sites kept by the Department of Planning, Lands and Heritage lists several sites of Aboriginal significance in the vicinity of this study area, see Figure 6. The waterways are spiritually, culturally and economically important to Wardandi-Pibelmen people including as spiritual reference points, campsites, food collection, and water supply, and this is clearly illustrated in Figure 14 (The Scott River Action Plan 2020).

Figure 14 indicates that the study area sits outside any registered or noted sites and mirrors the findings of SynergyRED's initial heritage surveys. However, feedback from Karri Karrak during the fieldwork process notes that the visual and significant infrastructure change to the region and its landscape, may impact Traditional Owner's sense of place.

Ongoing consultation and engagement with Karri Karrak and Traditional Owners via the Cultural Advice Committee through subsequent stages of the project feasibility will assist to confirm the social values and a path of partnership moving forward.

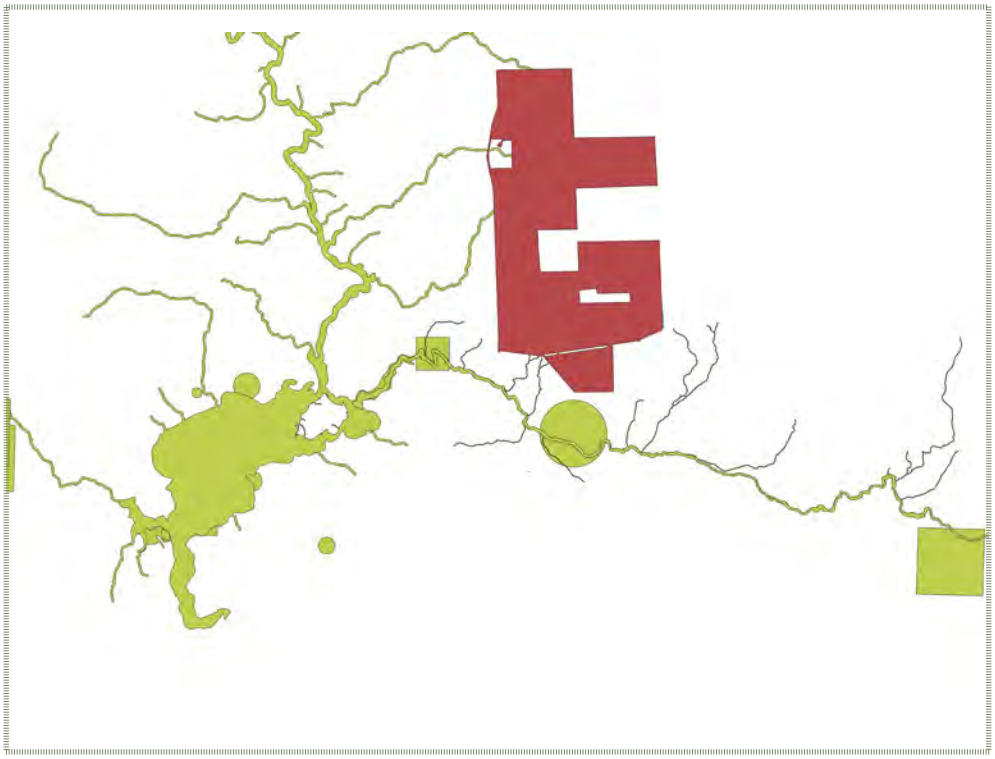

Figure 14. QGIS Aboriginal Heritage Places DPLH 0001

"This is going to significantly change the landscape and country down there, and our Traditional Owners need to be involved in that conversation." (IDI 2024)

6.4.2 COLONIAL CONNECTIONS

Colonial connection to the Scott River region was limited to early explorations by the Turner and Bussell families, along with some fledgling farming and timber milling activity. The pre-colonial landscape was originally dominated by a series of vegetated wetlands, with low dense heath and pockets of tall open forest on more drained areas. Water logging and other challenges of this landscape limited access and desirability for Scott River for a permanent settlement. This assisted in the preservation of the natural environment and protection of its ironstone flora communities and other natural values discussed in Section 6.3.

Those who took up farming in the area in the 1900s used the catchment primarily for dairy grazing, but it wasn't until post war that the area was cleared for primary agriculture. Several local intergenerational families remain in the area since this time, and they have contributed to the colonial history of this remote place. This contribution primarily took place post war, and then again through the growth period in 1960s and 1970s. The Scott River, Warner Glen and Karridale communities do have a shared and collective history of this area, which primarily relates to the commercialisation of the natural assets of the region via agricultural endeavour.

Molloy Island and East Augusta were granted title in the mid 1800s but were only developed for residential housing and a community from the mid 1970s and 80s. Molloy Island had its historic roots in a failed possum farm in the 1920s and was left vacant for many decades, until the recent lifestyle driven residential development.

The other relevant chapter in the historical context of the region was the early 90s efforts by BHP to develop a titanium mineral sand mine adjacent to the study area. Despite a $280m investment, commercial and technical issues forced the mine closure, and its extensive rehabilitation.

This colonial history supports the investment in the region, and use of natural assets in a sensitive way to deliver commercial benefit. It is an isolated region that has historically seen a balance and restoration in the natural environment post human activity.

There is a potential net benefit gained from this project in relation to building on the colonial history of dairy farming in the region to prepare it for the future. Several local landowners and commercial stakeholders interviewed cited the opportunity from a landowner rental contribution as a potential passive income that has the potential to improve borrowing capacity to reinvest in secondary processing and take the local agricultural industry into the future.

"This is land that has been in my family for generations, I want to retire here or have the option to capitalise off the investment my family has made in the land here."
(IDI 2024)

6.5. RESILIENT & PROSPEROUS COMMUNITIES

6.5.1 DECISION-MAKING SYSTEMS

"Include the people affected in the discussions. Reassure local people that wind farms are nothing to be feared. Explain the economic benefits and efficient use of land for multiple purposes." (Survey Respondent 2024)

Local decision-making systems are those that enable a community to contribute and determine their own future. There are several local decision-making systems that contribute to the governance and protection of the community, and its environment, in the face of change. These include:

- Local Government – who has two main responsibilities to the community that relate to this project. Firstly, the preparation and implementation of a district planning scheme, including development control, under the Planning and Development Act 2005, which allows Councils to control the use and development of land by way of the planning approval process. Secondly, the provision and maintenance of the local road system in accordance with the Local Government Act, provides Councils with an ability to limit or control heavy vehicle transport on its road system.
- Western Australian Planning Commission - under the Planning and Development Act 2005, the Commission has responsibility for determining applications to subdivide freehold land and is required to make recommendations to the Minister for Planning on proposed town or district planning schemes and amendments thereto. In addition, the Commission carries a regional and strategic planning function.
- Department of Primary Industries and Resource Development and the Commissioner of Soil and Land Conservation under the Soil and Land Conservation Act 1945, has control over the clearing of land or actions that may cause land degradation.
- Department of Water & Environmental Regulation - the Commissioner has the responsibility of managing the State's water resources, including the assessment and approval of applications for water bore licenses. Approvals can be given for limited periods and may contain specific conditions designed to protect the environment and the water resource.
- The Environmental Protection Authority (EPA) administers the Environmental Protection Act 1986. Projects referred for assessment under the EPA Act, are independently assessed by the EPA and determination is made whether the activities proposed are significant or not. The EPA prepares a report for the Minister of Environment for any significant projects, and the Minister makes the ultimate determination including the setting of any conditions.
- Department of Biodiversity, Conservation and Attractions - the Department is responsible for the management of State forests, national parks and nature reserves, and for the protection of rare and endangered species.
  (Scott Coastal Plain Land Use Strategy 1996).

These regulatory and management authorities provide appropriate levels of governance to contribute to the development of management plans and monitoring across the proposed project lifecycle. They also offer opportunities for local stakeholders to be actively involved the decisions being made in the region.

The Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act) is the Australian Government's central piece of environmental protection legislation. It provides a legal framework to protect and manage nationally and internationally important flora, fauna, ecological communities and heritage places — defined in the EPBC Act as "matters of national environmental significance." The EPBC Act also provides guidance about acid sulfate soils (The Scott River Action Plan 2020).

There are also three pieces of State legislation that protect environmental values and that are relevant to the Scott River Catchment. These are the Biodiversity Conservation Act 2016, the Environmental Protection Act 1986 and the Conservation and Land Management Act 1984. The Biodiversity Conservation Act 2016 provides for the listing of threatened native plants (flora), threatened native animals (fauna) and threatened ecological communities that require greater protection (The Scott River Action Plan 2020).

Department of Primary Industries and Regional Development (DPIRD) set its priorities for declared pests by a declaration under the Biosecurity and Agriculture Management Act 2007 (BAM Act). It is the landholders' legal obligation to manage/control invasive species (weeds and feral animals) on their land and this governance would apply to SynergyRED's activities on land within the designated area. Under the Act, there is a greater responsibility for the community and industry to identify, prioritise, and control established biosecurity threats (The Scott River Action Plan 2020).

These regulatory and decision-making bodies should provide re-assurance to landowners, stakeholders and the broader community that there are appropriate decision-making and governance structures in place to address raised concerns. As noted above for members of the community associated with the BHP Beenup Titanium Mine's model of engagement and subsequent closure, there is some skepticism about these decision-making bodies' ability to protect the natural environment in the face of industry pressure. That said, the BHP Beenup Consultative Group model that sought to actively involve stakeholders in decision-making was well received by the broader community and serves as a positive example for managing engagement processes over the lifecycle of a project in this region.

6.5.2 LAND TENURE

Strengthening the governance and security of land and housing tenure is an important part of building resilient communities.

The Scott Coastal Plain has been identified by the Western Australian State Planning Strategy 2050, as being an agricultural area of state/ regional significance. As such, its productive agricultural capacity is seen as the primary focus of secure land tenure in the region, and under the State Planning Strategy is to be protected against inappropriate subdivision or development.

The Department of Primary Industries and Regional Development (DPIRD) and other government agencies continue to investigate the region to capitalise on these natural assets for further food cultivation and secondary processing, biomass and more innovative dairy agricultural solutions (IDI 2024, DPIRD 1996, The Scott River Action Plan 2020).

Any impact that restricts agricultural lot sizes, or usable land area, is noted to impinge on the productive capacity of the land by restricting the operational flexibility and by reducing the scale and viability of the farming enterprise. Subdivision is also noted by the State Planners to lead to speculative pressures and artificial increases of land values. In turn these effects may limit the financial capacity of that landowner to carry out the appropriate land management procedures.

In both the Shire of Augusta-Margaret River Town Planning Scheme No. 11 and the Shire of Nannup Town Planning Scheme No. 1, the privately owned land within the study area is currently zoned "Rural". These schemes allow for a wide range of uses to be permitted at the discretion of the Council, some requiring prior public advertising. Figure 17a and b shows the growth and shifts in land planning over the respective periods and by number respectively, highlighting both shifts in land tenure and increases in dwelling numbers at a regional level.

The Scott River Catchment is approximately 64,276ha, of which approximately 43% (27,000 ha) is farmland, 53% (34,700 ha) reserves, and 3% unallocated Crown land (UCL) (DWER 2019 land use data). There is a total of 53 properties used for agriculture or lifestyle purposes in the Catchment. There are six dairy farms, one dryland and five both irrigated and dryland. Three of the six dairy farms are managed by four family-owned businesses. One corporate company manages the remaining three farms. The other industries are beef and sheep, blue gum plantations, and native vegetation (White, 2012 and Whitfield, 2019 in The Scott River Action Plan 2020).

Most of the private land holdings on the Scott Coastal Plain are much larger in area than those in other parts of the South West. The lots north of the Scott River and east of Scott River Road are between 600ha and 1,200ha in area and few at around 50ha. Most of the holdings are family owned, and some have two or more lots forming the total farming enterprise. The large lot sizes, relatively low land values and minimal land speculation pressures in this area have provided a favourable basis for developing large scale agricultural enterprises. The placement of 40ha centre pivot irrigation systems throughout these lots have improved the productivity of the restrictions placed on the region by lot boundaries, streamlines, remnant vegetation, poorer soils or other constraints. To the west of Scott River Road, the lot sizes are generally in the range of 40ha to 200ha, with a few smaller lots. South of the Scott River the lot areas are much more variable, ranging generally from 100ha to 500ha. Several land holdings consist of a few much smaller lots (Scott River Action Plan 2020).

In the area known as East Augusta, on the eastern bank of the Hardy Inlet and at the end of Scott River Road, there is a precinct of about 50 lots around 4,000m2 to 8,000m2 in area (DPIRD 1996).

Land in the area has been tightly held since the 1960s as evidenced by property turnover data. Risks to land tenure and enterprise include the deep leached sandy soils and high-water tables, combined with the widespread applications of high levels of fertilisers that could lead to nutrient overload in the adjoining waterways, and a loss of important ecological habitats and recreational areas (DPIRD 1996).

Those landowners interviewed felt that there is significant opportunity to increase the value derived from the land through secondary processing, plantations and horticulture opportunities, however these opportunities are constrained by limited infrastructure, water, power, telecommunications and accommodation. This was supported by the aforementioned findings of the DPIRD study.

The proposed wind farm in Scott River will have a positive financial benefit on the host property owners and the passive income from wind turbines is seen as way to improve resilience and debt proof property for future investment borrowings.

The requirement for buffer zones associated with the wind turbine locations are perceived as a negative to land tenure security and capitalising on the land in the eyes of some landowners – particularly adjoining neighbours who perceive that they will not receive the passive income contribution for hosting the turbine. There will be a requirement to work with neighbours to ensure any plans for their property aren't affected by the proposed wind farm, or appropriate compensations for any required adjustment to their plans or compliance with certain building conditions is addressed.

Distances from wind turbines to dwellings is primarily based on noise compliance. A dwelling describes an existing or proposed building used for residential or accommodation purposes, that is, a building used for a 'noise sensitive purpose' as defined in the Environmental Protection (Noise) Regulations 1997. Figure 16 shows the number of buildings across the Scott River and Molloy Island areas and demonstrates a low dispersal of buildings across the proposed project area.

"Access to land in Scott River is already a challenge, it is tightly held, wedged between national parks and state significant habitats, the perched water table and over 30% of wetland areas are on the farms. These are all excluded out of arable land, The proposed buffer is an additional issue that inhibits productivity and negatively impacts land value, and that is a key driver for me." (IDI 2024)

As per the Western Australian Planning Commission's Position Statement on Renewable Energy Facilities (2020), a buffer zone is required at a calculated distance between wind turbines and habitable dwellings. This distance is calculated based on noise modelling studies and landowner/neighbour agreements. In all cases, SynergyRED note that the priority is in ensuring that noise is compliant.

To maintain noise compliance throughout the life of the proposed wind farm in Scott River SynergyRED offer landowners and neighbours an annual fee to maintain a buffer zone around each wind turbine. This buffer zone limits the construction of new habitable dwellings within the zone.

There are no sensitive land uses i.e. those that are residential or institutional in nature such as a hospital, school or aged care facility where people live or regularly spend extended periods of time that would be compromised under the proposal land use by the proposed wind farm in Scott River.

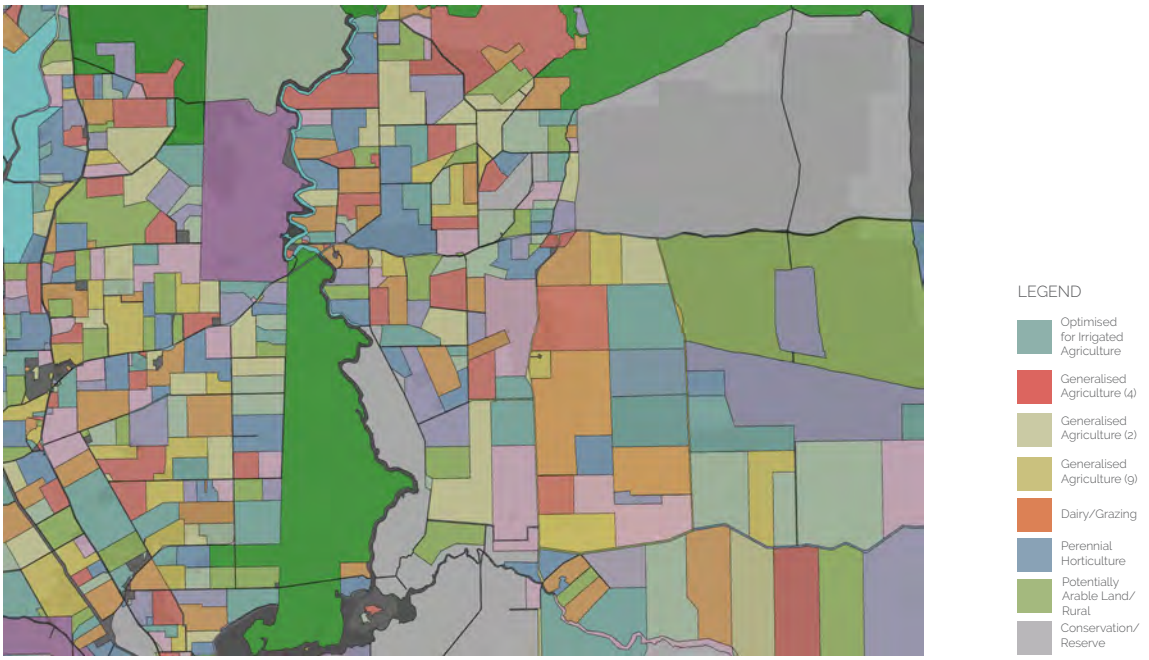

Figure 15. Land Capability across the Proposed Wind Farm in Scott River Area is classified by DPIRD as Rural Agricultural Scale 1: 50000 @A2

Figure 16. Study Area and Existing Buildings (Buildings_of_WA_DPIRD_084) - Scale 1: 50000 @A2

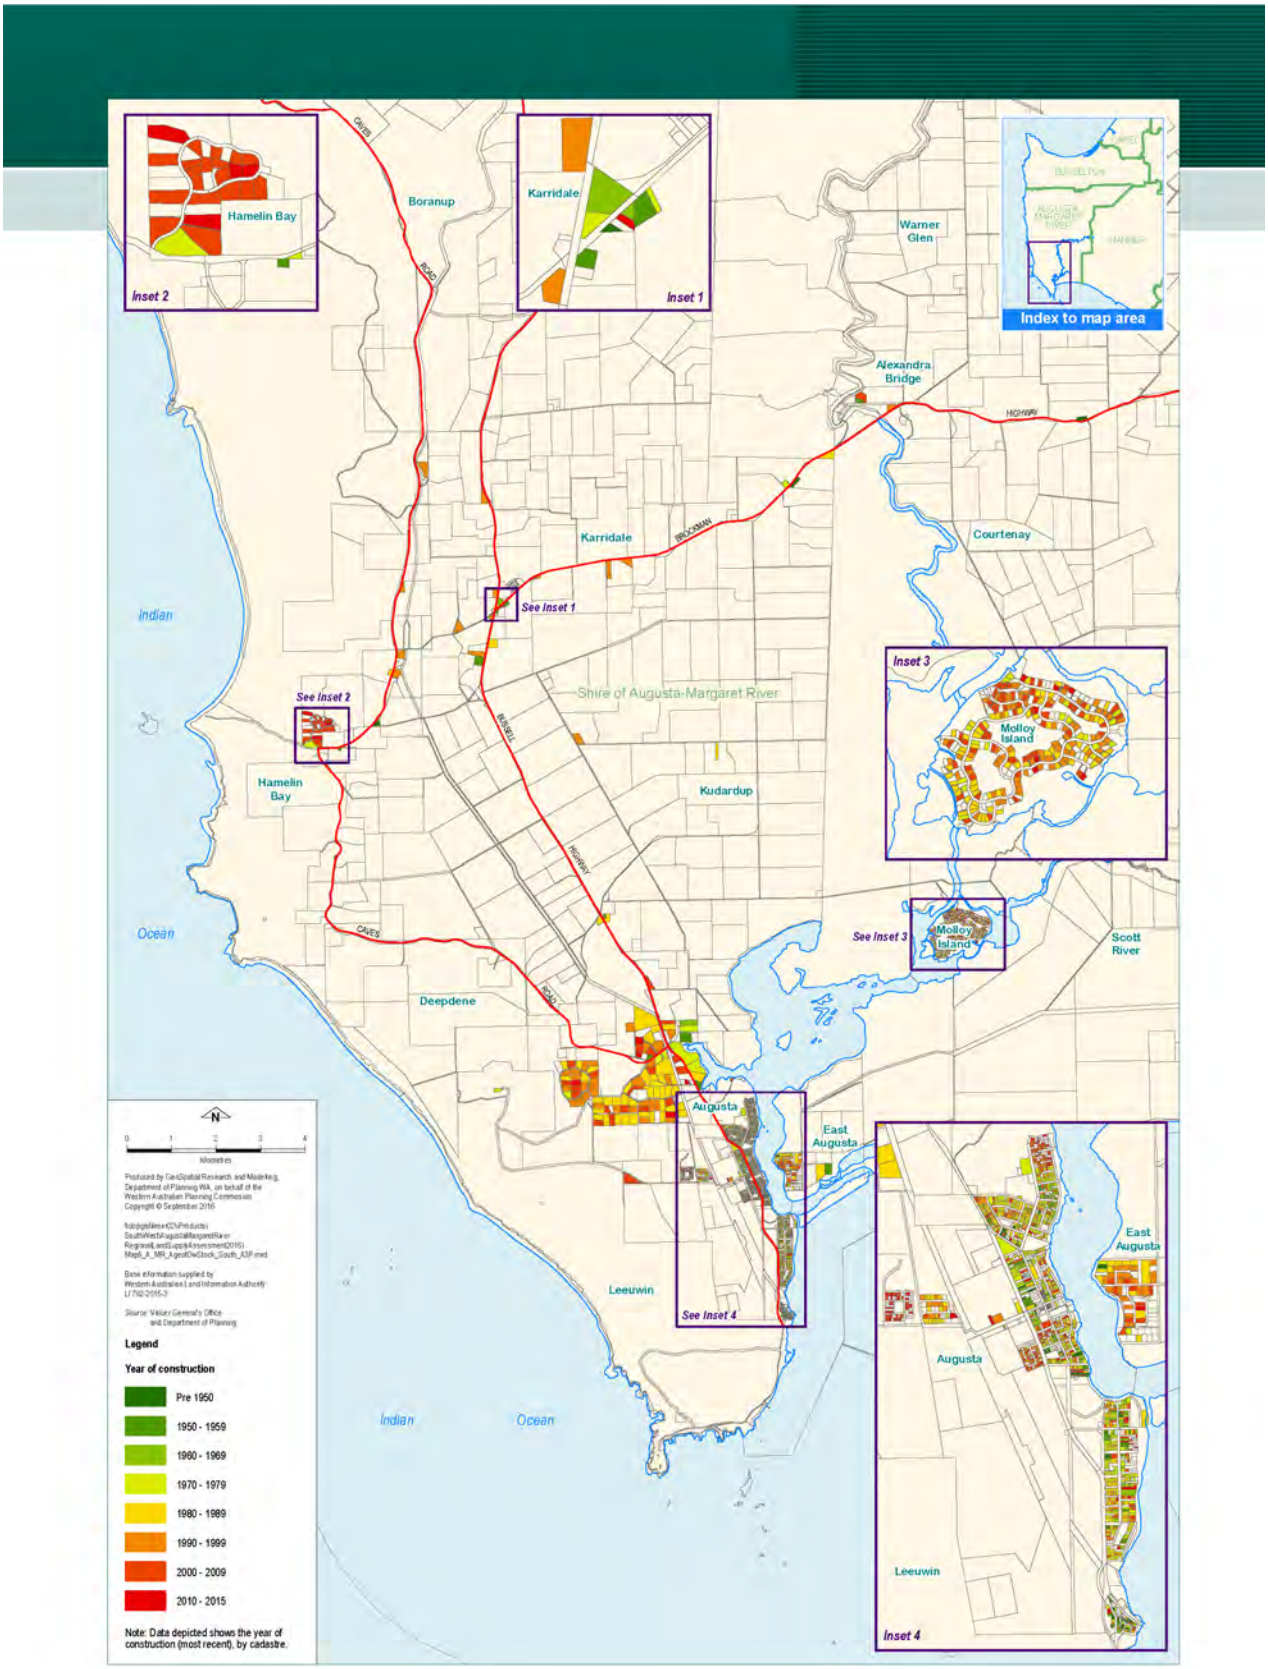

Figure 17a. Town Centre Land Planning and Period of Dwelling Construction

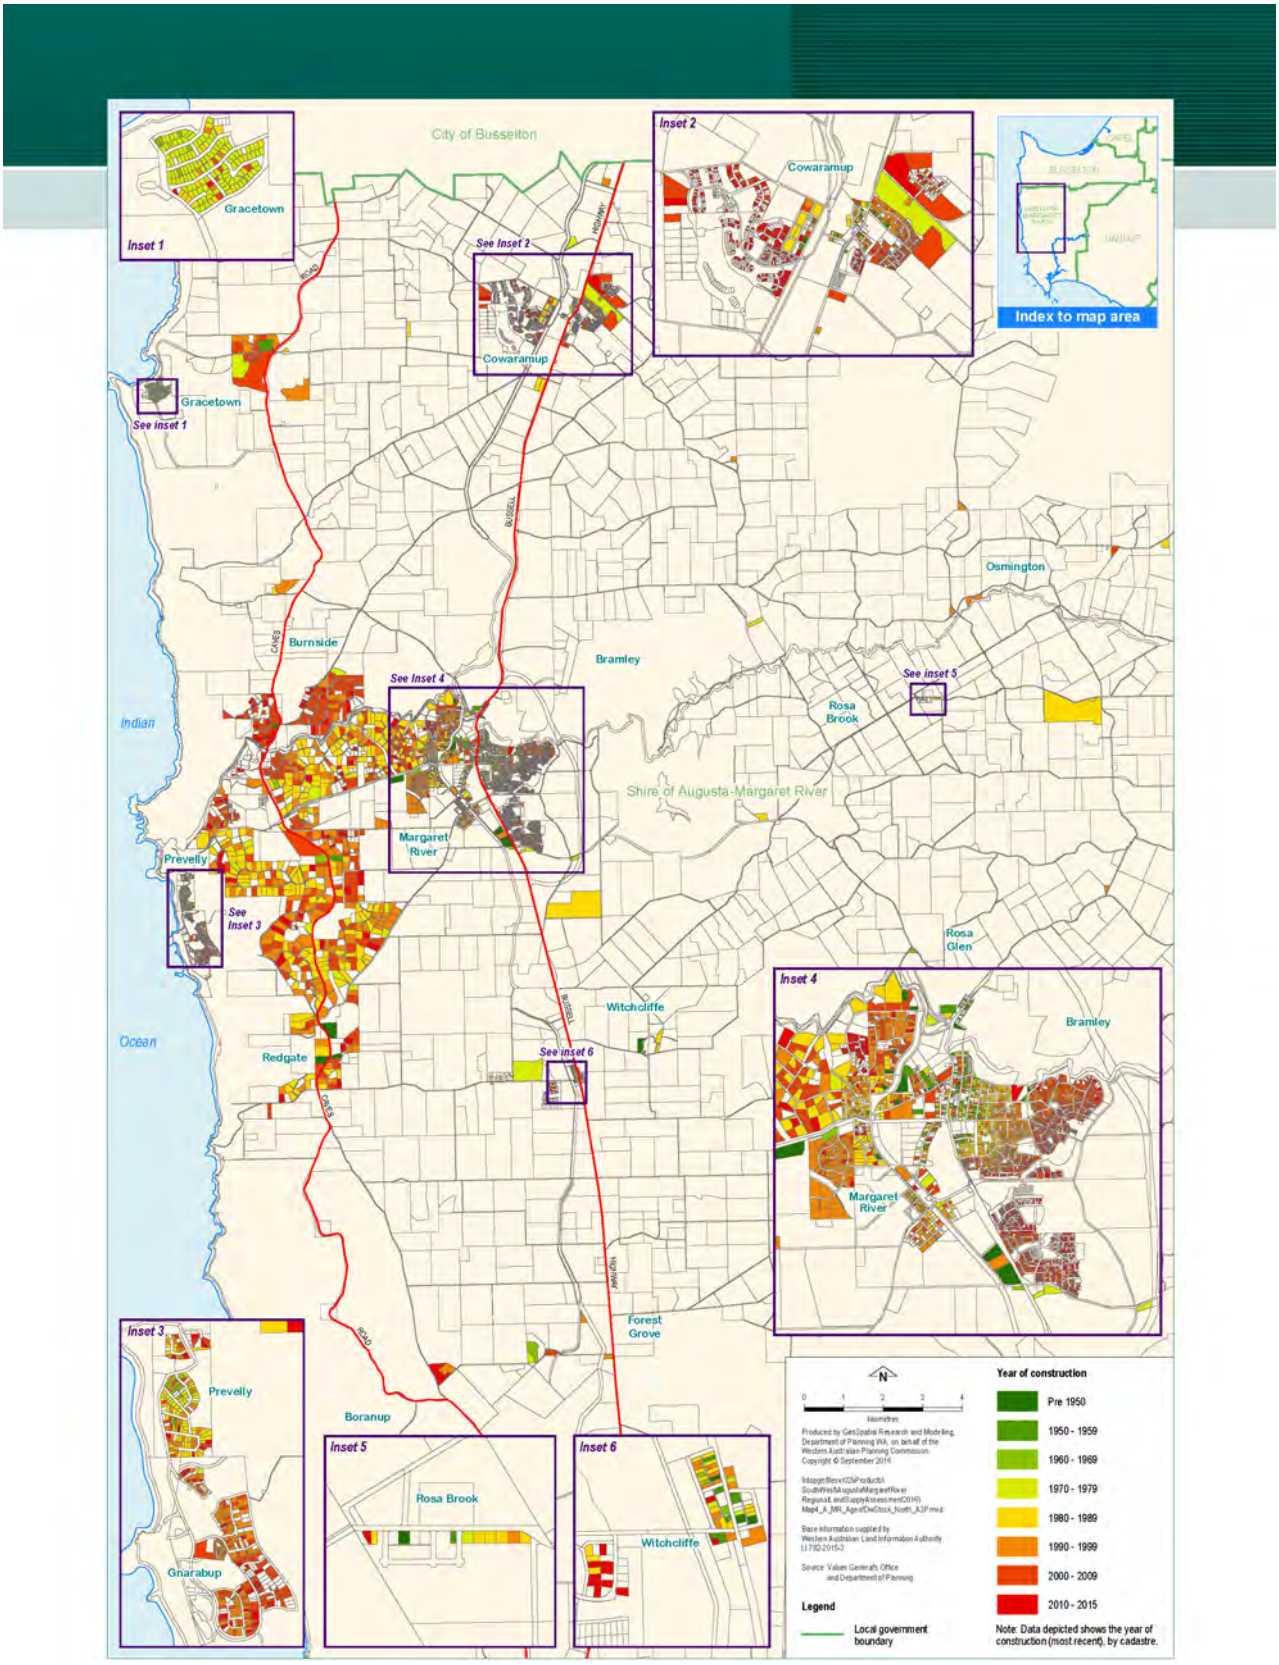

Figure 17b. Town Centre Land Planning and Period of Dwelling Construction

6.5.3 ROADS & TRANSPORT

In Australia, resilience in transportation is a critical indicator for a community to anticipate, prepare for and adapt to changing conditions, and withstand, respond or recover from disruption, particularly given the regional or rural nature of many communities across the country (Infrastructure Australia 2024).

The Scott River Catchment is remote and serviced primarily via Sues Road and Brockman Highway. The development of the BHP titanium mineral sands mine resulted in the reconstruction of parts of Brockman Highway, Black Point Road and Scott River Road, and the construction of Sues Road to the north.

Apart from a short section of Milyeanup Coast Road, all other roads in the study area are either graded earth roads or dirt tracks. One of the major constraints to road construction and upgrading in this area is the lack of road base materials within a reasonable haulage distance, as most of the materials reserves are located within the Department of Biodiversity, Conservation and Attractions and are generally not available for road purposes (Scott River Action Plan 2020).

A recent report by Monaghan, as cited in the referenced DPIRD Report shows that historically agricultural property movements in Scott River for supplies coming in, or stock/produce going out can generate up to 680 trucks per annum for the dairy farmers, 592 per annum for horticulture, and 2,083 per annum for farm forestry.

Consideration of these traffic movements, seasonal tourism visitation movements and natural constraints on access road construction will need to be incorporated into SynergyRED's decision making around traffic and transport in and out of the study area.

Figure 18. Indicative Primary Transport and Connection Arteries, as identified by respondents in the geospatial survey,

"The famers will lose feed or ability to get milk trucks in and out if they don't manage transport and roads use effectively." (IDI 2024)

6.5.4 POWER & TELECOMMUNICATIONS

""This region has always struggled with access to power, phone and basic utilities. Anything Synergy can do to help this would be well regarded." (IDI 2024)

Like transport corridors, power and telecommunications are essential infrastructure to maintain and generate future proofed resilient and prosperous communities.

Agricultural properties in the region are currently limited to single phase (240 volts) power supplies, which is sufficient to operate an irrigator, but a bore pump requires three phase (415 volts). There is a considerable cost saving in using appropriate electricity supplies, rather than diesel fuel, to power the plant associated with irrigated horticultural production (Monaghan 1999, as cited in the referenced DPIRD Report).

The landowners interviewed from in the study area have expressed a strong desire to connect to three phase power supplies. The Scott River Action Plan notes a preliminary estimate by Western Power to extend a suitable transmission line from the Beenup sub-station to the eastern sector of the study area. This is illustrated in Figure 19, page 37.

Currently, most of the properties in the central and western sections of the study area are connected to the Telstra cable phone system, but those in the east mostly rely on radio or satellite connections. Mobile telephone coverage is very limited. Those interviewed from Scott River and Augusta expressed a strong desire for an improved telecommunications service.

There may be an expectation on SynergyRED to work with Western Power or other utilities to improve power and telecommunications provisioning during construction, and operational stages of the proposed project.

6.5.5 COMMUNITY SERVICES

Remote settlements of less than 1,000 people in Western Australia are diverse in nature and present different challenges for government authorities, service providers, residents, commercial operators and funding agencies. Local service provision in remote settlements is governed by DPLH's Remote Services Level Guidelines, which looks at supply systems, networks, difficulties in access, size and technical knowledge/capacity.

In the Scott River region, local landowners and residents of these towns use the social infrastructure (schools, health and community facilities, commercial and civic facilities) in the larger surrounding towns such as Augusta, Witchcliffe and Margaret River. These are generally accessible and the communities at a scale that enables more appropriate provisioning of these services.

The Scott River Action Plan defines provision of community services from a common point at the Scott River township via the junction of Milyeannup Coast Road, Fouracres Road and Governor Broome Road, noting it is 70km to regional centre of Nannup, 60km to the township of Augusta, 68km to Margaret River, 81km to Pemberton and 84km to Manjimup. A small roadside shop, the Nillup General Store, exists on the north side of Brockman Highway, near the junction of Scott River Road.

The nearest regional hospital is at Augusta. The hospital includes a 24/5 Emergency Department, allied and general health services including mental health and telehealth services (WA Country Health 2024). All other regional community services are located within Augusta or Margaret River.

With increased population during construction and potential visitation to the proposed wind farm in Scott River as a tourist attraction, there is an implied implication amongst local stakeholders that this will see an increasing local population and in turn create the catalysts to improve local service provision.

However given the small scale of predicted impact in terms of population impact and flow on demand, this is unlikely to be a noticeable net benefit, nor a negative impact in terms of pressure on these services.

"There is so much pressure on facilities and infrastructure with growing population increases, slowing of subdivision development times and lag in services catch up to be ready." (IDI 2024)

6.5.6 WAY OF LIFE

"Windfarms are obviously not without landscape and visual impacts, however the Scott River location is able to accommodate impacts without adversely compromising way of life, or significant landscape values, as opposed, for example, to wind turbines on the coastal fringe or Leeuwin Naturaliste Ridge." (IDI 2024)

Part of the definition of a resilient and prosperous community is a strong, healthy and active community that has a clear purpose and a collective spirit. There is no established townsite in the immediate study area. In most instances, the Scott River 'community' is defined, by those interviewed for this assessment, as their own intergenerational family members residing on a family property, rather than a traditional definition of a community of different families and social structures residing within a common location.

This differs outside the Scott River Region, for example the Molloy Island Community, who note their strong sense of community spirit, and connection to their broader social structures of adjacent neighbours and residents. While in Augusta, 'community' is described, in both the qualitative and quantitative fieldwork as the wider township, its residents and its visitors.

The way of life within the Scott River area is described, as work and agriculturally focused, related to activity as part of 'farm life,' with a strong sense of ongoing learning and volunteering. For those in East Augusta and Molloy Island, the way of life is connected to activities on the water, nature and "peace and quiet."

In the township of Augusta, as noted in Section 6.2, community cohesion, sports and recreation and volunteering within the community drive this way of life.

In terms of the proposed wind farm in Scott River, and any potential impacts on the way of life in the region, the visual amenity, lights, noise and activity were cited as the main concerns with any changes introduced. Over sixty percent (60%) respondents to the online survey noted "preserving what is unique about this area" as an extremely important attribute of the region, and over fifty percent (50%) also rated "peace and quiet" as extremely important.

The proposed wind farm in Scott River does have the potential to drive some division in attitudes within the local community. This relates to the current high-profile nature of the project locally and the divided and public positions on the net benefit or negative impacts of the project.

This is evident in the overall support results for the project that are currently polarised at either edge of the perception spectrum in both the online survey and reflected in the analysis of the in-depth interviews. This will require careful management by the SynergyRED project engagement team.

Figure 19. Map of Proposed Transmission Line, provided by SynergyRED

6.6. THRIVING, DIVERSE & EQUITABLE ECONOMY/WORKFORCE

"The DPIRD report has highlighted the importance of agriculture in the region with advantages of water, high water table, soil health, the future for income generation in the area has to be agriculture and a diversity of agriculture." (IDI 2024)

Socio-economic considerations for productive human settlements relate to having an ability to derive an income, access to a thriving, diverse and equitable economy and workforce, and to have an active supply chain providing necessary goods and services. Delivery of this requires energy, appropriate infrastructure and a compatible range of industries/occupations/activities to provide livelihood and work for those currently employed in the energy industry or those currently outside the sector who may need additional skills, training or pathways if to benefit..

The proposed wind farm for Scott River will bring some employment opportunities, local procurement and the provision of improved regional infrastructure. The challenge will be ensuring the proposal is compatible with the existing agricultural productivity and tourism visitation, that the human settlements within the region are not only heavily reliant upon, but from which they also derive their sense of identity, history and community cohesion.

6.6.1 INDUSTRY SECTORS

The Shire of Augusta-Margaret River note its core industry sectors as tourism, agriculture, construction and manufacturing, noting "*tourism has just taken over agriculture in the region, followed by construction and manufacturing which primarily relates to wine making.*" (IDI 2024)

The total gross value of agriculture in the Scott River region is approximately $19.2 million, with a total value add $28 million (DPIRD Scott Coastal Plain – A Strategy for a Sustainable Future).

In addition to the agricultural activity described earlier, there are several other emerging and growth industry sectors around the Scott River Region. These include Abalone fishing and tourism. In the tourism sector, growth is being seen in boutique accommodation, remote camping and forestry, water-based activities and whale watching.

Wherever possible demonstrated compatibility between wind farms and agricultural activity, as well as nature-based tourism will need to be shown, and the evidence shared with local stakeholders and the broader community by the SynergyRED's engagement and access negotiation teams.

6.6.2 EMPLOYMENT

Employment opportunities are relatively low within the study area and are predominately related to agricultural management and trade/ farm hand roles. The proposed wind farm in Scott River introduces the opportunity to increase access to specialised and technical staff that may have some complimentary skills in terms of equipment or infrastructure maintenance on the rural properties.

Providing local employment opportunities is seen as the strongest area in which SynergyRED could deliver to this value to the community's benefit, with around a third (38.2%) rating it as 5 extremely well (to our benefit).

A full economic profile in terms of qualifications, industry of employment and employment numbers for each of the communities assessed is provided in Appendix 2.

Current Activity in Scott River Region	Employment per 100 ha	Area (ha)	Total Employment
Dairying (year-round workforce)	2	1,750	35
Horticulture (largely seasonal March to May)	50	450	225
Other (including Plantations)		5,000	30
Accommodation Provision			
Permanent Workforce			37
Seasonal Workforce			90
Total Beds			127

Table 2: Summary of Activity, Employment and Local Accommodation Provision in Scott River

"Employ local and look to local involvement in maintenance and blade restoration." (IDI 2024)

"It is a good thing for jobs, expenditure, and the local economy." (IDI 2024)

6.6.3 ABILITY TO DERIVE AN INCOME

"Compensate all local property owners in Scott River for their losses." (Survey Respondent 2024)

The ability to derive an income refers to one's earning capacity and the source from which that earning is drawn.

The impact on the agricultural landowners and the ability to derive an income is discussed in Section 6.5.2, 6.5.3 and Section 6.6.1 around land tenure and economic diversity. This risk is relatively low with respect to any negative impacts on the ability of the local community to derive an income, unless there are construction or operational impacts that have a flow-on impact to water quality, soil degradation, or fire. These will need to be managed carefully through appropriate management plans as noted in Section 6.3.1 to Section 6.3.3.

Several respondents in the qualitative fieldwork discussed the positive flow on that regular income for hosting a wind farm on a property has in terms of improved borrowing capacity for further capital investment.

A few respondents noted a potential negative impact for those wishing to capitalise through sub-division of their property. These are discussed above under land tenure, and as per the Western Australian State Planning Report for the region, sub-division and property price speculation are being restricted and controlled through efforts within the planning system, rather than being impacted by this proposed project.

6.6.4 SUPPLY CHAIN

As noted in Section 6.5.3 to Section 6.5.5, this proposed project can improve local supply chains through improved energy access, road and transportation link uplifts, procurement of local contractors and enabling passive income to local dairy farmers to invest in secondary processing and other value add propositions.

Synergy's obligations with regards to Western Australian industry participation and other government local procurement supply policies, the extent to which expenditure may be allocated, the types of supply chain opportunities and the availability of such goods and services in the region are outlined in Section 4.1 Summary of Synergy's Social Performance Approach.

Care will need to be taken during construction to ensure increased traffic does not interfere with agricultural transport to local properties, to avoid impacting their access to efficient supply chains.

"The ability to get equipment and feed in and milk/cattle trucks out, plus cattle movements is critical, and the roads aren't good." (IDI 2024)

7. PROJECT IMPACT CONSIDERATIONS

SynergyRED is aiming to determine the feasibility of a proposed wind farm in Scott River. Section 6 of this report detailed the social values held in high importance to the local communities, and areas of concern in SynergyRED's ability to manage any impacts on these values to the communities' detriment or benefit.

The following project description outlines the current project model being considered under this feasibility stage. It provides the baseline for the recommendations made in Section 8. Already several project decisions have considered the findings of this study and SynergyRED's ongoing engagement with local stakeholders and community members.

7.1. Project Description

The proposed 100MW onshore wind farm in Scott River is approximately 15 km north-east of the Augusta townsite in the south-west region of Western Australia (Figure 3). It is proposed to consist of up to 20 wind turbines and associated infrastructure and will connect into the South-West Interconnected System (SWIS) via the existing 132kV transmission line between Beenup and Manjimup. The proposed onshore wind farm is located on predominantly cleared freehold land used for farming and adjacent road reserves.

The design and layout has not yet been finalised. The indicative development footprint, shown in Figure 3 and 4, has been informed by discussions with landowners as well as in consideration of advice and any constraints identified from the various technical studies conducted in support of the proposed wind farm in Scott River.

The final layout will be determined through a comprehensive tender process. The turbine manufacturer will be selected by SynergyRED, who will then confirm the specifications of the wind turbines (including make, model, etc.) and the resulting final development footprint. This will be based on further detailed technical studies (e.g., geotechnical investigations) to ensure compliance with relevant international and national standards, guidelines, and site-specific constraints related to environment, heritage, and planning requirements. It is recommended that this tender process includes demonstration of how the final proposed layout will address the barriers and constraints raised in this social values assessment.

7.2. Project Scale and Size

The proposed wind farm in Scott River currently includes a maximum of 20 wind turbines, with a total maximum capacity of up to 100MW. The indicative turbine locations have been selected to maximise energy production whilst minimising impacts on the surrounding environment.

The overall height of the turbines (combination of hub height and blade length) shall not exceed 250m, as per the turbine design parameters being considered:

- Max blade length 90m.
- Tower/hub height between 80 to 164m.
- Turbine tip height between 150 to 250m.

The final turbine design and layout will be dependent on several factors including market conditions, cost of construction, availability of wind turbine infrastructure and the capacity of the existing 132kV power line. The cabling between the wind turbines will be underground and follow the roads as much as possible to minimise clearing and impacts on landowners.

Visual amenity, noise, impacts on the environmental values of biodiversity, flora and fauna, and the way of life in this remote region should be factored into decision-making around project size and scale.

7.3. Other Associated Infrastructure

Other associated infrastructure will include the substation, operations, and maintenance buildings, 4km transmission line, roads, and cabling. Foundations for each turbine will vary depending on the imposing load, ground conditions, construction methodology, and drainage requirements of the site. The depth of the foundation depends on a range of factors including turbine type, ground conditions and the unique Scott River geology. Traditional turbine foundation depth is generally around 4-5m. .

During construction up to six wind monitoring towers (meteorological masts or 'met masts') will be installed to obtain accurate wind speed measurements from the prevailing wind directions. Following commissioning up to three of these met masts will remain throughout operations (Figure 2). The met masts are required to be located a certain distance from nearby turbines and their locations will be confirmed at the detailed design phase to ensure that accurate measurements can be obtained throughout the life of the project in accordance with international standards. Met masts will be installed to the height of the turbine hub height (maximum height of 164m).

A microwave communication tower, with a height of 100m, would also be installed to enable the wind farm substation to communicate with Western Power operations remotely.

If the project is deemed feasible and environmental and regulatory approvals achieved, construction is anticipated to take up to 24 months. Project schedule and commencement time will be impacted by approvals timing and a conservative outlook on scheduling is being considered.

The physical construction of associated infrastructure, any clearing activities, gravel and concrete sourcing and production, operational use and construction activity (timing, location, access, visibility and noise) and accommodation of the construction workforce will have impact on the social values outlined in this report. Consideration should be given to clarifying these impacts as project decisions are made.

7.4. Project Water Requirements

Two 200kL water tanks and four 45kL water tanks will be installed to support construction and operational water requirements, including Emergency Services in the event of a bushfire either onsite or externally. This would likely be sourced elsewhere, purchased and ported in. There is a possibility that any dewater collected during construction, if treated appropriately to a suitable quality, maybe able to also be used during construction.

Water sourcing, provisioning, use, de-watering, treatment, and storage are of prime interest to all stakeholders and members of the broader community. It is an attribute with a high social value and the value placed should be factored into decision making, and engagement strategy development.

7.5. Clearing Requirements

The proposed project would involve little vegetation clearing as project infrastructue and associated activities will be located in previously cleared areas. Clearing of any previously disturbed or undisturbed areas will need to factor in the high social value placed on the ironstone flora communities, bird life and other fauna and visual amenity. Again, this should be factored into decision making, and engagement strategy development.

7.6. Land Access and Buffer

A cleared area of approximately 40-70m around each turbine will be required to maintain vehicle access. This area would not be usable for farming. A buffer zone of up to 100m would be in place around each turbine that would limit built construction within this area, with farming activities still permissible on this land.

There would be two main site access points into the wind farm to achieve safe access and minimise community disruption during the construction stage, as well as reducing the extent of local roads required for delivery of turbine components. The site would also include three additional emergency services access points to allow easy access to and movement around the site.

On-site access roads will be designed to utilise existing roads or disturbance as much as practicable to limit impacts on the environment and existing agricultural activities once the wind farm is fully operational. The internal site access roads will be private roads only accessible to the landowners, and Synergy and its contractors.

It is anticipated that up to 30 km of gravel capped roads will be required, with the following design criteria and mitigation measures applied to mitigate potential impacts:

- Access road widths will typically be approximately 5-6m wide, with some portions proposed to be wider to accommodate turning circles for cranes, trucks, and other construction/delivery and emergency vehicle requirements.
- Turning areas and passing bays will be constructed where necessary.
- Roads are not proposed to be sealed and will be constructed from locally sourced aggregate/gravel.
- Drainage channels will be located on either side of the road as necessary.
- Culverts will be installed to maintain flows across the site.

These access roads will remain permeable and unsealed to allow for improved water penetration and minimised impact.

Minor works will be undertaken at these entrance points to facilitate the entry of large vehicles, including blade transport trucks and emergency services. This would typically involve widening of the road surface area and gates. Intersection works will be defined through the detailed design phase following turbine procurement and confirmation of blade length, and in consultation with the Shire.

Again, any access point or road construction, whether on previously disturbed or undisturbed areas, will need to factor in the high social value placed on the ironstone flora communities, bird life and other fauna and visual amenity. That said, improved access does have flow on benefits for the agriculture and wherever possible a net benefit to loss ratio should be applied.

Clearing, water management, and location of turbines and access decisions should be discussed openly with stakeholders and factored into project team and contractor inductions, as well as the engagement strategy.

7.7. Workforce and Employment

The Proposal is expected to require a workforce of up to 150 personnel at peak construction periods. The construction period is expected to take 18 to 24 months. It is anticipated that construction workforce will be accommodated at existing facilities in surrounding towns and localities, with no construction camp or temporary onsite accommodation currently proposed as part of this Proposal.

Once operational, it is anticipated that approximately five full time wind farm technicians who reside locally will be required throughout the life of the project, working day shift only and will be on call during weekends. These on-site personnel will be responsible for reporting, monitoring, and some maintenance of the wind turbines. Where required, an additional expert maintenance technicians would be engaged.

There will be several additional offsite personnel and contractors who will perform Australian Energy Market Operator (AEMO) coordination, turbine performance monitoring and licensing compliance, wind farm reporting and remote resetting and controlling.

There may be local supply chain opportunities for maintenance and refurbishment work during the project's operational lifetime. These would be sourced in line with SynergyRED's procurement processes and policies.

Again, as noted in Section 6.6 any local employment or procurement opportunities will have a positive net flow of improved access to workforce participation, skill development and income. A few respondents in the quantitative survey provided feedback that opportunities for technical, environmental, health and safety training could also be provided by SynergyRED to the broader community to increase this opportunity and benefit. Other participation requests around environmental surveying, rehabilitation and monitoring were also made.

Care will need to be taken in decisions relating to accommodation of the construction workforce during peak times to ensure any negative impacts on the community's perception of safety, cohesion, and pressure on supply or pricing is managed.

7.8. Tourism Opportunity

A wind farm viewing area that can accommodate up to six vehicles will be developed off Scott River Road to ensure a safe pull over area where tourists can stop and observe the turbines and learn about renewable wind energy.

This would be a positive net benefit to the local community, and one that offers an opportunity for active community participation in decision-making and engagement.

7.9. Project Lifecycle Considerations

The proposed wind farm in Scott River would have an operational life of approximately 30 years. Once the operational life of the wind farm comes to an end, the wind farm can be repowered by replacing the wind turbines, or wind turbine components to extend its life, or decommissioned with land returned to its previous state, or as agreed by the landowner.

Leaving a minimal footprint in this remote and natural environment is a core value expressed by local stakeholders and community members. Active engagement and involvement in project lifecycle planning, monitoring and rehabilitation should be factored in early in the project feasibility process.

Clarification on the lifecycle implications of wind farms compared with other energy sources has been requested by participants in this study.

8. SUMMARY OF RECOMMENDATIONS

8.1. ENERGY TRANSITION

This proposed project has a significant net positive actual impact in terms of the transition to renewable energy for Western Australia's future, generating up to 100MW of power which would be contributed to the grid.

Electricity from the proposed wind farm would feed into the Beenup substation in Scott River, which connects to homes and businesses in Augusta, Scott River, Molloy Island, Alexandra Bridge, Karridale, Hamelin Bay, East Augusta and Forest Grove. The remaining electricity from the proposed wind farm would flow along the transmission line to Manjimup, Collie and the rest of the energy grid.

Recommendations for Mitigation/Benefit Realisation

1. Providing neutral, accurate and timely information that sets out a relative comparison of the proposed project against different future renewable options in terms of lifecycle renewal, power consistency, carbon footprint, supply and cost may help moderate any polarisation of the debate within the community.

2. Consider financial support, or donation of technical expertise, to flagged projects around biomass, a micro-grid project or technological uplifts to elevate power supply or support through passive investment diversification, as recommended by DPIRD and the Dairy Industry Association, to show direct benefit flowing into the community.

8.2. POPULATION & DEMOGRAPHICS

The provision of appropriate accommodation, infrastructure and community services to support this growing population is somewhat limited, and pressure is evident in increasing rental and housing prices, government agency feedback and current investment into these areas within the community (Infrastructure WA 2022, Shire of Augusta Margaret River Annual Report 2024).

As such any population shift, or demographic change, is often shown to be more significantly felt in a smaller community, than comparatively within a larger regional centre where adequate services and infrastructure are already in place to service a larger population (Cheshire, Lynda, et al 2014).

In addition, any impact on the perceived values of "isolation," "peace" and "close-knit" nature of this community will be felt. This potential impact was raised by community members in both the qualitative and quantitative stages of the study.

That said, given the small operational workforce, this project would not have a noticeable impact on the demographic profile of the community, except during construction. The addition of up to 150 construction workers during peak construction, whose industry profile tends to show a greater proportion of young males within it (Master Builders Australia 2024), will sit differently within the ageing demographic of Molloy Island and Augusta, and other small population clusters distributed through the area.

The size of construction workforce may put pressure on social cohesion, accommodation, rental prices, utilities and services within the region, although it is noted that this is a short-term impact (Carrington, et al 2016, Scott and Hogg 2015, Lockie, Stewart, et al 2009, Bush and Lipari 2015, Chapman, Janine, et al, 2020, Pidd, K, et al, 2019, Shire of Augusta Margaret River Annual Report 23/24). This potential impact was considered a concern by several community members in both the qualitative and quantitative stages of the study.

Positive flow-on social benefit could be achieved through income contribution to accommodation providers, advice or suggestions on appropriate training or pathways to access employment within Synergy or the energy sector for the local workforce, local procurement and increased participation in social, sporting and recreation clubs.

Recommendations for Mitigation/Benefit Realisation

3. Any project decisions relating to accommodation of the construction workforce should consider:
   - Potential impacts on the region's smaller, tourism-based communities,
   - Potential impacts on communities such as Augusta whose demographic profile differs significantly from that of the profile of the construction workforce, as referenced in Section 8.2,
   - Potential impacts on rental housing, or holiday accommodation, that is already under pressure and where additional pressure may negatively impact residents, and visitors, in terms of rising prices, or reduced supply.
   - A commitment to achieve a greater diversity in the profile of the construction, and operational, workforce would reduce social impacts historically associated with construction workforces in regional areas.
   - The potential of a construction camp was raised by the local government, and some landowners, as an opportunity to address this pressure. Early investigations suggest that an accommodation camp may not be financially and commercially viable. Synergy should explore and continue to test the market should the project progress to the next stage. Other mitigation strategies could include recommended accommodation zones, behavioural management, policies and communication strategies.

8.3. ENVIRONMENTAL VALUES

The primary impact on environmental values and stewardship for this project are around water, visual amenity, flora and fauna. A full assessment of impacts on social and environmental values for these indicators will require project location, transport routes and construction decisions to be finalised.

However, the baseline provides a snapshot in time to help guide project feasibility decision making and design of mitigation strategies to minimise any potential negative social impacts.

Recommendations for Mitigation/Benefit Realisation

4. Recognise the importance of water, soils, ironstone floral communities, and conservation significant flora and fauna unique to this area, and, wherever possible, avoid the areas noted as high value through the quantitative survey results, and through SynergyRED's commissioned environmental and visual impact studies and assessments.

5. Support local volunteer and care groups to ensure that ongoing protection and restoration of the natural assets continues.

6. Ensure induction protocols include recognition of important flora and fauna values, expected behaviours are articulated in response to these, and weed mitigation control for vehicles entering the site is in place to assist in protection of local flora.

8.4. WATER

Changes in surface water flows from placement of infrastructure and any impact on already degraded water supplies was raised as a concern by several participants in both the qualitative and quantitative stages of the study.

Recommendations for Mitigation/Benefit Realisation

7. Develop a project management plan to manage any potential impacts to groundwater and acid sulfate soils.

8. Support local volunteer and care groups to ensure that ongoing protection and restoration of the natural waterways will continue.

9. Consider social values around water in any project decisions relating to dewatering requirements, clearing, access road or footing installation.

10. Ensure induction protocols include recognition of values, expected behaviours, and control for spills/discharges.

8.5. FLORA

The Scott River Region's sensitive flora communities, and the role they play in regional biodiversity is an important consideration for the proposed windfarm in Scott River. The following recommendations were provided by technical experts of the Wildflower Society and local conservation groups.

Recommendations for Mitigation/Benefit Realisation

11. A management plan be developed to manage any potential impacts on ironstone communities, waterlogged soils, and surface water flows to address community concerns around these values.

12. Support local volunteer and care groups to ensure that ongoing protection and restoration of the natural flora and fauna is seen as valued.

13. Ensure induction protocols include recognition of flora values through visual guides, controls for clearing and vehicle and transport protocols.

14. Priority actions include appropriate management and monitoring for weed control and spread of dieback disease, in line with standard industry practice in flora and biodiversity protection.

8.6. SOILS

SynergyRED has completed preliminary geotechnical investigations and is progressing detailed geotechnical investigations to adequately characterise the site, including the location of potentially acid sulfate soils. SynergyRED would submit an acid sulfate soils management plan to the Department of Water and Environment Regulation for approval prior to construction.

Recommendations for Mitigation/Benefit Realisation

15. Develop management plans outlining the proposed management strategies, and a comprehensive monitoring program, to ensure impacts on the downstream environment are appropriately managed.

16. Investigate as part of the feasibility study alternative foundation types, construction timing, and dewatering methodologies.

17. Consideration of corrosion in choice of foundation materials and associated steel infrastructure.

8.7. FAUNA

The following recommendations are based on the information and secondary research provided by Bird Life Australia in relation to minimising potential impacts on identified priority species of birds and bats. They should be considered against SynergyRED's Environmental Impact Assessment conclusions and appropriate messages provided to stakeholders and community as project decisions are finalised.

Recommendations for Mitigation/Benefit Realisation

18. Effort be made to avoid areas between forest or waterways (as birds will cross the turbine areas to move between fragments), and along forested ridge or waterways (as these are often used as navigational aids by birds and bats, abutting forest or remnants (as increased foraging activity along edges).

19. Reduce the attractiveness of turbine areas for birds and bats by minimising perching opportunities (e.g. guy lines) and lighting.

20. Provision of "passive" visual cues may enhance the visibility of the rotor blades enabling birds to take evasive action in due time. (May et al 2020).

21. Once built, ongoing management to reduce bird deaths during periods of high risk may be necessary, such as during peak foraging activity times and poor weather conditions (rainy, foggy, poor visibility).

22. Understand appropriate flight patterns through the environment studies and where possible establish fauna buffer zones to minimise collision hazards. This can be determined based on high habitat value features (e.g. hollow bearing trees or raptor nests) and biological and species specific information.

23. Lighting at operation and maintenance facilities should be on sensors, hooded and directed to minimise skyward illumination.

24. Funding scientific research to address information gaps and areas of uncertainty, i.e. barotrauma, low and high-speed rates of movement for bats, modeling work based on microbat activity periods/weather conditions. Information should be passed into the public arena to assist in future assessments.

25. Appropriate timing of construction activities to minimise impacts to birds and microbats, i.e. outside of known nesting periods.

8.8. FIRE

Fire in this region would have potentially catastrophic consequences to human life, property and emergency services. Studies conducted by SynergyRED to date demonstrates a low fire risk resulting from this proposed project, and note fire suppression and other risk management procedures will be in place.

Improved private access roads will allow better access for emergency services in case of fire, and provide additional fire breaks. Dedicated water tanks at the proposed wind farm can also be used in the event of a fire (SynergyRED).

Aerial firefighting is generally not impacted by a wind farm, with aircraft generally able to avoid the wind turbines in a similar manner to other obstacles such as power lines and communications towers. However, within the volunteer fire fighting community, interference with aerial firefighting activities is seen to be a perceived impact that is seen to potentially result in increased destruction of native vegetation and habitat during fire events. This may need to be worked through with DFES and as part of a local fire management plan.

Recommendations for Mitigation/Benefit Realisation

26. Ensure appropriate fire monitoring and prevention protocols around ignition sources are in place during construction and operations.

27. Install wind turbines with fire detection and fire suppression systems to prevent significant fires.

28. Employ a robust fire management plan for the proposed project to mitigate risks, in consultation with Department of Fire and Emergency Services.

29. Work with local volunteer fire brigades to ensure local protocols are employed, and all staff onsite are inducted to local nuances relating to fire risk.

30. Maintain appropriate levels of water for emergency response events as highlighted in the current project planning detailed in Section 7.4.

8.9. SENSE OF PLACE

The vast openness, peace, quiet, agricultural activities, forest, natural waterways and flora and fauna in the Scott River area are all contributing social values to maintaining a sense of place in the region. The scale of turbines, their layout and visibility/noise can be seen as a hinderance to this sense of place, or as in the case of Albany and many other European communities can be a value add contributing to a sense of place and pride over time.

Van Der Horst and Vermeylen in their LA Journal Article "Beautiful Eyesores" comment on this new way of seeing the aesthetics of wind energy turbines in remote areas in terms of functional and iconic landscapes. This balance will need to be sought, and communicated, as the proposed wind farm for Scott River moves forward in planning.

Recommendations for Mitigation/Benefit Realisation

31. Monitoring and finding appropriate controls for light emissions/shadow flicker and noise that may impact on the sense of remoteness, quiet and night sky.

32. Explore creative solutions around the aesthetic of the wind turbines – suggestions made by interview respondents include impressive artist murals and design. Wayfinding signage that described the art or the future of energy may assist to promote the infrastructure as a tourism asset and minimise negative perceptions. This may assist to create a greater net positive benefit. This would need to be done in a collaborative way with the community and professional artists to realise the benefit.

8.10. INDIGENOUS HERITAGE

SynergyRED, via consultants, have completed Aboriginal Heritage Surveys of the area in January 2024. The survey was conducted in accordance with the Noongar Standard Heritage Agreement under the South West ILUA to determine whether Aboriginal sites existed, and if any such sites would be impacted by the proposal. The survey was completed with local Elders nominated by the Karri Karrak Aboriginal Corporation.

A draft of the report provided to Synergy by the Heritage Consultant from the completed survey indicates no previously unrecorded Aboriginal sites were identified. The draft report also advises that SynergyRED can proceed with the proposed activities within the survey area with no regulatory approval required under the Aboriginal Heritage Act, excepting the portion of the survey area that remains unsurveyed and the ID20434 Blackwood River and ID22928 Scott River Aboriginal heritage sites. See Figure 14.

There was a request to avoid the identified specific tree at the intersection of Sues Road, Chester Road, and Brockman Highway, as well as the cultural protection of raptors, ospreys, and the wetlands and waterways.

Further discussions with Karri Karrak Aboriginal Corporation brought forward the following recommendations.

Recommendations for Mitigation/Benefit Realisation

33. Engage with Karri Karrak Aboriginal Corporation as the project moves from feasibility into planning to actively involve the local Indigenous community via an established set of consultation protocols for the life of the project.

34. If the project moves from feasibility to planning, to engage with Karri Karrak and the cultural representatives regarding opportunities for culturally appropriate interpretative material, employment and contracting opportunities.

35. Ensure all inductions and engagement protocols are in place prior to any commencement of works, potential clearing or accommodation/infrastructure activity.

8.11. COLONIAL HERITAGE

The local history and heritage of this region demonstrates social values of persistence, perseverance and an attachment to commercialising natural assets for greater community good, such as food supply, recreation and tourism-based activities.

There is an opportunity for the proposed wind farm in Scott River to demonstrate these core values in terms of provision of clean energy for the future, respecting and caring for the natural environment and persevering to deliver a win-win project for the local community and state.

Recommendations for Mitigation/Benefit Realisation

36. Ensure the proposed wind farm in Scott River adds another level of demonstratable economic activity to the region in terms of energy provision, as well as potential for investment in the historic dairy industry to sure up its future.

8.12. RESILIENT AND PROSPEROUS COMMUNITIES

The Federal Government defines community resilience and prosperity as the long-term wellbeing of a community and its ability to recover from, adapt and thrive in the face of change (Marinucci 2024). These changes are generally considered to be natural, economic or human made influences, pressures and disasters. This is generally the product of appropriate decision-making systems, land and housing security, connections and access and infrastructure provision, all of which are described in Section 6.5.1 to Section 6.5.6.

SynergyRED's proposed wind farm in Scott River adds resilience to the wider community through power generation and energy transition. However, at a local level the direct and tangible visibility of this contribution is not recognised locally.

Given the low operational workforce numbers and minimal impact on adequate provision of health and community service infrastructure, these are not discussed within this social values assessment. Further consideration of health and community service impacts should be considered if additional projects in the region were added into the future and contributed to cumulative impacts.

8.13. DECISION-MAKING SYSTEMS

The qualitative and quantitative fieldwork results have highlighted a strong expectation by local stakeholders and community members to be informed of, and actively involved in, decision making related to the proposed wind farm in Scott River. The suggestions to minimise negative impacts of the proposed wind farm in Scott River included demonstrating values around flexibility, transparency, humility and listening, educating and engagement, explaining energy generation and future technologies, being actively involved in clearing, monitoring and rehabilitation work associated with the project and involvement in decision making. See Figure 20a and b.

Recommendations for Mitigation/Benefit Realisation

37. Work to increase the community's faith in engagement and positive benefit decision making to help create a resilient and prosperous community through efforts and consistency to educate, inform and proactively demonstrate benefit across each stage of the project lifecycle.

38. If the project moves through the feasibility stage to a planning stage, ongoing consultation and application of any of the recommended/suggested mitigation strategies will need to be provided to those affected stakeholders. This will be the basis in which the community and stakeholders will feel they have had a say in the decisions that affect them.

8.14. LAND TENURE

Decisions relating to final locations for the proposed wind farm in Scott River turbines and associated infrastructure would have an impact on local landholdings and potential compensation income flow-ons. These will need to be managed not only from a commercial perspective, but also through recognising the social value attachment to land and its use and the financial gains for some landowners over others in region.

Recommendations for Mitigation/Benefit Realisation

39. Positive benefit can be realised through landowner rental agreements relating to the placement of the proposed wind farm in Scott River Turbines on private land, and there is an opportunity to demonstrate good faith and fairness through these negotiations.

40. Clarify the terms of the buffer restrictions and the definition of dwelling within the broader landowner community, particularly where it relates to sheds, workshops, proposed accommodation and other infrastructure on an adjacent property.

41. Consider power offsets, or additional benefits, for adjacent or affected landowners, not just those hosting a wind turbine as part of the landowner's agreement.

8.15. ROAD & TRANSPORT NETWORKS

Construction and operational activities will have implications for the road network and will need to be considered in mitigation management. Timing, and planning to reduce impacts on existing traffic on these remote roads will need to be factored into planning given the impact any congestion will have on access to local rural properties and essential transport for the agricultural industry and local supply chains.

Increased truck movements may increase the risk of collision on remote roads which would be classified as a project safety risk and should be managed as such.

Recommendations for Mitigation/Benefit Realisation

42. Access road planning should include considerations around drainage, permeability, protection of the ironstone roadside flora communities, tourism and agricultural traffic movements on the remote roads around the site, and safety.

43. A Traffic Planning and Management System is recommended to be developed to avoid key supply chain routes for dairy and feed trucks in and out of Scott River Region, particularly during construction.

44. Where possible, construction and turbine movements to be managed outside peak regional tourism seasons and key agricultural seasons.

8.16. POWER & TELECOMMUNICATIONS

SynergyRED are undertaking an Electromagnetic Interference study to identify issues and potential mitigation strategies if required. Liaison with other utility providers in the region will continue during subsequent project phases.

Recommendations for Mitigation/Benefit Realisation

45. Consider an advocacy approach on behalf of the local community with partnering utilities and service providers to improve power and communications into the Scott River Catchment.

8.17. COMMUNITY SERVICES

Recommendations for Mitigation/Benefit Realisation

46. SynergyRED could encourage local procurement of goods and use of local community services, as well as employee volunteering, to both direct employees and contractors, under Synergy's Social Values Framework to improve economic return to the local community and encourage investment in these core services.

8.18. WAY OF LIFE

Recommendations for Mitigation/Benefit Realisation

47. Care should be taken in the engagement strategy to ensure the community is not publicly pushed into a position of support or against the project, which may contribute to polarisation within this close-knit community. Rather discussion should focus on discussing the potential impacts and benefits, and how these can best be managed with community input.

48. Consideration of the way of life and demographics of the differing local settlements should be considered in decisions relating to accommodation of construction and operational workforces.

49. Contribution with respect to Synergy's benefit funding and social performance commitments should be made in line with existing community values and way of life.

8.19. INDUSTRY SECTORS

The economic footprint for the operational project area is small based on workforce size, and predicted local economic impact, as such, careful consideration of compatibility and ways to reduce impact on existing economic industries such as agriculture and tourism, should be at the forefront of the feasibility assessment for this project.

Recommendations for Mitigation/Benefit Realisation

50. Considerations to minimise negative impacts such as potential congestion on transport routes during construction, competition for seasonal workers, access and amenity issues and impacts on agricultural productivity in final positioning of the turbines will require ongoing engagement and transparent project decision making in subsequent stages of the project.

51. Provision of the tourism viewing point and managing any restricted access to camping areas, forest or waterways will also ensure a positive legacy is left for the local tourism industry.

8.20. EMPLOYMENT

The impact of the introduced employment for the proposed wind farm in Scott River is relatively low with respect to the operational workforce. The construction workforce may have an impact on either local draw, or an introduced workforce from out of the region. This impact will be dependent on SynergyRED's final procurement strategy for the project once it moves into the planning phase.

Recommendations for Mitigation/Benefit Realisation

52. Efforts to employ locally will be defined by SynergyRED's Buy Local, Aboriginal Procurement Policy and WA Industry Participation Plans (WAIPS) is encouraged.

8.21. SUPPLY CHAINS

Care will need to be taken during construction to ensure increased traffic does not interfere with agricultural transport to local properties, to avoid impacting their access to efficient supply chains.

Recommendations for Mitigation/Benefit Realisation

53. Local procurement ensures incomes derived provide a direct local economic benefit that is multiplied through the region to a greater extent than if it is taken outside the region. This can be quantified once the proposed wind farm in Scott River procurement strategy is in place.

54. Implement appropriate management plans to manage risk to water, soils or land clearing that may impact on agricultural enterprises.

55. Introduce positive procurement strategies for local construction, maintenance, operations and technical teams.

Figure 20a. Summary of Survey Respondents Suggestions for Social Benefit Realisation

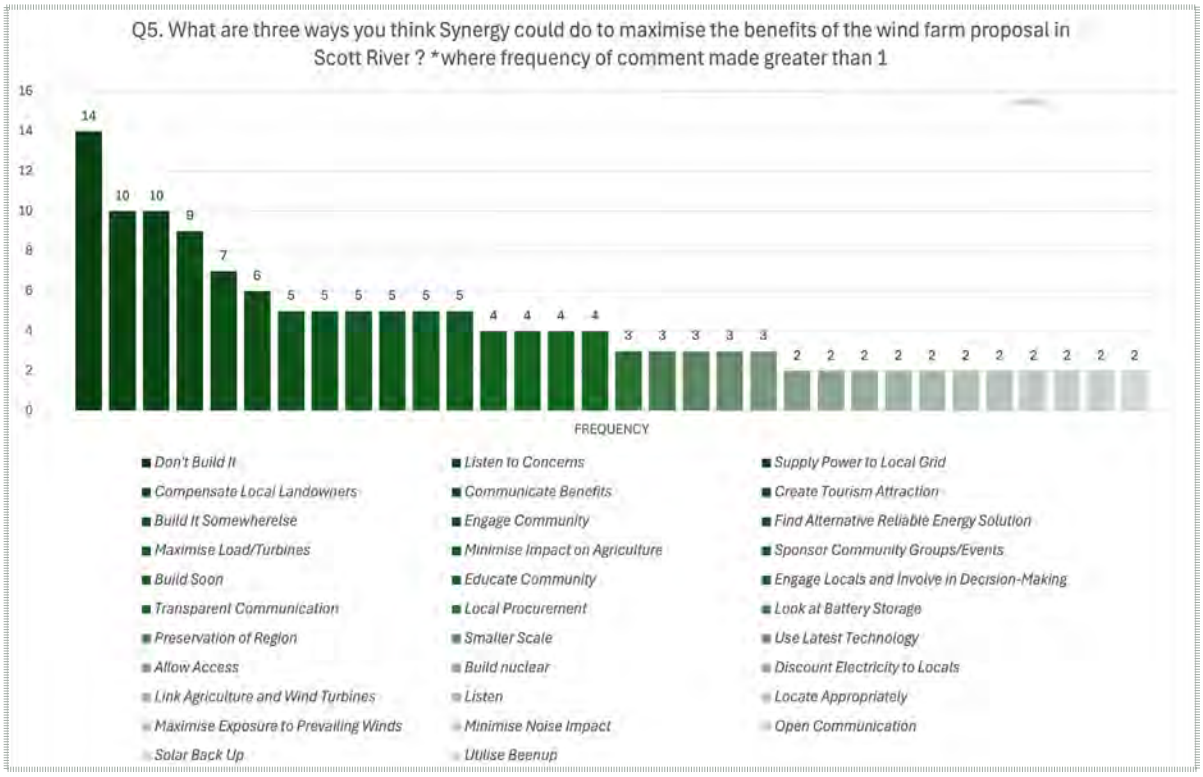

Figure 20b: Summary of Survey Respondents Suggestions for Social Impact Reduction or Mitigation

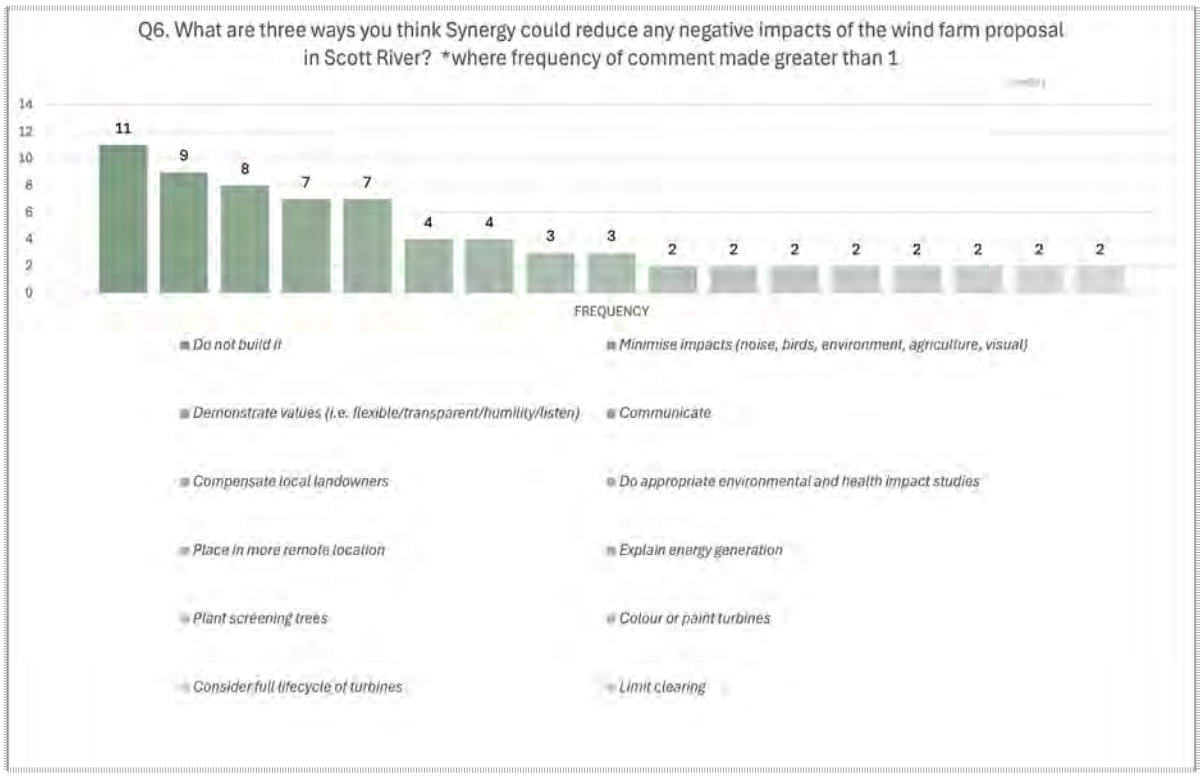

8.22. ADDITIONAL LIFECYCLE CONSIDERATIONS

Understanding the full project lifecycle and long-term carbon footprint of the proposed wind farm in Scott River was raised, by stakeholders and the local community, in relation to understanding the full picture of the proposed projects impacts.

As per the Section 7 project description, the proposed wind turbines have a typical life span of around 30 years. It is understood that parts, including blades, may need to be replaced, if they are damaged, before end-of-life.

SynergyRED notes that approximately 85 percent of a wind turbine (by weight) is commonly recycled in Australia. This includes the steel tower and valuable metals in the generator. While wind turbines blades are not yet commonly recycled, a variety of reuse products have been trialed including bridges, poles, sound barriers, bus stops, roofs and farming equipment. The industry is working to make turbine blades more easily recyclable.

Several residents and stakeholders questioned the estimation on the SynergyRED Fact Sheet that a wind turbine takes only six to nine months to pay back the carbon footprint required for its production, transport, construction, maintenance, dismantling and disposal. This estimation is referenced to Vesta Energy 2024, and should be clarified further, along with full lifecycle information, in future consultation and engagement work undertaken by SynergyRED.

Recommendations for Mitigation/Benefit Realisation

56. A full lifecycle assessment should be completed for the wind turbines and associated infrastructure as the project potentially moves from feasibility to planning. This could include the considerations summarised in Table 3.

Table 3: A Summary of Recommendations Provided by Project Lifecycle Stage

Planning & Feasibility

- Invest in pre-construction phase surveys and monitoring for birds, bats and habitat to improve knowledge of breeding populations in area.
- Continue engagement with local landowners, Traditional Owners, transport and infrastructure agencies, local environmental groups, community representatives and accommodation providers.
- Establish ongoing performance management indicators, monitoring and reporting frameworks across the project lifecycle.
- Consider demonstration of this proposal against other future energy solutions.

Construction

- Implementation of mitigation and benefit realisation measures identified during construction and operations phases.
- Detailed and considered engagement with local landowners and community on proposed transport and access routes.
- Plans to minimise clearing and ensure construction workforce is appropriately inducted and aware of obligations to minimise impacts in high-risk areas identified in this report.
- Considered and effective water management strategies in place – particularly in relation to dewatering and acid sulphate soil risks.
- Assess and manage traffic congestion, truck collision risks and interference with local supply chains.
- Consider recommended accommodation zones, behavioural management strategies and local employment to reduce potential risks and impacts.
- Confirm latest technology to minimise bird or bat impacts in turbine procurement.

Operations

- Consider energy consistency in low wind scenarios.
- Fire mitigation and management plans in place.
- Local procurement and maintenance contracts with local benefits quantified.
- Water management plans are in place and monitored.
- Bird and bat sensors and or management strategies in place.
- Weed control and vehicle access procedures are in place.

Replacement & Lifecycle Renewal

- Maintain focus on recycling and life cycle renewal for the turbines and associated infrastructure.
- Focus on supporting new and emerging technologies to find appropriate re-use and re-cycle opportunities for the turbine blades.

9. CONCLUSION

This report intends to provide a baseline understanding of the social value drivers for the proposed wind farm in Scott River in the context of the remote, rural and agriculturally based community in Scott River, and human settlements in the immediate surrounds.

The Scott River and associated communities of the Augusta region embody a rich tapestry of social, cultural, and environmental values that resonate with local community members and visitors alike. These areas are celebrated for their unique natural landscapes, including pristine waterways, biodiversity, and agricultural heritage, which contribute to both individual well-being and community identity.

The connection between people and place is evident through the region's recreational opportunities, agricultural activity, and strong sense of community stewardship. However, these values face challenges from increasing development, environmental pressures, and shifting demographics. Balancing sustainable development with the preservation of these social values is essential to ensure that future generations continue to experience and cherish the unique character of Scott River and Augusta.

Through collaborative planning, inclusive decision-making, and proactive management, stakeholders can safeguard the region's cultural and environmental integrity, enhancing its role as a vibrant and meaningful place and one that may play an important role in the state's transition to a new energy future. This assessment underscores the importance of aligning social values with long-term regional strategies to foster resilience, equity, and sustainability in these treasured parts of Western Australia.

If the proposal for the wind farm in Scott River progresses to subsequent stages in the approvals and project planning processes, impacts on these social values can be quantified and a monitoring/reporting base established for the project's lifecycle.

3. IN-DEPTH INTERVIEW GUIDE

Synergy Wind Farm Feasibility

INDEPTH INTERVIEW GUIDE

YOUR VIEWS & PERSPECTIVES

WIND FARM FEASIBILITY SOCIAL IMPACT QUESTIONNAIRE

Your views will form part of an independent social impact assessment that will directly assist with the project feasibility and future decision making. There are no right or wrong answers, we are simply interested in your perspectives.

Q1. Firstly, I'd like to understand more about your connection to the region? How long have you lived here? Why did you choose to live here? Do you volunteer for any organisations in the region?

Q2. How do you derive your income? What is this reliant on e.g. people, land, environment, transport?

Q3. How many people do you employ? And where do you draw them from?

Q4. What do you think are the most significant issues facing this region into the future?

Q5. What do you think are the most important attributes of this area to you?

Q6. Please share any other thoughts you might have on the most important attributes to keep or protect in the Scott River area.

Q7. Are you aware of the Synergy Wind Farm Feasibility Study for Scott River?

Q8. Do you have any initial thoughts around the proposal – either concerns or positive benefits?

IDEAS TO CONSIDER

Q9. Based on your understanding to date, are there any things you think Synergy could do to maximise the benefits of the wind farm proposal in Scott River?

1.

2.

3.

Q10. Based your understanding to date, what are three ways you think Synergy could reduce any negative impacts of the wind farm proposal in Scott River?

1.

2.

3.

Q11. On a scale of 0-5, how much do you support a transition to a NetZero emission future? (0=not supportive at all and 5 = highly supportive)

Enter a value between 0 (Not at all Supportive) and 5 (Highly Supportive)

Q12 What is your energy generation preference, and why?

PLACES OF IMPORTANCE

Q10a. Please indicate on the map any places that have an important value to you.

Q.10b. Briefly describe why you have chosen these points and what makes them important to you.

4. ONLINE QUESTIONNAIRE FRAME

YOUR VIEWS & PERSPECTIVES

WIND FARM FEASIBILITY SOCIAL IMPACT QUESTIONNAIRE

Your views will form part of an independent social impact assessment that will directly assist with the project feasibility and future decision making.

There are no right or wrong answers, we are simply interested in your perspectives.

Q.1 On a scale of 1-10, how supportive would you be of a renewable energy wind farm in the Scott River area?

Not at all supportive — Highly supportive

5

Q2a. In thinking about the Scott River area, how important are the following attributes to you ? (1 = not at all important and 5 = extremely important)

Agricultural production and history

Local biodiversity of native flora and fauna

Peace and quiet

Being able to visit the forests and national parks

Preserving what is unique about this area

Local employment opportunities

Unique bird life

Being close to community and our networks

Environmental conservation and restoration of cleared land

Tourists and visitors enjoying the region

Using the regions natural assets to help provide for my family (e.g through farming or tourism)

Water values such as rivers, wetlands and swamps

Aboriginal history and culture

Being able to see the clouds, horizon and sky

Being able to drive and access remote areas around us

Other (please specify below)

Q2b. Please share any other thoughts on the most important attributes to keep or protect in the Scott River area

Q3a. Thinking about a proposed wind farm consisting of up to 30 wind turbines in Scott River, how would you rate the likely impacts on the following identified attributes? (1= not manageable at all (to our detriment) and 5 = manage extremely well (to our benefit)

Being able to see the clouds, horizon and sky

Tourists and visitors enjoying the region

Being close to community and our networks

Environmental conservation and restoration of cleared land

Water values such as rivers, wetlands and swamps

Being able to visit the forests and national parks

Being able to drive and access remote areas around us

Peace and quiet

Biodiversity of native flora and fauna

Local employment opportunities

Other (please specify below)

Preserving what is unique about this area

Unique bird life

Using the regions natural assets to help provide for my family (e.g through farming or tourism)

IDEAS TO CONSIDER

Q5. What are three ways you think Synergy could do to maximise the benefits of the wind farm proposal in Scott River?

Q6. What are three ways you think Synergy could reduce any negative impacts of the wind farm proposal in Scott River?

Q7. On a scale of 0-5, how much do you support a transition to a NetZero emission future? (0=not supportive at all and 5 = highly supportive)

Not at all Supportive — Highly Supportive

3

Q.8 What is your energy generation preference, and why?

Q9a. If you had $10 million dollars to invest in energy for the future, what proportion would you allocate to the following?

$0 / $10,000,000

0

Coal or traditional energy sources

$0

Natural Gas

$0

Solar Power

$0

Wind Power

$0

Hydro power

$0

Ocean Power

$0

Stand-alone power systems

$0

Nuclear power

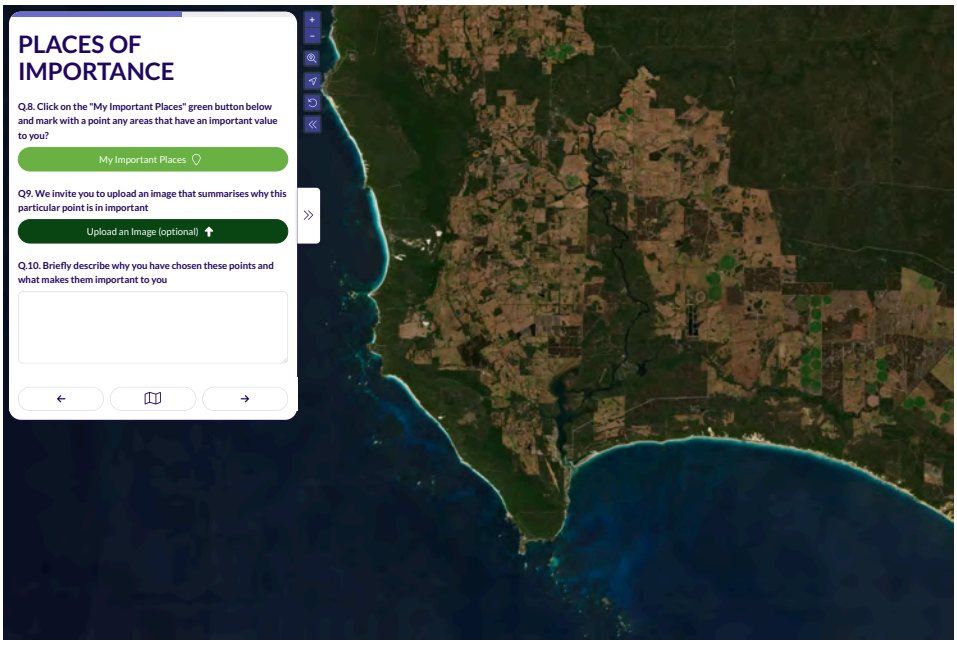
$0

Other (please specify below)

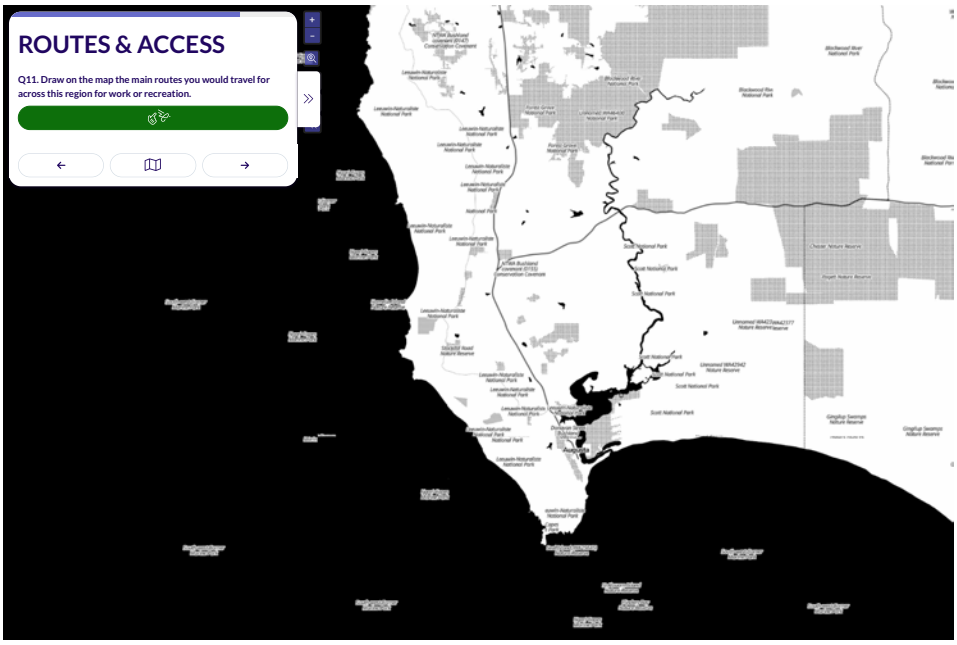
$0

Q9b. If you selected 'other' please write your response here

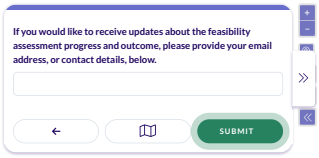
2 / 5



PLACES OF IMPORTANCE
Q.8. Click on the "My Important Places" green button below and mark with a point any areas that have an important value to you?
My Important Places
Q9. We invite you to upload an image that summarises why this particular point is important
Upload an Image (optional)
Q.10. Briefly describe why you have chosen these points and what makes them important to you



ROUTES & ACCESS
Q11. Draw on the map the main routes you would travel for across this region for work or recreation.



If you would like to receive updates about the feasibility assessment progress and outcome, please provide your email address, or contact details, below.

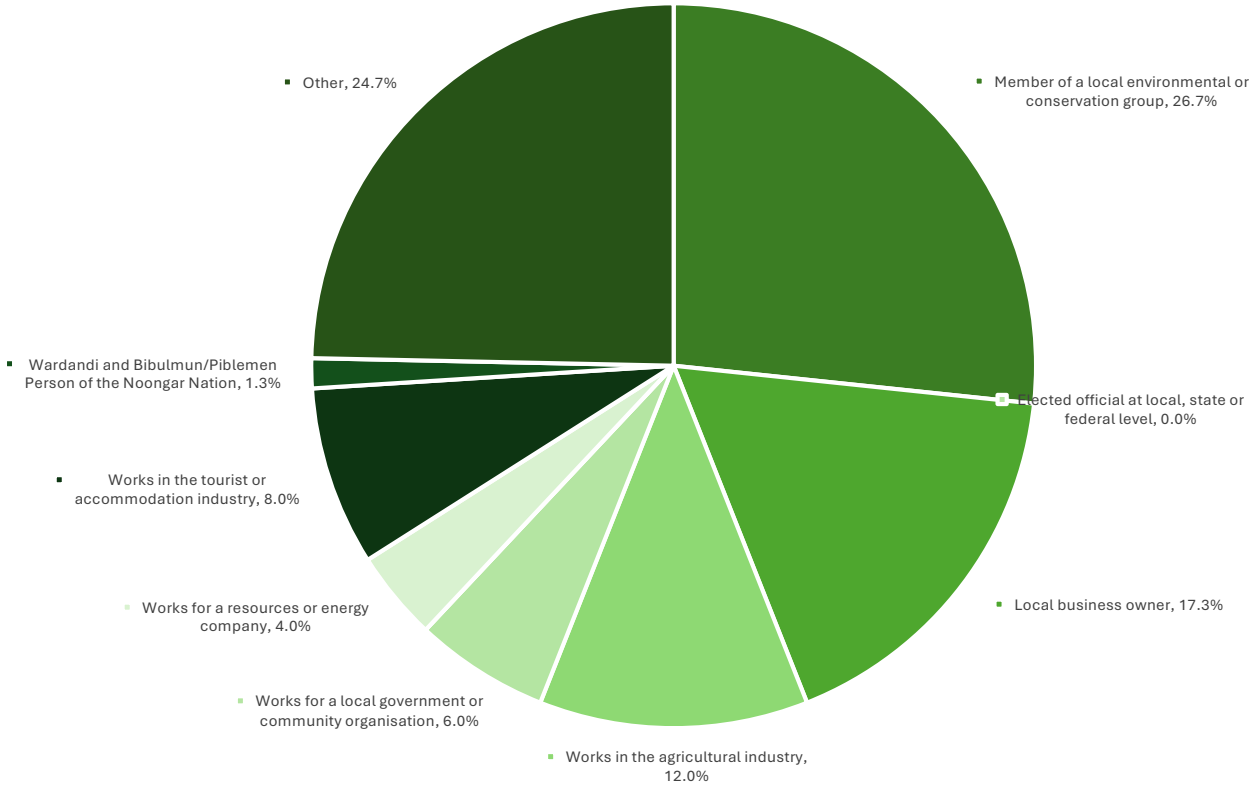
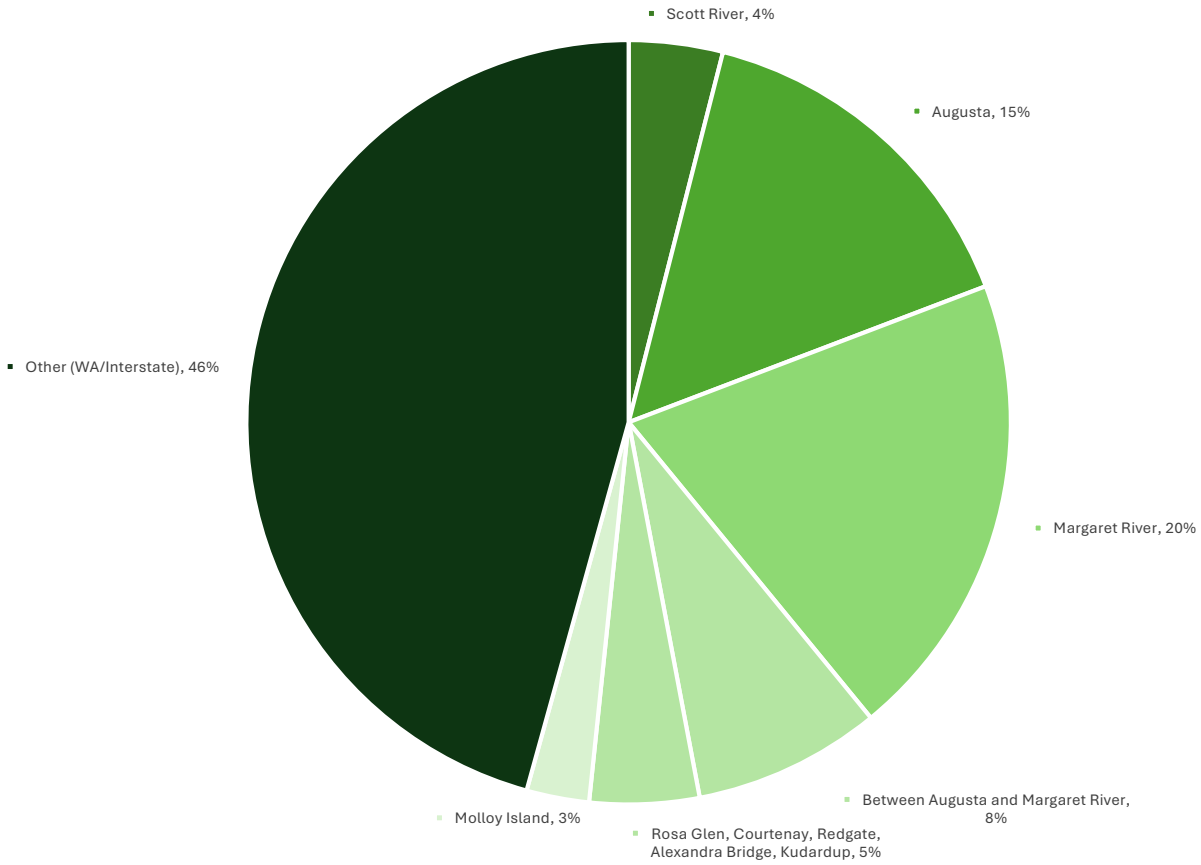
Profile of Respondents



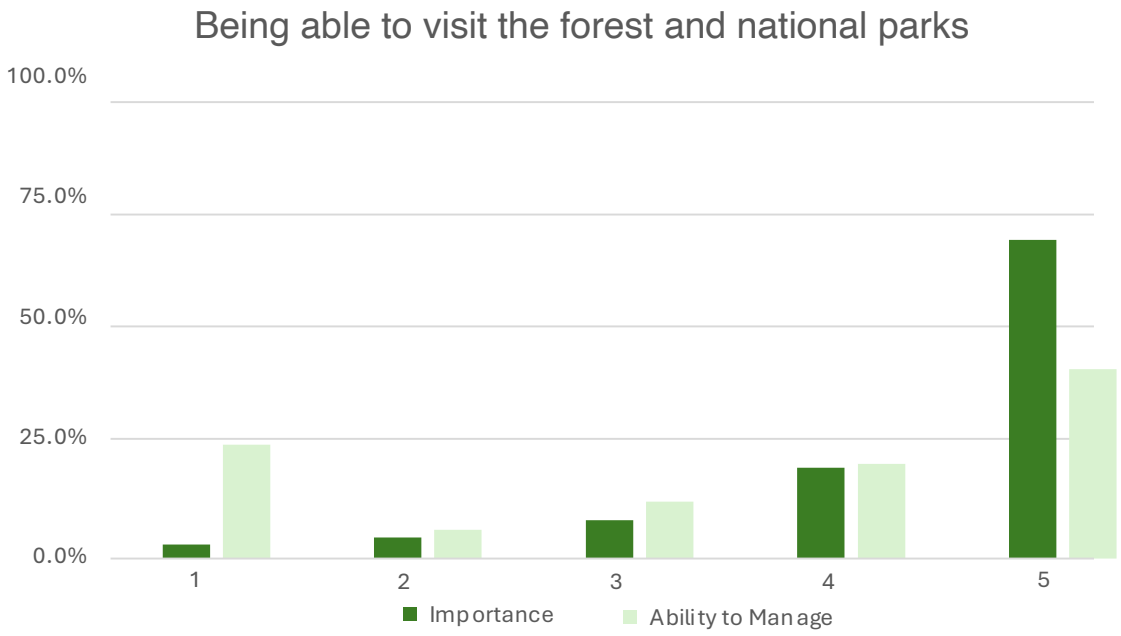
Area of Residence



Place.ID Social Values Matrix Frequencies

Q. In thinking about the Scott River area, how important are the following attributes to you ? (1 = not at all important and 5 = extremely important)?

Q. Thinking about a proposed wind farm consisting of up to 30* wind turbines in Scott River, how would you rate the likely impacts on the following identified attributes? (1= not manageable at all (to our detriment) and 5 = manage extremely well (to our benefit)



*Note: This question was asked as part of the community survey released in March 2024. This was prior to the scope of the proposed wind farm being reduced from a maximum of 30 turbines to 20 turbines to cater for transmission line capacity.

Executive summary

Synergy Renewable Energy Developments Pty Ltd (SynergyRED) is proposing to develop a wind farm at Scott River in southwest WA (the Project). A noise impact assessment (NIA) for the operation of wind turbine generators (WTGs) has been conducted to support the relevant environmental and planning approvals for the Project.

A dual criteria approach was adopted for this NIA which involved deriving the criteria based on both the WA *Environmental Protection (Noise) Regulations* 1997 and SA *Wind Farm Environmental Noise Guidelines, 2021* using the background noise monitoring data collected at seven locations around the Development Envelope.

A 3D environmental noise model of the Project was created to predict noise levels at the adjacent noise sensitive receptors, using the ISO9613-2:2024 calculation algorithm implemented in SoundPLAN (v 8.2) software. A proposed 20 WTG layout with a hub height of 164 metres was considered in the 3D noise model. The turbine source noise input data was based on the overall sound power level and the 1/3 octave source spectra data provided by SynergyRED.

Noise modelling results show that predicted noise levels from turbine operation at adjacent noise sensitive receptors are expected to comply with the noise criteria in accordance with both WA Noise Regulations (1997) and the SA Guidelines (2021).

This report summarises the results of the NIA. This report is subject to and must be read in conjunction with the limitations set out in Section 1.4 and the assumptions and qualifications contained throughout this report.

Glossary

Term	Description
Background noise level	The measured background noise level at a noise receptor location as per the SA Guidelines.
dB	Decibel, which is 20 times the logarithm (base 10) of the ratio of a given sound pressure to a reference pressure; used as a unit of sound.
dB(A)	A-weighted decibel measurement to represent the sound frequency sensitivity of the human ear.
Downwind direction	Wind direction for which a noise receptor location is downwind of the nearest WTG as per the SA Guidelines.
Downwind background noise level	Measured background noise level at a noise receptor location for winds within ±45° of the downwind direction as per the SA Guidelines.
Dwelling	Building used for a noise sensitive purpose,
DWER	WA Department of Water and Environmental Regulation
EPA	Environmental Protection Authority of Western Australia
Cut-in wind speed	Wind speed at which the turbine starts power production
GHD	GHD Pty Ltd
IEC 61400-11:2012	International Standard published by the International Electrotechnical Commission regarding wind turbines.
IF	Influencing Factor which is calculated to determine the noise criteria at a specific noise receptor location and depends on the ratio of commercial and industrial land zoning and the presence of major and secondary roads within 100 metres and 450 metres of the point under consideration.
ISO 9613-2: 2024	Recent version of international standard *ISO9613-2:2024 Acoustics – Attenuation of sound during propagation outdoors Part 2: General method of calculation* (ISO9613-2), used for noise propagation modelling by considering the distance between source and noise sensitive receptor topography, ground attenuation, atmospheric absorption at different frequencies and meteorological conditions favourable to noise propagation.
L_{A1}	A-weighted sound pressure level that is exceeded for 1 percent of the measurement period.
L_{A10}	A-weighted sound pressure level that is exceeded for 10 percent of the measurement period.
L_{Amax}	Maximum A-weighted sound pressure level recorded during a specified time period.
$L_{Aeq,10\text{-}min}$	The predicted equivalent noise level adjusted for tonality over a 10-minute period.
$L_{A90,10\text{-}min}$	Measured ambient background noise in the absence of the noise under investigation that is equalled or exceeded for 90 percent of the measurement time interval.
$L_{Aeq\ (time)}$	Equivalent sound pressure level: the steady sound level that, over a specified period of time, would produce the same energy equivalence as the fluctuating sound level actually occurring.
L_{Afast}	A-weighted sound level measured with a fast time constant of 125 milliseconds.
L_{Aslow}	A-weighted sound level measured with a slow time constant of 1 second

Term	Description
L_{Apeak}	A-weighted peak sound level. It represents the highest instantaneous sound pressure level measured.
Mitigation	Reduction in severity.
NIA	Noise impact assessment
NMP	Noise monitoring point
Premises	Residential, industrial or other premises of any kind whatsoever and includes land, water and equipment
Project	Proposed wind farm at Scott River in southwest WA
Rated power wind speed	Lowest hub height wind speed at which the WTG reaches its rated power
SA Guidelines	*SA Wind Farm Environmental Noise Guidelines, 2021*
Noise receptor	A noise modelling term used to describe a location/premises used for different purposes where the noise by a specific source is received, measured, predicted or mitigated. The noise receptor types vary depending on the usage of the premises e.g. sensitive, non-sensitive, involved, or not-involved.
Noise sensitive receptor	A noise modelling term used to describe a building or dwelling used for residential or accommodation purposes.
Non-sensitive noise receptor	A noise modelling term used to describe a building not used for residential or accommodation purposes e.g. a shed.
Involved noise sensitive receptor	A noise sensitive receptor in a parcel of land that accommodate part of a wind farm development.
Not-involved noise sensitive receptor	A noise sensitive receptor in a parcel of land that do not accommodate any part of a wind farm development.
Position statement	The Position Statement: Renewable Energy Facilities (WAPC, March 2020) outlines the Western Australian Planning Commission's guidelines for the development and assessment of renewable energy facilities.
pW	Picowatt, which is a unit of power equal to one trillionth of a watt
Sound pressure level (SPL)	The change in air pressure above and below the average atmospheric pressure caused by a passing pressure wave; this is then converted to decibels and can be abbreviated as SPL or L_p.
Sound power level (SWL)	Represents the total noise output of the plant or equipment. Also presented as L_{wA} or SPW.
SynergyRED	Synergy Renewable Energy Developments Pty Ltd
The Regulations	*Environmental Protection (Noise) Regulations, 1997*
Tonal noise	Noise with perceptible and definite pitch or tone.
TF	Transport Factor
Wind speed bin	±0.5 m/s at each integer of wind speed from cut-in to cut-out.
WAPC	Western Australian Planning Commission
WHO	World Health Organization
WTG	Wind turbine generator

1. Introduction

1.1 Background

Synergy Renewable Energy Developments Pty Ltd (SynergyRED) is currently investigating development of a new wind energy project at Scott River in southwest WA (the Project). The Project has the potential to connect to the Southwest Interconnected System.

The Project Development Envelope is located at Scott River in southwest WA, predominantly surrounded by rural lands developed for agricultural purposes with small areas of remnant and regenerated vegetation (Figure 1.1). The development Envelope is generally bound by the following roads:

– Brockman Highway
– Dennis Road
– Milyeannup Coast Road
– Scott River Road

SynergyRED engaged GHD Pty Ltd (GHD) to undertake an environmental noise impact assessment (NIA) for the Project.

1.2 Purpose of this report

This report summarises the results of an operational NIA for the Project, including background noise monitoring, noise modelling and impact assessment in accordance with applicable regulatory requirements.

1.3 Scope of works

The scope of works for this assessment is as follows:

– Background noise monitoring:
  - Review of adjacent noise receptor locations to identify representative noise receptor locations to conduct noise monitoring.
  - Five months of unattended background noise monitoring at seven representative noise receptor locations, with one local weather monitoring station (wind speed, wind direction and rainfall) deployed at one of the seven representative noise receptor locations.
  - NIA based on dual criteria. The criteria were derived primarily based on the *Environmental Protection (Noise) Regulations 1997* (the Regulations). The baseline noise monitoring results were used to determine criteria in accordance with the SA Environment Protection Authority's (SA EPA) *Wind Farms Environmental Noise Guidelines* (SA Guidelines, 2021). The criteria derived based on the SA Guidelines were used as secondary noise criteria for NIA and details of the background noise data processing are provided in Appendix B.

– Noise modelling of the Project:
  - Development of 3D noise model of the Project and surrounding area, incorporating topographic data and all identified noise receptors.
  - Review noise emission data for the candidate turbines being considered for the Project.
  - Conduct noise impact modelling of the Project site according to the prediction procedures as specified in SA Guidelines using ISO9613-2:2024 modelling algorithm.
  - Assess the compliance margin for the proposed layout at noise receptors based on the modelling results. In the case that potential non-compliance is predicted at any noise sensitive receptor, liaise with Project team to discuss mitigation strategies (e.g. changes to turbine layout) to ensure compliance can be achieved. If non-compliance with relevant criteria is still predicted, explore further mitigation measures such as turbine noise curtailment, to achieve the noise criteria
  - Assess operational noise for the substations in accordance with the Regulations.

– Provide a NIA report, summarising the findings relevant to the agreed layout within the scope components above.

1.4 Limitations

This report has been prepared by GHD for SynergyRED and may only be used and relied on by SynergyRED for the purpose agreed between GHD and SynergyRED as set out in Section 1.3 of this report.

GHD otherwise disclaims responsibility to any person other than SynergyRED arising in connection with this report. GHD also excludes implied warranties and conditions, to the extent legally permissible.

The services undertaken by GHD in connection with preparing this report were limited to those specifically detailed in the report and are subject to the scope limitations set out in the report.

The opinions, conclusions and any recommendations in this report are based on conditions encountered and information reviewed at the date of preparation of the report. GHD has no responsibility or obligation to update this report to account for events or changes occurring subsequent to the date that the report was prepared.

The opinions, conclusions and any recommendations in this report are based on assumptions made by GHD described in this report (refer to Section 1.5 of this report). GHD disclaims liability arising from any of the assumptions being incorrect.

1.5 Assumptions

This report is subject to the following general assumptions at the time of writing this report:

– All information provided by SynergyRED, including relevant Project location and noise receptor information, wind turbine generator (WTG) layout and specification, wind data from the Project's meteorological mast, and relevant noise data are deemed correct.
– All parameters used in the assessment and other relevant data are based on best estimates using information provided by SynergyRED and other relevant sources.
– Operating hours for the wind farm would be 24 hours a day, seven days a week.
– It is assumed that noise emission from WTGs for the development do not exhibit tonal character that evokes noise level adjustment in accordance with SA Guidelines.
– Hub heights for the layouts of proposed WTGs used in the current assessment were assumed to be 164 metres above ground level.
– Due to the substantial separation distance to the nearest noise receptors (the nearest noise receptor to the substation is located more than 1700 metres away) it is not expected that vibration impacts would be relevant during the operation of the Project.

2. Assessment criteria

2.1 Operation of wind turbines

Specific noise guidelines are applicable to assessment of noise from wind farms due to their unique noise generating characteristics in conjunction with typically low ambient noise surroundings.

Following advice from the Department of Water and Environmental Regulation (DWER), the *Environmental Protection (Noise) Regulations 1997* (the Regulations) will be used as the primary noise criteria for the NIA.

In addition, the SA Guidelines will be also used to derive the secondary noise criteria based on the background noise monitoring data.

2.1.1 Environmental Protection (Noise) Regulations 1997

Noise emissions from the operation of WTG and associated substation will be assessed against criteria according to the *Environmental Protection (Noise) Regulations 1997* (the Regulations).

Regulation 8 sets out the maximum allowable noise levels (assigned noise levels) based on different time of day and land use (i.e. noise sensitive premises, commercial and industrial type premises), applicable at the premises receiving the noise. Various parameters of the assigned noise levels (L_{A10}, L_{A1} and L_{Amax}) also depend on influencing factor (IF) which are calculated in accordance with Schedule 3 of the Regulations, taking into account the area of industrial and commercial land and the presence of major and secondary roads within a 100 m and 450 m radius around the noise receptor.

A summary of the assigned noise levels from Regulation 8 is presented in Table 2.1.

Table 2.1 Assigned noise levels based on the Environmental Protection (Noise) Regulations 1997

Type of premises receiving noise	Time of day	Assigned noise level. dB(A)		
		L_{A10}	L_{A1}	L_{Amax}
Noise sensitive premises: Highly sensitive area (i.e. noise sensitive premises at locations within 15 metres of a building directly associated with a noise sensitive use)	7:00 am to 7:00 pm Monday to Saturday (Day)	45 + IF	55 + IF	65 + IF
	9:00 am to 7:00 pm Sunday and public holidays	40 + IF	50 + IF	65 + IF
	7:00 pm to 10:00 pm all days (Evening)	40 + IF	50 + IF	55 + IF
	10:00 pm on any day to 7:00 am Monday to Saturday and 9:00 am Sunday and public holidays (Night)	35 + IF	45 + IF	55 + IF
Noise sensitive premises: Any area other than highly sensitive area (i.e. Noise Sensitive premises at locations further than 15 metres from a building directly associated with a noise sensitive use)	All hours	60	75	80
Commercial premises	All hours	60	75	80
Industrial and utility premises other than those in the Kwinana Industrial Area	All hours	65	80	90

2.1.1.1 Influencing factor

Influencing factors (IFs) have been calculated and used to determine assigned noise level criteria as presented in Table 2.2 for nearest noise receptors (refer to Figure 3.5).

Schedule 3 of the Regulations details the process to determine the IF for noise sensitive premises, which can be summarised as the following steps:

1. Obtain a Council zoning map covering an area up to 500 m from the receiving location.
2. Draw two circles around the receiving point, of 100 m radius and 450 m radius.
3. Determine the percentage of each circle that is taken up with industrial and commercial zonings. Note that the industrial and commercial areas in the inner circle are also counted in the outer circle.
4. Add the percentages up as follows:
   - (Percent industrial in small circle + percent industrial in a large circle) x 1/10 = I
   - (Percent commercial in small circle + percent commercial in large circle) x 1/20 = C
5. Determine the transport factor (TF) as follows (Note – TF cannot be more than 6):
   - Major road (more than 15,000 vehicles/day) in small circle, TF = 6
   - A major road in a large circle, TF = 2
   - For each secondary road (6,000 - 15,000 vehicles/day) in small circle, TF = 2
6. Add I, C and TF from steps 4 and 5 above to obtain the IF (i.e., IF = I + C + TF), and
7. Fill in the table of assigned levels by adding in the IF to obtain the L_{A10}, L_{A1} and L_{Amax} assigned levels.

Table 2.2 summarises the list of noise receptors, their coordinates and calculated IFs surrounding the Development Envelope.

Table 2.2 Influencing factor (IF) calculated for noise receptors

ID	Noise Receptor Type	Coordinates, GDA2020 / MGA Zone 50		IF

R34	Not-involved noise sensitive receptor	339819	6217839	0

[1] R12 is a commercial building, and in agreement with the landowner, R11, R25, R26 and R27 will not be used for residential, or accommodation purposes when the wind farm is built. For these reasons, these premises are considered to be "Non-sensitive" and are not considered within the NIA.

[2] R17 and R18 are involved noise sensitive receptors (participating landowners).

2.1.1.2 Annoying noise characteristics

Regulation 7 requires that the noise character received at noise sensitive receptors must be free from annoying characteristics of tonality, modulation, and impulsiveness. If these characteristics cannot reasonably and practicably be removed, then a series of adjustments to the measured or calculated received levels are set out, and the adjusted level must comply with the assigned level. The adjustments are set out in Table 2.3 and are further defined in Regulation 9(1). These adjustments are cumulative up to a maximum of 15 dB.

Table 2.3 Table of adjustments

Adjustment where noise emission is not music (Adjustments are cumulative to a maximum of 15 dB)		
Where tonality is present	**Where modulation is present**	**Where impulsiveness is present**
+5 dB	+5 dB	+10 dB

– Tonality is defined in Regulation 9(1) as being present where the difference between the A- weighted sound pressure level in any one third octave band and the arithmetic average of the A weighted sound pressure levels in the two adjacent one third octave bands is greater than 3 dB in terms of $L_{Aeq, T}$ where the time period T is greater than 10 percent of the representative assessment period, or greater than 8 dB at any time when the sound pressure levels are determined as $L_{A, Slow}$ levels.

– Modulation is defined as a variation in the emission of noise that:

- Is more than 3 dB $L_{A, Fast}$ or is more than 3 dB $L_{A, Fast}$ in any one third octave band

- Is present for at least 10 percent of the representative assessment period, and
- Is regular, cyclic and audible

– Impulsiveness is defined as present where the difference between $L_{A, peak}$ and $L_{Amax, S}$ is more than 15 dB when determined for a single representative event.

2.1.2 SA Guidelines

The *Position Statement: Renewable energy facilities (WAPC, March 2020) (Position Statement)* has been used by the Western Australian Planning Commission (WAPC) for wind farm development. For assessment purposes, the Position Statement endorses the use of the SA Guidelines. As a result, the criteria derived based on the SA Guidelines will be used as an additional criterion (secondary criterion) for the NIA presented in this study.

To prevent adverse impacts from the WTG noise, the SA Guidelines require that the received noise levels at the relevant noise sensitive receptors be compared to the corresponding background noise.

The predicted equivalent noise level ($L_{Aeq,10\text{-}min}$) adjusted for tonality in accordance with these guidelines, should not exceed:

– 35 dB(A) at relevant noise sensitive receptors in localities which are primarily intended for rural living (equivalent to noise sensitive receptors in accordance with the WA Regulations), or

– 40 dB(A) at relevant noise sensitive receptors in localities in other zones (equivalent to other types of premises apart from noise sensitive premises in accordance with the WA Regulations), or

– Background noise ($L_{A90,10\text{-}min}$) by more than 5 dB(A)

whichever is the greater, at all relevant noise sensitive receptors for wind speed from cut-in to rated power of the WTG and each integer wind speed in between. These criteria apply for both daytime and nighttime hours.

The proposed project site is located within a rural area. Therefore, the 35 dB(A) baseline criterion or the adjusted “background + 5” dB(A) criteria apply to all relevant noise sensitive receptors.

2.1.2.1 Participating landowners

It should be noted the criteria based on SA Guidelines have been developed to minimise the impact on the amenity of premises that do not have an agreement with wind farm developers (i.e. Not-involved noise sensitive receptors).

Wind farm developers commonly enter into agreements with the owners of private land suitable for a wind farm site (participating landowners). The agreement provides the developer with the appropriate siting and generally rewards the landowner with a level of compensation and diversity in their income stream. Notwithstanding this, the Environmental Protection Authority (EPA) cannot ignore noise impacts on the basis that an agreement has been made between the developer and the landowner. Developers cannot absolve themselves of their obligations under the *Environmental Protection Act 1986* (EP Act) by entering into an agreement with a landowner, i.e., the development should not have an adverse effect on the amenity of the area which unreasonably interferes with the enjoyment of the area. In terms of health impacts in particular, the likely exposure level should not result in sleep disturbance.

The World Health Organization (WHO) *Guidelines for Community Noise* (1999) recommend a 30 dB(A) indoor limit to prevent negative effects on sleep. *The Working Group on Noise from Wind Turbines* (Final Report, ETSU for DTI, 1996) recommends the outdoor noise limit of 45 dB(A) after any adjustment for tonality for landowners having financial involvement in the wind farm. As such, if the received noise level from a wind farm does not exceed 30 dB(A) indoor and 45 dB(A) outdoor at an involved noise sensitive receptor having financial involvement with the developers, then it is considered that the development is not having adverse effect on the amenity of the involved noise sensitive receptor.

2.1.2.2 Background noise monitoring

Long term (unattended) noise measurements were conducted at seven noise logger locations in the area within and adjacent to the Development Envelope. The details of the background noise monitoring and data processing are provided in Appendix B.

As can be seen on appended Figures B.2 to B.8 the measured noise levels generally:

– range approximately from 20 dB to 50 dB L_{A90} at NMP02 (at 4 m/s and 15 m/s wind speed respectively), with averaged values ranging from 30 to 45 dB L_{A90}.
– range approximately from 20 dB to 50 dB L_{A90} at NMP03 (at 4 m/s and 15 m/s wind speed respectively) with averaged values ranging from 30 to 44 dB L_{A90}.
– range approximately from 20 dB to 50 dB L_{A90} at NMP04 (at 4 m/s and 15 m/s wind speed respectively) with averaged values ranging from 30 to 39 dB L_{A90}.
– range approximately from 20 dB to 50 dB L_{A90} at NMP05 (at 4 m/s and 15 m/s wind speed respectively) with averaged values ranging from 28 to 38 dB L_{A90}.
– range approximately from 20 dB to 50 dB L_{A90} at NMP06 (at 4 m/s and 15 m/s wind speed respectively) with averaged values ranging from 28 to 42 dB L_{A90}.

Appended Figure B.2 to Figure B.6 show results of postprocessed data and relevant noise criteria calculated in accordance with SA Guidelines 2021. Data postprocessing is performed for arithmetic averages of measured noise levels in integer wind speed bins as per Section 3.4 of the SA Guidelines.

Relevant SA guidelines noise criteria are derived for each of the monitoring locations for wind speeds referenced to hub height of 164 m.

The resulting SA guidelines criteria are summarised in Table 2.4, along with other criteria.

2.1.3 Summary of wind farm noise criteria

Table 2.4 summarises the criteria derived from both the state Regulations and the SA Guidelines. The full list of noise receptors and their types are provided in Table 2.2.

For the NIA of the WTGs operation, the most stringent criteria i.e. 35 + IF, L_{A10} during nighttime will be adopted for the criteria based on the Regulations. Advice provided by DWER is that the assigned levels in the Regulations are unlikely to apply to involved noise sensitive receptors. DWER recommended that 40 dB L_{A10} be used as the criteria for the involved noise sensitive receptors.

The details of the noise monitoring including the representative monitoring locations and the calculations to derive the noise criteria according to the SA Guidelines are provided in Appendix B. It should be noted that R17 and R18 are involved noise sensitive receptors (section 2.1.2.1), the SA Guideline criteria of 45 dB(A) for an involved receptor has been used.

Table 2.4 Noise criteria for 164 m hub height – Dual criteria for wind farm NIA

Noise receptor [1]	Reference of noise criteria	Representative monitoring location [2]	Hub height wind speed, m/s							
			4	5	6	7	8	9	10	11
Involved, noise sensitive

	SA Guidelines	NMP05	35	35	35	35	35	35	35	36
R13	The Regulations	-	35	35	35	35	35	35	35	35
	SA Guidelines	NMP06	35	35	36	36	37	37	37	38

[1] R12 is a commercial building, and in agreement with the landowner, R11, R25, R26 and R27 will not be used for residential, or accommodation purposes when the wind farm is built. For these reasons, these premises are considered to be "Non-sensitive" and are not considered within the NIA.

[2] Background noise monitoring results and representative monitoring locations are not applicable to the criteria based on the Regulations.

[3] R17 and R18 are involved noise sensitive receptors (i.e. participating landowners) for which 40 dB(A) is used upon advice from DWER.

[4] R17 and R18 are involved noise sensitive receptors for which the SA Guideline criteria of 45 dB(A) for an involved receptor is used.

2.2 Operation of the substation

The noise emissions from the substation proposed for the Project are governed by the *Environmental Protection (Noise) Regulations 1997* (Refer to section 2.1.1 above).

3.1 Wind turbines

3.1.1 Wind turbine locations

A 20-WTG layout has been used for the NIA as presented in Figure 3.1 along with the locations of the transformers. The WTG coordinates are provided in Appendix D.

3.1.2 Sources of noise

There are two main groups of noise sources originating from a WTG: mechanical and aerodynamic noise. Sources of mechanical noise include the following (refer to Figure 3.2):

- Gearbox
- Generator
- Yaw drives
- Cooling fans
- Auxiliary equipment
- Brakes (when applied)

Sources of mechanical noise tend to be both tonal and broadband in nature since the emitted sound is associated with the rotation of mechanical and electrical equipment. However, in modern turbines, mechanical noise is not usually audible above aerodynamic noise at greater separation distances. Mechanical noise can be effectively reduced through standard noise control practices such as vibration isolation, damping and noise enclosures.

Aerodynamic noise is associated with the passage of air over the turbine blades and is considered the most dominant source of WTG noise emissions. Aerodynamic noise levels typically increase with rotor speed.

Figure 3.2 WTG components

3.1.3 Sound power levels

The proposed WTG make and model for the Project will be determined through a procurement process prior to commencement of construction. The turbine hub height is not yet finalised and is expected to be a maximum of 164 m.

Among the turbine options considered, the WTG make and model with worst-case noise emissions and their spectral data are used for the noise assessment study. The overall sound power levels (SWLs) are presented in Figure 3.3 with reference to the IEC 61400-11 standard. The SWLs presented are valid for the corresponding wind speeds referenced to the hub height. The prototype cut-in wind speed is 4 m/s and speed of rated power is 11 m/s.

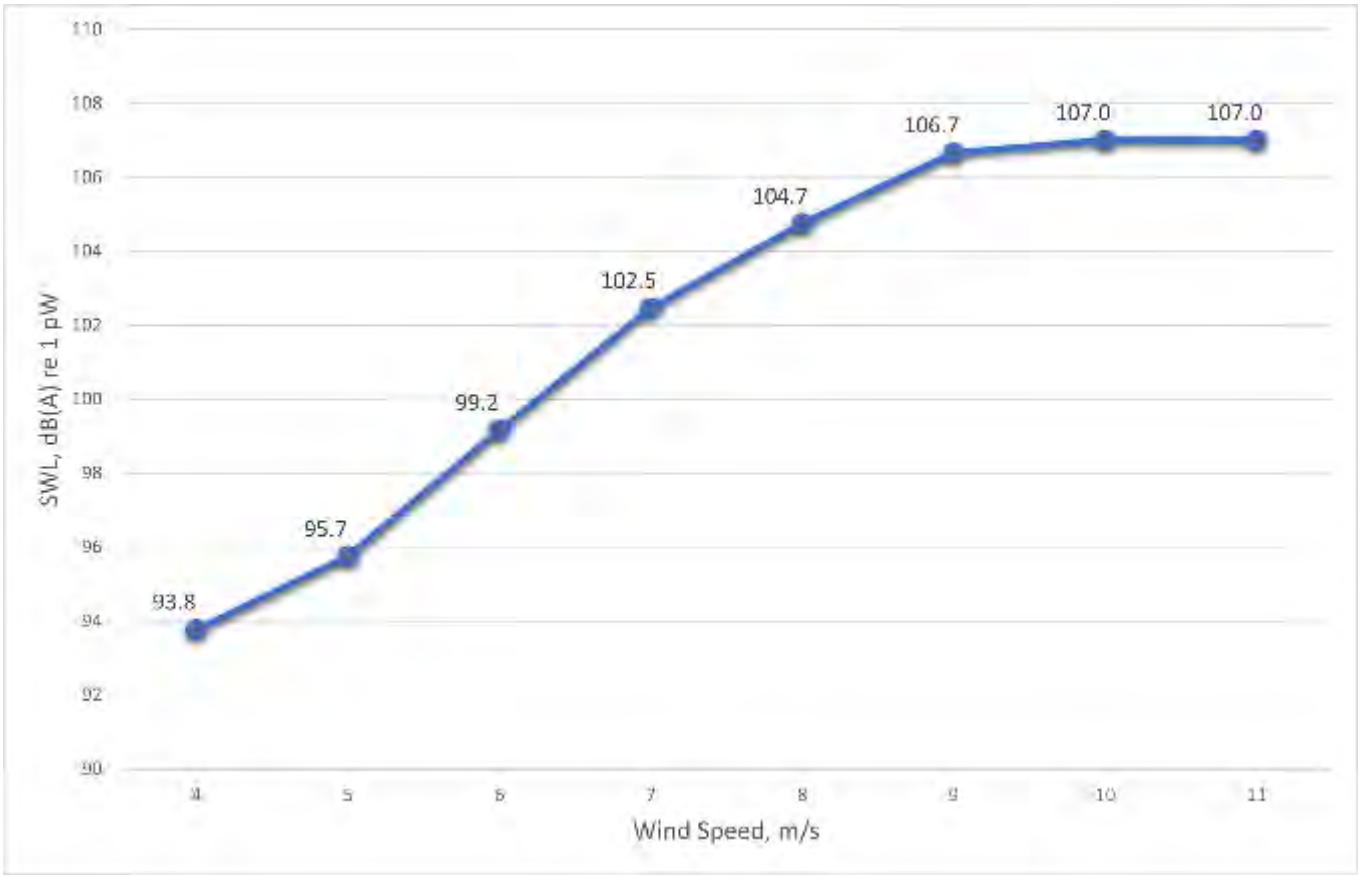

Figure 3.3 WTG SWL vs wind speed

The 1/3 octave source spectra in dB(A) re 1 pW for the corresponding centre frequencies are shown in Figure 3.4 for the wind speed of 8 m/s as an example, referred to the hub height as per IEC 61400-11. Appendix A provides the turbine source spectra for the full range of wind speeds.

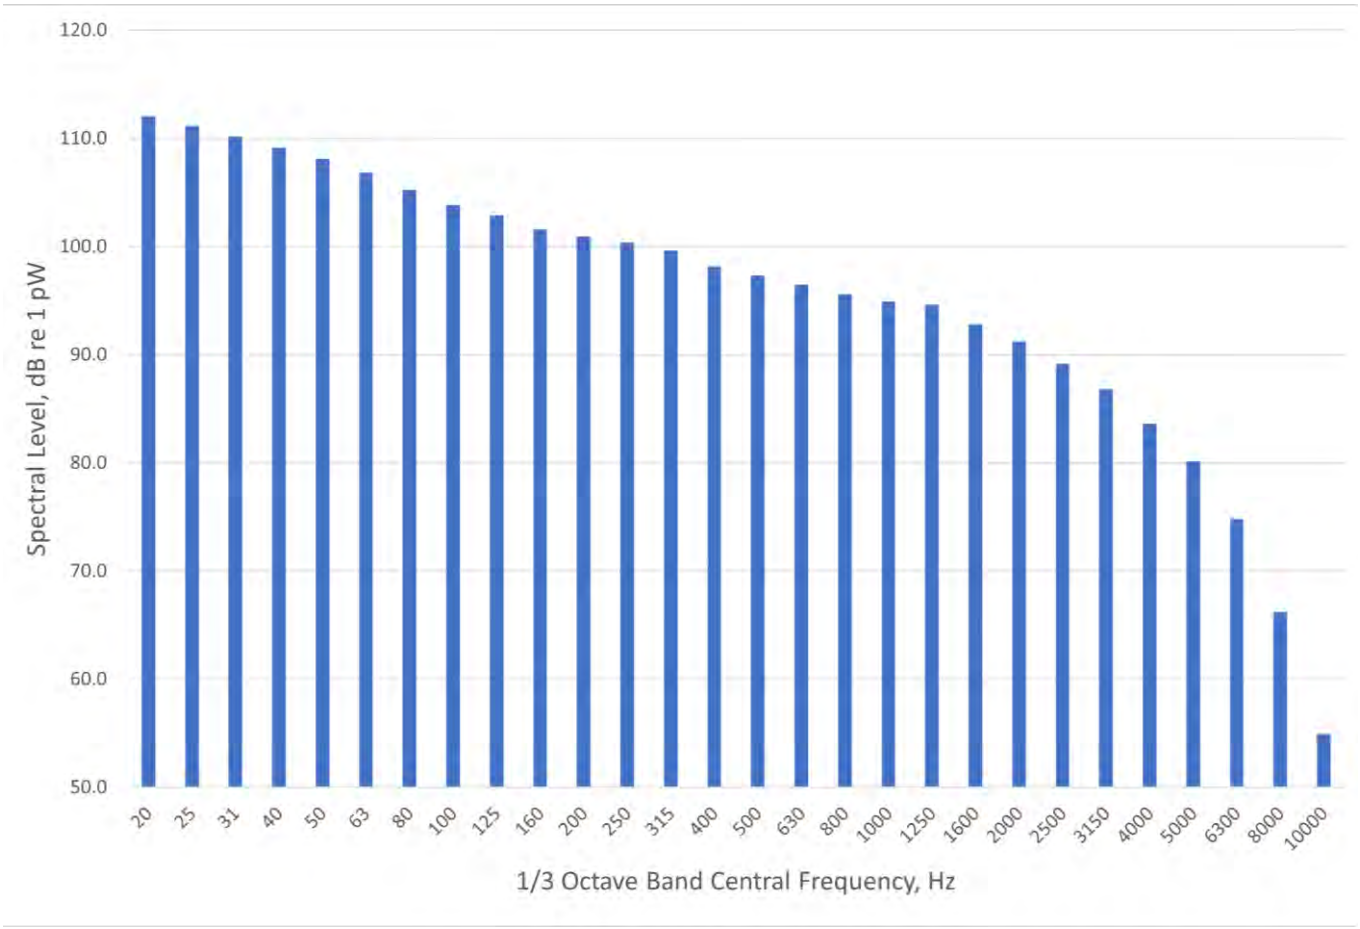

Figure 3.4 1/3 octave band spectral levels at hub height for wind speed 8 m/s

3.1.4 Tonality and infrasound

WTG manufacturers are expected to conduct independent acoustic tests in accordance with IEC 61400-11 to assess tonal audibility.

According to both the Regulations and the SA Guidelines, an additional 5 dB should be added to the measured noise level from a wind farm where tonality is shown to be a characteristic and is audible at the relevant noise sensitive receptor. GHD assumes no tonal characteristics associated with the WTG to be used and therefore tonality has been excluded from this assessment.

Infrasound (sound spectral component below 20 Hz) is not tested as an obligatory part of IEC61400-11 or the SA Guidelines. Infrasound was a characteristic attributable to earlier design of WTGs where turbine blades were downwind of the main tower. This generated an infrasound effect as the blades cut through the turbulence generated around the downwind side of the tower. Modern WTG designs typically have the blades upwind of the main tower and combined with improved blade design, infrasound is found not to be one of the major audible characteristics at modern wind farm sites (Wind-watch.org, 2014). SynergyRED is committed to using WTGs of modern design for the Project.

3.1.5 Noise receptors

The noise assessment methodology, as specified in both the Regulations and the SA Guidelines, require all noise receptors within the area surrounding the Development Envelope to be identified. Noise receptors identified within 5 km of the Development Envelope are presented in Figure 3.5.

©2025. While GHD has taken care to ensure the accuracy of this product, GHD and DATA CUSTODIAN(S), make no representations or warranties about its accuracy, completeness or suitability for any particular purpose. GHD and DATA CUSTODIAN(S) cannot accept liability of any kind (whether in contract, tort or otherwise) for any expenses, losses, damages and/or costs (including indirect or consequential damage) which are or may be incurred as a result of the product being inaccurate, incomplete or unsuitable in any way and for any reason.

The coordinates and types of these noise receptors are detailed in Table 2.2. It should be noted that R12 is a commercial building, and in agreement with the landowner, R11, R25, R26 and R27 will not be used for residential, or accommodation purposes when the wind farm is built. For these reasons, these premises are considered to be “Non-sensitive” and are not considered within the NIA. Also, receptors R17 and R18 are participating landowners (i.e. involved noise sensitive receptors).

4. Noise modelling and impact assessment

4.1 Noise modelling algorithm and inputs

4.1.1 Modelling algorithm

Both the Regulations and SA Guidelines state that a suitable model must be selected to predict worst-case noise levels at all relevant noise receptors and recommend the use of prediction methods in accordance with ISO9613-2 or CONCAWE.

Noise from the Project has been predicted using the most recent version of international standard *ISO9613-2:2024 Acoustics – Attenuation of sound during propagation outdoors Part 2: General method of calculation* (ISO9613-2). The ISO9613-2 noise propagation algorithm is used around the world and is generally accepted as an appropriate model for assessment of wind farms. The model has the ability to take into account the distance between source and noise receptor topography, ground attenuation, atmospheric absorption at different frequencies and meteorological conditions favourable to noise propagation.

In general accordance with the SA Guidelines, noise levels at relevant noise receptor locations were predicted for each reportable wind speed. Appendix D.4 of ISO 9613-2:2024 states that:

When the source is a WTG, attenuation due to ground effect appears lower than considered in the "General method" and selection of the ground factor in a) – c) in 7.3.1 should be modified as follows:

– *Hard ground, which includes paving, water, solid ice, concrete, and all other ground surfaces having a low porosity. Tamped ground, for example, as often occurs around industrial sites, can be considered hard. For hard ground G = 0.*
– *Porous or mixed ground, which includes ground covered by grass, trees or other vegetation, and farming land should be modelled using a maximum of G = 0.5.*
– *When using G = 0.5, a minimum receiver height of 4 m is recommended for the purposes of the predictions, regardless of actual receiver height.*

Because the ground surrounding the Development Envelope comprises mostly of sand, soil and vegetation, ground absorption was set to G=0.5. In order to adhere to ISO 9613-2:2024 for WTG noise prediction as per advice from DWER, noise receptors were set at 4 metres above ground level (instead of typical 1.5 metres above ground level) as this leads to more consistent outcomes for noise prediction of WTGs.

4.1.2 Modelling of wind turbine generators

The noise model was developed based on the following data inputs:

– Topographic elevation contours (5 m resolution) for the Development Envelope and surrounding area, obtained from publicly available data.
– A single scenario for the proposed Project turbine layout (20 WTG layout) (refer to Appendix D for the coordinates) and the hub height (164 m above ground level).
– Noise receptor locations and types, received from SynergyRED.
– The following modelling parameters were used in the model:
  - Atmospheric conditions at 10°C temperature and 80 percent relative humidity.
  - 50 percent acoustically porous or mixed ground (G = 0.5 ground factor).
  - No barriers or intervening structures were included in the model.
  - 4 m noise receptor height.
– Turbine source noise emissions and the 1/3 octave source spectra data, received from SynergyRED.

For modelling purposes, representative WTG type and noise emission data have been used to assess noise compliance. The overall SWLs and 1/3 octave source spectra data (20 Hz to 10 kHz) under integer wind speeds between 4 m/s and 15 m/s are provided in Appendix A. No penalty for tonality was applied to the modelling prediction results.

It should be noted that the following conservative assumptions were implemented in the noise model:

1- Noisiest turbine available at the time was used (i.e. with no mitigation applied).

2- General wind roses available from the BOM website for the area suggest that winds are predominantly south-easterly. However, in the noise model wind has been stipulated to occur in all directions which makes for a conservative assessment (i.e. the noise predicted in the assessment assumes downwind noise conditions have been used for all receptors).

4.1.3 Modelling of substations

The Project proposes a substation comprising two 132 kVA transformers. The overall sound power level of the transformers is 85 dB(A), estimated in accordance with Australian Standard AS 60076 Part 10: 2009 *Power Transformers – Determination of Sound Levels (IEC 60076-10, Ed.1 (2001) MOD)* and the proposed transfer rating (in kVA). The 1/3 octave sound power spectral curve used for the model input, as presented in Appendix A, is based on a reference spectral curve measured for a typical transformer facility.

It should be noted that the equivalent continuous noise parameter L_{Aeq} is used to characterise the noise emissions from the substation transformers. Considering the noise emissions from the transformers are constant in nature, it is expected that the parameter L_{Aeq} will be consistent with the parameter L_{A10} based on which the noise assessment criteria have been specified as in Table 2.1. For this conversion, a 3 dB conversion factor has been used (i.e. $L_{A10} = L_{Aeq} + 3$ dB(A)).

4.2 Impact assessment

4.2.1 WTG noise

Received noise levels have been predicted at all identified noise sensitive receptors with all WTGs (20 WTGs) operating simultaneously, for all source noise emission inputs under relevant individual integer wind speeds as provided in Appendix A.

As explained in Section 1.3, a dual criteria approach has been used for the NIA by assessing the predicted noise levels against the criteria based on the Regulations (Section 2.1.1) and based on the background noise monitoring data processing as indicated by the SA Guidelines (Section 2.1.2). The predicted noise levels for the Project assessed against the criteria derived are provided in Table 4.1 and Table 4.2 based on the Regulations and the SA Guidelines, respectively. As explained in section 2.1.3, the nighttime L_{A10} assigned noise levels for the nighttime (35 + IF) has been used as the most stringent criteria for the NIA at the Not-involved noise sensitive receptors based on the Regulations. Also 40 dB L_{A10} has been used as a conservative criteria for the involved noise sensitive receptors based on DWER advice. All predicted results and criterion values are rounded to the nearest integer for compliance assessment. As can be seen from the tables, the predicted noise levels at all noise sensitive receptors comply with the criteria derived based on both the Regulations and the SA Guidelines.

It should be noted that the criteria derived based on the Regulations, are more stringent which results in smaller safety margines at wind speeds above 10 m/s. The smallest safety margin is less than 1 dB predicted for noise sensitive receptor R32 at wind speeds above 10 m/s (Table 4.1).

Noise contour maps are provided in Figures C1 to C4 in Appendix C for 4 m/s, 6 m/s, 8 m/s and 10-11 m/s which constitute four representative wind speeds from the cut-in to the rated power wind speeds. It should be noted that the turbine source spectra and thus the predicted noise levels are similar for 10 and 11 m/s for the proposed WTG type (Appendix A).

4.2.2 Substation noise

Due to the large distances from the proposed substation to the noise sensitive receptors assessed (i.e. more than 2 km), the predicted noise levels from the substation transformers at all noise sensitive receptors are below 5 dB(A), which is well below the expected ambient noise levels.

Considering the +5 dB adjustment on received levels due to the potential tonal characteristics for transformer noise emissions, the predicted noise levels from the proposed substation are still well below the worst-case 35 dB(A) nighttime assigned level applicable to the fixed equipment under the Regulations.

[1] R12 is a commercial building, and in agreement with the landowner, R11, R25, R26 and R27 will not be used for residential, or accommodation purposes when the wind farm is built. For these reasons, these premises are considered to be "Non-sensitive" and are not considered within the NIA.

[2] R17 and R18 are involved noise sensitive receptors for which the SA Guideline criteria of 45 dB(A) for a not-involved receptor is used (Section 2.1.3).

4.2.3 Noise from substation vs noise from WTGs

Currently there are no known significant sources of noise in the area adjacent to the Development Envelope which is predominantly rural in nature. The noise modelling results for both WTG and substation demonstrate that the received noise levels at assessed noise sensitive receptors from the proposed substation are more than 20 dB lower than the noise levels received from the proposed WTGs. Therefore, the combined noise impact from the Project is dominated by the WTG noise emissions, and the proposed substation is unlikely to result in any noticeable increases in received noise levels at the assessed noise sensitive receptors.

5. Conclusion

A NIA has been conducted for the operation of the Project in general accordance with the requirements of the Regulations and the SA Guidelines (2021) for the operation of the WTGs.

A dual criteria approach was adopted for this NIA: 1- the criteria was derived based on the Regulations, and 2- baseline noise monitoring was conducted at seven monitoring locations around the Development Envelope, and the baseline noise criteria were derived in accordance with the SA Guidelines.

A 3D environmental noise model of the Development Envelope was created using the SoundPLAN software to predict noise levels at the adjacent noise sensitive receptors, using the ISO9613-2:2024 calculation algorithm. A 20 WTG layout with hub height of 164 metres was considered in the 3D noise model. The turbine source noise input data is based on the 1/3 octave source spectra data provided by SynergyRED.

The noise modelling results show that the predicted noise levels from the Project received at the adjacent noise sensitive receptors comply with the noise criteria in accordance with both the Regulations and the SA Guidelines. The smallest safety margin is less than 1 dB predicted for noise sensitive receptor R32 at wind speed 10 m/s and above when assessed against the criteria based on the Regulations which are more stringent especially at high wind speeds.

It should be noted that the following conservative assumptions were implemented in the noise model:

1- Noisiest turbine available at the time was used (i.e. with no mitigation applied).

2- General wind roses available from the BOM website for the area suggest that winds are predominantly south-easterly. However, in the noise model wind has been stipulated to occur in all directions which makes for a conservative assessment (i.e. the noise predicted in the assessment assumes downwind noise conditions have been used for all receptors).

It is recommended that the turbines are properly maintained to ensure the noise emissions of the turbines are not adversely affected by the turbine wear, which could potentially result in audible tonality.

Once the wind farm is operating, in accordance with the Regulations and SA Guidelines, it is recommended that compliance monitoring be undertaken at the noise sensitive receptors with the highest predicted noise levels (i.e. R32).

Background noise monitoring

B. Background noise monitoring

Long term (unattended) noise measurements were conducted at seven monitoring locations in the area adjacent to the Development Envelope. Loggers at locations NMP01 and NMP05 were deployed on 8 December 2023 and loggers at locations NMP02, NMP03, NMP04, NMP06 and NMP07 on 7 December 2023. Loggers at locations NMP01, NMP02, NMP03 and NMP04 were retrieved on 14 May 2024 and loggers at locations NMP05, NMP06 and NMP07 on 13 May 2024.

For measurement of local ground level meteorology and rainfall, one ultrasonic automatic weather mast was co-located at the NMP01 logger location during the deployment period (from 8 December 2023 to 14 May 2024). Wind data at greater heights was taken from the existing meteorological mast near the Development Envelope provided by the client.

The data across all noise loggers, local weather masts, and existing site meteorological masts was date and time synchronised over 10-minute data intervals.

B-1 Instrumentation

Ambient noise levels were monitored using SVAN 977 environmental noise loggers. Details of the noise measurement instrumentation used are presented in Table B.1.

All noise monitoring instrumentation was in current National Association of Testing Authorities (NATA) calibration at the time of use. All instrumentation was field-checked and calibrated both before and after noise measurements using a Svantek SV-36 calibrator. No discrepancies equal to or greater than 1 dB were noted throughout the measurement exercise as is required under Section 5.6 of Australian Standard AS 1055:2018 *Acoustics – Description and Measurement of Environmental Noise* (Standards Australia, 2018).

Table B.1 Unattended noise monitor equipment details

Instrumentation details	NMP01	NMP02	NMP03	NMP04	NMP05	NMP06	NMP07

Serial No.	69721	98077	99011	99009	92622	99010	99261
Deployment date	08 Dec 2023	07 Dec 2023	07 Dec 2023	07 Dec 2023	08 Dec 2023	07 Dec 2023	07 Dec 2023
Collection Date	14 May 2024	14 May 2024	14 May 2024	14 May 2024	13 May 2024	13 May 2024	13 May 2024

B-2 Noise measurement locations

Long term monitoring was performed at locations close to residences. Coordinates of the monitoring locations details are summarised in Table B.2. Figure B.1 shows the location of monitoring locations in relation to the noise receptors. As can be seen from Figure B.1, the monitoring locations were selected to cover a reasonable range of wind directions and to represent several NSRs by designating similar criteria to a number of noise receptors based on similarity of acoustic environment.

Table B.2 Noise logger coordinates

Logger location	Coordinates, GDA2020 / MGA Zone 50	
	Easting, metres	Northing, metres

B-3 Meteorology

B-3-1 Hub height wind speed

Data from a meteorological mast provided by SynergyRED was used for collecting wind data at various hub heights (from 60 m to 150 m with 30 m steps). Wind speeds were calculated at the proposed 164 m hub height and then used to calculate the noise criteria (refer to Section B-4-1).

B-3-2 Rainfall and local wind speed

SA Guidelines state: As part of the development application, developers should confirm that the reported noise levels are not influenced by high wind speed across the microphone.

Hence, in the case of wind farm noise monitoring, it is a requirement to undertake measurements in a manner that allows collection of noise measurements in situations where the wind speed exceeds the 5 m/s at the microphone position normally provided as the upper limit for environmental noise monitoring. The limit is a guide to reduce air pressure fluctuations across the microphone artificially increasing the measured noise level. Standard 90 mm wind shield was used during noise monitoring.

According to the SA Guidelines, sound level measurements should be made during a representative range of wind speeds and directions generally expected at the wind farm, and include the normal operating range of the turbines, that is from cut-in to rated power. Extraneous sound levels caused by events, including precipitation, insects, fauna, and so on, as far as is practical for an unattended monitoring exercise, be identified and removed from the data set.

Rain data collected by the co-located weather station placed at the logger location NMP01 was utilised to confirm rain events during the monitoring period. This data has been used to exclude periods where rain events were recorded.

Average 10-minute noise measurements where rainfall, high local wind speeds or irrelevant noise occurred were defined as ‘extraneous events’ and were excluded from the background noise assessment. Data acquired during local wind speeds (microphone height) exceeding 5 m/s was excluded from further analysis.

B-4 Results of noise monitoring and derived noise criteria

Applicable noise criteria were calculated for the proposed 20 WTG layout with 164 m hub height.

Background noise was processed and analysed in accordance with procedures in the SA Guidelines. The number of valid monitoring points is summarised in Table B.3. The total number of valid data points is well above 2000 which gives sufficient basis to derive applicable noise criteria.

Table B.3 Number of valid background noise monitoring data

Monitoring location			Valid data points-Guidelines 2021
Logger location	**Start time**	**End time**	**Hub height 164 m**
NMP01	7/12/2023	14/05/2024	22699
NMP02	7/12/2023	14/05/2024	22853
NMP03	7/12/2023	14/05/2024	22862
NMP04	7/12/2023	14/05/2024	22858
NMP05	8/12/2023	13/05/2024	22632
NMP06	7/12/2023	13/05/2024	22753
NMP07	7/12/2023	13/05/2024	22748

The SA Guidelines also recommend that no less than 500 data points are to be collected for downwind conditions. Wind direction for downwind conditions is defined as ±45° from line connecting the noise receptor and the nearest turbine. If there are more than one turbine at similar distances from the noise receptor, SA Guidelines recommend identification of more than one downwind angle. The resulted downwind angles and the number of downwind data points for each monitoring location is presented are presented in Table B.4.

Table B.4 Background noise data points - Downwind direction

Monitoring location			Nearest turbine ID	Downwind direction, degree	Valid downwind data points at hub height 164 m
Logger location	Start time	End time			
NMP01	3/08/2023	27/09/2023	WTG 15	356	1269
NMP02	3/08/2023	27/09/2023	WTG 11	196	2068
NMP03	16/08/2023	27/09/2023	WTG 1	101	10993
NMP04	3/08/2023	27/09/2023	WTG 5	300	794
NMP05	3/08/2023	27/09/2023	WTG 2	113	10974
NMP06	17/10/2023	22/11/2023	WTG 11	103	11021
NMP07	17/10/2023	22/11/2023	WTG 9	99	8773

Table B.3 and Table B.4 show that the background noise monitoring program allowed to collect a suitable number of downwind data points in accordance with the requirements of the SA Guidelines.

It is understood that relevant noise sensitive receptors around the Development Envelope are situated in zones classified as rural living. As such, Project specific noise criteria based on the SA Guidelines are derived as:

– 35 dB(A) at affected noise sensitive receptors, or
– Background noise ($L_{A90,10\text{-}min}$) plus 5 dB(A)

whichever is greater for wind speed from cut-in to rated power of the WTG.

The Project Development Envelope is located within a rural area. It should be noted that R12 is a commercial building, and in agreement with the landowner, R11, R25, R26 and R27 will not be used for residential, or accommodation purposes when the wind farm is built. For these reasons, these premises are considered to be “Non-sensitive” and are not considered within the NIA. Therefore, the 35 dB(A) baseline criterion or the adjusted “background + 5” dB(A) criterion apply to all Not-involved noise sensitive receptors identified in Table 2.2. R17 and R18 are involved noise sensitive receptors (section 2.1.2.1) for which the SA guidelines criteria of 45 dB(A) is used.

B-4-1 Background noise monitoring data and noise criteria for hub height 164m

Results of background noise monitoring were processed in accordance with SA Guidelines 2021 and relevant noise criteria are derived for each of the monitoring locations for wind speeds referenced to hub height of 164 m.

Figure B.2 to Figure B.6 show results of postprocessed data and relevant noise criteria calculated in accordance with SA Guidelines 2021. Data postprocessing is performed for arithmetic averages of measured noise levels in integer wind speed bins as per Section 3.4 of the SA Guidelines.

One can see that applicable noise criteria correspond to the baseline limit of 35 dB(A) where the background noise is equal or smaller than 30 dB and based on background plus 5 dB(A) where the background noise exceeds 30 dB (at higher wind speeds). The maximum applicable noise criterion used for the compliance assessment reaches approximately 41 dB(A) at monitoring location NMP02.

B-4-2 Summary of wind farm noise criteria based on SA guidelines

There are 35 noise receptors in the area within and adjacent to the Development Envelope. SA Guidelines recognise that it is not always practicable to perform background noise measurements at each of affected noise receptor. Noise monitoring has been undertaken at representative locations and used to derive the criteria at a number of adjacent noise receptors. Table 2.2 contains the list of noise receptors in the area surrounding the Development Envelope. Results of the background noise monitoring survey are used to assign criteria to relevant noise receptors with expected similar background. It should be noted that compliance with noise criteria at the nearest noise receptor typically ensures that noise from the wind farm will meet similar criteria at greater separation distances from a wind farm. Table B.5 presents noise limits for each integer wind speed from cut-in to the speed of the rated power as referenced to 164 m hub height. Results are presented for procedures included in the SA Guidelines.

Table B.5 Noise criteria for 164 m hub height - SA Guidelines

Noise receptor	Representative monitoring location	Hub height wind speed, m/s							
		4	5	6	7	8	9	10	11
R12[1]	NMP01	38	38	39	39	39	39	38	39
R17[2], R18[2]	-	45	45	45	45	45	45	45	45
R01, R02, R03, R04, R05, R06, R07, R08, R09, R10, R34	NMP02	35	36	38	39	40	40	39	41
R20, R21, R22, R23, R24, R25[1], R32, R33	NMP03	35	35	36	36	37	37	37	39
R26[1], R27[1], R28, R29, R30, R31	NMP04	35	36	37	37	37	37	37	38
R14, R15, R16, R19	NMP05	35	35	35	35	35	35	35	36
R13	NMP06	35	35	36	36	37	37	37	38
R11[1]	NMP07	35	35	35	35	35	35	35	36

[1] R12 is a commercial building, and in agreement with the landowner, R11, R25, R26 and R27 will not be used for residential, or accommodation purposes when the wind farm is built. For these reasons, these premises are considered to be "Non-sensitive" and are not considered within the NIA.

[2] R17 and R18 are involved noise sensitive receptors, the SA Guideline criteria of 45 dB(A) for a not-involved receptor will be used for the NIA.

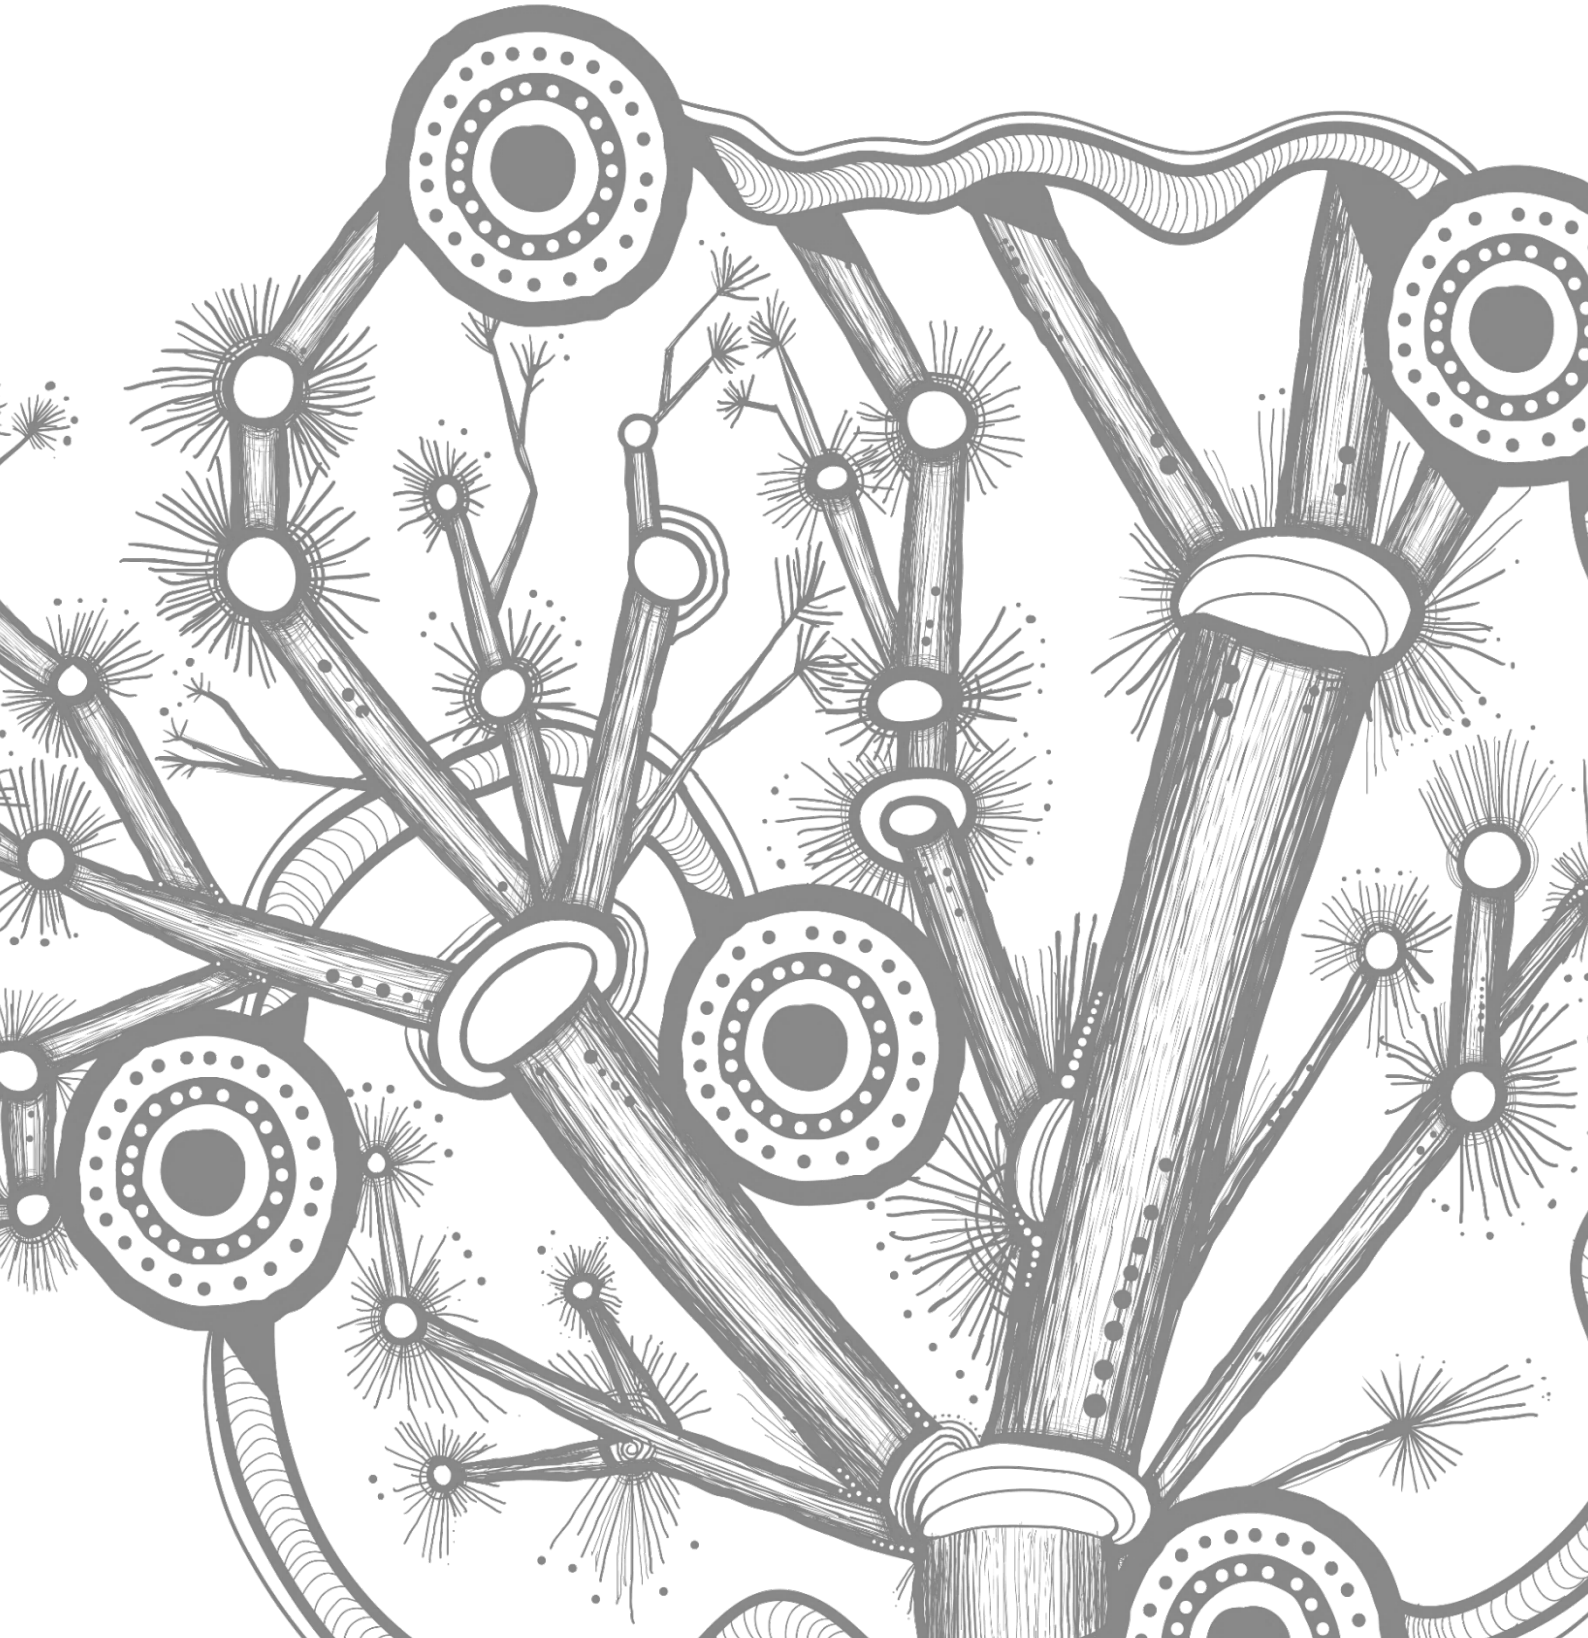
This document is and shall remain the property of GHD. The document may only be used for the purpose for which it was commissioned and in accordance with the Terms of Engagement for the commission. Unauthorised use of this document in any form whatsoever is prohibited.

Acknowledgement of Country

GHD acknowledges Aboriginal and Torres Strait Islander peoples as the Traditional Custodians of the land, water and sky throughout Australia on which we do business. We recognise their strength, diversity, resilience and deep connections to Country. We pay our respects to Elders of the past, present and future, as they hold the memories, knowledges and spirit of Australia. GHD is committed to learning from Aboriginal and Torres Strait Islander peoples in the work we do.



Executive summary

Introduction

SynergyRED engaged GHD Pty Ltd (GHD) to prepare a Landscape and Visual Impact Assessment (LVIA) for a Proposed Wind Farm in Scott River (The Proposal). The Study Area for this assessment is generally confined to the likely extent of visibility of the Proposal, within the surrounding context, being approximately 30 km in each direction of the Proposal site.

The purpose of the LVIA is to support the following:

– Environmental Protection Authority (EPA) referral under Part IV, Section 38 in accordance with *Environmental Factor Guideline –Social Surroundings* (EPA, 2023e) under the Environmental Protection Act 1986.
– Development approval application (Shire of Augusta Margaret River) to commence development of the Proposal described in Section 2.

Method

The LVIA assessment was informed by a desktop review, site inspection (March and August 2024), identified Landscape Character Units (LCU)'s and values, and a review of previous studies within a similar landscape context. It includes an assessment of potential landscape and visual impacts from twelve viewpoints (sensitive visual receptor locations) with four photomontages of the proposed works. Reflective of assessment findings the Report concludes with mitigation and management measures, to lessen the visual impacts of the Proposal, related to the LCU's and viewpoints.

Proposal summary

Primarily located within cleared farmland, the Proposal is envisioned to be built as a single stage project comprising nominally of 20 wind turbines, two meteorological masts, on-site substation, operational and maintenance facility, hard stand areas, transmission line and 33 kilovolt (kV) underground electrical transmission.

LVIA findings

Four LCU's were identified in the Study Area. The significance of impact on LCU1 is high-moderate, as the Proposal will likely affect the characteristics of LCU1, where the Leeuwin-Naturaliste Ridge is recognised as a key landscape feature. The significance of impact on LCU2 is also high-moderate, with contributing factors including scenic qualities and the inclusions of Scott National Park and Gingilup Swamps Nature Reserve, which host highly diverse flora and fauna species. The findings indicate a high-moderate significance of impact on LCU3 due to the high sensitivity and importance of notable drainage features that are registered Aboriginal heritage sites, as well as several national parks and nature reserves. The Proposal will likely result in notable changes to this landscape character. LCU4 would experience a moderate significance of impact, as the changes will be confined to specific locations within LCU4.

Twelve key and representative viewpoints were selected for this LVIA based on the desktop study and community feedback, Zone of Theoretical Visibility (ZTV) analysis and fieldwork conducted in March 2024. Consideration was also afforded to the duration of impact which was considered short term during construction and permanent during operation. This assessment identified the significance of impact for each viewpoint which ranged from negligible to high.

Mitigation and management measures

After conducting a contextual analysis, the visual management objectives for the Study Area were outlined. The focus of the visual management objectives included optimising the siting and design of the Proposal to protect and maintain the distinct landscape characters. The key recommendation, in support of this objective, and as practically possible with regards to flora and fauna is consideration of realignment of the wind turbines into a regular shape, such as a double line or grid, and a reduction in turbine height to reduce visual impact.

Other recommended mitigation and management measures include maintaining the rural landscape character by adopting measures such as retaining as much existing remnant vegetation as possible within the Proposal site and re-establishing any pastural land disturbed during construction. In addition, consideration of Aboriginal heritage

values and engagement with the Wardandi and Bibulmun/Piblemen people was recommended as a measure for protection and maintenance of cultural heritage values.

Concluding remarks

This report is subject to, and must be read in conjunction with, the limitations set out in Section 1.4 and the assumptions and qualifications contained throughout the Report.

Terminology

Terminology	Definition
Landscape	All aspects of a tract of land, including landform, vegetation, buildings, villages, towns, cities and infrastructure.
Landscape character	The combined quality of built, natural and cultural aspects that make up an area and provide its unique sense of place.
Landscape character unit	Areas of homogenous (similar) patterns of visual characteristics such as landform, vegetation, water form and land use as well as individual features.
Landscape impacts	Changes in the character and quality of the landscape that occur because of change and development, while *visual impacts* relate to the appearance of these changes.
Magnitude	The measurement of the scale, form and character of a development proposal when compared to the existing condition. In the case of visual assessment this also relates to how far the proposal is from the viewer. Combines with sensitivity, magnitude provides a measurement of impact.
Receptor	An aspect of the landscape or view that could be impacted, such as physical resources or viewer groups.
Sensitivity	The sensitivity of the landscape character or view and its capacity to absorb change of the nature of the development proposal. In the case of visual impact this also relates to the type of viewer and number of viewers. Combined with magnitude, sensitivity provides a measurement of impact.
Susceptibility to change	The capacity of the landscape to accommodate a change of a particular type or scale, without adverse effects on the existing landscape character, requirement for baseline situation maintenance, and obtaining new landscape planning policies and approaches.
Study Area	Consists of land in the vicinity of, and including, the Proposal site. The study area is a wider area surrounding the Proposal site as defined in this assessment, including landscape that has the potential to be indirectly impacted by the Proposal.
The Proposal	A proposed wind farm in Scott River
View	Comprises a portion of a landscape seen by an observer.
Viewpoint	The point from which a view is observed.
Visual amenity	The overall quality of views that people enjoy of their surroundings.
Visual impact assessment	The analysis of changes in the appearance of the landscape as a result of development. Impacts may be negative or positive.
Visual receptor	Individuals and/or defined groups of people who have the potential to be affected by the proposal.
Zone of theoretical visibility	A map, usually digitally produced, showing areas of land within which, a development is theoretically visible.

Introduction

1. Introduction

GHD Pty Ltd (GHD) engaged by Synergy Renewable Energy Development (Synergy RED) has prepared this report and the accompanying information in support of the proposed development of a Proposed Wind Farm in Scott River (The Proposal), situated within the Scott River region, next to Chester and Pagett Nature Reserves, South Blackwood State Forest and Scott National Park.

SynergyRED is a wholly-owned subsidiary of Synergy (electricity retail and generation corporation) located in Perth, Western Australia. SynergyRED is currently in the process of investigating future renewable energy assets with the potential to connect to the South West Interconnected System (SWIS). The Proposal is one such project being investigated.

1.1 Purpose and scope of this report

This report provides a Landscape and Visual Impact Assessment (LVIA) for the Proposal. The purpose of this report is to meet the requirements of:

– Environmental Protection Authority (EPA) Environmental Factor Guideline –Social Surroundings (EPA, 2023) under the Environmental Protection Act 1986.
– Development Approval (DA) application (Shire of Augusta Margaret River) to commence development of the Proposal described in Section 2.

The Proposal has been considered against the relevant planning and environmental regulatory framework applicable to landscape and visual impact.

1.2 Overview of the Proposal

The Proposal is planned within the South West Boojarah, traditional lands of the Bibulmun/Piblemen Noongar language group, in the southwest region of Western Australia (WA). The Proposal site is located approximately 15 kilometres (km) northeast of Augusta, 5 km northeast of Molloy Island, 3 km southeast of Nillup Village General Store and less than 2 km from Brockman Highway, the nearest main road. The Proposal site covers an area of approximately 4,000 hectares located on freehold land owned by multiple landowners. Zoned ‘General Agriculture’ under the provisions of the Shire of Augusta Margaret River Local Planning Scheme No. 1 (LPS1), the majority of the Proposal site has been cleared and is currently used for agricultural purposes with some areas of remnant vegetation remaining.

Scott River, a tributary of the Blackwood River, lies close to the southern boundary of the Proposal and flows in an east-west direction to the Hardy Inlet.

The Proposal is proposed to be built as a single stage project comprising nominally of 20 wind turbines, two meteorological masts, on-site substation, operational and maintenance facility, hard stand areas, transmission line and 33 kV underground electrical transmission. For the Proposal location see Figure 1.

1.3 Report structure

The report comprises sections itemised in Figure 2.

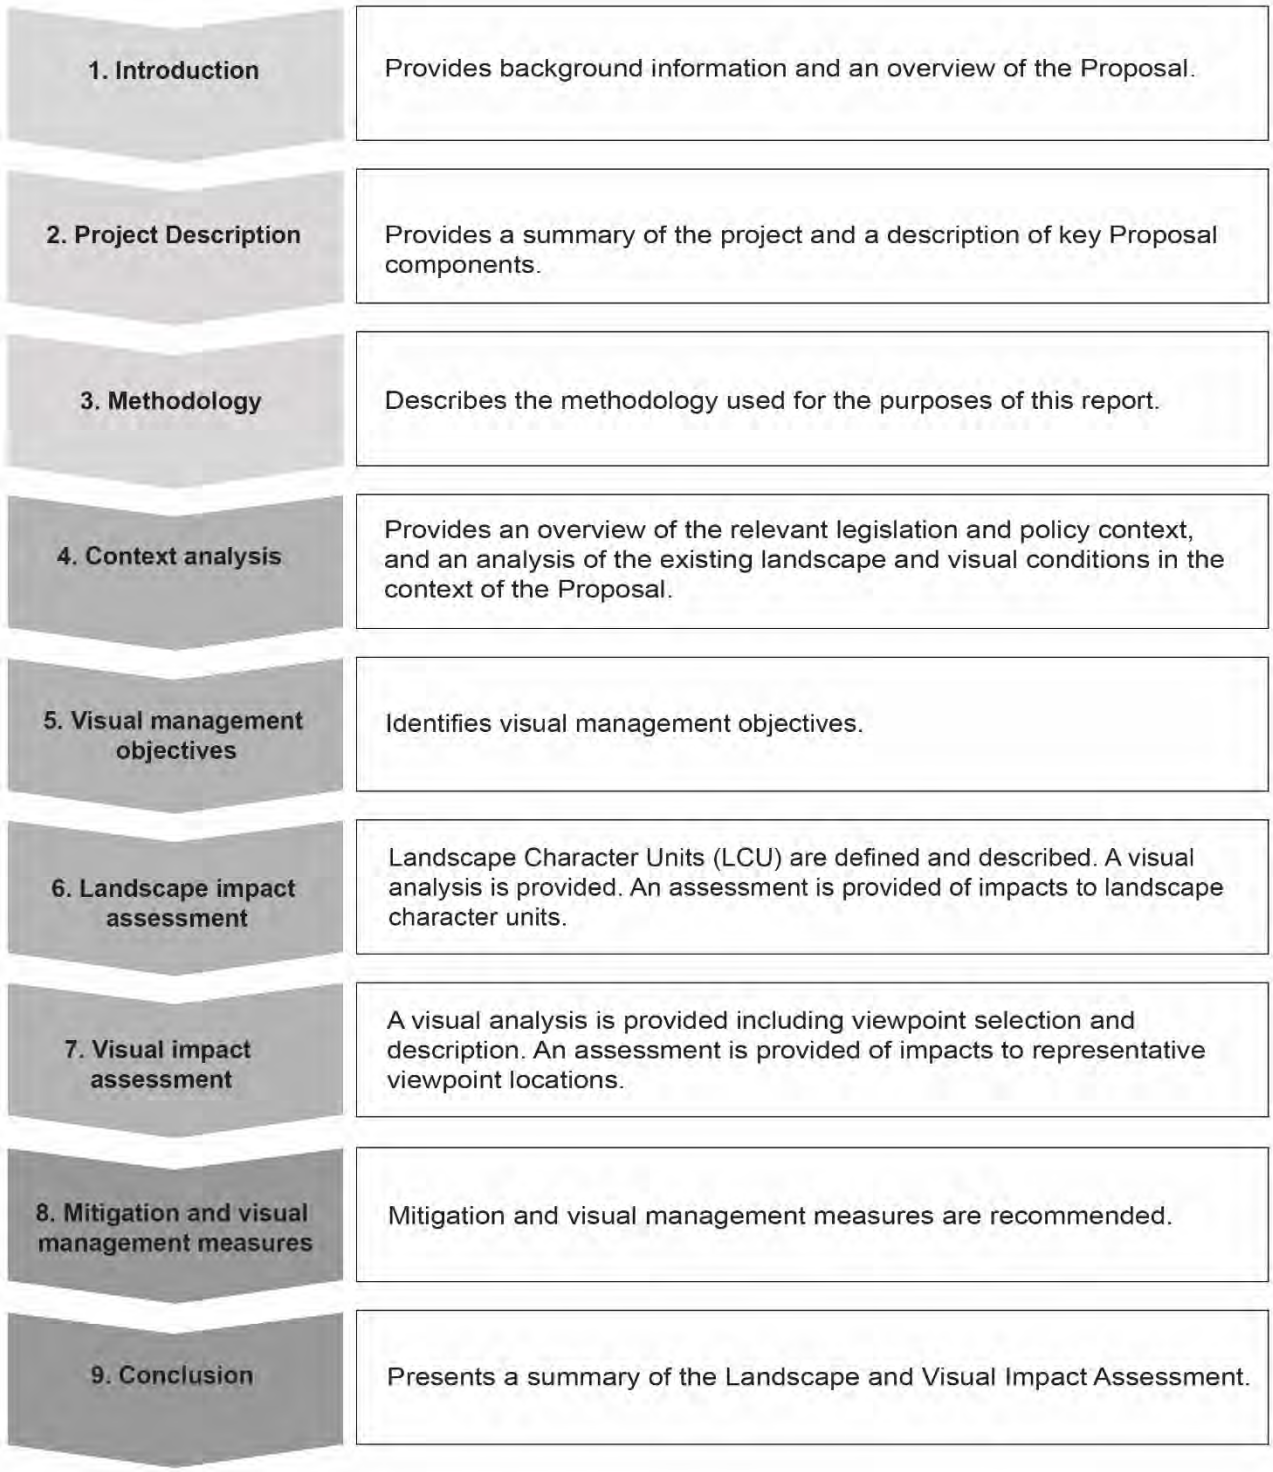

Figure 2 Report structure

1.4 Limitations

This report has been prepared by GHD for SynergyRED and may only be used and relied on by SynergyRED for the purpose agreed between GHD and SynergyRED as set out in section 1.1 of this report.

GHD otherwise disclaims responsibility to any person other than SynergyRED arising in connection with this report. GHD also excludes implied warranties and conditions, to the extent legally permissible.

The services undertaken by GHD in connection with preparing this report were limited to those specifically detailed in the report and are subject to the scope limitations set out in the report.

The opinions, conclusions and any recommendations in this report are based on conditions encountered and information reviewed at the date of preparation of the report. GHD has no responsibility or obligation to update this report to account for events or changes occurring subsequent to the date that the report was prepared.

The opinions, conclusions and any recommendations in this report are based on assumptions made by GHD described in this report (refer section(s) 8 and 9 of this Report). GHD disclaims liability arising from any of the assumptions being incorrect.

Accessibility of documents

If this report is required to be accessible in any other format, this can be provided by GHD upon request and at an additional cost if necessary.

1.5 Assumptions

There is no national guidance on the assessment of landscape and visual impacts specific to Australia. However, in WA, the industry typically refers to *Visual Landscape Planning in Western Australia: a manual for evaluation, assessment, siting, and design (*Western Australian Planning Commission, 2007). This assessment has also referred to:

- *Guidelines for Landscape and Visual Impact Assessment, Third Edition* (Landscape Institute, 2013)
- *Environmental Factor Guideline: Social Surroundings* (Environmental Protection Authority, 2016)
- *Position Statement: Renewable energy facilities* (Western Australian Planning Commission, 2020)

The assessment aims to be objective and describe any potential changes factually. While potential impacts resulting from the Proposal are defined, the significance of these changes requires qualitative (subjective) judgements. The conclusion of this assessment therefore combines objective measurement and professional interpretation. While this assessment aims to be objective, it is recognised that LVIA can be subjective, and individuals are likely to associate different visual experiences to the study area.

This assessment is based on the information provided to GHD at the time of writing. The scope of this assessment does not include consideration of landscape and visual impacts from lighting or during night time conditions, as these are not included or required in the design of the Proposal.

2. Project description

2.1 Site overview

The Proposal covers an area of approximately 4,000 hectares and is located on freehold land owned by multiple landowners. Zoned 'General Agriculture' under LPS1, the majority of the Proposal site has been cleared and is currently used for agricultural purposes with some areas of remnant vegetation remaining. It is possible that a minor level of remnant vegetation clearing, (as approved), may occur during the development of the Proposal. Access to the Proposal site is via Scott River Road.

2.2 Project overview

SynergyRED is currently in the process of investigating future renewable energy assets with the potential to connect to the South-West Interconnected System (SWIS). The Proposal is one such project being investigated.

The Proposal is proposed to be developed as a single stage project. Elements of the Proposal, shown in Figure 3 include nominally up to 20 wind turbines, two meteorological masts, on-site substation, Operational and Maintenance facility (O&M facility), hard stand areas, transmission line and 33 kilovolt (kV) underground electrical transmission. The wind turbines and ancillary infrastructure are described below.

2.2.1 Wind turbines

The final turbine model and design are yet to be confirmed. It is expected that a traditional turbine tower design would be utilised, and the turbines would be light grey to reduce their contrast with the background sky and minimise reflections (Photo 1).

The following maximum dimensions have been used for this assessment to allow selection of wind turbines withing the following criteria:

– Maximum tip height: 250 m
– Maximum hub height: 164 m

Photo 1 *Example 7.2 megawatt wind turbine*

2.2.2 Ancillary infrastructure

Ancillary infrastructure would include transmission poles, access tracks, underground 33 kV electrical reticulation wind turbine foundations and hard stand areas. Permanent access tracks are required to form a connection between turbines and existing public roads. An onsite substation is also proposed within the site area along with an operational and maintenance facility.

2.2.2.1 Electrical reticulation

Cable routes were selected to utilise similar routes as other collector groups and access roads to minimise trenching and ground disturbance. Further optimisation will need to be completed to verify this design.

2.2.2.2 Electrical transmission line

Transmission from the wind farm substation would tie into the existing MJP-BNP 81 line at the voltage of 132 kV. This tee connection occurs approximately 2 km from the Beenup Substation. The proposed transmission line corridor is approximately 4 km, running through the centre of the Proposal site.

2.2.2.3 Substation

An on-site substation is proposed within the Proposal site, at the centre of the site. The substation would measure approximately 200 m by 200 m and may contains workshops, transformers, and high voltage equipment. The final layout and dimensions are subject to further detailed design.

2.2.2.4 Operational and maintenance facility

An O&M facility is also proposed, at the centre of the site close to the substation. This would typically include areas such as an office, warehouse, car parking and storage facilities.

2.2.2.5 Meteorological masts

Two permanent meteorological mast are proposed within the Proposal site, with a maximum height of 164 m.

2.2.2.6 Batching plant

A temporary batching plant, with a facility footprint measuring 100 m by 100 m is also proposed to produce concrete on-site during the construction phase.

2.2.2.7 Construction and laydown area

A temporary construction and laydown area measuring 400 m by 100 m would also be required and typically consist of a site office, machinery, fuel storage, amenities, and car parking. They would also be suitable to receive and store machinery, wind farm components and materials. If required, to reduce the need for clearing of native vegetation, construction and laydown areas could be partially relocated to previously cleared land.

The construction duration is estimated to be approximately 24 months with a peak manning of up to 150 people at peak periods. It is assumed that project accommodation would be met by the utilisation of multiple facilities within an appropriate radius. As part of the feasibility, SynergyRED is considering off-site, mixed onsite and offsite and onsite accommodation options.

Some prior enabling works will be required prior to the commencement of construction. These may include:

– site investigations, such a geotechnical investigations or surveys
– establishing water supply options
– possible offsite road works
– installation of wind monitoring towers and establishment of roads and clearing for their installation.

The following activities are likely to occur during construction:

– potential construction of temporary compounds, works accommodation, laydown, and storage areas
– civil works, including construction of new site access tracks, associated earthworks, and vegetation clearance within the Proposal site and excavation for the foundations
– transportation of wind farm and transmission line components
– installation of wind turbine transformers, in parallel with electrical reticulation works
– construction of wind turbines, and ancillary infrastructure including meteorological masts, and electrical reticulation
– electrical balance of plant works including overhead transmission line, substations and switching stations
– rehabilitation of the site.

3. Methodology

This section outlines the methodology used to assess the impacts of the Proposal on landscape character and visual amenity (Figure 4).

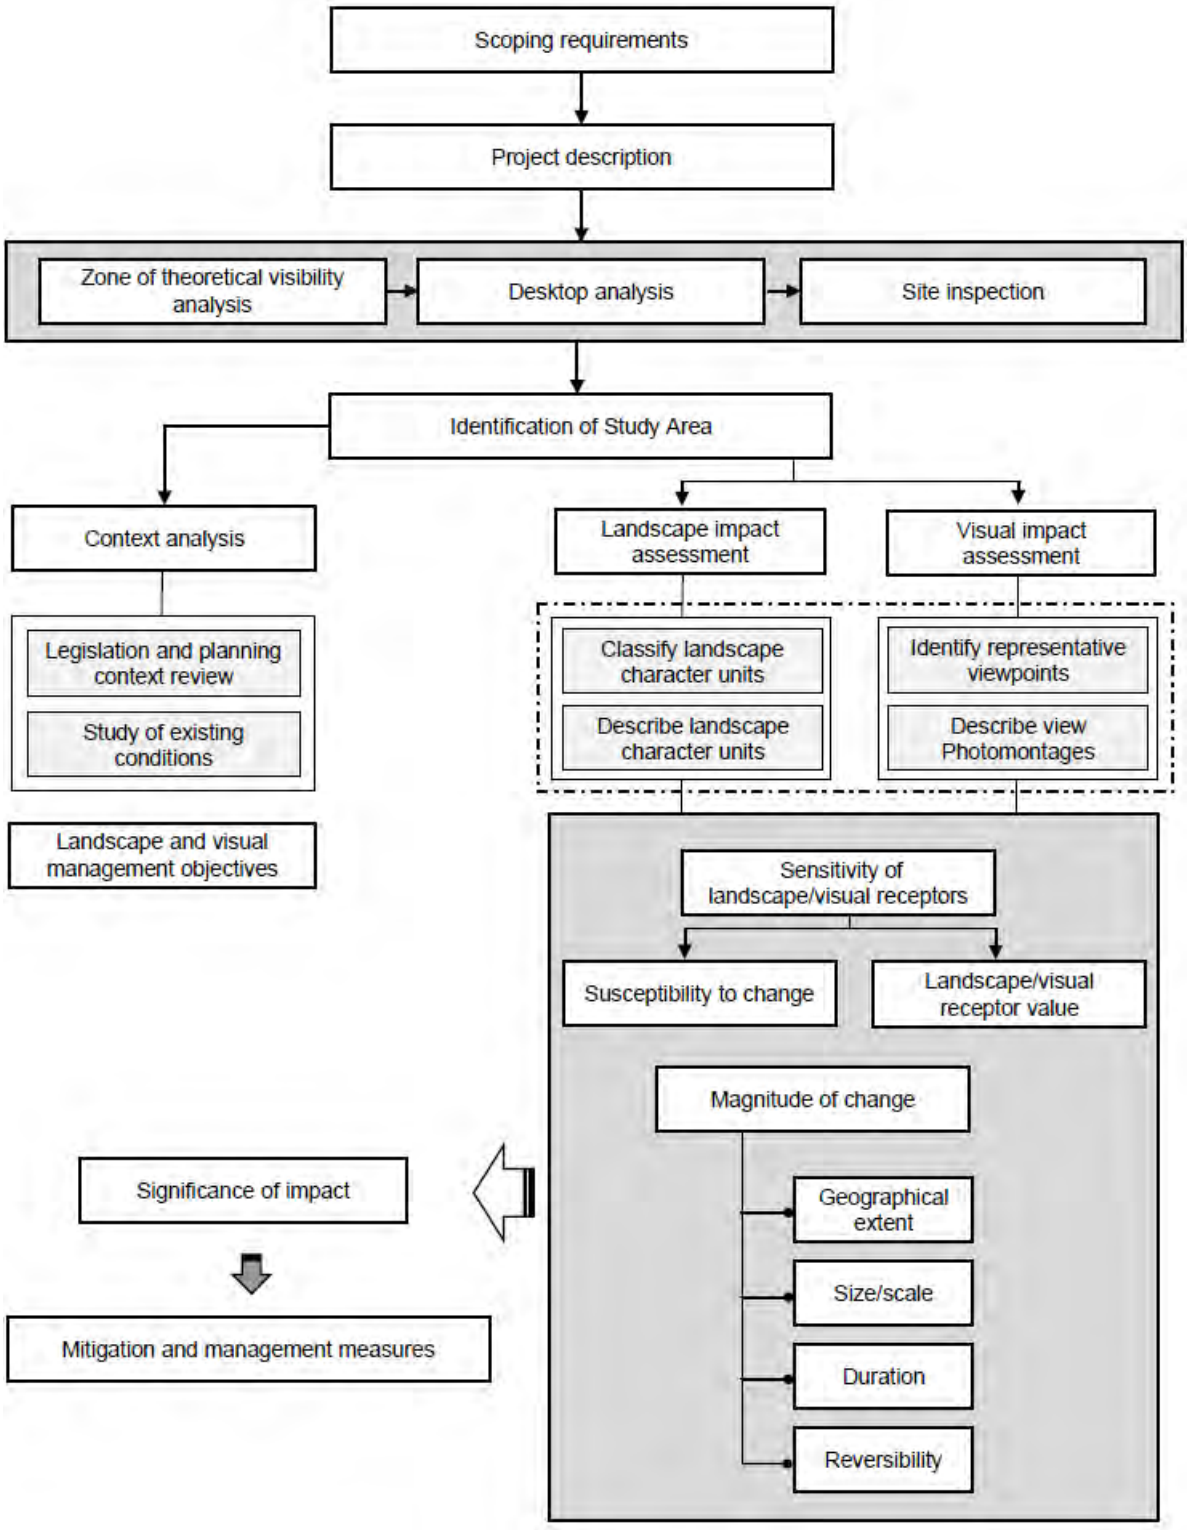

Figure 4 *Landscape and visual impact assessment process*

The methodology for the LVIA has been set out to respond to specific project requirements and constraints including the scale and nature of the Proposal.

There is no general and/or legislated guidance on the assessment of landscape and visual impacts produced by an independent body specific to Australia. Where practicable, the landscape and visual impacts associated with the Proposal have been assessed in accordance with the advice provided in international, national and state recognised resource documents and in accordance with all relevant legislation. These include but are not limited to the following:

– The Western Australian Planning Commission (2007) *Visual Landscape Planning in Western Australia: a manual for evaluation, assessment, siting and design.* This manual provides guidance for the practice of visual impact assessment in Western Australia; however, it is not a statutory procedure or prescriptive policy.
– The Landscape Institute and the Institute for Environmental Management and Assessment (2013) *Guidelines for Landscape and Visual Impact Assessment, Third Edition* (GLVIA3).
– Environmental Protection Authority (2023) *Environmental Factor Guideline: Social Surroundings*
– Natural England (2014) *An Approach to Landscape Character Assessment*

3.1 Zone of theoretical visibility

Zone of theoretical visibility mapping is a computer-generated analysis which identifies land from which it is theoretically possible to view the components of the Proposal. These have been used primarily to guide determination of the Study Area and representative viewpoint selection as well as to inform the site inspection.

ESRI ArcGIS was used to model the ZTV of the Proposal. A digital elevation model was produced using DEM data and a resolution of 30 m. The ZTV was mapped using the following parameters:

– A viewing height of 1.7 m, which is the average within the typical viewing level range of an adult.
– Maximum tip height of 250 m
– Maximum hub height of 164 m

The GIS software then digitally determines the likely extent over which the component would be visible or not visible. In interpreting the ZTV, the following considerations must be made:

– The ZTV only considers the landform and does not include land cover factors such as the presence of buildings and trees. It therefore represents the worst-case scenario of potential visual impacts.
– The ZTV does not consider the effect of distance. The greater the distance from the Proposal, the lower the impact, as the development will take up a smaller portion of the view, and atmospheric conditions may reduce the visual prominence of the Proposal.
– The ZTV is only accurate to the resolution of the elevation model.

3.2 Desktop analysis

As specified in Section 4, existing data focused on the proposed Study Area and the Proposal was gathered and reviewed, including:

– Proposal design information and site photographs
– Topography, land use, hydrology, and vegetation maps
– Available data on heritage sites
– Google Earth and Google Street View

Using this data, a preliminary assessment of the landscape and visual environment was undertaken to inform the site inspection and impact assessment process.

3.3 Site inspection

Numerous site inspections were undertaken by a Landscape Architect and Landscape Planner on 7, 8 and 27 March and the 28 August 2024 in varied weather conditions from clear, sunny, and high visibility to full cloud, light

rain, and low visibility. During the site inspections, the proposed Study Area was driven and walked to gain representative views of the Proposal from publicly accessible and private viewpoints. The purpose of the inspection was to:

– Inspect the proposed Study Area and appreciate views to and from the Proposal
– Inspect publicly accessible locations identified in the desktop analysis as likely to provide views of the Proposal
– Identify sensitive visual receptor locations (identified in Section 7.3)
– Assess the landscape character of the Study Area and identify landscape sensitivities
– Undertake site photography for the visual assessment and for the preparation of photomontages

3.4 Study Area

The Study Area for this report is generally confined to the likely extent of visibility of the Proposal within the surrounding context. This has resulted in an indicative study area of approximately 30 km from either side of the Proposal boundary, based on an understanding of the Proposal and informed by a comprehensive analysis. This includes a desktop review and site inspection of the existing landscape context, and previous studies of a similar type and/or within a similar landscape context. Refer to Figure 5 Study Area for the Study Area extent.

Located within South West Boojarah, the Study Area encapsulates the traditional lands of the Wardandi and Bibulmun/Piblemen Noongar language group with the Proposal site located within Bibulmun/Piblemen Country.

3.5 Legislation and planning context review

A review was conducted to assess essential planning designations, policies, and guidance concerning landscape and visual environment relevant to the Study Area. The focus of this review was to identify designations, protections, values, and objectives pertinent to the landscape and visual environment of the Study Area, including scenic amenity values (refer to Section 4).

3.6 Existing landscape and visual conditions

An assessment of the landscape was undertaken to determine the existing natural, cultural, and visual features within the Study Area. This includes determination of key landscape and spatial elements, features, and values. Visual analysis of the existing conditions involves identifying viewing locations, identifying who the viewers are and how they experience the landscape, identifying key views, and determining visibility. This assists in understanding how the proposed changes may impact the viewing experience and values. Aspects considered include:

– Land use and built form
– Landform, topography, and hydrology
– Vegetation
– Heritage features
– Aboriginal cultural heritage

3.7 Landscape and visual management objectives

The purpose of landscape and visual management objectives is to manage the character of the landscape and visual amenity within the Study Area. The legislation and policy review and context analysis form the basis of development of appropriate management objectives and strategies. Refer to Section 5.

3.8 Landscape impact assessment

The assessment of landscape impacts includes an identification of Landscape Character Units (LCU's) defined within the Study Area and an assessment of potential impacts from the Proposal provided for each LCU. Refer to Section 6.

3.8.1 Landscape character units

LCU's generally comprise of homogenous patterns of characteristics such as landform, vegetation, water features and land use as well as individual features, as identified during the context analysis and site inspection.

The blend of elements shown in Figure 6 contributes to shaping a landscape character which defines distinct landscapes with unique attributes and sense of place.

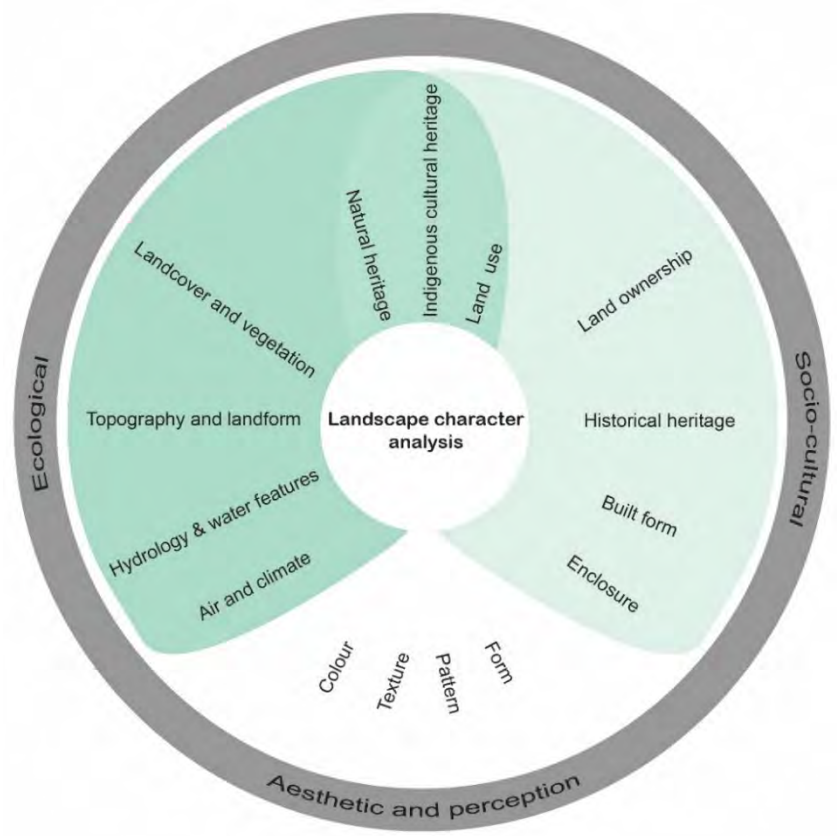

Figure 6 Landscape character elements

These elements have been considered to establish the existing landscape character of the Proposal and Study Area and serve to provide a framework for measuring the impact of the Proposal. This assists in:

– Identifying landscape elements that contribute to defining character
– Defining landscape character attributes
– Identifying landscape value

The assessment of the existing landscape also considers factors which have influenced landscape change in the past and those that are likely to do so in the future. The identified LCU's in the Study Area are defined in Section 6.1.

Values associated with the landscape have also been identified for each LCU. Landscape value considers designated and undesignated landscapes and all elements such as the environmental, cultural, historical, and visual elements that form the landscape. When defining landscape value considerations include landscape quality, scenic quality, rarity, representativeness, conservation value, recreation value, and associations. Refer to Table 1 for the criteria used to determine the landscape value.

3.8.2 Assessment of impacts to landscape character

Landscape impact assessment deals with the effects of change and development on landscape as a resource. The assessment focuses on how the Proposal could affect the elements that make up the landscape, including the aesthetic and perceptual aspects and its distinctive characteristics.

The consideration of potential impacts to landscape character is determined based on the sensitivity of the existing landscape to the proposed change, and the magnitude of change that is likely to occur.

The sensitivity of a landscape is determined on the capacity of the landscape to accommodate the change of a particular type and scale, without impacts on existing landscape character, and the value of the existing landscape. A judgement on the level of sensitivity is made and a rating of high, medium, low, and negligible applied.

The magnitude of change to landscape character depends on the nature, scale and duration of the change expected to occur. It also depends on the loss, change or addition of any feature to the existing landscape.

3.8.2.1 Sensitivity to landscape impacts

The sensitivity of landscape impacts addresses the following specific criteria:

– Sensitivity of landscape to proposed change, is based on the landscapes susceptibility to change, and the value of the landscape. Refer to Table 1 for landscape sensitivity, landscape value criteria and landscape susceptibility to change criteria. Professional judgement on the level of sensitivity is made and a rating of high, moderate, low, or negligible applied.

Table 1 Landscape sensitivity

Landscape sensitivity	Criteria	
	Landscape value	**Landscape susceptibility to change**
High	Landscapes located within, or contributes to the value of, landscapes designated and/or recognised at state, national and/or international level such as designated National Park, World Heritage Area, or State Heritage Place. May include nationally important features and landscapes that are valued by the community such as: – Conservation areas and designated landscapes. – Visually prominent landforms with elevated features such as ridges, hills and escarpments. – Waterways such as rivers, lakes and coastal areas. – Areas with a high degree of naturalness and/or areas subject to active rehabilitation or landscape treatments. – Cultural and heritage sites, features or designations including Aboriginal heritage sites of state, regional or local significance. – Residential areas and areas of recognised community value and amenity.	– Landscape of high quality and condition with consistent, intact, well-defined attributes – The landscape is well managed. – The proposed development would be incompatible with the existing characteristics of the area. – Mitigation measures are unlikely to reduce the impacts of the change.
Moderate	– Landscapes that are not explicitly recognised for a heritage significance or a value but are well-used by local communities. – Landscapes dominated by agricultural or other modified land uses, although with some degree of relative wilderness	– Landscapes of moderate quality and condition – Some of the key characteristics of the landscape relate well to the proposed development. – Any change caused by the type of development would be unlikely to have a significant adverse effect on the landscape character, condition or value that cannot be effectively mitigated.

Landscape sensitivity	Criteria	
	Landscape value	Landscape susceptibility to change
	– Landscape where there is evidence of some value associated with natural heritage, recreational activity, cultural associations, or other special interests.	
Low	– Landscapes with few specific natural features and cultural associations – Limited distinctive local features.	– Landscapes of low quality and poor condition – Attributes poorly managed and in poor state of repair – Landscape intrinsically able to accommodate the proposed change with many of the key characteristics relating well to the proposed development or unlikely to be diminished. – Mitigation measures would be effective in neutralising adverse effects.
Negligible	– Landscapes with no specific features of natural heritage, cultural associations, or other special interest. – No distinctive local features	– Degraded landscapes with poor quality and condition – Neglected landscapes without management and maintenance of natural features – None of the key characteristics are likely to be diminished by the proposed change. – Mitigation measures are not required.

3.8.2.2 Magnitude of landscape impacts

The magnitude of landscape impacts addresses the following specific criteria:

– The magnitude of change to landscape character is based on the size or scale of change, the geographical extent of effects, and the duration and reversibility of effects (Table 2). It also depends on the loss, change or addition of any feature to the existing landscape. It is based on the part of the LCU which is likely to be impacted to the greatest extent by the Proposal.
– An assessment is made on the overall level of significance of landscape impacts in relation to the existing conditions as per the significance of impact matrix defined in Section 3.9.4.

Table 2 Landscape magnitude of change criteria

Rating	Criteria
High	A substantial/obvious change to the landscape character due to total loss of, or change to, elements, features or characteristics of the landscape. Would cause a landscape to be permanently changed and its perceived quality diminished. Mitigation measures are unlikely to reduce the impacts of the change.
Moderate	Discernible changes in the landscape character due to partial loss of, or change to elements, features or characteristics of the landscape, however, has potential to be partly mitigated. The change would appear to have an adverse effect on the landscape character since it would be out of scale with the local pattern and landforms.
Low	Minor loss or alteration to one or more key landscape character elements, features or characteristics, or the introduction of components that may be new but may not be uncharacteristic within the existing landscape character. Mitigation measures would be effective in neutralising perceived adverse effects.
Negligible	Almost imperceptible or no change in the landscape character as there is little or no loss of/or change to the elements, features, or characteristics of the landscape. Mitigation measures would be effective in neutralising perceived adverse effects and/or improve the landscape character.

3.9 Visual impact assessment

Assessment of visual impacts deals with the effects of change and development on the views available to people and their visual amenity. It assesses how the surroundings of individuals or groups of people may be specifically affected by changes in the context and character of views as a result of the change or loss of existing elements of the landscape and/or the introduction of new elements.

How a landscape is viewed is of critical importance in understanding changes in the landscape and how people perceive them. Visual landscapes are related to peoples' sense of place and quality of life. How people view, perceive, experience, and interact with landscape can be varied and diverse.

3.9.1 Viewpoint selection

A visual analysis of the Study Area was conducted. Via this process 12 sensitive visual receptors were identified, and their level of significance given, in line with guidance provided within the *Visual Landscape Planning in Western Australia* guidelines (WAPC, 2007) and *Guidelines for Landscape and Visual impact Assessment (IEMA, 2013).* Refer to Table 3 for visual sensitivity criteria and Section 7.2 for description of sensitive receptors

Level of significance generally increases with the importance of the view, the degree of sensitivity of the viewers, the degree to which experiencing the landscape is integral to the enjoyment of a travel route or site, and the length of duration of a view. These criteria were used to assist in determining which sensitive visual receptor locations to consider for assessment.

Sensitive visual receptors have been considered in terms of the views they are likely to obtain from within the Study Area including consideration of any key vantage points, such as lookouts, where there is particular interest in the view. Visual receptors are identified based on:

– Proximity of the sensitive visual receptors to the Proposal, as the most affected sensitive visual receptors are anticipated to be closest to the Proposal, unless located at an elevated vantage point.
– Type of sensitive visual receptor, as different viewer types would have different perceptions of the change.

Based on the analysis of the existing landscape and visual environment, viewpoint locations were selected for assessment as representative of sensitive visual receptor locations. To best illustrate the likely visual impacts of the Proposal, where appropriate, these viewpoint locations aim to represent a balance of:

– The most sensitive visual receptors.
– A range of sensitive visual receptor types.
– A range of distances from the Proposal.
– A range of view directions towards the Proposal within the Study Area.

3.9.2 Assessment of visual impacts

A series of 12 representative viewpoint locations were selected for assessment based on the visual analysis of the Study Area and understanding of the Proposal. Existing views were represented using a panorama technique (refer Section 3.9.5). An assessment of each viewpoint is provided which includes assessment of the sensitivity of the viewpoint to change, identification and description of the likely changes to the view, assessment of the magnitude of change that is likely to occur, and overall level of significance of impact on the visual environment or representative viewpoint.

The sensitivity of each viewpoint is considered to be dependent on the importance of the view, its existing scenic qualities, the presence of other existing built elements in the view, and the type of sensitive visual receptor and their likely interest in the view. The magnitude of change to views and visual amenity depends on the nature, scale and duration of the change that is expected to occur. This depends on the loss, change or addition of any feature in the field of view of the sensitive visual receptor including an assessment of the level to which the change contrasts with the existing view or expected view of the landscape.

The assessment considers the likely impacts of the Proposal, refer to Section 6. The level of impact on a view depends on factors such as the extent of visibility, degree of obstruction of existing features, degree of contrast with the existing view, angle and duration of the view, and the distance from the Proposal.

The sensitivity and magnitude of visual impacts address the following specific criteria:

– Sensitivity of the visual receptor to the proposed change, based on the susceptibility of visual receptors to change, and the value attached to the view (Table 3).
– Magnitude of change, based on the size or scale of the change, geographical extent of effects, and duration and reversibility of effect (Table 4).

Table 3 Visual sensitivity criteria

High	– Occupiers of residential properties, at home or going to or from, with long viewing periods, within close proximity to the proposed development – Communities that place value upon the urban landscape and enjoyment of views of their setting. – Users of designated tourist routes or scenic drives – Users of recreation, conservation, or scenic areas – Users of viewpoints and lookouts of state or national significance including their access routes – Viewers of scenic views, city views, rural views, elevated views, long or wide views, or views that include water bodies. – Viewers of views of national or state importance
Moderate	– Viewers at schools, or similar, when outdoor play and recreation areas are located within close proximity but viewing periods are limited – Occupiers of residential properties with long viewing periods, at a distance from or screened from the Proposal – State or main road users – Viewers who have intermittent views of the Proposal
Low	– Road users in motor vehicles, trains or on transport routes that are passing through or adjacent to the Study Area and therefore have short term views – Viewers indoor at their place of work, schools or similar – Local roads users
Negligible	– Viewers from locations where there is screening by vegetation or structures where only occasional screened views are available and viewing times are short – Road users in motor vehicles, trains or on transport routes that are passing through/adjacent to the Study Area and have partially screened views and short viewing times

Table 4 Visual magnitude of change criteria

High	A substantial/obvious change to the existing view due to total loss of, or change to, elements, features or characteristics of the view. Would cause a view to be permanently changed and its perceived quality diminished
Moderate	Discernible changes in the existing view due to partial loss of, or change to elements, features or characteristics of the view, however, has potential to be partly mitigated. The change would appear to have an adverse effect on the view since it would be out of scale with the existing view.
Low	Minor loss or alteration to one or more key view elements, features or characteristics, or the introduction of components that may be visible but may not be uncharacteristic within the existing view.
Negligible	Almost imperceptible or no change to the view as there is little or no loss of/or change to the elements, features, or characteristics of the view.

3.9.3 Duration of impact

Landscape and visual impacts can be temporary or permanent in nature. The duration of impact as used in this assessment is outlined in Table 5. This was used to assess the landscape and visual impacts associated with the construction and operation phase of the Proposal.

Table 5 Duration of impact

Temporary	Impacts lasting 1 year or less
Short term	Impacts lasting 1 to 5 years
Medium term	Impacts lasting 5 to 10 years
Long term	Impacts lasting 10 to 25 years
Permanent	Impacts lasting over 25 years

3.9.4 Significance of impacts

The combination of sensitivity and magnitude of change determines the significance of impact on the visual environment or representative viewpoint. Refer to Table 6 which illustrates the matrix used to determine the significance of impacts.

Table 6 Significance of impact matrix

		Magnitude of change			
		High	**Moderate**	**Low**	**Negligible**
Sensitivity	**High**	High	High-moderate	Moderate	Negligible
	Moderate	High-moderate	Moderate	Moderate-low	Negligible
	Low	Moderate	Moderate-low	Low	Negligible
	Negligible	Negligible	Negligible	Negligible	Negligible

3.9.5 Panorama and photomontage

All photographic images were captured using a 50 millimetre fixed focal length lens on a 35 millimetre full frame format camera at a camera height of 1.7 m. All photograph locations were recorded and mapped.

A series of 12 representative viewpoint locations were selected and existing views represented using a panorama technique. This technique involves the stitching together of a number of adjoining images using the Adobe Photoshop software program.

Photomontage images were prepared for all 12 viewpoints to represent proposed views following the completion of the Proposal. The software used to model and render the photomontages was Autodesk 3D Studio Max. In order to achieve an accurate photomontage of the Proposal and surrounding landscape, with a digital terrain model to a resolution of 10 m was used to model the surrounding landform.

Once the 3D model incorporating both the landscape and new Proposal elements was created, a virtual camera was placed in the software at the same location the photographs were taken. The film, focal lens and height of the virtual camera matches the real camera utilised to take the photographs. The photographs of the site were used in 3D Studio Max as a background to accurately match the 3D model with the Proposal elements to the perspective of the photographs. From the camera view, rendered images of the Proposal were produced to match the daylight exposure of the photographs. The rendered images were imported into Adobe Photoshop for post-production editing and collation of the photomontages.

The final result is the 3D model of the Proposal shown in the correct 3D location in the photographs (Appendix A). The final images were produced to a high resolution, suitable for printing.

3.10 Mitigation and management measures

GHD has proposed mitigation and management measures for SynergyRED's consideration, focusing on landscape character units and visual amenity. Determining these measures involves reviewing the achievability of visual management objectives and addressing impacts identified through the assessment. The feasibility of proposed measures has not been analysed.

Context analysis

4. Context analysis

4.1 Legislation and planning context

A detailed review of government legislation and policies relevant to the Proposal and adjoining Study Area are summarised below. This is not intended to be a thorough review of planning scheme, mechanisms and planning related triggers. The emphasis of the review is to identify designations, protections, values, and objectives relevant to the landscape and visual environment of the Study Area, including scenic amenity values.

Summary of findings

The assessment of relevant legislation, policies and guidelines has identified that the Study Area's existing landscape character and views are valued, and some areas are protected. A review of these key values informed the understanding of the existing landscape and the overall impact assessment.

A key reoccurring value was the protection of the natural character of Leeuwin-Naturaliste Ridge due to its unique social, ecological and landscape values and character and the Scott Coastal Plain which is known for its high and varied visual landscape values. In addition, the importance of the rural character, amenity, and landscape viewed from Brockman Highway was identified through the review.

4.1.1 State legislation and policy

State Planning Policy 2.0: Environment and Natural Resources Policy (WAPC, 2003)

This policy applies throughout the State of WA and includes specific objectives for the protection of landscapes.

Policy *5.9 Landscape* highlights WA's diversity of high value landscapes and scenic areas. It recognises that as the State grows, it will be increasingly important to ensure that landscapes valued by the community are protected. To do this, it is necessary to identify the landscape types and features requiring special attention and develop appropriate management and planning policies that can positively contribute to their maintenance and enhancement. To achieve this, planning strategies, schemes and decision-making should:

i. Identify and safeguard landscapes with high geological, geomorphological, or ecological values, as well as those of aesthetic, cultural or historical value to the community, and encourage the restoration of those that are degraded.

ii. In areas identified in 5.9 (i) above, consider the level or capacity of the landscape to absorb new activities and incorporate appropriate planning, building design and siting criteria to ensure that new development is consistent and sensitive to the character and quality of the landscape.

iii. Consider the need for a landscape, cultural or visual impact assessment for land use or development proposals that may have a significant impact on sensitive landscapes.

Position Statement: Renewable energy facilities (WAPC, 2020)

This document outlines the Western Australia Planning Commission (WAPC) requirements to '*support the consistent consideration and provision of renewable energy facilities within WA. The policy identifies assessment measures to facilitate appropriate development of renewable energy facilities' (WAPC, 2020).*

It states that landscape and visual impact assessments should address:

– *Landscape significance and sensitivity to change, earthworks, topography, extent of cut and fill, the extent and type of vegetation, clearing and rehabilitation areas, land use patterns, built form character, public amenity, and community values.*

– *Likely impact on views including visibility of the facility using view shed analysis and simulations of views from significant viewing locations including residential areas, major scenic drives, and lookouts.*

– *Layout of the facility including the number, height, and scale, spacing, colour, surface reflectivity and design of components, including any ancillary buildings, signage, access-roads, and incidental facilities.*

– *Measures proposed to minimise unwanted, unacceptable, or adverse visual impacts.*

Government of Western Australia, State Planning Strategy 2050 (WAPC, 2014)

The State Planning Strategy 2050 is WA's strategic planning response to the challenges WA is likely to face over the next 30 years. The strategy provides a guide for the future land-use planning and development of the State. The Study Area is part of the south-west sector. It is identified as the population centre for the State and a global biodiversity hotspot with endemic native flora and rare and threatened species.

State Planning Policy No 2.6 State Coastal Planning Policy (WAPC, 2013)

This policy recognises the importance of the WA coastal zone as a significant asset in terms of its environmental, economic, social, and cultural resources and recognises the varied pressure on the coastal zone for use by different groups in the community for a variety of purposes. Planning for coastal zone land is about balancing competing needs and desires in a manner that considers the value of the coastal zone which includes its scenic, aesthetic, and ecological qualities in addition to recreational opportunities and social, indigenous, culture and economic importance.

Development and settlement policy measure (v) identifies the importance of ensuring use and development, adjacent to the coast is designed and sited to complement and enhance the coastal environment in terms of its visual, amenity, social and ecological values.

4.1.2 Region and sub-region schemes and policies

Augusta-Walpole Coastal Strategy (WAPC, 2009)

A component of coastline between Augusta and Walpole is included in the Study Area. The Augusta-Walpole Coastal Strategy provides guidance on how various issues affecting the coastline in this vicinity can be managed. It addresses coastal tenure and management, settlement, tourism, coastal access, infrastructure, subdivision, development and the protection of the environment and biodiversity.

The strategy states that alternative power generation within the strategy area, such as solar or wind, may be applicable in isolated areas provided that infrastructure is consistent with the surrounding landscape and does not affect the visual amenity.

As affirmed in the strategy as the Study Area has low levels of development it has a very high level of natural landscape amenity.

Scott Coastal Plain – A Strategy for a Sustainable Future (DPIRD, 2001)

This document provides a broad strategy and vision for the future development and use of the Scott Coastal Plains recognising the importance of the region's potential, environmental values and receiving water bodies such as Hardy Inlet.

The strategy identifies the area south of Scott River be zoned as Rural Landscape and Conservation to protect significant landscapes and environmental features and provide for development which is compatible with and will enhance the landscape and environmental qualities of this location. As stated, this zone has high and varied visual landscape values and as such development or use should be designed and located as to be compatible with and complimentary to the visual landscape and in particular not be placed on exposed dunes or in visually conspicuous positions.

State Planning Policy 6.1 Leeuwin-Naturaliste Ridge Policy (WAPC, 2019)

Utilising a regional planning approach the purpose of this policy is to protect the unique ecological, social and landscape values and character of the Leeuwin-Naturaliste Ridge. This policy applies to all land use and development within the policy area which stretches from Cape Naturaliste to Cape Leeuwin, inland to Bussell Highway and the eastern extent of townsites along the highway.

The policy states that this is an extraordinary landscape and development needs to have due regard for the landscape integrity and value of the Ridge backdrops when viewed from the coastline, bays, or travel route corridors. In areas of natural landscape significance, the significant natural characteristics will be protected and provide adequate development setbacks. In areas of Rural Landscape Significance and General Character development should protect the rural character of the land.

4.1.3 Local planning framework

Shire of Augusta Margaret River Local Planning Strategy (DPLH, 2022)

The Shire of Augusta Margaret River (AMR Shire) Local Planning Strategy (LPS) specifies the inherent landscape values and visual character of agricultural land and the visual management controls relevant to travel route corridors such as Brockman Highway, located within close proximity to the Proposal. In these areas large visually obtrusive developments on sites that are prominently located along travel route corridors and contribute to the natural and rural landscape amenity of the Shire are discouraged (DPLH, 2022).

The strategy also stipulated that all development within the Shire should preserve and celebrate those elements of the built and natural environment that are of cultural heritage significance to the local Wardandi and Bibulmun/Piblemen people and are representative of the special character and heritage of the Shire and that the Shire will guide against inappropriate development of visually sensitive sites (DPLH, 2022).

This document also specifies the importance of the Leeuwin Naturaliste Ridge as one of the key landscape features within this area. Development within and surrounding this landform is required to be appropriate and visually sensitive (DPLH, 2022).

Shire of Augusta Margaret River Local Planning Scheme No 1 (DPLH, 2024)

Of relevance to this assessment AMR Shire Local Planning Scheme No 1 (LPS1) recognises the importance of the area included in the Leeuwin Naturaliste Ridge Landscape Amenity Zone as being of high landscape value and vital to the preservation of the visual and landscape amenity of the Ridge. In the Southern Ocean Foreshore Protection zone development shall be designed and sited to minimise impact on the rural character, amenity, and landscape elements of the locality. Within varying agricultural zones LPS1 identifies that established rural character and amenity within these zones is preserved and is consistent with the ongoing use and development of that land for agricultural purposes **(**DPLH, 2024).

In addition, development adjacent to a travel route corridor shall be designed and sited to minimise any adverse impacts on rural character, amenity, and landscape values **(**DPLH, 2024).

Draft Shire of Augusta Margaret River Local Planning Scheme No 2 (AMR Shire, 2024)

Currently under review AMR Shire draft Local Planning Scheme No 2 (LPS2) seeks to implement an environment first approach to development whilst also ensuring that development is sensitively located and constructed in a manner that maintains the natural and rural landscape and visual qualities of the scheme area.

LPS2 specifies that within visual management areas development is required to be located on lower contours to avoid sky lining. Vegetation backdrops may be required to be planted where they will lessen visual impact.

In Environmental Conservation Zones (previously the Southern Ocean Foreshore Protection Zone) development shall be designed and sited to minimise impact on the rural amenity, character, and landscape elements of the locality.

At the time of writing, LPS2 remains draft in its status having concluded its public consultation phase earlier in the year (28 February 2024).

Shire of Nannup Local Planning Strategy (DLPH, 2018)

One objective of the Shire of Nannup (Nannup Shire) Local Planning Strategy is of relevance to this LVIA being create sustainable communities and sustainable development which aims to retain the unique sense of place that values its culture and heritage.

Specific actions related to landscape protection include maintaining the outstanding visual amenity within the region inclusive of key landscape and vistas through ensuring that development is designed and located in a manner that does not detrimentally impact on the landscape values of the area and ensure the landscape and scenic quality is protected through the use of appropriate development criteria and development controls. Specific strategies aligned to these actions include:

– *Ensure development reflects and enhances the natural, cultural, visual and built character of the regions landscape.*

– *Protect and enhance landscapes and associated visual amenity and character 'viewsheds' associated with tourist routes and major roads.*
– *Do not support development that will unacceptably impact the views from tourist routes and major roads.*
– *Within rural and priority agriculture areas rural character, environmental and vista qualities of the area are to be protected.*

Shire of Nannup Local Planning Scheme No 4 (DPLH 2022)

Nannup Shire Local Planning Scheme No 4 (LPS4) outlines aims relevant to this LVIA including:

– *Manage development by means of development controls and zoning to achieve compatibility between land use and the preservation, and where possible enhancement of visual amenity of rural environs.*
– *Promote sustainable use of rural land for agricultural purposes whilst accommodating other rural activities.*
– *Safeguard and enhance the amenity and character of the built and natural environment of the scheme area.*

4.1.4 Other guiding documents

Landscape character types for WA (CALM, 1994)

The landscapes of WA have been classified into landscape character types as part of the Reading the Remote - Landscape Characters of Western Australia study (CALM, 1994). This study classifies the landscapes of WA into broad landscape character types in terms of common distinguishing visual landform, vegetation, water form and land-use characteristics.

The following landscape character types are relevant to the Study Area and will help inform the LCU's:

– Leeuwin Naturaliste Coast
– Scott Coastal Plains
– Darling Plateau | Darling Uplands subtype

4.2 Landscape and visual existing conditions

4.2.1 Land use and built form

The Proposal is located in the Warren Bioregion (Figure 7) within the locality of Scott River in the AMR Shire Local Government Area (LGA) which is situated approximately 294 km south-east of Perth. The AMR Shire includes the townsites of Margaret River, Augusta and Cowaramup and the settlements of Gracetown, Karridale, Kudardup and Witchcliffe. In addition to Scott River the region also includes the rural localities of Alexandra Bridge, Baudin, Boranup, Bramley, Burnside, Courtenay, Deepdene, East Augusta, Forest Grove, Gnarabup, Hamelin Bay, Leeuwin, Molloy Island, Nillup, Osmington, Prevelly, Redgate, Rosa Brook, Rosa Glen, Schroeder, Treeton and Warner Glen.

AMR Shire LGA has a population of approximately 16,791 (Australian Bureau of Statistics, 2021) which is expected to grow to approximately 25,000 people by 2036 (DPLH, 2022). The townsites include a variety of land uses and infrastructure such as parks, hospital, schools, light industry and town centre with cafés and shops with the settlements incorporating small town centres, residential areas, and parks.

The Proposal site is situated next to Chester and Pagett Nature Reserve and Scott National Park approximately 15 km northeast of Augusta, 5 km northeast of Molloy Island, 3 km of south-east of Nillup Village General Store and less than 2 km from Brockman Highway, the nearest main road.

The land use within the Study Area, which covers a 30 km area (in each direction) from the Proposal site, contains the townsites of Augusta and a proportion of Margaret River in addition to the settlements of Karridale, Kudardup and Witchcliffe. It also contains national parks, nature reserves, state forests, agricultural land, and tourism land uses (Figure 8).

Brockman Highway and Bussell Highway are important arterial roads traversing through the Study Area with Caves Road being another important road.

4.2.2 Landform, topography, and hydrology

As indicated in Figure 9 the Study Area terrain is diverse ranging from ridges, rugged cliffs and capes, exposed slopes, rounded hills, and valleys to an almost flat to gently undulating plains. The high points of the topography are located on the Leeuwin Naturaliste Ridge and have a peak elevation of 220m Australian Height Datum. One is situated to the south-west, towards Cape Leeuwin, approximately 18 km from the Proposal and the other further north, within Boranup, adjacent to Boranup Lookout approximately 28 km from the Proposal.

The Study Area encompasses a variety of watercourses, such as the Blackwood River (Goorbilyup Buerle) located to the west and north of the Proposal, Scott River located directly south and the Margaret River (Wooditjup Bilya) and Mowen River, both of which are located to the north of the Proposal. Blackwood River and Scott River connect to Hardy Inlet near Augusta and have tributaries within the Proposal site.

4.2.3 Vegetation

Vegetation cover within the Study Area consists of coastal heathland and rushes, low forest, woodland, and open forest interspersed with areas of cleared pastureland (irrigated and unirrigated) and farming lands, including areas of tree plantations.

The native vegetation within the Study Area includes the pre-European vegetation complexes, as identified in the Leeuwin Naturaliste Coast, Scott Coastal Plains and Darling Plateau | Darling Uplands Vegetation Complexes (Department of Parks and Wildlife, 2016). The region comprises a combination of uplands, valleys, depressions and swamps on uplands, estuaries and valley floors and swamps. Vegetation complexes are itemised in Table 7 and included in Figure 10. The Proposal is located within the Scott vegetation complex definition but is comprised predominantly of cleared farmland.

Table 7 Vegetation complexes located within the Study Area

Vegetation complex	Description
Bidella	Low woodland of *Melaleuca preissiana-Banksia littoralis-Hakea lasianthoides* on valley floors and open forest to woodland of *Eucalyptus marginata subsp. marginata-Corymbia calophylla-Eucalyptus* patens on slopes in per humid and humid zones.
Blackwood 1	Woodland to open forest of *Eucalyptus marginata subsp. marginata-Corymbia calophylla-Xylomelum occidentale-Agonis flexuosa* on raised river terrace in the per humid zone.
Blackwood 2	Low open woodland of *Banksia attenuata-Nuytsia floribunda-Eucalyptus marginata subsp. marginata* on low dunes in the per humid zone.
Blackwood 3	Tall open forest of *Eucalyptus diversicolor-Corymbia calophylla* with some *Eucalyptus marginata subsp. marginata* on undulating uplands in the per humid zone.
Blackwood 4	Open forest of *Corymbia calophylla-Eucalyptus marginata subsp. marginata* on the variable slopes in per humid and humid zones.
Blackwood 5	Woodland to low forest of *Melaleuca rhaphiophylla, tall shrubland of Melaleuca incana* and closed heath of *Agonis spp.* on depressions in the per humid zone.
Blackwood 6	Woodland of *Melaleuca cuticularis* and sedgelands of *Cyperaceae-Restionaceae spp*. on estuarine flats in the per humid zone.
Coate	Low open woodland of *Eucalyptus marginata subsp. marginata-Corymbia calophylla-Allocasuarina fraseriana-Banksia ilicifolia* and low open woodland of *Melaleuca preissiana-Banksia littoralis* on broad depressions in upper gullies in per humid and humid zones.
Cowaramup 1	Open to tall open forest of *Eucalyptus marginata subsp. marginata-Corymbia calophylla-Banksia grandis* on lateritic uplands in the hyper humid zone.
Cowaramup 2	Open forest of *Eucalyptus marginata subsp. marginata-Corymbia calophylla-Banksia grandis* on lateritic uplands in perhumid and humid zones.
Cowaramup 3	Woodland of *Eucalyptus marginata subsp. marginata-Corymbia calophylla-Banksia ilicifolia* on sandy rises and low woodland of *Melaleuca preissiana* on lower slopes in the hyperhumid to humid zones.
Cowaramup 4	Woodland of *Corymbia calophylla-Eucalyptus marginata subsp. marginata-Agonis flexuosa*, woodland of *Banksia littoralis* and closed heath on rocky slopes in hyperhumid and perhumid zone.
Cowaramup 5	Mixture of open forest to woodland of *Eucalyptus diversicolor-Corymbia calophylla* and woodland of *Eucalyptus marginata subsp. marginata -Corymbia calophylla* on slopes and low woodland of *Melaleuca preissiana-Banksia littoralis* on depressions in the hyperhumid zone.
Cowaramup 6	Woodland of *Eucalyptus marginata subsp. marginata-Corymbia calophylla* on slopes and low woodland of *Melaleuca preissiana-Banksia littoralis* on depressions in perhumid and humid zones.
D'Entrecasteaux 1	Tall shrubland and woodland of *Agonis flexuosa-Acacia saligna* on flats between dunes in the perhumid zone.

Vegetation complex	Description
D'Entrecasteaux 2	Mosaic of low woodland of *Agonis flexuosa* and closed heath of *Olearia axillaris-Spyridium globulosum-Acacia littorea* on steep dunes on calcareous deep sands in the perhumid zone.
D'Entrecasteaux 3	Woodland of *Eucalyptus marginata subsp. marginata-Corymbia calophylla- Agonis flexuosa-Banskia grandis* with some *Eucalyptus megacarpa* on recent low dunes with dense shrub understorey in hyperhumid and perhumid zones.
D'Entrecasteaux 4	Woodland to low forest of *Eucalyptus marginata subsp. marginata-Corymbia calophylla- Agonis flexuosa-Banskia grandis* with some *Eucalyptus megacarpa* on stabilised higher dunes in hyperhumid and perhumid zones.
D'Entrecasteaux 5	Coastal complex and closed heath of *Olearia axillaris* and *Senecio spp.* on recently stabilised dunes in hyperhumid and perhumid zones.
D'Entrecasteaux 6	Tall shrubland of *Agonis flexuosa* and closed heath of *Olearia axillaris-Spyridium globulosum* on coastal low dunes in the perhumid zone.
D'Entrecasteaux 7	Woodland of *Agonis flexuosa* and closed heath of *Olearia axillaris-Spyridium globulosum* on coastal low dunes in the perhumid zone.
D'Entrecasteaux 8	Coastal complex and closed heath of *Phyllanthus calycinus-Olearia axillaris-Spyridium globulosum-Pimelea ferruginea -Rhagodia baccata* with some emergents of *Agonis flexuosa* and sedgeland of *Lepidosperma spp.* on steeper exposed dunes in the hyperhumid zone.
Darradup	Open forest to woodland of *Corymbia calophylla* with some *Eucalyptus marginata subsp. marginata* on slopes, woodland of *Eucalyptus rudis-Banksia seminuda-Melaleuca preissiana-Agonis flexuosa* and tall shrubland of *Agonis linearifolia-Callistachys lanceolata* on fringes of streams in perhumid and humid ones.
Glenarty Hills 1	Open forest of *Eucalyptus marginata subsp. marginata-Corymbia calophylla-Banksia grandis* with some *Eucalyptus diversicolor* on upland and slopes in hyperhumid and perhumid zones.
Glenarty Hills 2	Open forest of *Eucalyptus marginata subsp. marginata-Corymbia calophylla* on undulating uplands in hyperhumid and perhumid zones.
Glenarty Hills 3	Mixture of open forest of Eucalyptus diversicolor-Callistachys lanceolata, woodland of *Eucalyptus patens-Corymbia calophylla* and woodland of *Eucalyptus rudis-Melaleuca rhaphiophylla* on depressions in hyperhumid and perhumid zones.
Gracetown 1	Tall open forest of *Eucalyptus diversicolor-Corymbia calophylla-Agonis flexuosa* on mild slopes in the hyperhumid zone.
Gracetown 2	Mixture of low woodland of *Agonis flexuosa,* open forest of *Corymbia calophylla-Eucalyptus marginata subsp. marginata* and tall open forest of *Eucalyptus diversicolor* with some *Corymbia calophylla* and *Eucalyptus cornuta* on eastward facing slopes in the hyperhumid zone.
Gracetown 3	Closed heath of *Olearia axillaris-Rhagodia baccata-Agonis flexuosa* on seaward slopes in hyperhumid to humid zones.
Gracetown 4	Low woodland of *Agonis flexuosa* with some *Corymbia calophylla* on crests of calcareous dunes in hyperhumid to humid zones.
Gracetown 5	Tall open forest and open forest of *Corymbia calophylla-Eucalyptus marginata subsp. marginata-Eucalyptus megacarpa* and tall open forest of *Eucalyptus diversicolor-Agonis flexuosa* on valley floors in the hyperhumid zone.
Gracetown Karst	Tall open forest of *Eucalyptus diversicolor-Corymbia calophylla -Agonis flexuosa* on karst areas with sink holes in the hyperhumid zone.
Jalbaragup	Open forest of *Eucalyptus marginata subsp. marginata-Corymbia calophylla-Eucalyptus patens* on slopes with some *Eucalyptus rudis* on broad terraces in perhumid and humid zones.
Jangardup	Open woodland of *Eucalyptus marginata subsp. marginata-Corymbia calophylla* on rises and low open woodland of *Melaleuca preissiana-Banksia littoralis* on depressions in hyperhumid and perhumid zones.
Kilcarnup 1	Mosaic of coastal complex on exposed dunes on seaward slopes in hyperhumid to humid zones.
Kilcarnup 2	Mosaic of coastal complex and closed heath of *Olearia axillaris-Pimelea ferruginea-Melaleuca huegelii* on exposed calcareous dunes on seaward slopes in hyperhumid to humid zones.
Kilcarnup 3	Tall shrubland to closed heath of *Agonis flexuosa-Spyridium globulosum* on exposed slopes of calcareous dunes in hyperhumid to humid zones.
Kilcarnup 4	Tall shrubland of *Agonis flexuosa* on windward slopes, woodland of **Eucalyptus cornuta** on leeside in the hyperhumid zone.
Kilcarnup 5	Tall shrubland to low woodland of *Agonis flexuosa* on leeside of dunes in the hyperhumid zone.
Kilcarnup 6	Tall shrubland of *Agonis flexuosa-Acacia saligna* on leeside of calcareous dunes in hyperhumid to humid zones.
Kingia	Open forest of *Eucalyptus marginata subsp. marginata-Corymbia calophylla-Allocasuarina fraseriana-Banksia grandis-Xylomelum occidentale* on lateritic uplands in perhumid and humid zones.
Layman	Woodland to open forest of *Eucalyptus marginata subsp. marginata-Corymbia calophylla-Eucalyptus patens* on slopes and woodland of *Melaleuca preissiana-Banksia littoralis* on valley floors in perhumid and humid zones.

Vegetation complex	Description
Milyeanup	Open forest to tall open forest of *Eucalyptus marginata subsp. marginata-Corymbia calophylla-Allocasuarina fraseriana* with some *Agonis flexuosa* on less undulating slopes in perhumid and humid zones.
Nillup 1	Open forest of *Eucalyptus marginata subsp. marginata-Corymbia calophylla –Banksia grandis-Xylomelum occidentale-Agonis flexuosa* on low undulating plains in the perhumid zone.
Nillup 2	Woodland to open forest of *Eucalyptus marginata subsp. marginata –Corymbia calophylla - Banksia attenuata-Xylomelum occidentale-Nuytsia floribunda* on low sandy rises above plain in the perhumid zone.
Nillup 3	Mixture of open woodland of *Corymbia calophylla with some Eucalyptus patens and Eucalyptus megacarpa* and tall shrubland of *Agonis spp.* with some emergent *Eucalyptus marginata subsp. marginata, Corymbia calophylla* and *Banksia littoralis* on broad depressions in the perhumid zone.
Preston	*Woodland of Eucalyptus rudis-Agonis flexuosa-Banksia seminuda* along streams, open forest of *Corymbia calophylla-Eucalyptus* patens on slopes in the humid zone.
Scott 1	Low open forest and low woodland of *Eucalyptus marginata subsp. marginata-Corymbia calophylla-Agonis flexuosa* with some *Eucalyptus patens* and *Banksia spp.* on low dunes to low woodland of *Melaleuca preissiana-Banksia littoralis* on inter-dune depressions in hyperhumid and perhumid zones.
Scott 2	Low woodland of *Banksia attenuata-Banksia ilicifolia-Nuytsia floribunda-Eucalyptus marginata subsp. marginata* with occasional *Corymbia calophylla* on dunes rising above the plain in hyperhumid and perhumid zones.
Scott 3	Mosaic of sedgeland of *Restionaceae-Cyperaceae spp.* and closed heath of *Myrtaceae-Proteaceae spp*. with occasional *Banksia occidentalis, Melaleuca preissiana* and *Banksia littoralis* on swampy depressions in the perhumid zone.
Scott 4	Mosaic of sedgeland of *Restionaceae-Cyperaceae spp.* and closed heath of *Myrtaceae-Proteaceae spp*. with occasional *Banksia ilicifolia* on swampy depressions and stunted *Eucalyptus marginata subsp. marginata-Banksia attenuata-Xylomelum occidentale* on low sandy rises in hyperhumid and perhumid zones.
Scott 5	Closed heath of *Myrtaceae-Proteaceae spp.* and tall shrubland *of Viminaria juncea* on flats and depressions in the perhumid zone.
Scott Scarp	Open forest of *Eucalyptus megacarpa-Eucalyptus patens* on the lower slopes of escarpment and open forest of *Eucalyptus marginata subsp. marginata-Corymbia calophylla* on slopes in the perhumid zone.
Telerah	Low open woodland of *Eucalyptus marginata subsp. marginata-Corymbia calophylla-Allocasuarina fraseriana-Xylomelum occidentale-Banksia ilicifolia* on slopes in perhumid and humid zones.
Treeton 1	Woodland of *Eucalyptus marginata subsp. marginata-Corymbia calophylla* with *some Allocasuarina fraseriana* on mild slopes in the per humid zone.
Treeton 2	Woodland of *Eucalyptus marginata subsp. marginata-Corymbia calophylla* on undulating sandy slopes in the perhumid zone.
Treeton 3	Open forest of *Eucalyptus patens-Corymbia calophylla-Eucalyptus marginata subsp. marginata* on lower slopes and on floors of minor valleys in the perhumid zone.
Wilyabrup 1	Tall open forest of *Eucalyptus diversicolor-Corymbia calophylla-Allocasuarina decussata-Agonis flexuosa* on deeply incised valleys in the hyperhumid zone.
Wilyabrup 2	Open forest of *Corymbia calophylla-Allocasuarina decussata-Agonis flexuosa* on deeply incised valleys in perhumid and humid zones.
Wilyabrup 3	Woodland of *Eucalyptus marginata subsp. marginata-Corymbia calophylla* on slight rises on lower slopes in perhumid and humid zones.
Wilyabrup 4	Low woodland and woodland of *Corymbia calophylla-Eucalyptus marginata subsp. marginata* with some *Banksia spp.* on exposed slopes in hyperhumid to humid zones.
Wilyabrup 5	Mosaic of coastal heath and low woodland to woodland of *Corymbia calophylla-Eucalyptus marginata subsp. marginata-Banksia spp.* on westward slope in hyperhumid to humid zones.
Wilyabrup 6	Sedgeland of *Cyperaceae-Restionaceae spp.* on depressions by coast in the hyperhumid zone.
Wilyabrup 7	Woodland of *Corymbia calophylla-Eucalyptus marginata subsp. marginata* with closed heath of *Myrtaceae-Proteaceae-Papilionaceae spp.* on steep rocky slopes in the hyperhumid zone.
Wilyabrup 8	Tall open forest of *Eucalyptus diversicolor-Agonis flexuosa-Callistachys lanceolata* with some *Corymbia calophylla on* flats and valleys in the hyperhumid zone.
Wilyabrup 9	Tall open forest of *Corymbia calophylla-Agonis flexuosa* on flats and valleys in perhumid and humid ones.

4.2.4 Heritage features

Aboriginal cultural heritage

The Proposal and Study Area are located within the South West Boojarah within the traditional lands of the Noongar People - Wardandi and Bibulmun/Piblemen language groups.

Noongar people have lived in the southwest of WA since time immemorial, at least 45,000 years. Noongar connection to country connects everything across the vast landscape with meaning and purpose with the belief that everything is connected, the past, the present, the people, the land, the sea and all of its plants and animals (Integrate Sustainability, 2024).

Approximately 30 Aboriginal cultural heritage sites are identified in the Study Area which are protected under the Aboriginal Heritage Act 1972. Tributaries of the Blackwood River (site 20434) and lodged ACH site (22926) are located within the Proposal site as illustrated in Figure 11.

European heritage

AMR Shire LGA is one of the first areas settled by Europeans in Western Australia, over 180 years ago. There are many archaeological and historical places of cultural heritage significance in the region. An overview of the European heritage of the Shire is included in Figure 11. There are 11 properties located within the AMR Shire LGA that are on the State Heritage Register, with 74 places on the Shire's Heritage List. The Heritage Inventory was adopted in July 2012, updated in 2021.

State registered heritage places within the Study Area include Cape Leeuwin Water Wheel, Cape Leeuwin Lighthouse and Quarters, Memorial HMAS Nizam, Cape Leeuwin Lighthouse, Davies Park and Foundry Chimney and Darnell's General Store, Witchcliffe.

4.2.5 Key visual features and experiences

Caves Road

Caves Road is a tourist attraction in its own right located within the western extent of the Study Area. Stretching between Cape Naturaliste and Cape Leeuwin, running parallel to the coast, Caves Road provides views of undulating pastureland and vineyards, olive groves and areas of undisturbed natural vegetation. Towards the south Caves Road has impressive views of the karri trees within Boranup Forest (Tourism Western Australia, 2024).

Cape Leeuwin Lighthouse

Constructed in 1895 from local limestone the Cape Leeuwin Lighthouse is situated at the most south-westerly point of Australia and is still a vital working lighthouse for vessels navigating this cape. Located within the southwest of the Study Area, the lighthouse provides uninterrupted views of the Southern Ocean joining the Indian Ocean. Frequented by approximately 120,000 visitors annually Cape Leeuwin Lighthouse is a key tourist attraction (Sealite, 2024).

Cape-to-Cape Track

The Cape-to-Cape Track is a long-distance trail along the Leeuwin-Naturaliste Ridge between the lighthouses of Cape Naturaliste and Cape Leeuwin, within the western extent of the Study Area. Spanning 123 km the Cape-to-Cape Track provides long ranging elevated views across the Indian Ocean and the windswept heath and the surrounding ever-changing display of vegetation and wildflowers in addition to sheltered woodlands and the towering karri forest at Boranup (Trails WA, 2024).

Leeuwin Naturaliste Ridge

Leeuwin Naturaliste Ridge includes a number of caves, formed approximately 1 million years ago, open to the public such as Jewel Cave, Lake Cave and Mammoth Cave. The ridge also includes the towering karri trees of Boranup Forest and bright white sands and turquoise waters of Hamelin Bay Beach, known for spotting stingrays are typical of the visual features and experiences available within Leeuwin Naturaliste Ridge.

Ellis Street – Dead Finish Walk Trail

The Dead Finish Walk Trail is located between Ellis Street Jetty, within the town centre of Augusta, alongside the Blackwood Rivermouth / Hardy Inlet and the Southern Ocean. The walk includes the scenic locations of Seine Bay, the Landing Place memorial, Flinders Bay, Granny's Pool, Augusta Boat Harbour concluding at Dead Finish, providing long ranging views of the Southern Ocean. Whale watching is a popular activity on the trail between May to August due to Humpback migration patterns and the arrival of the Southern Right Whales who use Flinders Bay as their nursery ground (Whale Watch Western Australia, 2024),

Farmland and agriculture

Farming and agricultural is a prevalent land use type within the Study Area with the agricultural industry prominent in the region. Agricultural land is typically cleared for dairy, beef, sheep, horticulture, grapes, nuts, avocados, and olives (AMR Shire, 2021). Agricultural land is intersected with swathes of remnant vegetation, continuous roadside vegetation corridors, timber reserves, state forests and drainage channels whereby clearings open views into the surrounding farmland framed by remnant vegetation, creating a visual backdrop which establishes a distinct rural setting.

Flinders Bay settlement and beach

Flinders Bay was previously a settlement of coastal shacks used by holiday makers and permanent residents in the interwar years. Located in the southwest of the Study Area, it has retained its informal settlement layout and narrow winding residential streets (Heritage Council of WA, 2021) that lead to Flinders Bay. Flinders Bay is a protected bay, with a grass bank shaded by pine trees, that is popular for swimming with local residents and tourists alike. Wide views of the open Southern Ocean and towards the coastal extent of the Scott Coastal Plain are afforded from Flinders Bay.

Blackwood River

Kayaking, boating, camping, and bushwalking alongside the Blackwood River (Goorbilyup Buerle) are popular recreational pursuits. Spanning the southwest to northeast of the Study Area recreational users avail enclosed views of the river valley, framed by naturally occurring vegetation.

Hardy Inlet

Situated within the southwest of the Study Area Hardy Inlet is a key visual feature of Augusta. As a recreational and tourism location, Hardy Inlet is utilised for a range of recreational pursuits including fishing, swimming, wind foiling, boating, kayaking and houseboat cruising. Bird watching, picnicking and walking are also regular activities associated with the inlet. Long ranging views towards the seemingly undeveloped area of East Augusta, Blackwood River, the Southern Ocean, or Augusta townsite are afforded from the banks of Hardy Inlet.

Scott River

Scott River is a tributary of the Blackwood River (Goorbilyup Buerle). Utilised for recreational purposes, such as kayaking, a component of Scott River is located directly adjacent to the southern extent of the Proposal site.

Augusta town centre

Located in an elevated position above Hardy Inlet Augusta town centre, including large swaths of the residential areas, are positions to take advantage of the step valley that affords views across the riparian vegetation towards Hardy Inlet.

4.3 Community and stakeholder engagement

SynergyRED has engaged the community and stakeholders using best practice methods aligned with IAP2 (International Association of Public Participation) and Clean Energy Council Community Engagement Guideline. The objectives included outlining the proposed wind farm scope and sharing initial findings from the feasibility assessment allowing SynergyRED to gather feedback to inform the remainder of the assessment. This provides SynergyRED with the opportunity to gain feedback from the community and stakeholders to inform the remainder of the feasibility assessment.

The team held four community consultation sessions in Augusta, Scott River, East Augusta, and Margaret River between March 11 and 13, 2024, with 72 community members attending. Feedback was mostly positive or neutral, with some opposition. Some community members were awaiting the feasibility study results before forming an opinion. Prior to these sessions, SynergyRED engaged directly with landowners near the proposed wind farm boundary and continued consultations with community members, groups, and key stakeholders throughout the feasibility phase. An interactive website allows local stakeholders to register their interest and ask questions as the project progresses.

Five additional community consultation sessions were held between December 7 and 12 to share initial findings from the feasibility assessment, including 14 photomontages from the report. These sessions were attended by 152 community members. Feedback was mixed, with visual impact being a significant concern, especially for those living closer to the proposed wind farm and those owning or managing holiday homes.

Engagement with the community continues, including meetings with various community groups and conducting a social impact values assessment. The remaining feasibility assessment outcomes, including visual impact, will be shared with the community and other key stakeholders once finalised.

5. Landscape and visual management objectives

Landscape and visual management objectives have been defined to manage the character of the landscape and visual amenity within the Study Area. The legislation and planning review and context analysis have formed the development of appropriate management objectives. The developed landscape and visual management objectives are generally categorised as follows:

– Best practice siting and design
– Protection and maintenance of landscape character
– Engagement

5.1 Best practice siting and design

– To protect the existing landscape character, the proposed infrastructure should be sited within the natural topographic context of the landscape.
– Vegetation clearance should be kept to a minimum and turbines and associated infrastructure should be carefully sited to minimise impact to areas of remnant native vegetation.
– The design of built form, including finishes and materials selection should respond to the surrounding landscape setting and minimise the facility's visual prominence.
– The layout (e.g. grid pattern or clustered) of the wind farm should consider the existing landscape character (vegetation, waterform, landform and land use) and any variation in the topography of the site.
– Siting should also consider Aboriginal cultural heritage sensitivities that exist within the Proposal site and surrounding landscape.

5.2 Protection and maintenance of landscape character

The valued elements that define the existing landscape character are recommended to be protected. This includes Leeuwin Naturaliste Ridge, wind pruned coastal heath, extensive areas of distinct Jarrah, Marri and Karri forest, agricultural lands, wetland corridors, V shaped river valleys, the coastal landscape of Leeuwin Naturaliste Coast (adjacent to the Indian Ocean), Scott Coastal Plain (adjacent to the Southern Ocean) and the rural amenity of Brockman Highway travel route corridor.

5.3 Engagement

– The significance of the landscape within the Study Area specifically the Blackwood River (Goorbilyup Buerle) and Margaret River (Wooditjup Bilya) and their tributaries to the Wardandi and Bibulmun/Piblemen people should be considered in the design of the Proposal. Where possible engagement with Traditional Custodians to discuss the visual elements of the design should be considered.
– Engagement with the community and stakeholders throughout the design process provides beneficial project outcomes and can improve the perception of additional infrastructure within views and the wider landscape.

Landscape and visual impact assessment

6. Landscape impact assessment

6.1 Landscape character units

Based on the review of the existing landscape context, the site visit and the Department of Conservation and Land Management (1994) *Landscape Character Types of Western Australia*, the LCU's were defined for the Study Area (see Figure 12 below). The locations of the LCUs can be found in Figure 13.

6.2 Landscape impact assessment

The following section includes a description of each LCU and an assessment of impacts to the landscape character within each LCU.

6.2.1 LCU1 Leeuwin Naturaliste Coast

Distinguishing features

– Topography consists of a central ridgeline, uneven beaches, towering sea cliffs and valleys and beyond the ridge an almost flat to gently undulating plain.

– Much of LCU1 encompasses Leeuwin Naturalise National Park and state forest. Vegetation includes wind pruned coastal heathland, stunted Jarrah Marri forest and the towering Karri (*E. divericolor*).

– Set out in a typical grid pattern Augusta town centre lies adjacent to Hardy Inlet and is orientated to take advantage of the views across the inlet from the typical building type of one or two storey commercial and residential properties.

– The local community has strong links to the marine and inlet environment, which are important natural assets that support the local fishing and tourism sectors.

Photo 7 *Enclosed bay at Flinders Bay with historical jetty sloping rocky shore and distinctive pine trees.*

6.2.1.1 Key characteristics

The key characteristics of LCU1 are listed in Table 8.

Table 8 *Key characteristics of LCU1*

Criteria	Description
Landform	The topography of LCU1 consists of conical dunes, rocky shorelines, towering sea cliffs, rounded undulating hillslopes punctuated by a discontinuous limestone ridge, known as Leeuwin Naturaliste Ridge. The eastern margin of the Leeuwin Naturaliste Coast, beyond the ridge, is characterised by an almost flat to gently undulating plain, with occasional granitic outcropping and slight gravelly rises or knolls (CALM 1994).
Vegetation	The western slopes of Leeuwin Naturaliste Coast consist of wind pruned coastal heathland vegetation the height and density of which is determined by the prevailing winds and salt spray (CALM 1994). The central ridge includes a stunted Jarrah Marri forest, which grows to its typical size to the east with more sheltered zones consisting of a variety of forests (CALM 1994). Rough barked Banksia and weeping peppermint dominate a range of structural remnant vegetation types, including low forest, woodlands, and open forest (CALM 1994). The vegetation pattern on the gentler eastern slopes is largely dictated by land use where largescale clearing for agriculture and timber has occurred. This, in some areas, has resulted in a colourful pattern of exotic crops, grasses and regrowth forest (CALM 1994). A key landscape feature of the Leeuwin Naturaliste Ridge is the towering Karri (*E. divericolor*), found within the protected depressions and gullies of the southwest proportion of this LCU (CALM 1994).
Waterways / reserves	LCU1 includes Leeuwin Naturaliste National Park, State Forest 45 and Cliff Spackman Nature Reserve. The main drainage feature of the Leeuwin Naturaliste Coast is the Margaret River (Wooditjup Bilya) located in the northern extent of LCU1. Wooditjup Bilya is approximately 60 km in length and comprises a 190 km network of tributaries (Shire of Augusta Margaret River, 2024). The ridge is also cut by a series of westerly flowing brooks with freshwater available on the coast at springs such as Contos and Cape Leeuwin where early settlers integrated the use of a waterwheel. Seasonal swamps and soaks scattered throughout the eastern portion are also evident (CALM 1994).
Land use	Land use within this area includes the expansive coastal landscape located within Leeuwin Naturalise National Park, state forest, agricultural lands (including grazing and vineyards), timber production, residential, town centre and transportation.
Infrastructure	Existing infrastructure within this LCU includes the dominant transport links of Caves Road and Bussell Highway, Augusta Boat Harbour, Cape Leeuwin Lighthouse, Augusta Airport and Augusta townsite.
Cultural and characteristics	LCU1 is located within the land of the Wardandi people. The Wardandi name for the Augusta area is Taalinup. Evidence of human occupation within this area extends beyond 9000 years before the present. Taalinup contains important cultural ecological values that form part of the heritage and identity of Wardandi custodians (Applied Archaeology International in Shire of Augusta Margaret River, 2022). Europeans first explored this area in 1801 and a settlement was set up in Augusta in 1830. European heritage places within LCU1 include Hamelin Bay jetty (DLPH, 2019).

Criteria	Description
	A dominant feature of this landscape is Cape Leeuwin Lighthouse. Cape Leeuwin Lighthouse is the tallest lighthouse on mainland Australia located at the most south-westerly point of Australia at the meeting point of the Southern and Indian Oceans (Margaret River Busselton Tourism Association, 2024). Constructed in 1895 the lighthouse receives approximately 120 thousand visitors annually. The most well-known and high use trail within LCU1 is the Cape to Cape Track. This trail extends 123 km from the Lighthouse at Cape Naturaliste to the Lighthouse at Cape Leeuwin providing a user experience of coastal and forest scenery (Trails WA, 2024). The marine environment of the Leeuwin Naturaliste Coast is a significant natural asset which the local fishing industries and tourism are dependent, and the local communities strongly connected to (DLPH, 2019). This includes Flinders Bay, a very popular swimming beach for community members as well as tourists.
Spatial qualities	The spatial qualities of the Leeuwin Naturaliste Coast include a central ridgeline with varying slopes, uneven beaches, towering sea cliffs and valleys, offshore reefs and wave-cut platforms, narrow sandbars, and U-shaped valleys (CALM, 1994).

6.2.1.2 Landscape impact assessment

Refer to Table 9 for assessment.

Table 9 LCU1 Leeuwin Naturaliste Coast landscape impact assessment

Criteria	Assessment
Anticipated change to landscape character	The Proposal will occur outside of LCU1. The Proposal will be visible from LCU1 and will therefore have the capacity to impact the setting of LCU1. The anticipated change would include views of: – Up to 20 wind turbines with a maximum tip height of 250 m – Two meteorological masts with a maximum height of 164 m
Landscape value	LCU1 has a landscape value of **high**. Values associated with LCU1 include the designated areas within Leeuwin Naturaliste National Park. As recognised in state planning policy 6.1 Leeuwin Naturaliste Ridge is recognised as one of the key landscape features of this area. In addition, LCU1 includes cultural heritage and Aboriginal heritage areas of recognised community value and amenity.
Susceptibility to change	Susceptibility to accommodate the proposed change is **high** as the landscape is of high quality with consistent, intact, well-defined attributes. The proposed development would be incompatible with the existing characteristics of the area and mitigation measures are unlikely to reduce the impacts of the change.
Sensitivity to change	The sensitivity to change is **high** as the susceptibility to accommodate the proposed change is considered high and the landscape value is high.
Magnitude of change	Magnitude of change is **moderate** as the Proposal will result is discernible changes in the landscape character due to partial loss of, or change to elements, features or characteristics of the landscape. The change would appear to have an adverse effect on the landscape character since it would be out of scale with the local pattern and the landforms.
Duration of impact	Permanent
Significance of impact	**High-moderate**

6.2.2 LCU2 Scott Coastal Plains

Distinguishing features

– The topography of LCU2 consists of the Southern Ocean coastline. This includes vertical cliffs, horizontal sandy plains and gently curving beaches. This secluded coastal dune system fronts a low-lying wetland corridor and low rounded hills.

– The wetland corridor includes seasonal swamps, wetlands and the Scott River (a tributary of the Blackwood River) in addition to Swan Lakes and Lake Gingilup.

– LCU2 includes the residential settlement of East Augusta. A small settlement of one to two storey dwellings. The Hardy Inlet has numerous jetties housing small boats used by residents to access Augusta town centre.

– Flora, fauna and landscape conservation is a significant land use of LCU2 as encompasses in Scott National Park and Gingilup Swamps Nature Reserve with privately owned land primarily cleared for farming.

Photo 8 ***Open sandy plain featuring low stunted heath***

Photo 9 ***Limestone rural road through flat plain lined by expanse of uniform vegetation cover.***

Photo 10 ***Intermittent remnant vegetation abutting and within cleared agricultural land.***

Photo 11 ***Cleared flat pastoral land with remnant vegetation.***

Photo 12 ***Lower area of the plain features a flat topography with wild heath and sedge including the bright red swamp bottlebrush.***

Photo 13 ***Sheltered expanse of uniform vegetation cover with variation in colour, texture, and pattern.***

6.2.2.1 Key characteristics

The key characteristics of LCU2 are listed in Table 10.

Table 10 Key characteristics of LCU2

Criteria	Description
Landform	LCU2 lies between the hills delineating the southern extent of the Darling Plateau and the ocean and to the west the Hardy Inlet. Landform characteristics associated with LCU2 include windswept dunes, sandy shoreline deposits fronting a low-lying wetland corridor with low rounded hills and scattered ridges to the north that gradually slope towards the sandy plains below (CALM, 1994).
Vegetation	Vegetation within LCU2 is diverse in structure and composition ranging from sedges to low heath, woodlands, and forests. The taller forest includes Jarrah (*Eucalyptus marginata*), Marri (*E. calophylla*) and Karri (*E. diversicolor*) with the Karri occurring in varies areas of the landscape such as shallow gullies, hill slopes and low plains. The understorey includes a variety of Wattles, Hazels (*Chorilaena spp*.), Water Bush (*Bossiaea aquifolia),* Bull Banksia (*B. grandis*), Snottygobble (*Persoonia longifolia*) and Peppermints (*Agonis flexuosa.)* with the lower areas of the plain influenced by the variability of the water table which effects the vegetation cover surrounding the swamps and lakes. Vegetation in these areas is often heath and sedge (CALM, 1994).
Waterways / reserves	LCU2 includes Scott National Park and Gingilup Swamps Nature Reserve. Terminating at Hardy Inlet the key water feature is Scott River (a tributary of the Blackwood River), with additional rivers, streams and springs also occurring, including Swan Lakes and Lake Gingilup (CALM, 1994).
Land use	Land use within LCU2 is primarily farmland. The remaining areas consist of reserves, national park, and unallocated crown land (Shire of Augusta Margaret River, 2022).
Infrastructure	Infrastructure includes the settlement of East Augusta, East Augusta Jetty, local unsealed roads and 4WD tracks.
Cultural and characteristics	An area of significant environmental and biodiversity value this LCU, incorporating Scott National Park and Gingilup Swamps Nature Reserve, includes highly diverse flora and fauna species. The environmental values are an essential component of both the heritage and wilderness value of this area with previous community engagement outcomes indicating a strong desire to protect the integrity of the environment (WAPC, 2009). Recreational pursuits at Swan Lakes, including fishing and boating and East Augusta residents daily transport needs met by boat are unique to LCU2 (Margaret River Busselton Tourism Association, 2024).
Spatial qualities	The scale of this LCU2, as defined by CALM (1994) includes vertical cliffs, horizontal sandy plains, shoreline, parallel series of dune ridges, horizontal reefs and wave cut platforms, gently curving beaches, swampy corridors and U-shaped valleys and a wetland corridor. Extensive views are provided from high points with long ranging views over the landscape offered by the swampy low-lying plain. Views to the foreground and midground restricted by the coastal dune system (CALM, 1994).

6.2.2.2 Landscape impact assessment

Refer to Table 11 for assessment.

Table 11 LCU2 Scott Coastal Plains landscape impact assessment

Criteria	Assessment
Anticipated change to landscape character	The Proposal will occur outside of LCU2. The Proposal will be visible from LCU2 and will therefore have the capacity to impact the setting of LCU2. The anticipated change would include views of: – Up to 20 wind turbines with a maximum tip height of 250 m – Two meteorological masts with a maximum height of 164 m
Landscape value	LCU2 is an area of significant environmental and biodiversity value with a landscape value of **high**. Scenic qualities include long stretches of coastline free of disturbance and designated areas incorporating Scott National Park and Gingilup Swamps Nature Reserve which includes highly diverse flora and fauna species. These values are recognised in the Augusta Margaret River LPS1.

Criteria	Assessment
Susceptibility to change	Susceptibility to accommodate the proposed change is **high** as the landscape is of high quality with consistent, intact, well-defined attributes. The proposed development would be incompatible with some of the existing characteristics of the area and mitigation measures are unlikely to reduce the impacts of the change.
Sensitivity to change	The sensitivity to change is **high** as the susceptibility to accommodate the proposed change is considered high and the landscape value is high.
Magnitude of change	Magnitude of change is **moderate** as the Proposal will result in discernible changes in the landscape character due to partial loss of, or change to elements, features, or characteristics of the landscape. The change would appear to have an adverse effect on the landscape character since it would be out of scale with the local pattern and the landforms.
Duration of impact	Permanent
Significance of impact	**High-moderate**

6.2.3 LCU3 – Darling Uplands

Distinguishing features

– A deeply dissected landscape featuring rolling hills, V shaped river valleys and extensive areas of Jarrah, Marri and Karri forest.

– LCU3 consists of the Margaret River (Wooditjup Bilya) and tributaries of the Blackwood River (Goorbilyup Buerle). The Margare River (Wooditjup Bilya) and tributaries of the Blackwood River, (Goorbilyup Buerle) and their foreshores are registered Aboriginal heritage sites.

– Farming and agriculture (including viticulture) and the timber industry are prevalent throughout LCU3 with family farms being quintessential to the way of life within LCU3.

Photo 14 *Gently rolling hills with uniform rows of grape vines backed by undisturbed forest.*

Photo 15 *Remnant vegetation alongside a semi-enclosed canopied rural road.*

Photo 16 *Cleared pasture land across gently rolling hills with ageing farm buildings, isolated trees backed by undisturbed forest.*

Photo 17 *Flat agricultural land with uniform windbreak planting and stand of remnant vegetation.*

Photo 18 Fenced Group Settlement farm residence

Photo 19 Karridale newly developed residential area

6.2.3.1 Key characteristics

The key characteristics of LCU3 are listed in Table 12.

Table 12 Key characteristics of LCU3

Criteria	Description
Landform	Located within the Darling Uplands this LCU includes rolling low hills, areas of granite outcrops and boulders and deep sided valleys influenced by the tributaries of the Blackwood River (Goorbilyup Buerle) and other watercourses.
Vegetation	Native vegetation includes dense areas of Jarrah forest (*Eucalyptus margrinata)* with an understorey including Sheok (*Allocasuarina fraseriana),* Bull Banksia (*B. grandis),* Snottygobble (Persoonia longifolia) and Woody Pear (*Xylomelum occidentale).* Other plant species include Grass Tree (*Xathorroea preissii*), Zamia Palm (*Macrozamia reidlii*), Prickly Bitter-Pea (*Daviesia decurrens*), Parrot Bush (*Dryandra sessilis*), Couch Honeypot (*D.nivea*), Snail Hakea (*H. cristata*) and the Two-leaf Hakea (*H. trifurcata*). This vegetation is interspersed with areas of cleared pastoral and farming lands, including areas of tree plantation.
Waterways/reserves	Reserves within LCU3 are plentiful and include, in no particular order, Milyeannup State Forest, Milyeannup National Park, Barlee Brook State Forest, Blackwood State Forest, Blackwood River National Park, South Blackwood State Forest, Hilliger National Park, Forest Grove National Park, Pagett Nature Reserve, Chester Nature Reserve and Wiltshire Butler National Park. Prominent drainage features of LCU 3 include the Margaret River (Wooditjup Bilya) located in the northern extent of LCU3 and the tributaries of the Blackwood River (Goorbilyup Buerle). Both the Margaret River (Wooditjup Bilya) and tributaries of the Blackwood River (Goorbilyup Buerle) are registered Aboriginal heritage sites.
Land use	Land use within LCU3 primarily includes farming / agriculture and state forest / national parks and nature reserves. Within this LCU also sits residential areas of Augusta, Kudardup, Karridale, Witchcliffe, and south-east Margaret River in addition to rural residential areas.
Infrastructure	LCU3 is bordered by Bussell Highway (the main arterial road north to south) and Brockman Highway (the main arterial road east to west). Infrastructure associated with rural localities and residential areas is also included in LCU3 as is Alexandra Bridge.
Cultural and characteristics	LCU3 includes the rural localities of Karridale, Kudardup, Alexandra Bridge and Witchcliffe. Farming and agriculture (including viticulture) and the timber industry are prevalent throughout LCU3 with family farms being quintessential to the way of life within LCU3.
Spatial qualities	Subdued topography with a gently undulating plateau featuring rolling hills and V shaped river valleys, tall forests and cleared agricultural land.

6.2.3.2 Landscape impact assessment

Refer to Table 13 for assessment.

Table 13 LCU3 Darling Uplands landscape impact assessment

Criteria	Assessment
Anticipated change to landscape character	The Proposal will occur within LCU2. The anticipated change may include: – Up to 20 wind turbines with a maximum tip height of 250m – Two meteorological masts with a maximum height of 164 m – Transmission poles – Access tracks – Substation – Operation and maintenance facility – Temporary batching plant – Temporary construction and laydown area
Landscape value	LCU3 has a landscape value of **high**. The two main drainage features within LCU3 are registered Aboriginal heritage sites. LCU3 also includes a number of designated national parks, including but not limited to Blackwood River National Park and Milyeannup National Park in addition to residential areas such as new subdivisions located east of Bussell Highway in Karridale and Witchcliffe.
Susceptibility to change	Susceptibility to accommodate the proposed change is **moderate** as LCU3 is a dissected landscape consisting of native vegetation interspersed with areas of cleared pastoral and farming lands, as such classified as being of moderate quality and condition. In addition, changes caused by the Proposal would be unlikely to have a significant adverse effect on the landscape character, as a whole, that cannot be effectively mitigated.
Sensitivity to change	The sensitivity to change is **high** as the landscape value is high and the susceptibility to accommodate the proposed change is considered moderate.
Magnitude of change	The magnitude of change is **moderate** as the Proposal will likely result in discernible changes to the landscape character due to partial loss of, or change to, elements, features or characteristics of the landscape that would be out of scale with the local pattern and landforms.
Duration of impact	Permanent
Significance of impact	**High-moderate**

6.2.4 LCU4 – Blackwood River and Hardy Inlet Riparian Corridor

Distinguishing features

– LCU4 consists of the Blackwood River and Hardy Inlet (Goorbilyup Buerle). Hardy Inlet and the Blackwood River, (Goorbilyup Buerle) and their foreshores are registered Aboriginal heritage sites.

– Hardy Inlet is open to the Southern Ocean, via Flinders Bay. The Blackwood River (Goorbilyup Buerle) discharges into the north eastern end of the inlet.

– 70% of lower Blackwood land use consists of State Forest or conservation estate.

– Fringing vegetation is largely in excellent condition.

– Recreational pursuits such as kayaking, boating, and camping alongside the Blackwood River (Goorbilyup Buerle) are popular pastimes for local residents, tourists, and visitors.

– Ellis Street Jetty primarily serves as the boat access from East Augusta (a regular form of transport)

Photo 20 *Open basin of Hardy Inlet*

Photo 21 *A unique gated private jetty at East Augusta*

Photo 22 *An enclosed view of the dark waters of the river fringed by riparian vegetation*

Photo 23 *Gently rippling water fringed by riparian vegetation gives a sense of enclosure*

Photo 24 *A framed view of the river at Alexandra Bridge*

Photo 25 *Reflected undisturbed natural vegetation on the banks of the river*

6.2.4.1 Key characteristics

The key characteristics of LCU4 are listed in Table 14.

Table 14 Key characteristics of LCU4

Criteria	Description
Waterform	Edged by irregular slopes, LCU4 consists of Hardy Inlet and the lower / coastal catchment of the Blackwood River (Goorbilyup Buerle). The river mouth is at its narrowest at the entrance channel, which expands out at Senge Bay and further still just north of East Augusta settlement before opening out into the Hardy Inlet basin that has an area of 9 km. Molloy Island is located within the northeast component of the inlet with Blackwood River (Goorbilyup Buerle) to the northwest of the Island. The long sinuous lower Blackwood gently ripples and snakes through the landscape in an irregular pattern, becoming wider or narrower throughout the extent of the catchment. The depth of the inlet and river vary from shallow areas with sandy beaches and sand bars closer to the entrance channel and deeper water towards the centre. The depth variances are reflected in surface colour from light blue – deep dark brown and blue.
Vegetation	Fringing vegetation throughout the extent of LCU4 is largely intact and in excellent condition. There are various zones of riparian with rushes present towards the coast giving way to salt and then freshwater melaleucas with medium height jarrah-marri forest. A small area of medium height woodland comprising flooded gum ((*Eucalyptus rudis*) and blackbutt with some bullich, jarrah and marri fringes the river whilst another small area is covered by low paperbark woodlands (*Melaleuca sp*.) (Department of Water, 2015).
Reserves	National parks adjacent to LCU4 include Scott National Park and Blackwood River National Park. There are also numerous unnamed reserves located alongside the river banks.
Land use	Land use within LCU4 mostly consists of vegetation and conservation estates with almost 70% of the lower catchment being State Forest or conservation estate with other land use consisting of timber milling, intensive horticulture, viticulture, dairy and beef farming (DWER, 2024).
Infrastructure	Infrastructure within LCU4 includes boat ramps, jetties of various size, styles and types, Molloy Island vehicle and pedestrian chain ferry and two vehicle bridges being Warner Glen and Alexandra Bridge.
Cultural and characteristics	Blackwood River (Goorbilyup Buerle) is a registered Aboriginal heritage site. It is believed that the Blackwood River (Goorbilyup Buerle) was created by and is home to the Waugal, rendering the entire river and its tributaries as a sacred site. It is also important to Aboriginal people as it forms the cultural boundary between the Bibulmun/Piblemen and Wardandi language groups (Brad Goode & Associates, 2018). Kayaking, boating, fishing, camping, and bushwalking alongside the Blackwood River (Goorbilyup Buerle) are popular recreational pursuits.
Spatial qualities	A narrow entrance channel at the river mouth that opening out into a wide basin at Hardy Inlet that transitions into a narrower winding river, edged by irregular slopes framed by varying zones of riparian vegetation.

6.2.4.2 Landscape impact assessment

Refer to Table 15 for assessment.

Table 15 LCU4 Blackwood River and Hardy Inlet Riparian Corridor landscape impact assessment

Criteria	Assessment
Anticipated change to landscape character	The Proposal will occur outside of LCU4. Elements of the Proposal will be visible from LCU4 and will therefore have the capacity to impact the setting of LCU4. The anticipated change may include views of: – Up to 20 wind turbines with a maximum tip height of 250 m.
Landscape value	Landscape values associated with LCU4 include designated landscapes such as Scott National Park and Blackwood River National Park and the nationally important features of the river corridor in addition to Aboriginal Cultural Heritage sensitivities. LCU4 therefore has a **high** landscape value.

Criteria	Assessment
Susceptibility to change	The landscape susceptibility to change is **moderate** as any change caused by the Proposal would be unlikely to have a significant adverse effect on the landscape character, condition or value that could not be mitigated.
Sensitivity to change	Sensitivity to change is **high** as the community place high value upon the landscape of LCU4 and enjoyment of views of their setting.
Magnitude of change	The magnitude of change is **low**, as the proposal will alter one or more key view elements, features, or characteristics by introducing components likely to be visible from specific confined locations within LCU4. Although limited, the change would appear to have an adverse effect on the view at these specific locations, as it would be out of scale with the existing view.
Duration of impact	Permanent
Significance of impact	**Moderate**

6.3 Summary of landscape character impacts

Landscape character units within the Study Area include LCU1 – Leeuwin Naturaliste Coast, LCU2 Scott Coastal Plains, LCU3 Darling Uplands and LCU 4 Blackwood River and Hardy Inlet Riparian Corridor. The detailed review undertaken provided a thorough understanding of the key characteristics of each LCU which, in turn, provided the baseline data required to carry out the landscape impact assessment (Table 16).

The landscape impact assessment found that LCU 1 – Leeuwin Naturaliste Coast, LCU2 – Scott Coastal Plain and LCU3 - Darling Uplands would be most significantly impacted by the Proposal, with a rating of high-moderate, for the following reasons:

– LCU1 Leeuwin Naturaliste Ridge has a high sensitivity relating to Leeuwin Naturaliste Ridge, a landscape of high quality and a magnitude of change of moderate as the Proposal will result in discernible changes in the landscape.
– LCU2 Scott Coastal Plain has a high sensitivity relating to the Southern Ocean coastline, an area of high scenic values, and numerous designated areas which include highly diverse flora and fauna species. The magnitude of change is moderate as the Proposal will result in discernible changes in the landscape that would be out of scale with the landscape character and at odds with the local pattern of the landform.
– LCU3 Darling Uplands received a high-moderate significance of impact rating due to the importance of the drainage features and inclusion of designated areas within a dissected landscape whereby the Proposal would result in discernible changes to the landscape that would leave an adverse impact on the landscape character.
– LCU4 Blackwood River and Hardy Inlet Riparian Corridor received a significance of impact rating of moderate as it likely that this LCU will experience landscape character impacts confined to specific locations.

Table 16 Summary of landscape character impacts

LCU	Name	Sensitivity to change	Magnitude of change	Significance of impact
LCU1	Leeuwin Naturaliste Coast	High	Moderate	High-moderate
LCU2	Scott Coastal Plains	High	Moderate	High-moderate
LCU3	Darling Uplands	High	Moderate	High-moderate
LCU4	Blackwood River and Hardy Inlet Riparian Corridor	High	Low	Moderate

7. Visual impact assessment

7.1 Zone of theoretical visibility analysis

A ZTV analyses were undertaken for the Proposal, focusing on the theoretical visibility of the Proposal. Refer to Section 3.1 for the methodology and heights used and below for an analysis of the ZTV.

Figure 14 and Figure 15 show the Proposal ZTV. The areas showing colour gradient from purple to white indicate land where the Proposal is theoretically visible.

7.2 Site inspection and sensitive visual receptors

The ZTVs show that the siting of the Proposal has resulted in a high visibility of the Proposal throughout the Study Area. During the site inspection the existing Telstra radio tower was used as a reference guide to locate the Proposal site. It was observed that some areas shown as being theoretically visible on the ZTV mapping did not have views of the Proposal site due to intervening vegetation and / or distance. As a result, potential sensitive visual receptors were ruled out of the assessment including:

– East Augusta residential area
– Nillup General Store
– Cape Leeuwin lighthouse complex

The ZTVs showed that the wind turbines would be theoretically visible from Southern Ocean sensitive visual receptors (such as cruise passengers, commercial and recreational fisherpersons) to the south of the Proposal site. However, these areas were discounted from the assessment due to inaccessibility and limited public use.

Remaining sensitive visual receptor locations were chosen for viewpoint assessment in Section 7.3.

7.3 Viewpoint locations

Based on the visual analysis and understanding of the Proposal, viewpoint locations were selected for assessment of sensitive visual receptors. Refer to Table 17 and Figure 16 for viewpoint locations. For each viewpoint, a panorama of the existing view is provided, together with a description of the existing view, anticipated changes, and impact assessment rating.

Table 17 Viewpoint locations

VP	Title	Location

7.4 Assessment of visual impacts

7.4.1 Viewpoint 1 Augusta Hotel

Viewpoint 1 Augusta Hotel is located on Blackwood Avenue, Augusta facing north-east, as shown in Photo 26. Refer to Table 18 for assessment. Refer to Appendix A for photomontages of this viewpoint.

Photo 26 ***Existing view from VP01 Augusta Hotel - Blackwood Avenue, Augusta***

Photo 27 ***Photomontage from VP01 Augusta Hotel - Blackwood Avenue, Augusta***

Photo 28 ***Proposed design rotated 90 degrees with rotated blades from VP01 Augusta Hotel - Blackwood Avenue, Augusta***

Table 18 VP01 assessment

Criteria	Comments
Location	50 34°19.19" S 115° 9' 38" E Elevation: 45.4 m VP01 is situated approximately 12 km south-west of the Proposal and is facing in a north-east direction. This viewpoint is representative of views experienced by Augusta residents and Augusta town centre visitors including patrons of Augusta Hotel. VP01 provides expansive views across Hardy Inlet and East Augusta.
Description of existing view	The foreground includes the grassed slope of the hotel alfresco area with frosted sphere lighting and a variety of fencing types including colorbond compound, rendered brick, hit and miss timber panel and post and rail fencing all of cream tones. A series of cream fibre cement buildings with forest green trim and red corrugated iron roofs are also located within the left to right of centre of the foreground view. The midground includes a proportion of the grassed embankment and the sweeping form of Hardy Inlet. The densely vegetated area of East Augusta is visible across the extent of the background view with a glimpse of the Southern Ocean to the far right of the view.
Anticipated change to view	**Construction** During the construction phase potential short term visual impacts associated with assembly of the wind turbines (including use of cranes) may be achieved in the background view. Views may be partially screened by intervening vegetation. **Operation** During operation, a proportion of the wind turbines (hub tip and blades) are highly likely to be visible in the centre of the background. This will be a permanent change in the view that will not be screened.
Sensitivity to change	The sensitivity of change is **high** as residents and visitors to Augusta town centre place value on the scenic, elevated long and wide views across Hardy Inlet and East Augusta from VP01 located on Blackwood Avenue, the main street of Augusta.
Magnitude of change	The magnitude of change is **high** as the top of the towers and blades of the Proposal will be visible above the vegetation cover resulting in a substantial and obvious change to the existing view, which permanently alters the characteristics and diminishes the perceived quality of the view.
Significance of impact	The significance of impact is **high**, as the sensitivity to change is **high** and the magnitude of change is high.

7.4.2 Viewpoint 2 Augusta Residential

Viewpoint 2 Augusta Residential is located on Hurford Place, Augusta facing north-east, as shown in Photo 29. Refer to Table 19 for assessment.

Photo 29 Existing view from VP02 Augusta Residential - Hurford Place, Augusta

Photo 30 *Photomontage from VP02 Augusta Residential - Hurford Place, Augusta*

Photo 31 *Red overlay showing maximum blade tip height from VP02 Augusta Residential - Hurford Place, Augusta*

Table 19 *VP02 assessment*

Criteria	Comments
Location	50 34°18'10"S 115°9'35"E Elevation: 19.4m VP02 is situated approximately 12 km south-west of the Proposal and is facing in a north-east direction. This viewpoint is representative of views experienced by Augusta residents. VP02 provides expansive views across Hardy Inlet and East Augusta.
Description of existing view	The foreground highlights landscaping, red asphalt driveways and cul-de-sac typical of the hillside residential areas of Augusta. Within the midground elevated two storey dwellings, orientated to capture the view of Hardy Inlet across to East Augusta, step down the hillside with street trees consisting of the weeping Peppermint tree (*Agonis flexuosa*). The calm waters of Hardy Inlet and undisturbed natural vegetation of East Augusta are visible in the background.
Anticipated change to view	**Construction** During the construction phase potential short term visual impacts associated with assembly of the wind turbines (including use of cranes) may be achieved in the background view. Views may be partially screened by intervening vegetation. **Operation** During operation, a proportion of the wind turbines (hub tip and blades) are highly likely to be visible in the centre - right of the background. This will be a permanent change in the view that will not be screened.
Sensitivity to change	Sensitivity to change is **high** as the community of Augusta, as a whole, place value on the scenic, elevated, and wide views that include the water body of Hardy Inlet with occupiers of residential properties such as those included in VP02 placing their living and outdoors areas on the second floor to take advantage of these views.

Criteria	Comments
Magnitude of change	The magnitude of change is **moderate** as the top of the towers and blades of the Proposal above the vegetation cover is a discernible change to the characteristics of the central - right view. The change would appear to have an adverse effect on the view since it would be out of scale with the existing view.
Significance of impact	The significance of impact is **high-moderate**, as the sensitivity to change is high and the magnitude of change is moderate.

7.4.3 Viewpoint 3 Hillview Road Lookout

Viewpoint 3 Hillview Road Lookout is located just off Lawrence Road, Augusta facing north-east, as shown in Photo 32. Refer to Table 20 for assessment.

Photo 32 ***Existing view from VP03 Hillview Road Lookout, Lawrence Road, Augusta***

Photo 33 ***Photomontage from VP03 Hillview Road Lookout, Lawrence Road, Augusta***

Photo 34 ***Red overlay showing maximum blade tip height from VP02 Hillview Road Lookout, Lawrence Road, Augusta***

Table 20 VP03 assessment

Criteria	Comments
Location	50 34°17'39"S 115°6'13"E Elevation: 196 m VP03 is situated approximately 17 km south-west of the Proposal and is facing in a north-east direction. This viewpoint is representative of views experienced by visitors to Hillview Road Lookout and Augusta Golf Club members as Augusta Golf Club is of a similar vantage point, located adjacent to Hillview Road Lookout. VP02 provides expansive views from Leeuwin-Naturaliste Ridge across the flat to undulating plain of Leeuwin Naturaliste Coast and the Darling Uplands towards Hardy Inlet, East Augusta and the Southern Ocean.
Description of existing view	Situated within the Leeuwin-Naturaliste Ridge the foreground indicates wind pruned heath and stunted low forest located on top of a rounded undulating hillside. The midground view includes cleared agricultural lands with remnant vegetation and forested areas with the winding form of Hardy Inlet and the relatively undisturbed landscape surrounding East Augusta and a glimpse of the Southern Ocean in the background.
Anticipated change to view	**Construction** During the construction phase potential short term visual impacts associated with assembly of the wind turbines (including use of cranes) may be achieved in the background view. Views may be partially screened by intervening vegetation. **Operation** During operation, a proportion of the wind turbines (hub tip and blades) may be visible in the background but the prominence if this will be diminished due to the distance of VP03 from the Proposal.
Sensitivity to change	VP03 is situated with LCU1 Leeuwin-Naturaliste Coast which is protected by State Planning Policy 6.1. This policy nominates the Leeuwin-Naturaliste Ridge as an area of extraordinary landscape value and one of the key landscape features within this area. The sensitivity to change is **high** as VP03 is a designated lookout that provides long and wide-ranging, elevated views within a scenic landscape that includes the Hardy Inlet.
Magnitude of change	The view is approximately 17 km away from the Proposal, as a result, the wind turbines may be visible but would occupy a very small portion of a much wider view. Although the visual impacts would be permanent in nature the magnitude of change is considered **low** due to the introduction of components that may be new but may not be uncharacteristic within the existing landscape character.
Significance of impact	The significance of impact is **moderate**, as the sensitivity to change is high and the magnitude of change is low.

7.4.4 Viewpoint 4 Adjacent to Molloy Island

Viewpoint 4 Adjacent to Molloy Island is located just off Howe Road, Kudardup facing north-east, as shown in Photo 35. Refer to Table 21 for assessment.

Photo 35 Existing view from VP04 Adjacent to Molloy Island, Howe Road, Kudardup

Photo 36 *Photomontage from VP04 Adjacent to Molloy Island, Howe Road, Kudardup*

Photo 37 *Red overlay showing maximum blade tip height from VP04 Adjacent to Molloy Island, Howe Road, Kudardup*

Table 21 *VP04 assessment*

Criteria	Comments
Location	50 34°15'21"S 115°12'39"E Elevation: 8.7 m VP04 is situated approximately 6 km south-west of the Proposal and is facing in a north-east direction. This viewpoint is representative of views experienced by visitors of Molloy Hideaway Holiday Park, recreational river users and Molloy Island residents from the chain ferry vehicle barge. VP04 provides expansive views across Blackwood River, Molloy Island and Scott National Park.
Description of existing view	The varied and textured riparian vegetation of the Blackwood River (Goorbilyup Buerle) is indicated within the foreground of VP04. This provides a sense of intimacy and enclosure in juxtaposition to the large expanse of the Blackwood River (Goorbilyup Buerle), the rippled and calm nature of which dominated the midground. The muted dark green – charcoal tones of Molly Island and Scott River National Park in the background provide a high degree of tranquillity.
Anticipated change to view	As indicated in Photo 36 it is likely that a number of turbines will be visible from this public viewpoint, with intervening vegetation shielding the majority of the Proposal.
Sensitivity to change	Sensitivity to change is **high** as VP04 is a conservation and scenic area used for recreation with views that include bodies of water. In addition, occupiers of residential properties frequently engage with this view via use of the chain ferry vehicle barge.
Magnitude of change	The magnitude of change at VP04 is assessed as **moderate** as a proportion of the wind turbines would be visible in the left side of the view which causes discernible change to the characteristics of the view. The change would appear to have an adverse effect on the view since it would be out of scale with the existing view.
Significance of impact	The significance of impact is **high-moderate**, as the sensitivity to change is high and the magnitude of change is moderate.

Note: This VP was the nearest to Molloy Island and offers representational views from the island. According to the assessment of VP04 and considering the dense vegetation on Molloy Island and in Scott River National Park it is unlikely that the Proposal will be visible from most areas of Molloy Island.

7.4.5 Viewpoint 5 Scott River Road

Viewpoint 5 Scott River Road is located on the Scott River Road, Scott River facing north, as shown in Photo 38. Refer to Table 22 for assessment.

Photo 38 ***Existing view from VP05 Scott River Road, Scott River Road, Scott River***

Photo 39 ***Photomontage from VP05 Scott River Road, Scott River Road, Scott River***

Photo 40 ***Red overlay showing maximum blade tip height from VP05 Scott River Road, Scott River Road, Scott River***

Table 22 VP05 assessment

Criteria	Comments
Location	50 34°14'26"S 115°16'11"E Elevation: 40.4 m VP05 is situated directly adjacent to the Proposal site and is facing in an eastern direction. This viewpoint is representative of views experienced by residents and agricultural workers of East Augusta and Scott River. VP05 provides expansive views across the pastureland and remnant vegetation located within the Proposal site.
Description of existing view	The sandy flats of the foreground include an open area of homogenous browning grassland with the midground including clumps of trees and fence line to the left. The background exemplifies the gradual and naturally appearing transition between agricultural land and naturally vegetated areas.
Anticipated change to view	**Construction** During the construction phase, potential short term visual impacts may be associated with construction of gravel access tracks and associated earthworks and vegetation clearing (between turbines and existing public access roads and within the site), trenching, concrete batching plant (100 m x 100 m), construction and laydown area (100 m x 400 m), wind turbine, meteorological mast and transmission post and lattice tower transportation and construction in addition to additional construction activities such as increased vehicle movements. **Operation** Windfarm components visible from VP05 are subject to finalisation of detailed design. Components that may be present in the view include wind turbines and foundations in the midground and background. Access tracks, hard stand areas and the meteorological mast.
Sensitivity to change	Sensitivity to change is **high** as VP05 will be experienced by occupiers of residential properties going to and from work with long viewing periods within close proximity to the Proposal. Outside workers will also have prolonged views of the Proposal from this vantage point.
Magnitude of change	The magnitude of change is considered **high** as the Proposal will have a substantial and obvious change to the existing view due to a change of elements within the view which cause a view to be permanently changed and its perceived quality diminished.
Significance of impact	The significance of impact is **high**, as the sensitivity to change is high and the magnitude of change is high.

7.4.6 Viewpoint 6 Warner Glen Road

Viewpoint 6 Warner Glen Road is located on Warner Glen Road, Forest Grove facing south-east, as shown in Photo 41. Refer to Table 23 for assessment. Refer to Appendix A for photomontages of this viewpoint.

Photo 41 Existing view from VP06 Warner Glen Road, Warner Glen Road, Forest Grove

Photo 42 *Photomontage from VP06 Warner Glen Road, Warner Glen Road, Forest Grove*

Photo 43 *Red overlay showing maximum blade tip height from VP06 Warner Glen Road, Warner Glen Road, Forest Grove*

Table 23 *VP06 assessment*

Criteria	Comments
Location	50 34°4'25"S 115°9'48"E Elevation: 148.6 m VP06 is situated approximately 15 km north-west of the Proposal and is facing in a south-east direction. This viewpoint is representative of views experienced by occupiers of residences and farm workers within Warner Glen in addition to recreational users and tourists (accessing scenic locations such as Chapman Pool). VP06 provides elevated views across reticulated undulating pastureland towards forested areas.
Description of existing view	The foreground is characterised by the gently undulating irrigated pastureland featuring textured, bright green pasture. A cleared, sloping valley is in the centre of the midground. Components of the mid-ground view include isolated trees, tree clumps, farm related infrastructure (access tracks, fencing, power pole) with the farm dwelling visible in the righthand side. Further irrigated fields and a farm building can be seen in the background, along with the boundary of the surrounding forested area with the cleared agricultural landscape.
Anticipated change to view	**Construction** During the construction phase potential short term visual impacts associated with assembly of the wind turbines (including use of cranes) may be achieved in the background view. Views may be partially screened by intervening vegetation. **Operation** During operation, a proportion of the wind turbines (hub tip and blades) may be visible in the background but the prominence if this will be diminished due to the distance of VP06 from the Proposal.
Sensitivity to change	Sensitivity to change is **high** as Warner Glen Road is a scenic road that is utilised by local residents, recreational users, and tourists. It provides long and wide scenic views across the rural landscape from an elevated vantage point and occupiers of rural properties will experience prolonged views of the Proposal from VP06.

Criteria	Comments
Magnitude of change	Due to the distance from the Proposal the magnitude of change is **low** as the introduced wind turbines are not out of character with the existing view. The wind turbines are likely to be seen in the righthand side of the background view, just above the tree canopy. As the view already includes a range of industrial elements such as fencing, farm building and tracks, irrigated pastureland, the addition of the diminished turbines, located approximately 15 km away will be mostly consistent with the existing characteristics of the view.
Significance of impact	The significance of impact is **moderate**, as the sensitivity to change is high and the magnitude of change is low.

7.4.7 Viewpoint 7 Brockman Highway Residential

Viewpoint 7 Brockman Highway Residential is located on Brockman Highway, Schroeder facing south, as shown in Photo 44. Refer to Table 24 for assessment.

Photo 44 ***Existing view from VP07 Brockman Highway Residential, Brockman Road, Schroeder***

Photo 45 ***Photomontages from VP07 Brockman Highway Residential, Brockman Road, Schroeder***

Photo 46 ***Red overlay showing maximum blade tip height from VP07 Brockman Highway Residential, Brockman Road, Schroeder***

Table 24 VP07 assessment

Criteria	Comments
Location	50 34°9'32"S 115°17'37"E Elevation: 44.9 m VP07 is situated approximately 1.6 km north of the Proposal and is facing in a southern direction. This viewpoint is representative of views experienced by Brockman Highway road users. VP07 provides views across agricultural pastureland towards the Proposal site.
Description of existing view	The diagonal line of the access track spans the foreground, midground and background of VP07, the colour of which is quintessential of the rubbly pale orange lateritic soil and pea gravel of the Darling Uplands LCU. Shaded by remnant roadside vegetation (out of view) the foreground encompasses fenceposts and gates either side of the access track, with patches of low untended grass. To the left of the track stands a clump of trees. The midground includes a large flat expanse of dry uniform unirrigated pastureland with rolls of hay adjacent to the access track and a herd of cows grazing in the paddock. Large trees delineate the extent of the background view.
Anticipated change to view	**Construction** During the construction phase potential short term visual impacts associated with assembly of the wind turbines (including use of cranes) may be achieved in the background view. Views may be partially screened by intervening vegetation. **Operation** During operation, a proportion of wind turbines will likely be visible in the background. Depending on where it is situated a component of the meteorological mast may also be visible from VP07.
Sensitivity to change	Brockman Highway is an arterial road between Karridale in the west and Nannup in the east. As stated in AMR Shire LPS Brockman Highway has associated visual management controls whereby large visually obtrusive developments on sites that are prominently located along travel route corridors and contribute to the natural and rural landscape amenity of the shire are discouraged. Categories of road users include, but are not limited to, local residents, agricultural workers, heavy haul vehicles and tourists. Based on the local government road designations and type of sensitive visual receptors and their likely interest in the view the sensitivity to change is defined as **high.**
Magnitude of change	The magnitude of change is **moderate** as the top of the towers and blades of the Proposal above the vegetation cover is a discernible change to the characteristics of the view. The change would appear to have an adverse effect on the view since it would be out of scale with the existing view.
Significance of impact	The significance of impact is **high-moderate**, as the sensitivity to change is high and the magnitude of change is moderate.

7.4.8 Viewpoint 8 Karridale Residential

Viewpoint 8 Karridale Residential is located on Sawmill Loop, Karridale facing east, as shown in Photo 47. Refer to Table 25 for assessment.

Photo 47 Existing view from VP08 Karridale Residential, Sawmill Loop, Karridale

Photo 48 *Red overlay showing maximum blade tip height from VP08 Karridale Residential, Sawmill Loop, Karridale*

Table 25 *VP08 assessment*

Criteria	Comments
Location	50 34°4'25"S 115°9'48"E Elevation: 135.7 m VP08 is situated approximately 15 km west of the Proposal and is facing in an eastern direction. This viewpoint is representative of views experienced by residents of Karridale semi-rural residential area. VP08 provides representative views of the residential area.
Description of existing view	The view is centred along the residential street of Sawmill Loop. The centre of the foreground and midground view is composed of Sawmill Loop, adjacent grey concrete pathway and post and wire rural fencing. The residential street is sparse and includes (from left to right) the roadway, sparsely vegetated verge segregated by the concrete path and the sloped yard of the adjacent residential property. Residential dwellings and associated infrastructure such as sheds, a water tank and fencing material are evident in the midground with open swales with driveways over concrete culverts and newly planted street trees, between the road and pathway in the midground to background of the view. The remainder of the background view consists of construction machinery, power poles and an agricultural field lined with trees on the skyline.
Anticipated change to view	Due to the distance from the Proposal and intervening vegetation there is no anticipated changed to the view from construction or operation.
Sensitivity to change	The sensitivity to change is **moderate** as VP08 will be experienced by occupiers of residential properties with long viewing periods at a distance from and screened from the Proposal.
Magnitude of change	The magnitude of change is **negligible** as there is almost imperceptible or no change in the view as there is little or no loss of/or change to the elements, features, or characteristics of the view.
Significance of impact	The significance of impact is **negligible**, as the sensitivity to change is moderate and the magnitude of change is negligible.

7.4.9 Viewpoint 9 Glenarty Road

Viewpoint 9 Glenarty Road is located on Glenarty Road, Karridale facing east, as shown in Photo 49. Refer to Table 26 for assessment.

Photo 49 *Existing view from VP09 Glenarty Road, Glenarty Road, Karridale*

Photo 50 *Photomontages from VP09 Glenarty Road, Glenarty Road, Karridale*

Photo 51 *Red overlay showing maximum blade tip height from VP09 Glenarty Road, Glenarty Road, Karridale*

Table 26 *VP09 assessment*

Criteria	Comments
Location	50 34°12'20" S 115°9'49"E Elevation: 85.4 m VP09 is situated approximately 9.5 km west of the Proposal and is facing in an eastern direction. This viewpoint is representative of views experienced by occupiers of residences within the locality of Glenarty in addition to tourists and visitors to such places as local wineries. VP08 provides representative views across gently undulating pastureland towards forested area.
Description of existing view	Evident in the foreground is an open view of gently undulating low, dry pasture. The centre of the midground view includes sparsely scattered trees and cattle grazing. Within the gradual undulating form of the midground, scattered trees and vegetation are located to the left and right of the view, framing the open pastural landscape. Within the background the landscape transitions from agriculture to relatively undisturbed, low-lying forested areas.
Anticipated change to view	**Construction** During the construction phase potential short term visual impacts associated with assembly of the wind turbines (including use of cranes) may be achieved in the background view. Views may be partially screened by intervening vegetation. **Operation** During operation, a proportion of the wind turbines (hub and blades) are likely to be visible in the background. Views may be partially screened by intervening vegetation.
Sensitivity to change	The sensitivity to change is **high** as Glenarty Road is a local road that provides scenic and rural views from an elevated position which is utilised by local residents, agricultural workers, recreational users and tourists.
Magnitude of change	The magnitude of change is **moderate** as the likely view of a proportion of the wind turbines above the vegetation cover is discernible change to the characteristics of the view. The change would appear to have an adverse effect on the view since it would be out of scale with the existing view.
Significance of impact	The significance of impact is **high-moderate**, as the sensitivity to change is high and the magnitude of change is moderate.

7.4.10 Viewpoint 10 Albany Terrace Beach Access

Viewpoint 10 Albany Terrace Beach Access is located on Albany Terrace, Augusta facing north-east, as shown in Photo 52. Refer to Table 27 for assessment. Refer to Appendix A for photomontages of this viewpoint.

Photo 52 ***Existing view from VP10 Albany Terrace, Albany Terrace, Augusta***

Photo 53 ***Photomontage from VP10 Albany Terrace, Albany Terrace, Augusta***

Photo 54 ***Proposed design rotated 90 degrees with rotated blades from VP10 Albany Tce, Albany Terrace, Augusta***

Table 27 VP10 assessment

Criteria	Comments
Location	50 34°19'36" S 115°10'12"E Elevation: 7.9 m VP10 is situated approximately 12.5 km southwest of the Proposal and is facing in a north-east direction. This viewpoint is representative of views experienced by local residents, recreational beach users and tourists. VP10 provides representative views of the Hardy Inlet / Southern Ocean river mouth and the coastal zone of the Scott Coastal Plain from Albany Terrace beach access point.
Description of existing view	A sand dune with low-growing coastal vegetation is located in the left of the foreground view. The beach expands across the centre and right of the foreground view. The beach extends across the midground view where it merges with the Blackwood river mouth and into the Southern Ocean. In the background the gentle curve of the coastline allows for long unobstructed views of the Southern Ocean and coastal zone of the Scott Coastal Plain which provides and expansive and rugged coastal view.
Anticipated change to view	**Construction** During the construction phase potential short term visual impacts associated with assembly of the wind turbines (including use of cranes) may be achieved in the background view. **Operation** During operation, a proportion of the wind turbines are highly likely to be visible in the background.
Sensitivity to change	Sensitivity to change is **high** as VP10 is a coastal vantage point that includes long scenic views of the Southern Ocean, Blackwood river mouth and the coastal zone of Scott Coastal Plain that will be experienced by recreation users in additional to local residents and tourists.
Magnitude of change	Although the Proposal is located approximately 12.5 km away Photo 53 highlights the permanent change the Proposal will have to an otherwise undeveloped and rugged coastal view. As such the magnitude of change is **high** as the Proposal will cause the view to be permanently altered and its perceived quality diminished through the inclusion of a substantial and obvious change to the existing view.
Significance of impact	The significance of impact is **high**, as the sensitivity to change is high and the magnitude of change is high.

7.4.11 Viewpoint 11 Flinders Bay Jetty

Viewpoint 11 Flinders Bay Jetty is located on Davies Road, Augusta facing north-east, as shown in Photo 55. Refer to Table 28 for assessment. Refer to Appendix A for photomontages of this viewpoint.

Photo 55 VP11 Flinders Bay Jetty, Davies Road, Augusta

Photo 56 *Photomontage from VP11 Flinders Bay Jetty, Davies Road, Augusta*

Photo 57 *Proposed design rotated 90 degrees with rotated blades from VP11 Flinders Bay Jetty, Davies Road, Augusta*

Table 28 *VP11 assessment*

Criteria	Comments
Location	50 34°20'36"S 115°10'6"E Elevation: 52.6 m VP11 is situated approximately 14 km south-west of the Proposal and is facing in a north-east direction. This viewpoint is representative of views experienced by local residents, recreational beach users and tourists. VP11 provides representative views across Flinders Bay to the Southern Ocean and the coastal zone of the Scott Coastal Plain, in addition to residential areas of Augusta from Flinders Bay Jetty.
Description of existing view	Framed by a platform on the left and a jetty on the right the foreground view consists of the gently rippling form of the ocean. Crystal clear and shallow, with scatterings of boulders adjacent to the shore, the shallow water also contains dark patches of reef and seaweed. To the left of the midground view is the moderately inclined hillslope adjacent to Augusta town centre. This is densely vegetated with numerous houses dispersed throughout. Across the large expanse of ocean, within the background view, is the coastal zone of Scott Coastal Plain. A slither of land with a high degree of naturalness.
Anticipated change to view	**Construction** During the construction phase potential short term visual impacts associated with assembly of the wind turbines (including use of cranes) may be achieved in the background view. **Operation** During operation, a proportion of the wind turbines are highly likely to be visible in the background.
Sensitivity to change	Sensitivity to change is **high** as VP11 is a coastal vantage point that includes long scenic views of the Southern Ocean, and the coastal zone of Scott Coastal Plain that will be experienced by recreation users in addition to local residents and tourists.

Criteria	Comments
Magnitude of change	Although the Proposal is located approximately 14 km away Photo 56 highlights the permanent change the Proposal will have to an otherwise undeveloped view across the Southern Ocean towards the Scott Coastal Plain coastal zone. As such the magnitude of change is **high** as the Proposal will cause the view to be permanently altered and its perceived quality diminished through the inclusion of a substantial and obvious change to the existing view.
Significance of impact	The significance of impact is **high**, as the sensitivity to change is high and the magnitude of change is high.

7.4.12 Viewpoint 12 Colourpatch / Seine Bay

Viewpoint 12 is located at Colourpatch / Seine Bay, within close proximity to Albany Terrace, Augusta. VP12 faces in a north-east direction, as shown in Photo 58. Refer to Table 29 for assessment. Refer to Appendix A for photomontages of this viewpoint.

Photo 58 ***Existing view from VP12 Colourpatch, Seine Bay, Augusta***

Photo 59 ***Photomontages from VP12 Colourpatch, Seine Bay, Augusta***

Photo 60 ***Red overlay showing maximum blade tip height from VP12 Colourpatch, Seine Bay, Augusta***

Table 29 VP12 assessment

Criteria	Comments
Location	50 34°19'27"S 115°10'6"E Elevation: 17 m VP12 is situated approximately 12 km south-west of the Proposal and faces a north-east direction. This viewpoint is representative of views experienced by local residents, recreational users of the inlet and tourists. VP12 provides representative views of the Hardy Inlet / Southern Ocean river mouth from Colourpatch / Seine Bay.
Description of existing view	The foreground showcases a well-maintained green lawn, a tall pine tree and shrubs fronted by a sandy beach. The midground is dominated by the deep grey/blue choppy form of the Hardy Inlet which, to the right of view, connects to the Southern Ocean. East Augusta is the landform shown in the distance. The gently sloping portion of East Augusta visible within this view, is covered with low, dense vegetation. Trees and shrubs make up the majority of the vegetation, which creates a dense natural buffer along the water's edge.
Anticipated change to view	**Construction** It is unlikely that the construction activities will impact VP12. **Operation** It is unlikely the wind turbines be visible from VP12. The wind turbine would be screened by the existing landform and topography.
Sensitivity to change	Sensitivity to change is **high**, as views of the landscape from this area are highly valued by the community, recreational users and tourists. Long scenic views of Seine Bay and Hardy Inlet, the Southern Ocean river mouth and East Augusta are afforded from VP12.
Magnitude of change	Although the Proposal is located approximately 12.5 km away it will impose a permanent change to an otherwise undeveloped view. The magnitude of change is **moderate** as a proportion of the wind turbines would be visible in the right side of the view which causes discernible change to the characteristics of the view. The change would appear to have an adverse effect on the view since it would be out of scale with the existing view.
Significance of impact	The significance of impact is **high-moderate**, as the sensitivity to change is high and the magnitude of change is moderate.

7.5 Visual impact assessment summary

Table 30 provides a summary of the assessment of sensitive visual receptors. This assessment includes a panorama of the existing view, view description, anticipated visual changes in addition to an impact assessment rating. As highlighted in this table the overall visual impact rating ranges from high – negligible.

Table 30 Visual impacts assessment summary

VP	Title	Sensitivity to change	Magnitude of change	Significance of impact
VP01	Augusta Hotel	High	High	High
VP02	Augusta Residential	High	Moderate	High-moderate
VP03	Hillview Road Lookout	High	Low	Moderate
VP04	Adjacent to Molloy Island	High	Moderate	High-moderate
VP05	Scott River Road	High	High	High
VP06	Warner Glen Road	High	Low	Moderate
VP07	Brockman Highway	High	Moderate	High-moderate
VP08	Karridale Residential	Moderate	Negligible	Negligible
VP09	Glenarty Road	High	Moderate	High-moderate
VP10	Albany Tce Beach Access	High	High	High
VP11	Flinders Bay Jetty	High	High	High
VP12	Colourpatch / Seine Bay	High	Moderate	High-moderate

Mitigation and management measures

8. Mitigation and management measures

This section includes a discussion on how the Proposal responds to the visual management objectives identified in Section 5. Landscape and visual mitigation measures are proposed in Section 8.2

8.1 Response to landscape and visual management objectives

8.1.1 Best practice siting and design

Impacts on views from key landscape features identified in Section 4, including Leeuwin Naturaliste Ridge, Scott Coastal Plain, coastal environments, waterbodies, and Brockman Highway travel route corridor, in addition to sensitive visual receptors identified in Section 7, should be considered during initial wind farm layout design, having regard to other pertinent factors including wind quality and acoustic impacts that typically drive the wind turbine layout. Landscape character values identified in Section 6 should also be protected through appropriate siting and design.

The layout (e.g. grid pattern or clustered) of the wind farm should consider the existing landscape character (vegetation, waterform, landform and land use) and any topography variation. Best practice suggests that a regular shape, such as a double line, triangle or grid can appear appropriate within a wide open and level space where there is a regular landscape pattern, such as with in agricultural fields. As identified in Figure 4 the turbine layout seems to be dictated by the existing environmental constraints with turbines located within cleared agricultural areas. This has resulted in an irregular turbine layout which stands out from the natural surroundings and the turbines will interact in varying ways with each other as well as with the landscape.

8.1.2 Protection and maintenance of landscape character

The valued elements that define the existing landscape character are recommended to be protected. This includes but is not limited to, Leeuwin Naturaliste Ridge, wind pruned coastal heath, extensive areas of distinct Jarrah, Marri and Karri forest, agricultural lands, wetland corridors and V shaped river valleys, the coastal landscape of Leeuwin Naturaliste Coast (adjacent to the Indian Ocean), Scott Coastal Plain (adjacent to the Southern Ocean) and the rural amenity of Brockman Highway travel route corridor.

Elements of the Proposal, namely the wind turbines, are uncharacteristic with the existing landscape context. Turbine height and layout should be considered in future design iterations to manage impacts to landscape character.

8.1.3 Engagement

The significance of the landscape within the Study Area, specifically the Blackwood River (Goorbilyup Buerle) and Margaret River (Wooditjup Bilya) and their tributaries, to the Wardandi and Bibulmun/Piblemen people should be considered in the design of the Proposal. Where possible, engagement with Traditional Custodians to discuss the visual elements of the design should be considered. See Section 4.3 for a summary of the community engagement.

8.2 Mitigation

The following section identifies potential mitigation measures that respond to issues arising within the assessment that have the potential to impact on:

– The character of the landscape
– Views to the Proposal from sensitive visual receptors within the Study Area

Mitigation measures address the most visual elements of the Proposal, as well as referencing any relevant considerations drawn from the legislation and planning context review in Section 4.

8.2.1 Site layout and design

– To assist with blending the Proposal into the existing visual context, as far as practically possible, consider realigning turbine layout into a regular shape, such as double line or grid.
– Consider a reduction in the height of all turbines to ease visibility from sensitive visual receptors, including but not limited to VP01 – Augusta Hotel.
– To assist with blending the Proposal into the existing visual context, ensure that the colour, materiality and finishes of proposed supporting infrastructure are of a complementary muted colour palette, compatible with the surrounding visual landscape. Bright or highly contrasting colours, and reflective surfaces, should be avoided.
– Consider maintaining turbine access roads in an unsealed condition within the site boundary where appropriate, rather than sealed roads with dark coloured asphalt, to reduce visual impacts and blend with the surrounding rural setting.

8.2.2 Vegetation

– Retain as much existing remnant vegetation as possible within the Proposal site.
– Where clearing of remnant vegetation occurs in relation to construction of Proposal consider revegetation given due regard of regulatory requirements.
– Where possible, revegetate disturbed areas of native vegetation, using select endemic species from the existing palette within the surrounding area, using species of an appropriate maximum height.
– Consider potential screen planting in strategic locations. Ensure any screen planting is proposed in appropriate locations, does not increase bushfire risk and is undertaken in collaboration and with consent of landowners.
– Ensure native roadside vegetation is retained, where practicable, to screen views to the ancillary infrastructure and overhead transmission line.

8.2.3 Overhead transmission lines

– Where possible, minimise the number and height of transmission poles / towers required to reduce the associated visual impact.
– Where possible, in line with relevant standards, minimise the width of the transmission line easement required to be maintained, to reduce the area of vegetation clearance required (if any).

8.2.4 Ancillary infrastructure

Substation, operational and maintenance facility

– Ensure any permanent visible infrastructure uses a non-reflective material finishes and a recessive colour palette that responds to the landscape character (e.g., rural setting) and visual context within which it sits.
– Where practicable, locate permanent storage, operation and maintenance areas on relatively flat land already clear of canopy vegetation to minimise earthworks and vegetation removal.
– In consultation with landowners and ensuring it does not increase bushfire risk, where practicable, use native plant species to provide screening planting around permanent built form infrastructure to assist in filtering views to the infrastructure and reinstate the existing landscape character.

Meteorological masts

– If applicable and where practicable, micro-site meteorological masts to avoid tree removal.

Access tracks

– Where practicable, align access tracks to avoid the removal of existing vegetation.

8.2.5 Construction and decommissioning

– Minimise the area of disturbance during the construction period to areas within the Proposal site, where possible.
– After construction is complete, seek to ensure any disturbed areas (including temporary construction compounds, areas disturbed by the construction, erection, and transportation of Proposal infrastructure) are reinstated to their previous condition (or better), including the reinstatement of topography, soils, vegetation cover, and natural drainage patterns. Replace any trees, shrubs and ground covers that have been removed with the same (or similar) species of local provenance, in accordance with the rural landscape character.
– Where possible, ensure construction equipment, stockpiles, and other visible elements are located away from views to or from sensitive visual receptors. Should equipment or stockpiles be located in visually prominent locations for any reasonable period of time, incorporate screening measures and practices to ensure sites are kept tidy.
– During construction, protect any sensitive landscape features (e.g., remnant vegetation, waterways) via a construction management plan.

8.2.6 Cultural heritage values

To ensure that cultural heritage landscape values have been appropriately incorporated into this assessment, cultural knowledge holders, the Wardandi and Bibulmun/Piblemen people, should be consulted, and where appropriate relevant heritage approvals should be obtained.

8.3 Recommendations for further work

– The impacts of where one blade of each turbine is painted black have not been assessed. The effect of the black blade on views, particularly from Augusta town centre and the Southern Ocean coastline, Augusta, should be considered and assessed.

9. Conclusion

This LVIA report has been prepared to assess the possible effect of the Proposal on the surrounding landscape and views. The purpose of this report is to support the following:

– Environmental Protection Authority (EPA) referral under Part IV, Section 38 in accordance with *Environmental Factor Guideline –Social Surroundings* (EPA, 2023e) under the Environmental Protection Act 1986.
– Development approval application (Shire of Augusta Margaret River) to commence development of the Proposal.

The Proposal has been thoroughly assessed in relation to the relevant planning and environmental regulations concerning landscape and visual impact. The scope of the assessment is limited to the expected distance from which the Proposal would likely be visible in its surrounding environment. This determination has led to a Study Area covering roughly 30 km in each direction of the Proposal site. Accordingly, the Study Area encompasses regions within AMR Shire LGA and the Shire of Nannup.

The Proposal is located in Warren Bioregion (Figure 7) within the locality of Scott River in the AMR LGA which is situated approximately 294 km south-east of Perth. AMR Shire LGA has a population of approximately 16,791 (Australian Bureau of Statistics, 2021) which is expected to grow to approximately 25 000 people by 2036 (DPLH, 2022). The landscape within the Study Area contains the townsites of Augusta and a proportion of Margaret River, in addition to the settlements of Karridale, Kudardup and Witchcliffe. It also contains national parks, nature reserves, state forests, agricultural land, and tourism land uses.

The topography of the Study Area is a landscape dominated by gently undulating and rolling hills, rocky shorelines, towering sea cliffs, gently curving beaches, wetland corridors and areas of granite outcrops. Features of the landscape include Leeuwin Naturaliste ridge and the long stretch of coastline adjacent to the Indian and Southern Ocean free of disturbance. It encompasses various watercourses, including the Blackwood River

(Goorbilyup Buerle) and Hardy Inlet and the Margaret River (Wooditjup Bilya). The Study Area has a diverse array of vegetation, featuring native woodlands and forests, sedges, and low heath with cleared irrigated and non-irrigated areas linked to agricultural use.

This assessment was undertaken based on a comprehensive desktop study, and site inspections of the existing landscape and views.

Four LCU's were identified in the Study Area. The significance of impact on LCU1 is high-moderate, as the Proposal will likely affect the characteristics of LCU1, where the Leeuwin-Naturaliste Ridge is recognised as a key landscape feature. The significance of impact on LCU2 is also high-moderate, with contributing factors including scenic qualities and the inclusions of Scott National Park and Gingilup Swamps Nature Reserve, which host highly diverse flora and fauna species. The findings indicate a high-moderate significance of impact on LCU3 due to the high sensitivity and importance of notable drainage features that are registered Aboriginal heritage sites, as well as several national parks and nature reserves. The Proposal will likely result in notable changes to this landscape character. LCU4 would experience a moderate significance of impact, as the changes will be confined to specific locations within LCU4.

Visual impacts associated with construction were considered short term (approximately 2 years) with operation considered permanent. Based on the desktop study and ZTV analysis as well as a fieldwork conducted in March and August 2024, 12 representative viewpoints were selected for this LVIA. The assessment identified the significance of impact for the viewpoints, ranging from negligible to high.

After conducting a contextual analysis, the visual management objectives for the Study Area were outlined. The focus of the visual management objectives included optimising the siting and design of the Proposal to protect and maintain the distinct landscape characters with a key recommendation being to consider realignment of wind turbines into a regular layout such as a double line or grid and a reduction in turbine height. In addition, the impact of wind turbines on the visual landscape, from Brockman Highway needs to be taken into account and future design iterations should consider how the Proposal appears from the roadway.

Other recommended visual management measures include maintaining the rural landscape character through mitigation by adopting measures such as retaining as much existing remnant vegetation as possible within the Proposal site and re-establishing any pastural land disturbed during construction. In addition, consideration of Aboriginal heritage values and engagement with the Wardandi and Bibulmun/Piblemen people was recommended as a consideration for protection and maintenance of cultural heritage values.

Technical Memorandum

March 10, 2026

To	[redacted]	**Contact No.**	[redacted]
Copy to	[redacted]	**Email**	[redacted]
From	[redacted]	**Project No.**	[redacted]
Project Name	Scott River Wind Farm LVIA		
Subject	Addendum to the LVIA to address agency comments.		

1. Introduction

The proposed Scott River Wind Farm (the Proposal) is located in Scott River, approximately 15 kilometres (km) north-east of Augusta, Western Australia. The Proposal site covers an area of approximately 4,000 hectares located on freehold agricultural land owned by multiple landholders and is primarily located within cleared agricultural land zoned 'General Agriculture'.

The Proposal includes 20 wind turbines, two meteorological masts, an on-site substation, operational and maintenance facility, hard stand areas, transmission line, and 33 kilovolts underground electrical transmission. Access to the Proposal site is via Scott River Road. The Proposal is being investigated by SynergyRED as part of its assessment of future renewable energy projects with the potential to connect to the South West Interconnected System.

GHD prepared a Landscape and Visual Impact Assessment (LVIA) for the Proposal in January 2025 to support the:

– Environmental Protection Authority (EPA) referral under Part IV, Section 38 in accordance with *Environmental Factor Guideline – Social Surroundings* (EPA, 2023) under the *Environmental Protection Act 1986*.
– Regional Development Assessment Panel Application for Development Approval to commence development of the Proposal.

The LVIA found that the landscape context is defined by a diverse rural and natural setting within the South West of Western Australia. The LVIA Study Area, extending 30 km in all directions from the Proposal site, includes agricultural land, national parks, nature reserves, state forests and tourism areas. The terrain varies from almost flat to gently undulating plains within cleared farmland to more elevated and visually prominent landforms. The Study Area also contains several key watercourses, including the Blackwood River (Goorbilyup Buerle) to the west and north, the Scott River immediately south of the Proposal site, and the Margaret River (Wooditjup Bilya) and Mowen River to the north, with tributaries present within the Proposal site. Key transport corridors traversing the Study Area include Brockman Highway, Bussell Highway and Caves Road, which contribute to the visual experience of the surrounding landscape.

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

Refer to Figure 1 for the Proposal layout, which has been updated with turbine numbering and the Development Envelope.

1.1 Purpose of this Memorandum

This Technical Memorandum (memorandum) has been prepared by GHD Pty Ltd (GHD) to address comments issued by the Department of Biodiversity, Conservation and Attractions (DBCA), and the Department of Planning, Lands and Heritage (DPLH) in response to the Scott River Wind Farm LVIA.

The structure and content of this memorandum correspond directly with agency feedback, as provided in Appendix A: Agency Comments, with an additional section summarising additional mitigation recommendations relevant to LVIA. All commentary, analysis, and updated figures are cross-referenced to specific comment numbers for clarity and auditability. Updated photomontages produced to support this memorandum are included in Appendix B and Appendix C.

1.2 Scope and limitations

The scope of this memorandum includes:

– Technical Memorandum (addressing relevant DBCA and DPLH comments), including:
  - Update to figures, including zone of theoretical visibility (ZTV) mapping
  - ZTV analysis for the transmission line, substation and alternative wind farm layout
  - Detailed commentary for all visual receptor locations identified by DBCA and DPLH
  - Photomontages and red overlay figures for visual receptor locations identified by DBCA and DPLH
  - Discussion of mitigation in response to DBCA and DPLH comments
  - Additional mitigation discussion relative to the alternative wind farm layout
– Fieldwork has also been undertaken to obtain additional information to support the response to DBCA and DPLH comments.
– A wind turbine micro-siting meeting was undertaken with the Shire of Augusta Margaret River to discuss an alternative layout.

This technical memorandum has been prepared by GHD for SynergyRED. It is not prepared as, and is not represented to be, a deliverable suitable for reliance by any person for any purpose. It is not intended for circulation or incorporation into other documents. The matters discussed in this memorandum are limited to those specifically detailed in the memorandum and are subject to any limitations or assumptions specially set out.

Accessibility of documents

If this Technical Memorandum is required to be accessible in any other format this can be provided by GHD upon request and at an additional cost if necessary.

1.3 Assumptions

– This memorandum is based on information provided by SynergyRED at the time of writing.
– This memorandum relies on assessments made within the Proposal LVIA, undertaken in 2025.

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

2. Methodology

2.1 Assessment approach

As an addendum to the Proposal LVIA undertaken in 2025, this memorandum uses the same basis of assessment as that outlined in section 3 Methodology of the Proposal LVIA (2025) report.

2.2 Zone of theoretical visibility

Zone of theoretical visibility (ZTV) mapping has been prepared as part of this LVIA addendum, using the same methodology as outlined in section 3 Methodology of the Proposal LVIA (2025) report, however with the following parameters:

– A viewing height of 1.7 m, which is the average within the typical viewing level range of an adult
– Maximum transmission pole / tower height of 28 m
– Maximum substation height of 10 m
– Tip height of 250 m (for the alternative wind farm layout)
– Hub height of 164 m (for the alternative wind farm layout)

The GIS software then digitally determines the likely extent over which the component would be visible or not visible. In interpreting the ZTV, the following considerations must be made:

– The ZTV only considers the landform and does not include land cover factors such as the presence of buildings and trees. It therefore represents the worst-case scenario of potential visual impacts.
– The ZTV does not consider the effect of distance. The greater the distance from the Proposal, the lower the impact, as the development will take up a smaller portion of the view, and atmospheric conditions may reduce the visual prominence of the Proposal.
– The ZTV is only accurate to the resolution of the elevation model.

2.3 Site inspection

A site inspection was undertaken by a Landscape Planner on 6 February 2026. The purpose of the site inspection was to:

– further investigate specific public locations within the study area in order to address specific Agency comments
– undertaken site photography for visual assessment and preparation of additional photomontages and red-overlay views, in response to Agency comments.

2.4 Photomontages

All photographic images were captured using a 50 millimetre fixed focal length lens on a 35 millimetre full frame format camera at a camera height of 1.7 m, which is consistent with the approach undertaken in the Proposal LVIA (2025). All photograph locations were recorded and mapped.

The software used to model and render the photomontages was AutoDesk 3D Studio Max, and the methodology consistent with section 3 Methodology within the Proposal LVIA (2025).

Turbine individual numbering has been added to all photomontages. The turbines are numbered as per their respective location in the wind farm. Numbering has been generated using AutoDesk 3D Studio Max for accuracy. The number labels have been overlayed over the photomontages to align with the turbines, while not obstructing the elements of the view. Each label is facing the virtual camera and the label size has been adjusted for legibility and consistency across the photomontage.

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

3. Response to DBCA submission

The following section outlined the specific DBCA comments and the response provided.

3.1 Comment 1

DBCA comment:

The methodology, process and outcomes as presented in Attachment 4 - Referral Supporting Documents (RSD), Ecological Australia 2025 and the main assessment documented in Proposed Wind Farm - Scott River Landscape and Visual Impact Assessment by GHD 2025 are generally supported given:

- *The methodology aligns with industry standards using established methodologies and approved documents, including the WAPC Visual Landscape Planning in Western Australia: a manual for evaluation, assessment, siting, and design.*
- *Suitable Landscape Character Units (LCU) were developed highlighting the variety of landscape types that surround the project. These were then extended to describe the public's acceptance of visual change to the landscape quality of those LCUs.*
- *The Zones of Visual Influence (ZVI) capture where the wind farm infrastructure will be seen across the landscape.*

Response:

Noted and confirm the above comment.

3.2 Comment 2

DBCA comment:

Views specific to DBCA managed lands are largely absent, including the Cape to Cape Track, recreation sites and activity on and along the Blackwood River / Scott River and Hardy Inlet, and the Cape Leeuwin Lighthouse (from the ground and the top viewing deck). Assessing more receptors could help to identify small scale or local mitigation measures.

Response:

The wind farm hub and tip height ZTV figure have been updated to show the Cape to Cape Track, Leeuwin Lighthouse, key waterways and the Scott River National Park (Refer to Figure 2 and Figure 3). As shown in these figures, the Cape to Cape Track and Leeuwin Lighthouse are not within the visible area, and therefore no views to the Proposal would be achieved from these locations. However other recreational sites such as the Scott River National Park, Hardy Inlet, Blackwood River, and Scott River are within the visible area. However, as noted in section 2.2, the ZTV considers only the landform and exclude the effect of distance and existing canopy cover and buildings.

In addition to the ZTV figures, within the Proposal LVIA report (2025), two photomontages were provided in Appendix B from the top and bottom of Cape Leeuwin Lighthouse, illustrating that there would be no views of the Proposal from these locations due to intervening landform.

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

3.3 Comment 3

DBCA comment:

The majority of the assessment focuses on the WTGs as these are the largest elements in the landscape - this includes the mapping of ZVIs. Other infrastructure worthy of the same detailed assessment as the WTGs include the access and maintenance roads, transmission line, meteorological masts and the substation, given they are of significant scale or length in the landscape and will be seen in a different context to the towers.

Individual ZVIs for the other infrastructure will determine where these elements will be seen from the landscape and sensitive visual receptors. These ZVIs could inform mitigation measures that could reduce the individual visual impact of these items and therefore reduce the collective total visual impact for the project as a whole.

Response:

To address the request for a more detailed assessment of non-turbine infrastructure, additional ZTV modelling has been undertaken for key project components beyond the wind turbine generators.

Two additional ZTV figures have been produced for inclusion in this addendum, modelling visibility from the transmission line and the substation (refer to Figure 4 and Figure 5, respectively). The ZTV for the transmission line has been modelled to a study area of 3 km from the transmission line, while the ZTV for the substation has been modelled to a study area of 1 km from the substation, reflecting the relative scale and anticipated visual influence of these elements within the landscape.

Figure 4 shows that the transmission line would be theoretically visible from areas surrounding the Proposal site, with higher levels of visibility (shown in red) occurring predominantly within the central part of the study area. A patchy visibility of the transmission line is expected along the northern section, Governor-Broome Road and west of Scott River Road. Visibility is generally low or absent toward the northwest and northeast, and western parts of the study area, where landform provides increased screening, as reflected by areas of reduced or no visibility shown in lighter colours.

Figure 5 shows that the substation would be theoretically visible within most parts of the 1 km study area, where higher levels of visibility are indicated in closer proximity to the substation location. The substation may be visible from the Scott River Road looking east.

Regarding the metrological masts, two permanent masts with a maximum height of 164 m are proposed within the Proposal site. While these structures are taller than other ancillary infrastructure, they are slender elements with a limited physical footprint and lack moving components. Their potential visibility has been considered qualitatively by reference to their scale, form and siting within the broader wind farm context, including surrounding landform and vegetation screening. The visual presence of the meteorological masts is expected to be localised and generally perceived in association with the wind turbine generators and other project infrastructure. On this basis and given their limited contribution to overall visual change relative to the turbines, separate ZTV modelling has not been undertaken.

With respect to access and maintenance roads, while these elements are low-lying, they may result in localised impacts through vegetation removal and changes to existing land cover. Where visible, access tracks would be generally perceived in close proximity and within an established rural agricultural context alongside existing farm access tracks and agricultural infrastructure. Mitigation measures are recommended to minimise these effects, including aligning access tracks to avoid the removal of existing vegetation and to follow existing land patterns where practicable, thereby reducing the need for earthworks, aligned with the recommendation provided in Section 8.2.4 of the Proposal LVIA (2025), which identifies the importance of locating access tracks to minimise vegetation loss and landscape disturbance.

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

3.4 Comment 4

DBCA comment:

The report notes that there will be an impact to the quality of the visual landscape from this proposal. Because of this acknowledgment, and the degree of the impact, the proposed mitigation measures appear limited. More advanced assessment of mitigation measures, based on a more detailed assessment of sensitive visual receptors, infrastructure assessment and associated ZVI may provide more protection of landscape quality and the viewer's sensitivity to the proposal.

Response

To further inform mitigation, additional ZTV analysis has been undertaken for the transmission line and substation (Figure 4 and Figure 5). The ZTVs illustrate potential visibility based on landform only and provide further context regarding the extent and distribution of visibility within the immediate vicinity of the Proposal site. The ZTV figures have been discussed in section 3.3.

In addition, as part of community engagement activities, photomontages were prepared from selected private residences to provide a more detailed, receptor-based understanding of potential visual effects, beyond the landform-based ZTV analysis. Together, this information supports the suitability of the mitigation measures proposed in the LVIA and informs consideration of further mitigation, where practicable, during detailed design.

Additional mitigation considerations are also outlined in the following responses to comments, and in section 4.

3.5 Comment 5

DBCA comment:

1. *The viewing deck at the Cape Leeuwin Lighthouse sits ~40m above ground, and the base of the lighthouse is ~ 20m above sea level. As this is a significant tourism site it would warrant an assessment.*
2. *The Visual Impact Assessment identifies that this proposal will be highly visible in the surrounding landscape and that there is limited scope in most instances to reduce this visual impact.*
3. *The proposed mitigation measures are limited and reflect the high impact of the proposal from scattered receptor sites but do not consider local or small-scale mitigation measures or interventions to protect visual quality from the entire landscape.*
4. *Potential mitigation measures to address landscape-wide and locally identified impacts could include:*

– *Road edge vegetation screening along surrounding travel route corridors of all types managing and screening views along the length of these corridors.*

– *Localised screening surrounding the ancillary infrastructure.*

– *Broadscale landscape planting within the project area.*

Response to point 1:

As noted in comment 1 response, within the Proposal LVIA (2025), two photomontages from the top and bottom of the Cape Leeuwin Lighthouse viewing deck were provided (refer to Appendix B of this report). These photomontages demonstrate that there would be no views of the Proposal from these locations due to intervening landform. In addition, the wind turbine ZTVs have been revised to show the Cape Leeuwin Lighthouse location, which shows that the Lighthouse is not in the wind turbine visible area.

Response to point 2:

Comment noted.

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

Response to point 3:

In response to DBCA's comment regarding the extent of mitigation measures, two additional ZTV figures have been prepared for the transmission line and substation (Figure 4 and Figure 5). These ZTVs, which are based on landform only, provide a more detailed understanding of the extent and distribution of potential visibility in the immediate vicinity of the Proposal site and in relation to landscape character and sensitive visual receptors.

The additional ZTVs indicate that visibility of these components is generally localised and strongly influenced by topography. This refined understanding supports the suitability of the mitigation measures currently proposed in the LVIA, including infrastructure siting to utilise landform screening, minimisation of disturbance, and rehabilitation of disturbed areas.

Response to point 4:

The additional ZTV analysis also informs consideration of localised and landscape-wide mitigation measures, where practicable, including detailed micro-siting during final design, localised screening of ancillary infrastructure, and rehabilitation and landscape planting to reduce visual exposure over time. Where appropriate, a simplified Landscape Plan may be developed at later design stages to address locally identified visual impacts in a targeted manner. In addition, it is recommended that offsite mitigation is offered to adjacent residents to mitigate landscape and visual impacts.

4. Response to DPLH submission

The following section outlines the specific DPLH comments and the response provided.

4.1 Comment 6

DPLH comment:

The following comments and attached photos are provided on the visual impact of the proposed Scott River wind farm and the proponent's Landscape and Visual Impact Assessment (LVIA). The comments are made with reference to the WAPC "Visual landscape Planning in Western Australia – a manual for evaluation, assessment, siting, and design" and the Department of Planning, Lands and Heritage GIS "InQuiry", as well as knowledge of the area.

The viewshed mapping indicates that the turbines may be extensively visible. However, it is likely that roadside trees would obscure views from two of the three major roads to Augusta (Bussell Highway and Caves Road), and views from narrow, treelined secondary roads oriented generally towards the site e.g. Challis Road, and Fisher Road, which is used to access the settlement on Molloy Island.

Response:

Noted and confirm the above comment. As outlined in the Proposal LVIA (2025) section 3 Methodology, the ZTV only considers the landform and does not include land cover factors such as the presence of buildings and trees. It therefore represents the worst-case scenario of potential visual impacts.

4.2 Comment 7

DPLH comment:

Analysis using Google Streetview images indicates that the greatest visibility is likely to be from:

– *private residences in Augusta which have northeasterly views, comprising*
  - *elevated sites*

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

- *sites along the shore of the Blackwood River, Hardy Inlet, or ocean*

– *public recreation sites on the western banks of the Blackwood River (e.g. the river end of Howe Road), Hardy Inlet (e.g. end of Ellis Road) or open ocean (e.g. Flinders Bay).*

– *from western portions of Hardy Inlet.*

– *from the open ocean.*

It also appears that there will also be significant visibility from Augusta's main intersection at Blackwood Avenue and Ellis Street, other locations along Blackwood Avenue, and from Scott River Road and Governor Broome Road, which are at the project site and are used to access East Augusta and more distant coastal areas e.g. for recreational purposes.

Response:

Noted. The locations identified by DPLH as having the greatest potential for visibility are acknowledged and are consistent with the landscape and visual impact assessment findings. Representative viewpoints and receptor locations have been used to assess visual exposure and sensitivity from these areas, including views from public roads, recreation areas, coastal and inlet environments, and residential receptors. The assessment therefore adequately captures the range of viewing contexts and receptor types from which the proposal may be visible and addresses the potential landscape and visual effects associated with these locations.

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

4.3 Comment 8

DPLH comment:

Assessment report - method and conclusions

– *The method used for the assessment is generally suitable, with two exceptions as below. Several important viewpoints have been overlooked in analysis:*

1. *Travelling east along Scott River Road leaving East Augusta, in locations where the vegetation is naturally low (see attached Photo 1).*
2. *Main street intersection, Ellis Street moving downhill into the intersection with Blackwood Avenue (Photo 2 – two examples).*
3. *Main town foreshore opposite East Augusta (Photo 3).*
4. *Albany Terrace, close to the opening between Hardy Inlet and the ocean (Photo 4).*

– *Reference to the three primary visual management objectives as being 'protection', best practice, and 'engagement', but the third objective advised in the WAPC's manual is 'enhancement', not 'engagement'.*

It is beneficial to identify potential engagement opportunities, but this should occur elsewhere in the report and 'enhancement' should be addressed. This objective would justify introducing roadside tree planting to Scott River Road and Governor Broome Road, within the project site, as it would reduce turbine visibility from the closest viewpoints, and would enhance environmental values in the landscape.

Response summary:

Additional fieldwork has been undertaken to assist in addressing this comment. All specific locations outlined were visited. Additional assessment has been undertaken to address the viewpoints identified by DPLH as requiring further consideration. Detailed commentary has been prepared for all locations identified, including key locations within the Augusta townsite (Ellis Street and Blackwood Avenue), the Hardy Inlet foreshore, Albany Terrace near the Hardy Inlet–ocean opening, and Scott River Road, including sections where roadside vegetation is naturally low.

The viewpoint assessment commentary has been prepared for these locations and photomontages and red-line visibility overlays provided to illustrate the extent of potential turbine visibility. These assessments are informed by field verification and ZTV analysis and represent the viewing conditions experienced at each location.

The viewpoint assessment commentary discusses the relationship between the viewpoints identified by DPLH and existing Proposal LVIA (2025) viewpoints. In particular, the views experienced from Ellis Street and the Blackwood Avenue intersection (Centre of Augusta) are comparable in terms of viewing direction, distance and receptor sensitivity to those illustrated in existing town-based viewpoints. Similarly, views from Centre of Augusta, the Hardy Inlet foreshore and Albany Terrace are consistent with those represented by existing photomontages at VP01 (Augusta Hotel), VP02 (Augusta Residential), VP10 (Albany Terrace Beach Access) and VP12 (Colourpatch / Seine Bay), which capture comparable town, coastal and inlet-based viewing contexts.

By providing both new illustrative material and explicit cross-referencing to existing assessed viewpoints, the assessment addresses concerns regarding overlooked viewpoints and demonstrates that visibility from all key locations identified by DPLH has been appropriately considered.

Additional mitigation has also been explored in the form of an amended wind turbine layout, revised ZTV and updated photomontages for the locations specified, which is discussed in comment 10 response, and provided in Appendix C.

With respect to visual management objectives, it is acknowledged that the term 'enhancement', as set out in the *Visual Landscape Planning in Western Australia: a manual for evaluation, assessment, siting and design* (The Western Australian Planning Commission, 2007), was not explicitly identified as a primary objective. This matter is addressed separately in the mitigation and discussion sections of this memo (refer

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

to Comment 10 and Comment 11). Notwithstanding this, enhancement outcomes are considered through the identification of mitigation and landscape enhancement measures this memorandum, and section 8.2.2 Vegetation within the Proposal LVIA (2025). Landscape enhancement strategies focus on retaining existing remnant vegetation within the Proposal site and restoring disturbed areas using locally endemic species of appropriate height to reinforce existing vegetation patterns and landscape continuity. These measures support the recovery and long-term strengthening of the existing rural and agricultural landscape character.

Response to point 1:

OVP01 - Scott River Road

OVP01 Scott River Road is located on the east of east Augusta, facing north-east. Refer to Figure 6 for the viewpoint location, Photo 1 for the existing view, Photo 2 for photomontage of the proposed view, and Photo 3 for the red overlay image.

Photo 1 ***Existing view from OVP01 Scott River Road***

Photo 2 ***Proposed view from OVP01 Scott River Road***

Photo 3 ***Red overlay showing maximum blade tip height from OVP01 Scott River Road***

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

Description of the view:

The foreground includes low, dense coastal heath and scrub vegetation interspersed with areas of pale sandy ground, with narrow and unsealed Scott River Road extending along the right-hand side of the view. Vegetation is predominantly low in height and comprises mixed native shrubs and grasses. A series of timber power poles with overhead lines run parallel to the road, introducing a minor vertical and linear element within the foreground and midground of the view. The midground includes an expansive area of flat to gently undulating heathland, with subtle variations in vegetation texture and colour creating a broad, open landscape. The background consists of a continuous horizon of low native vegetation, with no prominent built elements visible, reinforcing the rural and sparsely modified character of the view.

Visual assessment commentary:

Sensitivity to change is assessed as **moderate**, as short term views area experienced by road users travelling through an area of nature reserve valued for its conservation and scenic qualities.

During the construction phase, short-term visual impacts associated with the assembly of the wind turbines, including the use of cranes, are likely to be visible in the midground and background of the view. These elements would appear above the low heathland vegetation and increase the presence of man-made features within an otherwise predominantly open rural landscape. During operation, the wind turbines will be visible in the midground and background of the view as a series of vertical elements rising above the low heathland vegetation. The turbines will introduce movement through rotating blades and increase the presence of built form along the distant horizon, although they will be viewed within a landscape that already contains linear infrastructure such as the unsealed road and associated power poles. This will represent a permanent change to the view.

The magnitude of change is assessed as **moderate**, reflecting the clear visibility and scale of the turbines balanced against the openness of the landscape and its existing modified elements. Taking into account the moderate sensitivity of receptors and the moderate magnitude of change, the overall significance of visual impact is assessed as **moderate**.

Response to point 2:

OVP02 - Centre of Augusta (Ellis Street, Blackwood Avenue)

OVP02 Centre of Augusta is located in the centre of Augusta, at the intersection of Ellis Street, Blackwood Avenue, facing northeast. Refer to Figure 6 for the viewpoint location, Photo 4 for the existing view, Photo 4 for photomontage of the proposed view, and Photo 5 for the red overlay image.

Photo 4 Existing view from OVP02 Centre of Augusta

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

Photo 5 *Proposed view from OVP02 Centre of Augusta*

Photo 6 *Red overlay showing maximum blade tip height from OVP02 Centre of Augusta*

Description of the view:

OVP02 is located in the centre of Augusta at the intersection of Ellis Street and Blackwood Avenue, with the view facing northeast. The foreground includes a sealed road intersection incorporating traffic islands, signage, street lighting and pedestrian footpaths. Low-scale commercial buildings with painted masonry walls and red or terracotta tiled roofs are located to the left and right of the view, forming a cohesive small-town streetscape. The midground includes additional town buildings, overhead service lines and scattered street trees, with partial views across Hardy Inlet visible between built elements. The background comprises the waterbody of Hardy Inlet and the densely vegetated shoreline beyond, providing a natural coastal backdrop to the developed town centre setting.

The view is similar in character to VP01 August Hotel assessed in the Proposal LVIA (2025) report, located on Blackwood Avenue and in the vicinity of OVP02, sharing a combination of low-scale residential development in the foreground and midground with open views across Hardy Inlet and the vegetated shoreline beyond. In both views, the contrast between the built townscape and the natural coastal setting is a defining feature, contributing to a consistent visual experience within this part of Augusta.

Visual assessment commentary:

During the construction phase, potential short-term visual impacts associated with the assembly of the wind turbines, including the use of cranes, may be visible in the background of the view. Views may be partially screened by intervening vegetation and built form within the town centre. During operation, a proportion of the wind turbines (including hub, tower tip and blades) are highly likely to be visible above the vegetated horizon in the background of the view. This will represent a permanent change that will not be screened.

Sensitivity to change at OVP02 is assessed as **high**, as residents and visitors to the Augusta town centre place value on the scenic, elevated long and wide views across Hardy Inlet and East Augusta from Blackwood Avenue, the main street of Augusta. The view forms part of a valued coastal townscape setting and is experienced frequently by pedestrians, motorists and visitors, often for prolonged periods.

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

The proposed wind turbines are visible in the background of the view, appearing above the distant vegetated horizon beyond Hardy Inlet. While the turbines introduce new vertical and moving elements into the skyline, they would be seen at distance and would not dominate the townscape or foreground built form. The magnitude of change is therefore assessed as **moderate**, reflecting a noticeable but not overwhelming alteration to the existing view.

Taking into account the **high** sensitivity of receptors and the **moderate** magnitude of change, the overall significance of visual impact is assessed as **high–moderate**.

Response to point 3:

OVP03 - Town Beach (Ellis Street Jetty)

OVP03 Town Beach is located on the east of Augusta, on the western foreshore of Hardy Inlet, facing northeast. Refer to Figure 6 for the viewpoint location, Photo 7 for the existing view, Photo 8 for photomontage of the proposed view, and Photo 9 for the red overlay image.

Photo 7 ***Existing view from OVP03 Town Beach***

Photo 8 ***Proposed view from OVP03 Town Beach***

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

Photo 9 Red overlay showing maximum blade tip height from OVP03 Town Beach

Description of the view:

OVP03 is located at the Augusta Town Beach, which forms the main foreshore area of the town. The foreground includes the sheltered shoreline of Hardy Inlet with a timber jetty and associated mooring infrastructure extending into the water, as well as small vessels moored adjacent to the jetty. The midground is dominated by the open waterbody of Hardy Inlet, which provides expansive and uninterrupted views across the inlet. The background comprises the low, densely vegetated shoreline of East Augusta, forming a largely continuous natural horizon, within which small jetties, a boat launching area and beached recreational craft are visible, reinforcing the recreational coastal character of the view.

Visual assessment commentary

The sensitivity to change is **high**, as residents and visitors place value on the scenic, recreational coastal views experienced from the Augusta Town Beach, which forms the main foreshore area of the town and is used frequently for leisure and recreation.

During the construction phase, no visual impacts associated with turbine assembly are anticipated at OVP03, as the turbines would be fully screened by intervening landform and dense vegetation on the opposite side of Hardy Inlet.

During operation, the wind turbines would not be visible from OVP03, as they would be entirely obscured by the landform and vegetated shoreline of East Augusta in the background. No change to the existing view is anticipated. The magnitude of change therefore would be **negligible**, as the Proposal would not be visible from this viewpoint and would result in no discernible alteration to the existing view.

Taking into account the high sensitivity of receptors and the negligible magnitude of change, the overall visual impact at OVP03 is assessed as **negligible**.

Response to point 4:

OVP04 - Albany Terrace

OVP04 Albany Terrace is located on the Albany Terrace Beach, overlooking Hardy Inlet near its mouth, opposite opening to Swan Lake, facing northeast. Refer to Figure 6 for the viewpoint location, Photo 10 for the existing view, Photo 11 for photomontage of the proposed view, and Photo 12 for the red overlay image.

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

Photo 10 ***Existing view from OVP04 Albany Terrace***

Photo 11 ***Proposed view from OVP04 Albany Terrace***

Photo 12 ***Red overlay showing maximum blade tip height from OVP04 Albany Terrace***

Description of the view:

The foreground includes low coastal grasses and sandy foreshore areas adjacent to the inlet edge. The midground is dominated by the open waters of Hardy Inlet, with a sand spit extending across part of the inlet mouth. The background comprises a gently undulating, low vegetated landform, with a subtly sloping dune at the entrance to Swan Lake. The view is characterised by a strong natural coastal setting defined by expansive water views, subtle landform variation and native coastal vegetation.

This OVP is located between VP11 and VP12 presented in the Proposal LVIA (2025). OVP04 is similar in character to VP12, with both comprising expansive coastal and inlet views and a low, gently undulating vegetated horizon. OVP04 is located approximately 100 m to the east of VP12, and in both views the turbines are perceived at distance above the background landform, resulting in a comparable visual relationship with the proposed development.

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

Visual assessment commentary

The sensitivity to change is **high**, as residents and visitors place value on the scenic coastal views from this location, which are associated with recreational use and appreciation of the natural inlet, dune systems and ocean setting.

During the construction phase, short-term visual impacts associated with turbine assembly, including the use of cranes, may be visible in the background of the view. These elements would appear beyond Hardy Inlet above the low vegetated landform and would not affect the foreground or midground coastal features.

During operation, a proportion of the wind turbines would to be visible above the gently undulating vegetated landform in the background of the view. The turbines would appear as vertical elements against the sky and introduce movement through rotating blades, resulting in a permanent change to the existing skyline.

The magnitude of change is assessed as **moderate**, as the turbines will be clearly visible above the background vegetation and introduce new vertical and moving elements into an otherwise predominantly natural coastal view. However, the turbines are seen at distance, remain confined to the background, and do not dominate or substantially alter the key characteristics of the foreground and midground landscape.

The significance of impact is **high-moderate**, as the sensitivity to change is high and the magnitude of change is moderate.

4.4 Comment 9

DPLH comment:

Further analysis advised

The significance of the project's potential visual impacts on the tourist town of Augusta warrants further work by consultants:

1. *Provision of photomontages for the additional viewpoints listed above, possibly using a simpler method to produce wireframe images but with vegetation overlaid.*
2. *Provision of a project site plan showing individually numbered turbines, with numbers also shown on the existing and new photomontages, to enable further assessment of the siting of individual turbines with a view to relocating some of the turbines elsewhere within the project site.*

Response summary:

As mentioned in Comment 8 response summary, additional fieldwork has been undertaken to assist in addressing this comment. All specific locations outlined in comment 8 were visited, including sites within Augusta. Photomontages have been prepared for all four locations listed in comment 8. An amended layout has also been explored in relation to views from Augusta (refer to Appendix C and comment 11 response for further detail).

In addition, a photomontage overlay has been prepared from the Viewpoint 01 Augusta Hotel comparing the proposed 250 m tip height turbines with 235 m tip height turbines (refer to Viewpoint 01 Augusta Hotel in Appendix B and Appendix C), illustrating that lower wind turbines may not result in a substantial reduction in visual impacts from this viewpoint location.

Response to point 1:

As outlined in comment 8 response, 4 additional photomontage and red overlays along with viewpoint assessment commentary has been provided for the specified locations on Scott River Road, centre of Augusta, Town Beach, and Albany Terrace. Refer to comments 8 response.

Response to point 2:

The Proposal Site and Components Plan has been updated with individually numbered turbines (refer to Figure 1). VP01, VP02, VP04, VP10, VP11 and VP12 photomontages provided in the Proposal LVIA

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

(2025), as well as the other viewpoints (OVPs) photomontage prepared for the four views suggested in comment 8, have been updated with individual turbine numbers. Refer to Appendix B for photomontages with individual turbine numbering.

4.5 Comment 10

DPLH comment:

Two measures to mitigate visual impacts are recommended:

1. *Relocate approximately three of the outlying turbines at each of the north and south ends of the layout, using numbered photomontages to identify the particular turbines which have the greatest impact.*
2. *Plant local trees to form a screen along the Scott River Road and Governor Broome Road boundaries of the project site (see Photos 5-7).*

Response to point 1:

Amended turbine layout

A 3D model of the wind farm and surrounding area was explored from various key viewpoint locations to investigate the potential to relocate wind turbines to reduce visual effects. As such, an alternative turbine layout was prepared, which can be found in Appendix C, Figure 1-A. These investigations found that there was an opportunity to adjust the layout in order to reduce visual clustering of turbines and spread the visual effects across the view more evenly, subsequently removing visual 'gaps' within key views. Five turbines were relocated, including at the northern, southern and eastern extents of the layout (turbine 3, 5, 6, 10 and 20).

To support this revision, updated numbered photomontages have been prepared from viewpoints assessed in the Proposal LVIA (2025), including VP01 (Augusta Hotel), VP02 (Augusta Residential), VP10 (Albany Terrace Beach Access) and VP12 (Colourpatch / Seine Bay), as well as requested viewpoint locations provided as part of this response memo, OVP01 (Scott River Road), OVP02 (Centre of Augusta), OVP03 (Town Beach), and OVP04 (Albany Terrace). These photomontages identify the turbines with the greatest visual influence and demonstrate the effect of the revised layout on key public views (Appendix C).

Revised ZTV mapping has been undertaken for the alternative layout hub and tip heights, which is also provided in Appendix C, Figures 2-A and 3-A respectively.

See below for viewpoints OVP01 (Scott River Road), OVP02 (Centre of Augusta), and OVP04 (Albany Terrace), reflecting the visual change associated with the alternative layout. There was no change associated with OVP03 (Town Beach), as there would be no view of the wind farm.

OVP01 - Scott River Road

Photo 13 Proposed view from OVP01 Scott River Road

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

Photo 14 *Proposed view from OVP01 Scott River Road, alternative layout*

OVP02 - Centre of Augusta (Ellis Street, Blackwood Avenue)

Photo 15 *Proposed view from OVP02 Centre of Augusta*

Photo 16 *Proposed view from OVP02 Centre of Augusta, alternative layout*

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

OVP04 - Albany Terrace

Photo 17 ***Proposed view from OVP04 Albany Terrace***

Photo 18 ***Proposed view from OVP04 Albany Terrace, alternative layout***

Response to point 2:

The Department's comments regarding potential screen planting along Governor Broome Road and Scott River Road are noted.

Key public views of the Proposal are primarily experienced from Augusta, located at distance to the west of the project site. For tall infrastructure such as wind turbines and transmission lines, landscape screening is generally more effective when located closer to the receptor rather than adjacent to the project components; therefore, planting within or immediately adjacent to the project site would not meaningfully address longer-range views from Augusta or other distant receptors.

Potential roadside planting along Scott River Road and Governor Broome Road within the project site may be considered where it is limited, selective and locally appropriate, and where it would reduce turbine visibility for nearby road users and contribute to improved landscape and environmental values. To be effective, such planting would need to be located either within the road corridor or within the project site, with potential land access or ownership considerations. Currently, discontinuous linear roadside vegetation corridor is present within the road reserve along both roads, providing visual screening and open views to the landscape. An existing overhead distribution power line along both roads adjacent to the Proposal boundary may also need considering.

The Local Planning Strategy and Local Planning Scheme No.1 emphasise maintaining the open rural character and valued long-range views from travel route corridors across agricultural land. Extensive or continuous screen planting has the potential to block views across farmland and alter the established visual character of the road corridor, which would conflict with the intent of these policies. Vegetation screening may therefore only be appropriate where it is limited, selective and reinforces existing vegetation patterns. For example, roadside planting may be appropriate as a continuation of existing linear vegetation within the road corridor, adjacent to areas with visual exposure to the nearest turbines, as shown in VP05 Scott River

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

Road within the Proposal LVIA (2025). Where appropriate, a simplified Landscape Plan may be developed at later design stages to address locally identified visual impacts in a targeted manner.

4.6 Comment 11

DPLH comment:

The proponent concludes that a grid layout would be preferable to the proposed irregular layout, on the basis that this is more appropriate for the open, agricultural setting. This is consistent with Scottish wind farm guidance which recommends a regular layout for wide open and level landscapes with regular agricultural fields.

It is noted that there is a significant proportion of woodland vegetation, so the landscape is not fully 'open', and the overall landscape setting is gently undulating, not level, partly due to clumps of trees set amongst areas of lower dune and wetland vegetation. From distant viewpoints such as Augusta and the south coastline of town, the horizon-line is not level, but hillocky, with variations in colour and texture of remnant vegetation. Although the turbines are located in an agricultural setting, from the significant viewpoints the wind farm appears to be located within a broadly natural wider landscape. Therefore, the currently proposed irregular layout is considered to be the most suitable and should therefore be retained.

Response:

The Department's comments regarding turbine layout are noted. While the turbines are located within agricultural land, the wider landscape is gently undulating and includes woodland, wetland vegetation and a hillocky horizon when viewed from distant viewpoints such as Augusta and the southern coastline. From these sensitive viewpoints, the wind farm is perceived within a broader, predominantly natural landscape rather than a level, open agricultural plain. In this context, the retained irregular layout is considered more responsive to landform and vegetation patterns and better integrated with the wider landscape character. The existing layout pattern has therefore been retained, however with the adjusted layout of 5 turbines.

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

DBCA comments

Ref	Feedback
1	The methodology, process and outcomes as presented in Attachment 4 - Referral Supporting Documents (RSD), Ecological Australia 2025 and the main assessment documented in Proposed Wind Farm - Scott River Landscape and Visual Impact Assessment by GHD 2025 are generally supported given: – The methodology aligns with industry standards using established methodologies and approved documents, including the WAPC *Visual Landscape Planning in Western Australia: a manual for evaluation, assessment, siting, and design*. – Suitable Landscape Character Units (LCU) were developed highlighting the variety of landscape types that surround the project. These were then extended to describe the public's acceptance of visual change to the landscape quality of those LCUs. – The Zones of Visual Influence (ZVI) capture where the wind farm infrastructure will be seen across the landscape.
2	Views specific to DBCA managed lands are largely absent, including the Cape to Cape Track, recreation sites and activity on and along the Blackwood River / Scott River and Hardy Inlet, and the Cape Leeuwin Lighthouse (from the ground and the top viewing deck). Assessing more receptors could help to identify small scale or local mitigation measures.
3	The majority of the assessment focuses on the WTGs as these are the largest elements in the landscape - this includes the mapping of ZVIs. Other infrastructure worthy of the same detailed assessment as the WTGs include the access and maintenance roads, transmission line, meteorological masts and the substation, given they are of significant scale or length in the landscape and will be seen in a different context to the towers. Individual ZVIs for the other infrastructure will determine where these elements will be seen from the landscape and sensitive visual receptors. These ZVIs could inform mitigation measures that could reduce the individual visual impact of these items and therefore reduce the collective total visual impact for the project as a whole.
4	The report notes that there will be an impact to the quality of the visual landscape from this proposal. Because of this acknowledgment, and the degree of the impact, the proposed mitigation measures appear limited. More advanced assessment of mitigation measures, based on a more detailed assessment of sensitive visual receptors, infrastructure assessment and associated ZVI may provide more protection of landscape quality and the viewer's sensitivity to the proposal.
5	1. The viewing deck at the Cape Leeuwin Lighthouse sits ~40m above ground, and the base of the lighthouse is ~ 20m above sea level. As this is a significant tourism site it would warrant an assessment. 2. The Visual Impact Assessment identifies that this proposal will be highly visible in the surrounding landscape and that there is limited scope in most instances to reduce this visual impact. 3. The proposed mitigation measures are limited and reflect the high impact of the proposal from scattered receptor sites but do not consider local or small-scale mitigation measures or interventions to protect visual quality from the entire landscape. 4. Potential mitigation measures to address landscape-wide and locally identified impacts could include: – Road edge vegetation screening along surrounding travel route corridors of all types managing and screening views along the length of these corridors. – Localised screening surrounding the ancillary infrastructure. – Broadscale landscape planting within the project area.

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

DPLH comments

	Feedback
6	The following comments and attached photos are provided on the visual impact of the proposed Scott River wind farm and the proponent's Landscape and Visual Impact Assessment (LVIA). The comments are made with reference to the WAPC *"Visual landscape Planning in Western Australia – a manual for evaluation, assessment, siting, and design"* and the Department of Planning, Lands and Heritage GIS "InQuiry", as well as knowledge of the area. The viewshed mapping indicates that the turbines may be extensively visible. However, it is likely that roadside trees would obscure views from two of the three major roads to Augusta (Bussell Highway and Caves Road), and views from narrow, treelined secondary roads oriented generally towards the site eg Challis Road, and Fisher Road, which is used to access the settlement on Molloy Island.
7	Analysis using Google Streetview images indicates that the greatest visibility is likely to be from: – private residences in Augusta which have northeasterly views, comprising • elevated sites • sites along the shore of the Blackwood River, Hardy Inlet, or ocean – public recreation sites on the western banks of the Blackwood River (e.g. the river end of Howe Road), Hardy Inlet (e.g. end of Ellis Road) or open ocean (e.g. Flinders Bay). – from western portions of Hardy Inlet. – from the open ocean. It also appears that there will also be significant visibility from Augusta's main intersection at Blackwood Avenue and Ellis Street, other locations along Blackwood Avenue, and from Scott River Road and Governor Broome Road, which are at the project site and are used to access East Augusta and more distant coastal areas e.g. for recreational purposes.
8	**Assessment report - method and conclusions** – The method used for the assessment is generally suitable, with two exceptions as below. Several important viewpoints have been overlooked in analysis: 1. Travelling east along Scott River Road leaving East Augusta, in locations where the vegetation is naturally low (see attached Photo 1). 2. Main street intersection, Ellis Street moving downhill into the intersection with Blackwood Avenue (Photo 2 – two examples). 3. Main town foreshore opposite East Augusta (Photo 3). 4. Albany Terrace, close to the opening between Hardy Inlet and the ocean (Photo 4). – Reference to the three primary visual management objectives as being 'protection', best practice, and 'engagement', but the third objective advised in the WAPC's manual is 'enhancement', not 'engagement'. It is beneficial to identify potential engagement opportunities, but this should occur elsewhere in the report and 'enhancement' should be addressed. This objective would justify introducing roadside tree planting to Scott River Road and Governor Broome Road, within the project site, as it would reduce turbine visibility from the closest viewpoints, and would enhance environmental values in the landscape
9	**Further analysis advised** The significance of the project's potential visual impacts on the tourist town of Augusta warrants further work by consultants: 1. Provision of photomontages for the additional viewpoints listed above, possibly using a simpler method to produce wireframe images but with vegetation overlaid. 2. Provision of a project site plan showing individually numbered turbines, with numbers also shown on the existing and new photomontages, to enable further assessment of the siting of individual turbines with a view to relocating some of the turbines elsewhere within the project site.
10	**Mitigation measures** Two measures to mitigate visual impacts are recommended: 1. Relocate approximately three of the outlying turbines at each of the north and south ends of the layout, using numbered photomontages to identify the particular turbines which have the greatest impact. 2. Plant local trees to form a screen along the Scott River Road and Governor Broome Road boundaries of the project site (see Photos 5-7).
11	**Conclusions**

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

	Feedback
	The proponent concludes that a grid layout would be preferable to the proposed irregular layout, on the basis that this is more appropriate for the open, agricultural setting. This is consistent with Scottish wind farm guidance which recommends a regular layout for wide open and level landscapes with regular agricultural fields. It is noted that there is a significant proportion of woodland vegetation, so the landscape is not fully 'open', and the overall landscape setting is gently undulating, not level, partly due to clumps of trees set amongst areas of lower dune and wetland vegetation. From distant viewpoints such as Augusta and the south coastline of town, the horizon-line is not level, but hillocky, with variations in colour and texture of remnant vegetation. Although the turbines are located in an agricultural setting, from the significant viewpoints the wind farm appears to be located within a broadly natural wider landscape. Therefore, the currently proposed irregular layout is considered to be the most suitable and should therefore be retained.

This Technical Memorandum is provided as an interim output under our agreement with SynergyRED. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way.

The Power of Commitment

Appendix C: DPLH Community SVA and LVIA

1 SOCIAL IMPACT (ASSOCIATED WITH VISUAL IMPACT)

The Shire, through an RFI, has requested further detail on how community perspectives relating to landscape and visual impact have been considered and mitigated. The Shire has noted the high level of submissions during the DA public consultation period relating to visual impact.

To support this, SynergyRED has prepared the following updated information, which incorporates the completed LVIA, responses to feedback raised in public submissions, insights from subsequent engagement activities, and how we have addressed the concern.

1.1 Summary of the Social Values Assessment (SVA)

Synergy's Social Values Assessment (SVA) was delivered to support the engagement and decision making for the pre-feasibility stage of the proposed wind farm in Scott River. The SVA was delivered early in the feasibility assessment process, prior to the Landscape and Visual Impact Assessment (LVIA). This timing allowed the SVA findings to influence project decisions made throughout the feasibility assessment.

The SVA gathered evidence to identify key social impacts (both negative and positive) that may result from the proposal, focusing on:

- Community and stakeholder engagement perceptions
- Workforce management
- Housing and accommodation
- Local business and industry procurement
- Community health and wellbeing

In investigating the above potential social impacts, visual amenity was also explored as a potential impact. The following sections of the SVA discussed visual impact and suggested recommendations:

- **6.3.6 Sense of Place** – Feedback from participants suggested perceived impacts on amenity specific to visual and noise were a key area of interest to the community.
- **6.5.6 Way of Life** – Changes to visual amenity and potential for turbine lighting were cited among the main concerns from participants. The section also notes opposing opinions that the Scott River location is able to accommodate the visual impact or a wind farm without adversely compromising way of life, or significant landscape values.
- **7.2 Project Scale and Size** – It was recommended that visual amenity should be factored into decision-making around project size and scale.
- **7.5 Clearing Requirements** – It was recommended that clearing of any previously disturbed or undisturbed areas should consider the high social value placed on the visual amenity.

It was noted in the SVA that, at the time of the assessment, Synergy was delivering work to profile the potential visual impacts of the project. Participants in both the qualitative and quantitative stages of the SVA highlighted a strong interest in viewing the outcomes of these studies. Residents of Molloy Island highlighted their interest in understanding potential impacts from turbine lighting and other participants were interested in the potential visual impacts from the Hill View Road Lookout in Augusta, the Augusta Hotel and other local and tourist viewing areas. These potential impacts have since been shared with the community, as outlined in section 1.2.2 below.

1.2 Community feedback on visual impact

Synergy recognised the importance placed on visual amenity by the community and delivered the below activities following the completion of the SVA.

1.2.1 Landscape and Visual Impact Assessment

An initial Landscape and Visual Impact Assessment (LVIA) was delivered in January 2025 to evaluate how the proposed turbines and associated infrastructure could change the existing landscape character and the views experienced by the community. The LVIA included photomontages from the following 12 viewpoints, many of which were selected due to having been highlighted as areas of importance by participants of the SVA:

- Augusta Hotel
- Augusta residential
- Hillview Road lookout
- Molloy Island adjacent
- Scott River Road
- Warner Glen Road
- Brockman Highway residential
- Karridale residential
- Glenarty Road
- Albany Terrace beach access
- Flinders Bay jetty
- Colourpatch

1.2.2 Community engagement

Following the completion of the LVIA, outcomes were shared with the community through the following means:

- Community drop-in sessions (December 2024 and September 2025)
- Mail-out to all landowners within 5 km (March 2025)
- Synergy website
- Eleven editions of the Pelican Post
- Emails to subscribers
- Augusta Community Resource Centre, Library, and Synergy Drop-In Office

During these engagements, community feedback received included:

- Concerns regarding visual change
- Neutral responses
- Lack of concern regarding the visual change
- Acceptance of visual impacts considering renewable-energy benefits

This feedback was noted in engagement summaries, internally and publicly and shared with the project team for consideration of mitigation.

1.2.3 Public submissions

As part of the public comment period led by the Shire of Augusta Margaret River for Synergy's Development Approval application, 531 submissions were received with 153 submissions in support of the project, 8 submissions indifferent and 370 opposed.

Of the 531 submissions, 204 cited visual impact as a contributing factor for their objection to the proposal. The key concerns raised regarding visual impact included:

- Perceived incompatibility with the landscape character
- Changes to views from Augusta, Flinders Bay, Scott River, and Molloy Island
- Possible loss of dark sky if lighting is required
- Perceived negative impact on tourism
- Loss of open horizons
- Turbine height and perceived large scale

One hundred and fifty-three submissions were received in support of the proposal, and eight submissions were indifferent. Key comments of support received included:

- Acceptance of visual change
- Appreciation of turbines in the landscape
- Minimal perceived impact by some residents
- Response to community and DPLH submissions

2 RESPONSE TO COMMUNITY SUBMISSIONS

Based on the community and agency feedback regarding the LVIA impacts outlined in Section 1.2.3, additional work was undertaken to meaningfully address the concerns raised, while ensuring refinements remained within the margins of project viability for a site with a complex combination of environmental, technical and planning constraints such as sensitive receptors, transmission lines, roads, lodged heritage sites, landowner exclusion areas, native vegetation and DBCA managed areas..

Figure 5spel below shows the resulting constraint free area.

2.1 Project LVIA history

The initial 30-turbine configuration, developed only for internal feasibility testing, helped identify environmental, social and engineering constraints but was never advanced for planning. Through detailed assessment, the layout was refined to 20 turbines, addressing environmental limits, LVIA sensitivity around Augusta and Hardy Inlet, coastal proximity, noise and shadow-flicker constraints, residential setbacks, constructability and power line capacity.

This one-third reduction constitutes major early-stage visual mitigation: the 30-turbine layout would have placed turbines noticeably closer to waterbodies and coastal viewpoints, increasing apparent turbine height, horizon intrusion and overall visual presence from Augusta and the inlet. Figure 1 and Figure 2 below illustrate the difference between the early 30-WTG concept and the refined 20-WTG layout submitted for assessment.

Figure 1 Albany Terrace - 30 WTG photomontage

Figure 2 Albany Terrace 20 WTG photomontage

2.2 Additional Visual Technical Work Completed

Additional works were undertaken to address the Public and Agency LVIA feedback. This work included additional viewpoint analysis, updated formats have been developed to enhance transparency and ensure visual impacts are accurately understood by the community and decision-makers. These works are outlined in the **Appendix B: Addendum to the LVIA to address agency comments** of the Applicant Response to Shire, Agency and Public Submissions. The assessment method, viewpoints, camera settings and rendering process were unchanged; only the turbine geometry was revised

2.3 Relocating turbines

DPLH provided feedback relocate three of the outlying turbines at each of the north and south ends of the layout, using numbered photomontages to identify the turbines which have the greatest impact.

3 WTGs - North

Relocation all 3 turbines from the North WTGs was deemed not feasible for the following reasons

- The wind resource in the North is better than most of the other areas and relocating the turbines would have an economic impact to the overall business case for the wind farm
- The northern landowner was an initial project stakeholder from inception, and this would effectively cut them out of the project they have supported for over 3 years.
- The three northern turbines are furthest away from most key viewpoints and generally appear smaller and have less impact than the others, they are also not visible from a few locations.
- The northern area of the site, furthest from the rivers contains land with less complex geotechnical conditions and is therefore more viable and cost effective for the project to build on
- The site is already heavily constrained due to complex combination of environmental, technical, and planning constraints that must be balanced when determining appropriate turbine placement, see Figure 5 below.
- Reduced energy production associated with placing turbines closer together if moved amongst the other 17 to the south.

3 WTGs - South

Assessment of relocating all three of the outlying turbines (WTG 18, WTG 19 and WTG 20) in the south showed that only WTG 20 produced a meaningful improvement in visual impact. The relocation of WTG 18 and WTG 19 delivered only minimal change across key viewpoints and from some angles, no change.

Relocating WTG 20, shifted the southernmost turbine approximately 600 m further from the site's southern boundary and increasing its separation from the inlet and ocean, which reduced its prominence in coastal and water-facing views.

While this relocation improved the southern extent of the layout, it did not fully resolve the broader feedback received. Additional analysis was therefore undertaken to determine whether relocating other turbines could further reduce visible gaps and improve overall skyline cohesion across key viewpoints.

Relocation of Turbines T3, T5, T6, T10, T20

Through an iterative process, five WTGs were relocated (T3, T5, T6, T10, T20) to reduce visual clustering, smooth the skyline, and remove visual gaps in key outlooks from Augusta town, Albany Terrace, Scott River Road and Town Beach as shown below in Figure 3. Figure 4 shows where the WTGs T3, T5, T6 and T20 were relocated to.

Relocating the WTGs reduced the overall visual exposure of the wind farm. The adjustments pull the most prominent edge turbine further inside the site to create a cleaner, more consistent profile in views from Augusta, Albany Terrace and Scott River Road.

Relocating T20 delivers the greatest improvement by moving the southernmost turbine approximately 600 m further inland, increasing its setback from the inlet. All relocations remain within the available constraint-free area.

Figure 6 and Figure 7 below show the difference in view from Albany Terrace. and impact improvement. Other photomontages and associated viewpoint assessments for the alternative layout are presented in the Appendix B.

2.4 Commitment to Screening and Visual Mitigation

SRED is committed to offering targeted visual screening, vegetation strategies, or similar low-impact mitigation measures to adjacent landowners should these prove effective and appropriate in consultation with affected parties.

2.5 Assessment of Reduced Turbine Tip Heigh

A comparative assessment was undertaken to evaluate whether lowering turbine tip height from 250 m to 235 m would reduce visual impacts. Photomontage comparisons prepared for the LVIA addendum show negligible differences between the two heights, with the reduced tip height producing no material change in turbine visibility, prominence, or overall impact in any of the assessed viewpoints. Based on this assessment, lowering turbine height does not provide a meaningful visual benefit and therefore does not alter the LVIA outcomes.

2.6 Model refinement

For the LVIA addendum, the turbine model was updated to use the correct tower diameters, blade chord lengths and nacelle dimensions supplied for the project, replacing the simplified model used in the original LVIA. The assessment method, viewpoints, camera settings and rendering process were unchanged; only the turbine geometry was revised. This update provides a more accurate representation of the turbines and explains the difference in appearance between the original and updated photomontages

Executive summary

Synergy Renewable Energy Developments Pty Ltd (SynergyRED) is proposing to develop a wind farm at Scott River in southwest WA (the Project). A noise impact assessment (NIA) for the operation of wind turbine generators (WTGs) has been conducted to support the relevant environmental and planning approvals for the Project.

A dual criteria approach was adopted for this NIA which involved deriving the criteria based on both the WA *Environmental Protection (Noise) Regulations* 1997 and SA *Wind Farm Environmental Noise Guidelines, 2021* using the background noise monitoring data collected at seven locations around the Development Envelope. The project aims to comply with both sets of criteria.

A 3D environmental noise model of the Project was created to predict noise levels at the adjacent noise sensitive receptors, using the ISO9613-2:2024 calculation algorithm implemented in SoundPLAN (v 8.2) software. A proposed 20 WTG layout with a hub height of 164 metres was considered in the 3D noise model. The turbine source noise input data was based on the overall sound power level and the 1/3 octave source spectra data provided by SynergyRED, who selected an unmitigated wind turbine so that the noise model is conservative.

Noise modelling results show that predicted noise levels from turbine operation at adjacent noise sensitive receptors are expected to comply with the noise criteria in accordance with both WA Noise Regulations (1997) and the SA Guidelines (2021).

SynergyRED may consider additional noise mitigation measures to minimise noise impact from the proposed development. It may include further optimisation of the wind farm layout and consideration of other types of WTGs that are characterised by lower noise emission at wind speeds that are critical for noise compliance.

The wind turbine manufacturers aim to design modern WTGs so they are free from tonality. The report considers noise mitigation measures in case this characteristic is present. Presence of such a characteristic at large separation distances is unlikely, however may be confirmed only during post construction monitoring.

This report summarises the results of the NIA. This report is subject to and must be read in conjunction with the limitations set out in Section 1.4 and the assumptions and qualifications contained throughout this report.

Glossary

Term	Description
Background noise level	The measured background noise level at a noise receptor location as per the SA Guidelines.
dB	Decibel, which is 20 times the logarithm (base 10) of the ratio of a given sound pressure to a reference pressure; used as a unit of sound.
dB(A)	A-weighted decibel measurement to represent the sound frequency sensitivity of the human ear.
Downwind direction	Wind direction for which a noise receptor location is downwind of the nearest WTG as per the SA Guidelines.
Downwind background noise level	Measured background noise level at a noise receptor location for winds within ±45° of the downwind direction as per the SA Guidelines.
Dwelling	Building used for a noise sensitive purpose,
DWER	WA Department of Water and Environmental Regulation
EPA	Environmental Protection Authority of Western Australia
Cut-in wind speed	Wind speed at which the turbine starts power production
GHD	GHD Pty Ltd
IEC 61400-11:2012	International Standard published by the International Electrotechnical Commission regarding wind turbines.
IF	Influencing Factor which is calculated to determine the noise criteria at a specific noise receptor location and depends on the ratio of commercial and industrial land zoning and the presence of major and secondary roads within 100 metres and 450 metres of the point under consideration.
ISO 9613-2: 2024	Recent version of international standard *ISO9613-2:2024 Acoustics – Attenuation of sound during propagation outdoors Part 2: General method of calculation* (ISO9613-2), used for noise propagation modelling by considering the distance between source and noise sensitive receptor topography, ground attenuation, atmospheric absorption at different frequencies and meteorological conditions favourable to noise propagation.
L_{A1}	A-weighted sound pressure level that is exceeded for 1 percent of the measurement period.
L_{A10}	A-weighted sound pressure level that is exceeded for 10 percent of the measurement period.
L_{Amax}	Maximum A-weighted sound pressure level recorded during a specified time period.
$L_{Aeq,10\text{-}min}$	The predicted equivalent noise level adjusted for tonality over a 10-minute period.
$L_{A90,10\text{-}min}$	Measured ambient background noise in the absence of the noise under investigation that is equalled or exceeded for 90 percent of the measurement time interval.
$L_{Aeq\ (time)}$	Equivalent sound pressure level: the steady sound level that, over a specified period of time, would produce the same energy equivalence as the fluctuating sound level actually occurring.
L_{Afast}	A-weighted sound level measured with a fast time constant of 125 milliseconds.
L_{Aslow}	A-weighted sound level measured with a slow time constant of 1 second

Term	Description
L_{Apeak}	A-weighted peak sound level. It represents the highest instantaneous sound pressure level measured.
Mitigation	Reduction in severity.
NIA	Noise impact assessment
NMP	Noise monitoring point
Premises	Residential, industrial or other premises of any kind whatsoever and includes land, water and equipment
Project	Proposed wind farm at Scott River in southwest WA
Rated power wind speed	Lowest hub height wind speed at which the WTG reaches its rated power
SA Guidelines	*SA Wind Farm Environmental Noise Guidelines, 2021*
Noise receptor	A noise modelling term used to describe a location/premises used for different purposes where the noise by a specific source is received, measured, predicted or mitigated. The noise receptor types vary depending on the usage of the premises e.g. sensitive, non-sensitive, involved, or not-involved.
Noise sensitive receptor	A noise modelling term used to describe a building or dwelling used for residential or accommodation purposes.
Non-sensitive noise receptor	A noise modelling term used to describe a building not used for residential or accommodation purposes e.g. a shed.
Involved noise sensitive receptor	A noise sensitive receptor in a parcel of land that accommodate part of a wind farm development.
Not-involved noise sensitive receptor	A noise sensitive receptor in a parcel of land that do not accommodate any part of a wind farm development.
Position statement	The Position Statement: Renewable Energy Facilities (WAPC, March 2020) outlines the Western Australian Planning Commission's guidelines for the development and assessment of renewable energy facilities.
pW	Picowatt, which is a unit of power equal to one trillionth of a watt
Sound pressure level (SPL)	The change in air pressure above and below the average atmospheric pressure caused by a passing pressure wave; this is then converted to decibels and can be abbreviated as SPL or L_p.
Sound power level (SWL)	Represents the total noise output of the plant or equipment. Also presented as L_{wA} or SPW.
SynergyRED	Synergy Renewable Energy Developments Pty Ltd
The Regulations	*Environmental Protection (Noise) Regulations, 1997*
Tonal noise	Noise with perceptible and definite pitch or tone.
TF	Transport Factor
Wind speed bin	±0.5 m/s at each integer of wind speed from cut-in to cut-out.
WAPC	Western Australian Planning Commission
WHO	World Health Organization
WTG	Wind turbine generator

1. Introduction

1.1 Background

Synergy Renewable Energy Developments Pty Ltd (SynergyRED) is currently investigating development of a new wind energy project at Scott River in southwest WA (the Project). The Project has the potential to connect to the Southwest Interconnected System.

The Project Development Envelope is located at Scott River in southwest WA, predominantly surrounded by rural lands developed for agricultural purposes with small areas of remnant and regenerated vegetation (Figure 1.1). The development Envelope is generally bound by the following roads:

– Brockman Highway
– Dennis Road
– Milyeannup Coast Road
– Scott River Road

SynergyRED engaged GHD Pty Ltd (GHD) to undertake an environmental noise impact assessment (NIA) for the Project.

1.2 Purpose of this report

This report summarises the results of an operational NIA for the Project, including background noise monitoring, noise modelling and impact assessment in accordance with applicable regulatory requirements.

1.3 Scope of works

The scope of works for this assessment is as follows:

– Background noise monitoring:
  - Review of adjacent noise receptor locations to identify representative noise receptor locations to conduct noise monitoring.
  - Five months of unattended background noise monitoring at seven representative noise receptor locations, with one local weather monitoring station (wind speed, wind direction and rainfall) deployed at one of the seven representative noise receptor locations.
  - NIA based on dual criteria. The criteria were derived primarily based on the *Environmental Protection (Noise) Regulations 1997* (the Regulations). The baseline noise monitoring results were used to determine criteria in accordance with the SA Environment Protection Authority's (SA EPA) *Wind Farms Environmental Noise Guidelines* (SA Guidelines, 2021). The criteria derived based on the SA Guidelines were used as secondary noise criteria for NIA and details of the background noise data processing are provided in Appendix B.
– Noise modelling of the Project:
  - Development of 3D noise model of the Project and surrounding area, incorporating topographic data and all identified noise receptors.
  - Review noise emission data for the candidate turbines being considered for the Project.
  - Conduct noise impact modelling of the Project site according to the prediction procedures as specified in SA Guidelines using ISO9613-2:2024 modelling algorithm.
  - Assess the compliance margin for the proposed layout at noise receptors based on the modelling results. In the case that potential non-compliance is predicted at any noise sensitive receptor, liaise with Project team to discuss mitigation strategies (e.g. changes to turbine layout) to ensure compliance can be achieved. If non-compliance with relevant criteria is still predicted, explore further mitigation measures such as turbine noise curtailment, to achieve the noise criteria
  - Assess operational noise for the substations in accordance with the Regulations.
– Provide a NIA report, summarising the findings relevant to the agreed layout within the scope components above.

1.4 Limitations

This report has been prepared by GHD for SynergyRED and may only be used and relied on by SynergyRED for the purpose agreed between GHD and SynergyRED as set out in Section 1.3 of this report.

GHD otherwise disclaims responsibility to any person other than SynergyRED arising in connection with this report. GHD also excludes implied warranties and conditions, to the extent legally permissible.

The services undertaken by GHD in connection with preparing this report were limited to those specifically detailed in the report and are subject to the scope limitations set out in the report.

The opinions, conclusions and any recommendations in this report are based on conditions encountered and information reviewed at the date of preparation of the report. GHD has no responsibility or obligation to update this report to account for events or changes occurring subsequent to the date that the report was prepared.

The opinions, conclusions and any recommendations in this report are based on assumptions made by GHD described in this report (refer to Section 1.5 of this report). GHD disclaims liability arising from any of the assumptions being incorrect.

1.5 Assumptions

This report is subject to the following general assumptions at the time of writing this report:

All information provided by SynergyRED, including relevant Project location and noise receptor information, wind turbine generator (WTG) layout and specification, wind data from the Project's meteorological mast, and relevant noise data are deemed correct.

All parameters used in the assessment and other relevant data are based on best estimates using information provided by SynergyRED and other relevant sources.

Operating hours for the wind farm would be 24 hours a day, seven days a week.

It is assumed that noise emission from WTGs for the development do not exhibit tonal character that evokes noise level adjustment in accordance with SA Guidelines.

Hub heights for the layouts of proposed WTGs used in the current assessment were assumed to be 164 metres above ground level.

Due to the substantial separation distance to the nearest noise receptors (the nearest noise receptor to the substation is located more than 1700 metres away) it is not expected that vibration impacts would be relevant during the operation of the Project.

2. Assessment criteria

2.1 Operation of wind turbines

Specific noise guidelines are applicable to assessment of noise from wind farms due to their unique noise generating characteristics in conjunction with typically low ambient noise surroundings.

Following advice from the Department of Water and Environmental Regulation (DWER), the *Environmental Protection (Noise) Regulations 1997* (the Regulations) will be used as the primary noise criteria for the NIA.

In addition, and for completeness, the SA Guidelines will be also used to derive the secondary noise criteria based on the background noise monitoring data, this allows to also compare predicted project noise levels with this secondary criteria which historically has been used in Western Australia to assess wind farm developments.

2.1.1 Environmental Protection (Noise) Regulations 1997

Noise emissions from the operation of WTG and associated substation will be assessed against criteria according to the *Environmental Protection (Noise) Regulations 1997* (the Regulations).

Regulation 8 sets out the maximum allowable noise levels (assigned noise levels) based on different time of day and land use (i.e. noise sensitive premises, commercial and industrial type premises), applicable at the premises receiving the noise. Various parameters of the assigned noise levels (L_{A10}, L_{A1} and L_{Amax}) also depend on influencing factor (IF) which are calculated in accordance with Schedule 3 of the Regulations, taking into account the area of industrial and commercial land and the presence of major and secondary roads within a 100 m and 450 m radius around the noise receptor.

A summary of the assigned noise levels from Regulation 8 is presented in Table 2.1.

Table 2.1 Assigned noise levels based on the Environmental Protection (Noise) Regulations 1997

Type of premises receiving noise	Time of day	Assigned noise level. dB(A)		
		L_{A10}	L_{A1}	L_{Amax}
Noise sensitive premises: Highly sensitive area (i.e. noise sensitive premises at locations within 15 metres of a building directly associated with a noise sensitive use)	7:00 am to 7:00 pm Monday to Saturday (Day)	45 + IF	55 + IF	65 + IF
	9:00 am to 7:00 pm Sunday and public holidays	40 + IF	50 + IF	65 + IF
	7:00 pm to 10:00 pm all days (Evening)	40 + IF	50 + IF	55 + IF
	10:00 pm on any day to 7:00 am Monday to Saturday and 9:00 am Sunday and public holidays (Night)	35 + IF	45 + IF	55 + IF
Noise sensitive premises: Any area other than highly sensitive area (i.e. Noise Sensitive premises at locations further than 15 metres from a building directly associated with a noise sensitive use)	All hours	60	75	80
Commercial premises	All hours	60	75	80
Industrial and utility premises other than those in the Kwinana Industrial Area	All hours	65	80	90

2.1.1.1 Influencing factor

Influencing factors (IFs) have been calculated and used to determine assigned noise level criteria as presented in Table 2.2 for nearest noise receptors (refer to Figure 3.5).

Schedule 3 of the Regulations details the process to determine the IF for noise sensitive premises, which can be summarised as the following steps:

1. Obtain a Council zoning map covering an area up to 500 m from the receiving location.
2. Draw two circles around the receiving point, of 100 m radius and 450 m radius.
3. Determine the percentage of each circle that is taken up with industrial and commercial zonings. Note that the industrial and commercial areas in the inner circle are also counted in the outer circle.
4. Add the percentages up as follows:
   - (Percent industrial in small circle + percent industrial in a large circle) x 1/10 = I
   - (Percent commercial in small circle + percent commercial in large circle) x 1/20 = C
5. Determine the transport factor (TF) as follows (Note – TF cannot be more than 6):
   - Major road (more than 15,000 vehicles/day) in small circle, TF = 6
   - A major road in a large circle, TF = 2
   - For each secondary road (6,000 - 15,000 vehicles/day) in small circle, TF = 2
6. Add I, C and TF from steps 4 and 5 above to obtain the IF (i.e., IF = I + C + TF), and
7. Fill in the table of assigned levels by adding in the IF to obtain the L_{A10}, L_{A1} and L_{Amax} assigned levels.

Table 2.2 summarises the list of noise receptors, their coordinates and calculated IFs surrounding the Development Envelope.

[1] R12 is a commercial building, and in agreement with the landowner, R11, R25, R26 and R27 will not be used for residential, or accommodation purposes when the wind farm is built. For these reasons, these premises are considered to be "Non-sensitive" and are not considered within the NIA.

[2] R17 and R18 are involved noise sensitive receptors (participating landowners).

2.1.1.2 Annoying noise characteristics

Regulation 7 requires that the noise character received at noise sensitive receptors must be free from annoying characteristics of tonality, modulation, and impulsiveness. If these characteristics cannot reasonably and practicably be removed, then a series of adjustments to the measured or calculated received levels are set out, and the adjusted level must comply with the assigned level. The adjustments are set out in Table 2.3 and are further defined in Regulation 9(1). These adjustments are cumulative up to a maximum of 10 dB in the absence of music in the received sound (for a wind farm project music is not expected to be present in the emitted sound).

Table 2.3 Table of adjustments

Adjustment where noise emission is not music (Adjustments are cumulative to a maximum of 15 dB)		
Where tonality is present	**Where modulation is present**	**Where impulsiveness is present**
+5 dB	+5 dB	+10 dB

– Tonality is defined in Regulation 9(1) as being present where the difference between the A- weighted sound pressure level in any one third octave band and the arithmetic average of the A weighted sound pressure levels in the two adjacent one third octave bands is greater than 3 dB in terms of $L_{Aeq, T}$ where the time period T is greater than 10 percent of the representative assessment period, or greater than 8 dB at any time when the sound pressure levels are determined as $L_{A, Slow}$ levels.

– Modulation is defined as a variation in the emission of noise that:

- Is more than 3 dB $L_{A, Fast}$ or is more than 3 dB $L_{A, Fast}$ in any one third octave band

- Is present for at least 10 percent of the representative assessment period, and
- Is regular, cyclic and audible

– Impulsiveness is defined as present where the difference between $L_{A,\,peak}$ and $L_{Amax,\,S}$ is more than 15 dB when determined for a single representative event.

2.1.2 SA Guidelines

The *Position Statement: Renewable energy facilities (WAPC, March 2020) (Position Statement)* has been used by the Western Australian Planning Commission (WAPC) for wind farm development. For assessment purposes, the Position Statement endorses the use of the SA Guidelines. For completeness, the criteria derived based on the SA Guidelines will also be presented as an additional criterion (secondary criterion) in this study.

To prevent adverse impacts from the WTG noise, the SA Guidelines require that the received noise levels at the relevant noise sensitive receptors be compared to the corresponding background noise.

The predicted equivalent noise level ($L_{Aeq,10\text{-}min}$) adjusted for tonality in accordance with these guidelines, should not exceed:

– 35 dB(A) at relevant noise sensitive receptors in localities which are primarily intended for rural living (equivalent to noise sensitive receptors in accordance with the WA Regulations), or

– 40 dB(A) at relevant noise sensitive receptors in localities in other zones (equivalent to other types of premises apart from noise sensitive premises in accordance with the WA Regulations), or

– Background noise ($L_{A90,10\text{-}min}$) by more than 5 dB(A)

whichever is the greater, at all relevant noise sensitive receptors for wind speed from cut-in to rated power of the WTG and each integer wind speed in between. These criteria apply for both daytime and nighttime hours.

The proposed project site is located within a rural area. Therefore, the 35 dB(A) baseline criterion or the adjusted "background + 5" dB(A) criteria apply to all relevant noise sensitive receptors.

2.1.2.1 Participating landowners

It should be noted the criteria based on SA Guidelines have been developed to minimise the impact on the amenity of premises that do not have an agreement with wind farm developers (i.e. Not-involved noise sensitive receptors).

Wind farm developers commonly enter into agreements with the owners of private land suitable for a wind farm site (participating landowners). The agreement provides the developer with the appropriate siting and generally rewards the landowner with a level of compensation and diversity in their income stream. Notwithstanding this, the Environmental Protection Authority (EPA) cannot ignore noise impacts on the basis that an agreement has been made between the developer and the landowner. Developers cannot absolve themselves of their obligations under the *Environmental Protection Act 1986* (EP Act) by entering into an agreement with a landowner, i.e., the development should not have an adverse effect on the amenity of the area which unreasonably interferes with the enjoyment of the area. In terms of health impacts in particular, the likely exposure level should not result in sleep disturbance.

The World Health Organization (WHO) *Guidelines for Community Noise* (1999) recommend a 30 dB(A) indoor limit to prevent negative effects on sleep. *The Working Group on Noise from Wind Turbines* (Final Report, ETSU for DTI, 1996) recommends the outdoor noise limit of 45 dB(A) after any adjustment for tonality for landowners having financial involvement in the wind farm. As such, if the received noise level from a wind farm does not exceed 30 dB(A) indoor and 45 dB(A) outdoor at an involved noise sensitive receptor having financial involvement with the developers, then it is considered that the development is not having adverse effect on the amenity of the involved noise sensitive receptor.

2.1.2.2 Background noise monitoring

Long term (unattended) noise measurements were conducted at seven noise logger locations in the area within and adjacent to the Development Envelope. The details of the background noise monitoring and data processing are provided in Appendix B.

As can be seen on appended Figures B.2 to B.8 the measured noise levels generally:

– range approximately from 20 dB to 50 dB L_{A90} at NMP02 (at 4 m/s and 15 m/s wind speed respectively), with averaged values ranging from 30 to 45 dB L_{A90}.
– range approximately from 20 dB to 50 dB L_{A90} at NMP03 (at 4 m/s and 15 m/s wind speed respectively) with averaged values ranging from 30 to 44 dB L_{A90}.
– range approximately from 20 dB to 50 dB L_{A90} at NMP04 (at 4 m/s and 15 m/s wind speed respectively) with averaged values ranging from 30 to 39 dB L_{A90}.
– range approximately from 20 dB to 50 dB L_{A90} at NMP05 (at 4 m/s and 15 m/s wind speed respectively) with averaged values ranging from 28 to 38 dB L_{A90}.
– range approximately from 20 dB to 50 dB L_{A90} at NMP06 (at 4 m/s and 15 m/s wind speed respectively) with averaged values ranging from 28 to 42 dB L_{A90}.

Appended Figure B.2 to Figure B.6 show results of postprocessed data and relevant noise criteria calculated in accordance with SA Guidelines 2021. Data postprocessing is performed for arithmetic averages of measured noise levels in integer wind speed bins as per Section 3.4 of the SA Guidelines.

Relevant SA guidelines noise criteria are derived for each of the monitoring locations for wind speeds referenced to hub height of 164 m.

The resulting SA guidelines criteria are summarised in Table 2.4, along with other criteria.

2.1.3 Summary of wind farm noise criteria

Table 2.4 summarises the criteria derived from both the state Regulations and the SA Guidelines. The full list of noise receptors and their types are provided in Table 2.2.

For the NIA of the WTGs operation, the most stringent criteria i.e. 35 + IF, L_{A10} during nighttime will be adopted for the criteria based on the Regulations. Advice provided by DWER is that the assigned levels in the Regulations are unlikely to apply to involved noise sensitive receptors. DWER recommended that 40 dB L_{A10} be used as the criteria for the involved noise sensitive receptors.

The details of the noise monitoring including the representative monitoring locations and the calculations to derive the noise criteria according to the SA Guidelines are provided in Appendix B. It should be noted that R17 and R18 are involved noise sensitive receptors (Section 2.1), the SA Guideline criteria of 45 dB(A) for an involved receptor has been used.

Table 2.4 Noise criteria for 164 m hub height – Dual criteria for wind farm NIA

Noise receptor [1]	Reference of noise criteria	Representative monitoring location [2]	Hub height wind speed, m/s							
			4	5	6	7	8	9	10	11

Noise receptor [1]	Reference of noise criteria	Representative monitoring location [2]	Hub height wind speed, m/s							
			4	5	6	7	8	9	10	11
	SA Guidelines	NMP05	35	35	35	35	35	35	35	36
R13	The Regulations	-	35	35	35	35	35	35	35	35
	SA Guidelines	NMP06	35	35	36	36	37	37	37	38

[1] R12 is a commercial building, and in agreement with the landowner, R11, R25, R26 and R27 will not be used for residential, or accommodation purposes when the wind farm is built. For these reasons, these premises are considered to be "Non-sensitive" and are not considered within the NIA.

[2] Background noise monitoring results and representative monitoring locations are not applicable to the criteria based on the Regulations.

[3] R17 and R18 are involved noise sensitive receptors (i.e. participating landowners) for which 40 dB(A) is used upon advice from DWER.

[4] R17 and R18 are involved noise sensitive receptors for which the SA Guideline criteria of 45 dB(A) for an involved receptor is used.

2.2 Operation of the substation

The noise emissions from the substation proposed for the Project are governed by the *Environmental Protection (Noise) Regulations 1997* (Refer to section 2.1.1 above).

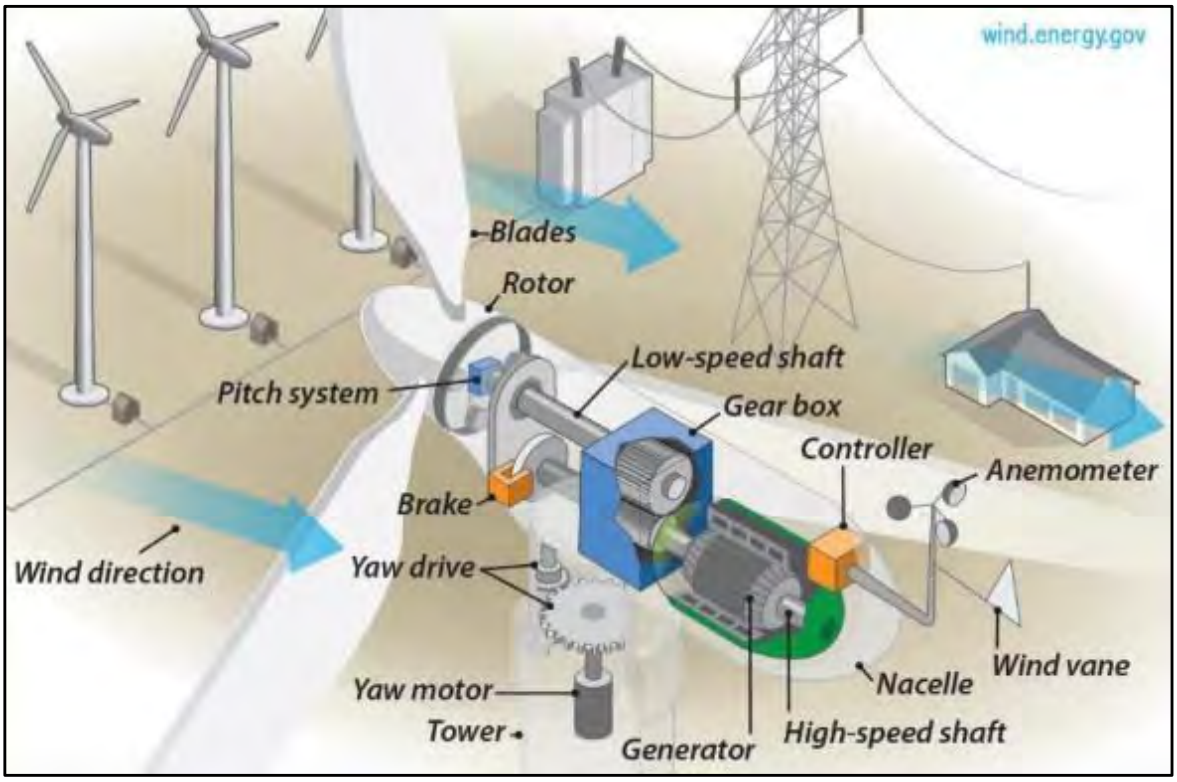
3.1.2 Sources of noise

There are two main groups of noise sources originating from a WTG: mechanical and aerodynamic noise. Sources of mechanical noise include the following (refer to Figure 3.2):

- Gearbox
- Generator
- Yaw drives
- Cooling fans
- Auxiliary equipment
- Brakes (when applied)

Sources of mechanical noise tend to be both tonal and broadband in nature since the emitted sound is associated with the rotation of mechanical and electrical equipment. However, in modern turbines, mechanical noise is not usually audible above aerodynamic noise at greater separation distances. Mechanical noise can be effectively reduced through standard noise control practices such as vibration isolation, damping and noise enclosures.

Aerodynamic noise is associated with the passage of air over the turbine blades and is considered the most dominant source of WTG noise emissions. Aerodynamic noise levels typically increase with rotor speed.



– Source: US Office of Energy Efficiency & Renewable Energy

Figure 3.2 WTG components

3.1.3 Sound power levels

The proposed WTG make and model for the Project will be determined through a procurement process prior to commencement of construction. The turbine hub height is not yet finalised and is expected to be a maximum of 164 m.

Among the turbine options considered, the WTG make and model with worst-case noise emissions and their spectral data are used for the noise assessment study. The overall sound power levels (SWLs) are presented in Figure 3.3 with reference to the IEC 61400-11 standard. The SWLs presented are valid for the corresponding wind speeds referenced to the hub height. The prototype cut-in wind speed is 4 m/s and speed of rated power is 11 m/s.

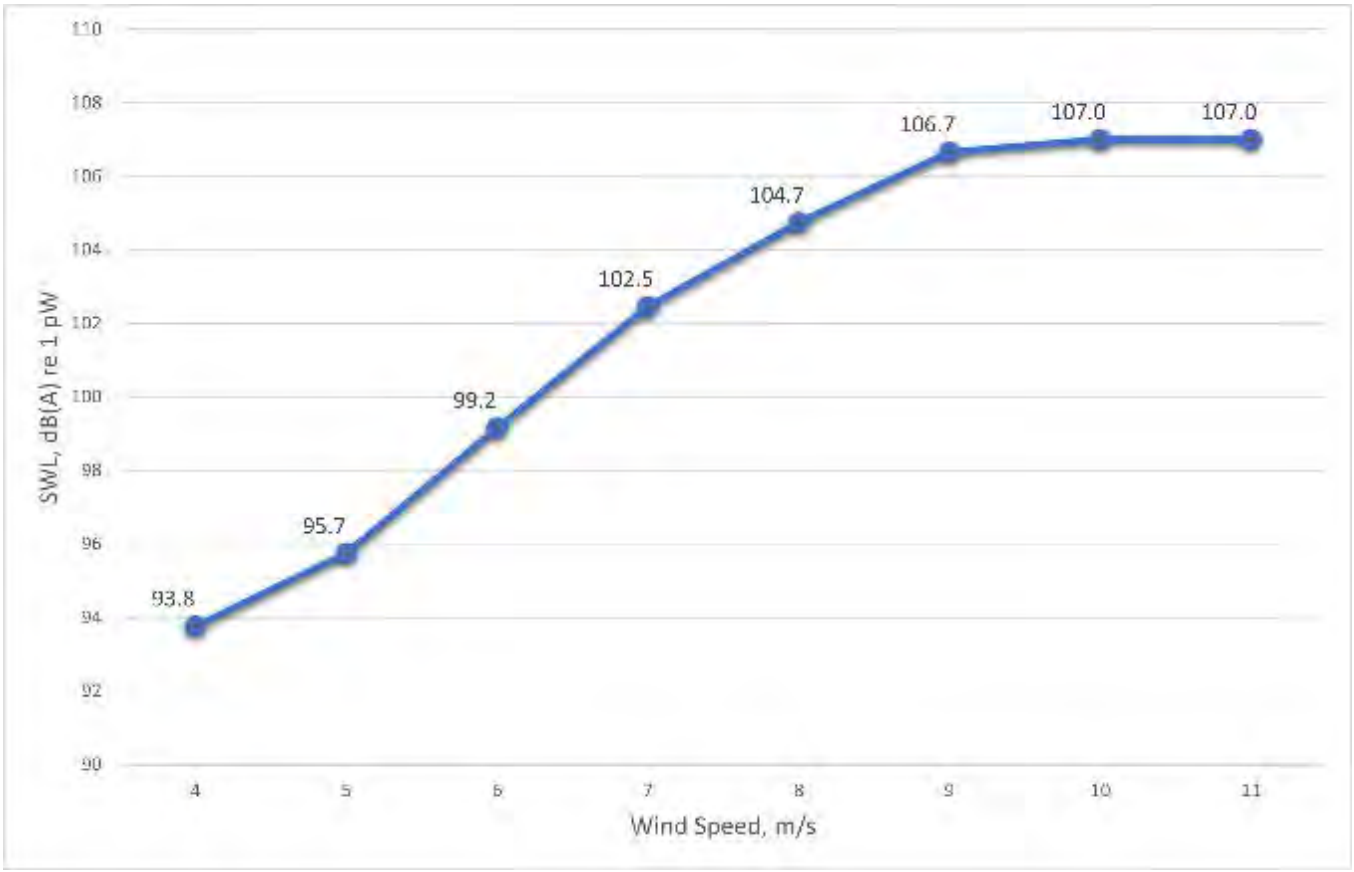


Figure 3.3 WTG SWL vs wind speed

The 1/3 octave source spectra in dB(A) re 1 pW for the corresponding centre frequencies are shown in Figure 3.4 for the wind speed of 8 m/s as an example, referred to the hub height as per IEC 61400-11. Appendix A provides the turbine source spectra for the full range of wind speeds.

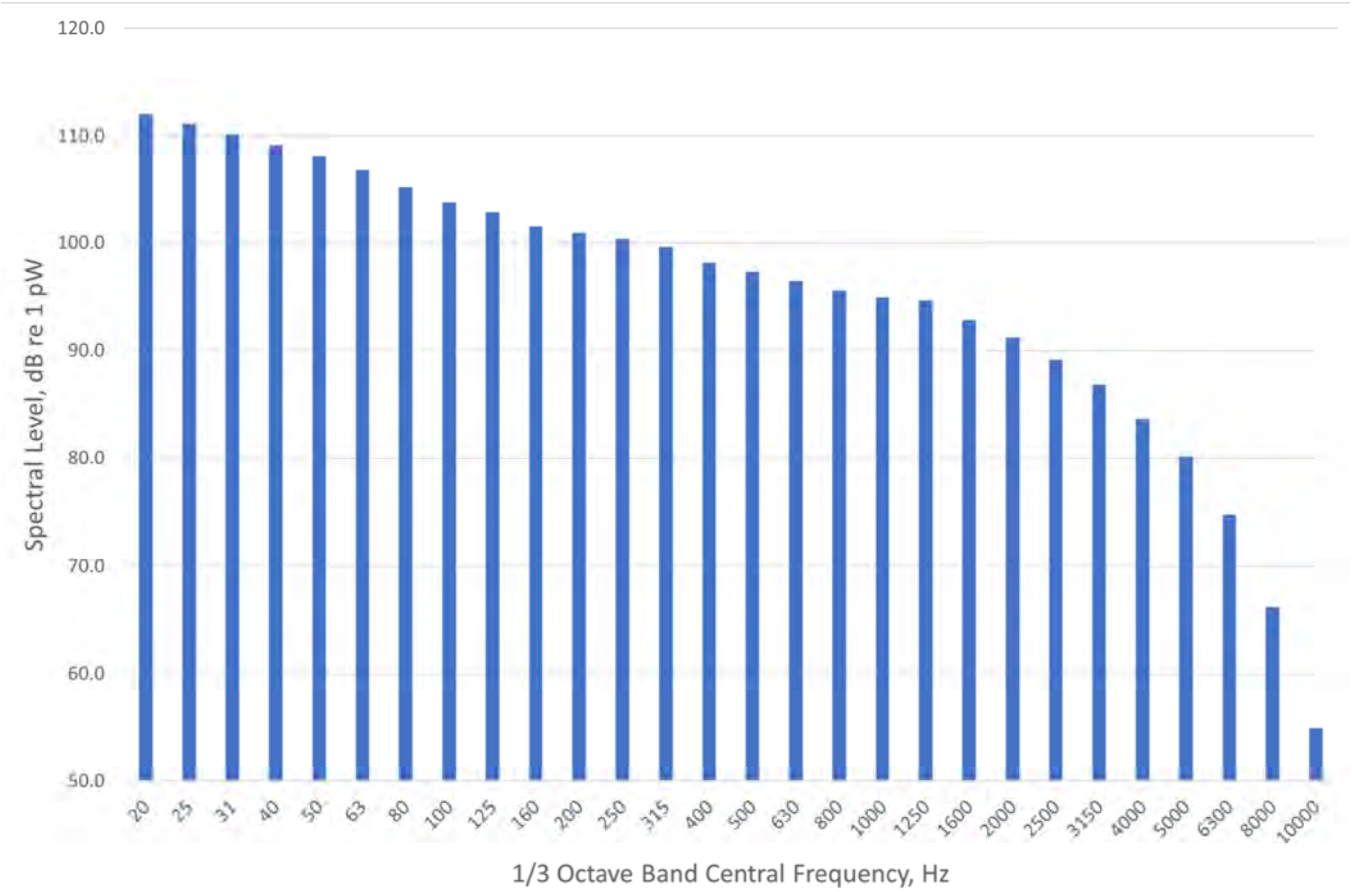

Figure 3.4 1/3 octave band spectral levels at hub height for wind speed 8 m/s

3.1.4 Tonality, infrasound and modulation

WTG manufacturers are expected to conduct independent acoustic tests in accordance with IEC 61400-11 to assess tonal audibility.

According to both the Regulations and the SA Guidelines, an additional 5 dB should be added to the measured noise level from a wind farm where tonality is shown to be a characteristic and is audible at the relevant noise sensitive receptor. GHD assumes no tonal characteristics associated with the WTG to be used and therefore tonality has been excluded from this assessment.

Infrasound (sound spectral component below 20 Hz) is not tested as an obligatory part of IEC61400-11 or the SA Guidelines. Infrasound was a characteristic attributable to earlier design of WTGs where turbine blades were downwind of the main tower. This generated an infrasound effect as the blades cut through the turbulence generated around the downwind side of the tower. Modern WTG designs typically have the blades upwind of the main tower and combined with improved blade design, infrasound is found not to be one of the major audible characteristics at modern wind farm sites (SA Guidelines). SynergyRED is committed to using WTGs of modern design for the Project.

While SA Guidelines do not suggest additional penalties for excessive modulation, WA Noise Regulations may consider an additional penalty of 5 dB(A) where modulation is present. The Noise Regulations do not suggest wind farm-specific methods for the accurate identification of amplitude modulation at distant receptors. It is unlikely that modulation from WTGs will be detected at substantial separation distances in an environment with a high influence of background noise.

Options available to mitigate noise pre-construction are:

– Selection of a quieter WTG than that modelled (which was considered worst case) prior to construction - this can reduce sound power levels by up to 3 dB

– Optimising the wind turbine layout prior to construction – this can reduce noise if required at a particular noise sensitive receptors.
– Implementing WTGs with serrated trailing edges prior to construction – this can reduce sound power levels by 2 dB

Should modulation be detected at some noise sensitive receptors during post construction noise monitoring, and penalties applied resulting in non- compliance with applicable noise limits, the use of mitigation such as curtailment modes would be acted in order to reduce the noise impact at these receptors and result in compliant noise levels. Implementing quieter turbine modes can provide up to 7 dB reduction based on manufacturer specifications.

3.1.5 Noise receptors

The noise assessment methodology, as specified in both the Regulations and the SA Guidelines, require all noise receptors within the area surrounding the Development Envelope to be identified. Noise receptors identified within 5 km of the Development Envelope are presented in Figure 3.5.

While GHD has taken care to ensure the accuracy of this product, GHD and DATA CUSTODIAN(S), make no representations or warranties about its accuracy, completeness or suitability for any particular purpose. GHD and DATA CUSTODIAN(S) cannot accept liability of any kind (whether in contract, tort or otherwise) for any expenses, losses, damages and/or costs (including indirect or consequential damage) which are or may be incurred as a result of the product being inaccurate, incomplete or unsuitable in any way and for any reason.

The coordinates and types of these noise receptors are detailed in Table 2.2. It should be noted that R12 is a commercial building, and in agreement with the landowners, R11, R25, R26 and R27 will not be used for residential, or accommodation purposes when the wind farm is built. For these reasons, these premises are considered to be “Non-sensitive” and are not considered within the NIA. Also, receptors R17 and R18 are participating landowners (i.e. involved noise sensitive receptors).

4. Noise modelling and impact assessment

4.1 Noise modelling algorithm and inputs

4.1.1 Modelling algorithm

Both the Regulations and SA Guidelines state that a suitable model must be selected to predict worst-case noise levels at all relevant noise receptors. SA Guidelines recommend the use of prediction methods in accordance with ISO9613-2 or CONCAWE.

Noise from the Project has been predicted using the most recent version of international standard *ISO9613-2:2024 Acoustics – Attenuation of sound during propagation outdoors Part 2: General method of calculation* (ISO9613-2). The ISO9613-2 noise propagation algorithm is used around the world and is generally accepted as an appropriate model for assessment of wind farms. The model has the ability to take into account the distance between source and noise receptor topography, ground attenuation, atmospheric absorption at different frequencies and meteorological conditions favourable to noise propagation.

In general accordance with the SA Guidelines, noise levels at relevant noise receptor locations were predicted for each reportable wind speed. Appendix D.4 of ISO 9613-2:2024 states that:

When the source is a WTG, attenuation due to ground effect appears lower than considered in the "General method" and selection of the ground factor in a) – c) in 7.3.1 should be modified as follows:

– *Hard ground, which includes paving, water, solid ice, concrete, and all other ground surfaces having a low porosity. Tamped ground, for example, as often occurs around industrial sites, can be considered hard. For hard ground G = 0.*
– *Porous or mixed ground, which includes ground covered by grass, trees or other vegetation, and farming land should be modelled using a maximum of G = 0.5.*
– *When using G = 0.5, a minimum receiver height of 4 m is recommended for the purposes of the predictions, regardless of actual receiver height.*

Because the ground surrounding the Development Envelope comprises mostly of sand, soil and vegetation, ground absorption was set to G=0.5. In order to adhere to ISO 9613-2:2024 for WTG noise prediction as per advice from DWER, noise receptors were set at 4 metres above ground level (instead of typical 1.5 metres above ground level) as this leads to more consistent outcomes for noise prediction of WTGs.

4.1.2 Modelling of wind turbine generators

The noise model was developed based on the following data inputs:

– Topographic elevation contours (5 m resolution) for the Development Envelope and surrounding area, obtained from publicly available data.
– A single scenario for the proposed Project turbine layout (20 WTG layout) (refer to Appendix D for the coordinates) and the hub height (164 m above ground level).
– Noise receptor locations and types, received from SynergyRED.
– The following modelling parameters were used in the model:
  - Atmospheric conditions at 10°C temperature and 80 percent relative humidity.
  - 50 percent acoustically porous or mixed ground (G = 0.5 ground factor).
  - No barriers or intervening structures were included in the model.
  - 4 m noise receptor height.
– Turbine source noise emissions and the 1/3 octave source spectra data, received from SynergyRED.

For modelling purposes, representative WTG type and noise emission data have been used to assess noise compliance. The overall SWLs and 1/3 octave source spectra data (20 Hz to 10 kHz) under integer wind speeds between 4 m/s and 15 m/s are provided in Appendix A. No penalty for tonality was applied to the modelling prediction results.

It should be noted that the following conservative assumptions were implemented in the noise model:

1- Noisiest turbine available at the time was used (i.e. with no mitigation applied).

2- General wind roses available from the BOM website for the area suggest that winds are predominantly south-easterly. However, in the noise model wind has been stipulated to occur in all directions which makes for a conservative assessment (i.e. the noise predicted in the assessment assumes downwind noise conditions have been used for all receptors).

4.1.3 Modelling of substations

The Project proposes a substation comprising two 132 kVA transformers. The overall sound power level of the transformers is 85 dB(A), estimated in accordance with Australian Standard AS 60076 Part 10: 2009 *Power Transformers – Determination of Sound Levels (IEC 60076-10, Ed.1 (2001) MOD)* and the proposed transfer rating (in kVA). The 1/3 octave sound power spectral curve used for the model input, as presented in Appendix A, is based on a reference spectral curve measured for a typical transformer facility.

It should be noted that the equivalent continuous noise parameter L_{Aeq} is used to characterise the noise emissions from the substation transformers. Considering the noise emissions from the transformers are constant in nature, it is expected that the parameter L_{Aeq} will be consistent with the parameter L_{A10} based on which the noise assessment criteria have been specified as in Table 2.1. For this conversion, a 3 dB conversion factor has been used (i.e. $L_{A10} = L_{Aeq} + 3$ dB(A)).

4.2 Impact assessment

4.2.1 WTG noise

Received noise levels have been predicted at all identified noise sensitive receptors with all WTGs (20 WTGs) operating simultaneously, for all source noise emission inputs under relevant individual integer wind speeds as provided in Appendix A.

As explained in Section 1.3, a dual criteria approach has been used for the NIA by assessing the predicted noise levels against the criteria based on the Regulations (Section 2.1.1) and based on the background noise monitoring data processing as indicated by the SA Guidelines (Section 2.1.2). The predicted noise levels for the Project assessed against the criteria derived are provided in Table 4.1 and Table 4.2 based on the Regulations and the SA Guidelines, respectively. As explained in section 2.1.3, the nighttime L_{A10} assigned noise levels for the nighttime (35 + IF) has been used as the most stringent criteria for the NIA at the Not-involved noise sensitive receptors based on the Regulations. Also 40 dB L_{A10} has been used as a conservative criteria for the involved noise sensitive receptors based on DWER advice. All predicted results and criterion values are rounded to the nearest integer for compliance assessment. As can be seen from the tables, the predicted noise levels at all noise sensitive receptors comply with the criteria derived based on both the Regulations and the SA Guidelines.

It should be noted that the criteria derived based on the Regulations, are more stringent which results in smaller safety margines at wind speeds above 10 m/s. The smallest safety margin is less than 1 dB predicted for noise sensitive receptor R32 at wind speeds above 10 m/s (Table 4.1).

Noise contour maps are provided in Figures C1 to C4 in Appendix C for 4 m/s, 6 m/s, 8 m/s and 10-11 m/s which constitute four representative wind speeds from the cut-in to the rated power wind speeds. It should be noted that the turbine source spectra and thus the predicted noise levels are similar for 10 and 11 m/s for the proposed WTG type (Appendix A).

4.2.2 Substation noise

Due to the large distances from the proposed substation to the noise sensitive receptors assessed (i.e. more than 2 km), the predicted noise levels from the substation transformers at all noise sensitive receptors are below 5 dB(A), which is well below the expected ambient noise levels.

Considering the +5 dB adjustment on received levels due to the potential tonal characteristics for transformer noise emissions, the predicted noise levels from the proposed substation are still well below the worst-case 35 dB(A) nighttime assigned level applicable to the fixed equipment under the Regulations.

[1] R12 is a commercial building, and in agreement with the landowner, R11, R25, R26 and R27 will not be used for residential, or accommodation purposes when the wind farm is built. For these reasons, these premises are considered to be "Non-sensitive" and are not considered within the NIA.

[2] R17 and R18 are involved noise sensitive receptors for which the SA Guideline criteria of 45 dB(A) for a not-involved receptor is used (Section 2.1.3).

4.2.3 Noise from substation vs noise from WTGs

Currently there are no known significant sources of noise in the area adjacent to the Development Envelope which is predominantly rural in nature. The noise modelling results for both WTG and substation demonstrate that the received noise levels at assessed noise sensitive receptors from the proposed substation are more than 20 dB lower than the noise levels received from the proposed WTGs. Therefore, the combined noise impact from the Project is dominated by the WTG noise emissions, and the proposed substation is unlikely to result in any noticeable increases in received noise levels at the assessed noise sensitive receptors.

5. Conclusion

A NIA has been conducted for the operation of the Project in general accordance with the requirements of the Regulations and the SA Guidelines (2021) for the operation of the WTGs.

A dual criteria approach was adopted for this NIA: 1- the criteria was derived based on the Regulations, and 2- baseline noise monitoring was conducted at seven monitoring locations around the Development Envelope, and the baseline noise criteria were derived in accordance with the SA Guidelines.

A 3D environmental noise model of the Development Envelope was created using the SoundPLAN software to predict noise levels at the adjacent noise sensitive receptors, using the ISO9613-2:2024 calculation algorithm. A 20 WTG layout with hub height of 164 metres was considered in the 3D noise model. The turbine source noise input data is based on the 1/3 octave source spectra data provided by SynergyRED.

The noise modelling results show that the predicted noise levels from the Project received at the adjacent noise sensitive receptors comply with the noise criteria in accordance with both the Regulations and the SA Guidelines. The smallest safety margin is less than 1 dB predicted for noise sensitive receptor R32 at wind speed 10 m/s and above when assessed against the criteria based on the Regulations which are more stringent especially at high wind speeds.

It should be noted that the following conservative assumptions were implemented in the noise model:

1- Noisiest turbine available at the time was used (i.e. with no mitigation applied, non-serrated blades).

2- General wind roses available from the BOM website for the area suggest that winds are predominantly south-easterly. However, in the noise model wind has been stipulated to occur in all directions which makes for a conservative assessment (i.e. the noise predicted in the assessment assumes downwind noise conditions have been used for all receptors).

SynergyRED can explore a number of pre-construction design options to minimise noise impact from the proposed wind farm which may include:

- Selection of a quieter WTG than that modelled (which was considered worst case) prior to construction - this can reduce sound power levels by up to 3 dB
- Optimising the wind turbine layout prior to construction – this can reduce noise if required at particular noise sensitive receptors.
- Implementing WTGs with serrated trailing edges prior to construction – this can reduce sound power levels by 2 dB.

It is recommended that the turbines are properly maintained to ensure the noise emissions of the turbines are not adversely affected by the turbine wear, which could potentially result in audible tonality.

Once the wind farm is operating, in accordance with the Regulations and SA Guidelines, it is recommended that compliance monitoring be undertaken at the noise sensitive receptors with the highest predicted noise levels (e.g. R32).

Should post construction noise monitoring find intrusive noise characteristics, such as modulation or tonality, to be present at one or more of the noise sensitive receptors, and resulting in non-compliance with assigned noise levels, SynergyRED would consider the following mitigations to ensure compliance::

- Investigate engineering options to reduce modulation.
- Implement noise curtailment modes for relevant WTGs in applicable wind directions for each impacted noise sensitive receptor – this can reduce sound power levels by up to 7 dB if necessary.

Based on the NIA assessment results and range of mitigation measures that may be implemented, compliance is expected at all noise sensitive receptors even if tonality or modulation is present.

Appendix B

Background noise monitoring

B. Background noise monitoring

Long term (unattended) noise measurements were conducted at seven monitoring locations in the area adjacent to the Development Envelope. Loggers at locations NMP01 and NMP05 were deployed on 8 December 2023 and loggers at locations NMP02, NMP03, NMP04, NMP06 and NMP07 on 7 December 2023. Loggers at locations NMP01, NMP02, NMP03 and NMP04 were retrieved on 14 May 2024 and loggers at locations NMP05, NMP06 and NMP07 on 13 May 2024.

For measurement of local ground level meteorology and rainfall, one ultrasonic automatic weather mast was co-located at the NMP01 logger location during the deployment period (from 8 December 2023 to 14 May 2024). Wind data at greater heights was taken from the existing meteorological mast near the Development Envelope provided by the client.

The data across all noise loggers, local weather masts, and existing site meteorological masts was date and time synchronised over 10-minute data intervals.

B-1 Instrumentation

Ambient noise levels were monitored using SVAN 977 environmental noise loggers. Details of the noise measurement instrumentation used are presented in Table B.1.

All noise monitoring instrumentation was in current National Association of Testing Authorities (NATA) calibration at the time of use. All instrumentation was field-checked and calibrated both before and after noise measurements using a Svantek SV-36 calibrator. No discrepancies equal to or greater than 1 dB were noted throughout the measurement exercise as is required under Section 5.6 of Australian Standard AS 1055:2018 *Acoustics – Description and Measurement of Environmental Noise* (Standards Australia, 2018).

Table B.1 Unattended noise monitor equipment details

Instrumentation details	NMP01	NMP02	NMP03	NMP04	NMP05	NMP06	NMP07
Model and class	SVAN 977 Type A	SVAN 977 Type C	SVAN 977 Type D	SVAN 977 Type D	SVAN 977 Type C	SVAN 977 Type D	SVAN 977 Type D
Serial No.	69721	98077	99011	99009	92622	99010	99261
Deployment date	08 Dec 2023	07 Dec 2023	07 Dec 2023	07 Dec 2023	08 Dec 2023	07 Dec 2023	07 Dec 2023
Collection Date	14 May 2024	14 May 2024	14 May 2024	14 May 2024	13 May 2024	13 May 2024	13 May 2024

B-2 Noise measurement locations

Long term monitoring was performed at locations close to residences. Coordinates of the monitoring locations details are summarised in Table B.2. Figure B.1 shows the location of monitoring locations in relation to the noise receptors. As can be seen from Figure B.1, the monitoring locations were selected to cover a reasonable range of wind directions and to represent several NSRs by designating similar criteria to a number of noise receptors based on similarity of acoustic environment.

Table B.2 Noise logger coordinates

Logger location	Coordinates, GDA2020 / MGA Zone 50	
	Easting, metres	Northing, metres

B-3 Meteorology

B-3-1 Hub height wind speed

Data from a meteorological mast provided by SynergyRED was used for collecting wind data at various hub heights (from 60 m to 150 m with 30 m steps). Wind speeds were calculated at the proposed 164 m hub height and then used to calculate the noise criteria (refer to Section B-4-1).

B-3-2 Rainfall and local wind speed

SA Guidelines state: As part of the development application, developers should confirm that the reported noise levels are not influenced by high wind speed across the microphone.

Hence, in the case of wind farm noise monitoring, it is a requirement to undertake measurements in a manner that allows collection of noise measurements in situations where the wind speed exceeds the 5 m/s at the microphone position normally provided as the upper limit for environmental noise monitoring. The limit is a guide to reduce air pressure fluctuations across the microphone artificially increasing the measured noise level. Standard 90 mm wind shield was used during noise monitoring.

According to the SA Guidelines, sound level measurements should be made during a representative range of wind speeds and directions generally expected at the wind farm, and include the normal operating range of the turbines, that is from cut-in to rated power. Extraneous sound levels caused by events, including precipitation, insects, fauna, and so on, as far as is practical for an unattended monitoring exercise, be identified and removed from the data set.

Rain data collected by the co-located weather station placed at the logger location NMP01 was utilised to confirm rain events during the monitoring period. The location NMP01 was specifically selected as it is in an open area free from terrain obstructions and is deemed representative of other conditions at other monitoring locations. This data has been used to exclude periods where rain events were recorded.

Average 10-minute noise measurements where rainfall, high local wind speeds were defined as ‘extraneous events’ and were excluded from the background noise assessment. Data points that were visible outliers in the wind speed bin analysis (i.e. noise levels much higher than the trend but don’t occur often) were also assumed to be caused by extraneous events and excluded from the background noise calculation. Data acquired during local wind speeds (microphone height) exceeding 5 m/s was excluded from further analysis. The process for excluding outliers was to plot the data points (i.e. wind speed) for each wind bin and exclude points that are noisier than the bulk of the points thus resulting in a conservative estimate of background noise.

The SA Guidelines methodology for assessing local wind conditions was adopted for this assessment (refer to Section 3 of the SA Guidelines).

B-4 Results of noise monitoring and derived noise criteria

Applicable noise criteria were calculated for the proposed 20 WTG layout with 164 m hub height.

Background noise was processed and analysed in accordance with procedures in the SA Guidelines. The number of valid monitoring points is summarised in Table B.3. The total number of valid data points is well above 2000 which gives sufficient basis to derive applicable noise criteria.

Table B.3 Number of valid background noise monitoring data

Monitoring location			Valid data points- Guidelines 2021
Logger location	**Start time**	**End time**	**Hub height 164 m**
NMP01	7/12/2023	14/05/2024	22699
NMP02	7/12/2023	14/05/2024	22853

Monitoring location			Valid data points- Guidelines 2021
NMP03	7/12/2023	14/05/2024	22862
NMP04	7/12/2023	14/05/2024	22858
NMP05	8/12/2023	13/05/2024	22632
NMP06	7/12/2023	13/05/2024	22753
NMP07	7/12/2023	13/05/2024	22748

The SA Guidelines also recommend that no less than 500 data points are to be collected for downwind conditions. Wind direction for downwind conditions is defined as ±45° from line connecting the noise receptor and the nearest turbine. If there are more than one turbine at similar distances from the noise receptor, SA Guidelines recommend identification of more than one downwind angle. The resulted downwind angles and the number of downwind data points for each monitoring location is presented are presented in Table B.4.

Table B.4 Background noise data points - Downwind direction

Monitoring location			Nearest turbine ID	Downwind direction, degree	Valid downwind data points at hub height 164 m
Logger location	Start time	End time			
NMP01	3/08/2023	27/09/2023	WTG 15	356	1269
NMP02	3/08/2023	27/09/2023	WTG 11	196	2068
NMP03	16/08/2023	27/09/2023	WTG 1	101	10993
NMP04	3/08/2023	27/09/2023	WTG 5	300	794
NMP05	3/08/2023	27/09/2023	WTG 2	113	10974
NMP06	17/10/2023	22/11/2023	WTG 11	103	11021
NMP07	17/10/2023	22/11/2023	WTG 9	99	8773

Table B.3 and Table B.4 show that the background noise monitoring program allowed to collect a suitable number of downwind data points in accordance with the requirements of the SA Guidelines.

It is understood that relevant noise sensitive receptors around the Development Envelope are situated in zones classified as rural living. As such, Project specific noise criteria based on the SA Guidelines are derived as:

– 35 dB(A) at affected noise sensitive receptors, or
– Background noise ($L_{A90,10\text{-}min}$) plus 5 dB(A)

whichever is greater for wind speed from cut-in to rated power of the WTG.

The Project Development Envelope is located within a rural area. It should be noted that R12 is a commercial building, and in agreement with the landowner, R11, R25, R26 and R27 will not be used for residential, or accommodation purposes when the wind farm is built. For these reasons, these premises are considered to be “Non-sensitive” and are not considered within the NIA. Therefore, the 35 dB(A) baseline criterion or the adjusted “background + 5” dB(A) criterion apply to all Not-involved noise sensitive receptors identified in Table 2.2. R17 and R18 are involved noise sensitive receptors (section 2.1.2.1) for which the SA guidelines criteria of 45 dB(A) is used.

B-4-1 Background noise monitoring data and noise criteria for hub height 164 m

Results of background noise monitoring were processed in accordance with SA Guidelines 2021 and relevant noise criteria are derived for each of the monitoring locations for wind speeds referenced to hub height of 164 m.

Wind speed at the hub height was calculated using the wind shear model (Appendix D3 of standard IEC 64100-11: 2018 Ed.3.1):

$$V_2 = V_1 \left(\frac{z_2}{z_1}\right)^{\alpha}$$

where,

V_2 - is the wind speed at height z_2 above ground level;

V_1 - is the wind speed at height z_1 above ground level (typical hub height);

z_2 is the height above ground for the desired wind speed;

z_1 - is the height above ground where the wind speed is known;

α - is the wind shear factor.

The wind shear was computed for each of 10 min measurement periods form indication of sensors at heights of 150 m and 90 m. The wind speed at 164 m was then calculated using known wind speed at 150 m (sensor nearest to the hub height) and the computed wind shear factor.

Figure B.2 to Figure B.6 show results of postprocessed data and relevant noise criteria calculated in accordance with SA Guidelines 2021. Data postprocessing is performed for arithmetic averages of measured noise levels in integer wind speed bins as per Section 3.4 of the SA Guidelines.

One can see that applicable noise criteria correspond to the baseline limit of 35 dB(A) where the background noise is equal or smaller than 30 dB and based on background plus 5 dB(A) where the background noise exceeds 30 dB (at higher wind speeds). The maximum applicable noise criterion used for the compliance assessment reaches approximately 41 dB(A) at monitoring location NMP02.

B-4-2 Summary of wind farm noise criteria based on SA guidelines

There are 35 noise receptors in the area within and adjacent to the Development Envelope. SA Guidelines recognise that it is not always practicable to perform background noise measurements at each of affected noise receptor. Noise monitoring has been undertaken at representative locations and used to derive the criteria at a number of adjacent noise receptors. Table 2.2 contains the list of noise receptors in the area surrounding the Development Envelope. Results of the background noise monitoring survey are used to assign criteria to relevant noise receptors with expected similar background. It should be noted that compliance with noise criteria at the nearest noise receptor typically ensures that noise from the wind farm will meet similar criteria at greater separation distances from a wind farm. Table B.5 presents noise limits for each integer wind speed from cut-in to the speed of the rated power as referenced to 164 m hub height. Results are presented for procedures included in the SA Guidelines.

Table B.5 Noise criteria for 164 m hub height - SA Guidelines

Noise receptor	Representative monitoring location	Hub height wind speed, m/s							
		4	5	6	7	8	9	10	11
R12[1]	NMP01	38	38	39	39	39	39	38	39
R17[2], R18[2]	-	45	45	45	45	45	45	45	45
R01, R02, R03, R04, R05, R06, R07, R08, R09, R10, R34	NMP02	35	36	38	39	40	40	39	41
R20, R21, R22, R23, R24, R25[1], R32, R33	NMP03	35	35	36	36	37	37	37	39
R26[1], R27[1], R28, R29, R30, R31	NMP04	35	36	37	37	37	37	37	38
R14, R15, R16, R19	NMP05	35	35	35	35	35	35	35	36
R13	NMP06	35	35	36	36	37	37	37	38
R11[1]	NMP07	35	35	35	35	35	35	35	36

[1] R12 is a commercial building, and in agreement with the landowner, R11, R25, R26 and R27 will not be used for residential, or accommodation purposes when the wind farm is built. For these reasons, these premises are considered to be "Non-sensitive" and are not considered within the NIA.

[2] *R17 and R18 are involved noise sensitive receptors, the SA Guideline criteria of 45 dB(A) for a not-involved receptor will be used for the NIA.*

Disclaimer and Limitation

This report is prepared solely for the nominated client, and any future residents of the subject lot(s), and is not for the benefit of any other person and may not be relied upon by any other person.

To the maximum extent permitted by the law, Linfire Consultancy, its employees, officers, agents and the writer ("Linfire") excludes all liability whatsoever for:

1. claim, damage, loss or injury to any property and any person caused by fire or as a result of fire or indeed howsoever caused;
2. errors or omissions in this report except where grossly negligent; and the proponent expressly acknowledges that they have been made aware of this exclusion and that such exclusion of liability is reasonable in all the circumstances.

If despite the provisions of the above disclaimer Linfire is found liable then Linfire limits its liability to the lesser of the maximum extent permitted by the law and the proceeds paid out by Linfire's professional or public liability insurance following the making of a successful claim against such insurer.

Fire is an unpredictable force of nature. Changing climatic factors (whether predictable or otherwise) either before or at the time of a fire can also significantly affect the nature of a fire and in a bushfire prone area it is not possible to completely guard against bushfire. The mitigation strategies contained in this Bushfire Risk Management Plan (BRMP) are considered to be prudent minimum standards only, based on the standards prescribed by relevant authorities. It is expressly stated that Linfire do not guarantee that if such standards are complied with or if a property owner exercises prudence, that a building or property will not be damaged or that lives will not be lost in a bush fire.

Further, the achievement of the level of implementation of fire precautions will depend on the actions of the landowner or occupiers of the land, over which Linfire has no control. If the proponent becomes concerned about changing factors then either a review of the existing BMP, or a new BMP, should be requested. Linfire accepts no liability or responsibility whatsoever for or in respect of any use or reliance upon this report and its supporting material by any third party.

1.0 Introduction

1.1 Background

Synergy Renewable Energy Developments Pty Ltd (SynergyRED; the Proponent) is seeking to lodge a development application (DA) for a new wind farm across a number of lots in Scott River (the wind farm development boundary) approximately 15 km north-east of Augusta, in the Shire of Augusta-Margaret River.

The proposed development will require the installation of the following infrastructure:

- New building/s (within nominated wind farm building envelope)
- 20 wind turbine generators
- 132 kV transmission line (above-ground)
    - From proposed substation to existing high-voltage powerlines approximately 4 km north of the substation.
    - Consisting of above-ground towers, poles and electrical lines
    - To be designed and constructed to Western Power specifications
- 33 kV distribution lines
    - Reticulated from each turbine to substation, preferably through use of underground cables, but could be above-ground if ground conditions are unsuitable for underground cables
- High voltage substation
- Internal access driveways providing access to proposed buildings, turbines and firewater tanks.
- Firewater tanks

A plan of the proposed wind farm is provided on Figures 1, 2, 3 and 4 in the project Bushfire Management Plan, which includes the location of proposed wind turbines, transmission lines, building and substation envelopes, driveways and firewater tanks.

Regarding onsite personnel, once operational, the following is expected:

- Occupant numbers likely to be 2 to 4 staff, 5 days a week (business hours)
- There will be at least one on-call technician allocated to the facility for all other times

Further information on the existing site is provided in the project BMP, namely Section 1.2.

As detailed in Section 1.4, this BRMP has been prepared to assess the proposed renewable infrastructure against the relevant the Country Fire Association (CFA) Design Guidelines and Model Requirements: Renewable Energy Facilities, to demonstrate the bushfire risk associated with this infrastructure has been appropriately managed. This differs to the purpose of the project BMP which is to demonstrate compliance for habitable buildings against *State Planning Policy 3.7: Bushfire* (SPP 3.7; WAPC 2024) and the *Planning for Bushfire Guidelines* (the WA Guidelines; WAPC 2024).

1.2 Relevant Legislation and Guidance

- State Planning Policy 3.7: Bushfire (SPP 3.7) and the Planning for Bushfire Guidelines (the WA Guidelines).
- WAPC Position Statement: Renewable energy facilities, 2020
- Country Fire Association (CFA) Design Guidelines and Model Requirements: Renewable Energy Facilities v4, 2023
- Building Code of Australia / National Construction Codes (BCA/NCC)

- AS 3959 Construction of Buildings in Bushfire Prone Areas
- AS/NZS ISO 31000:20018 Risk management – Guidelines
- Australian Disaster Resilience - National Emergency Risk Assessment Guidelines (NERAG) 2020.
- AS 3745-2010 Planning for Emergencies in Facilities
- Dangerous Goods Safety Act 2004
- Dangerous Goods Safety (Storage and Handling of Non-Explosives) Regulations 2007 (the Regulations)
- Australian Dangerous Goods Code (ADG Code) for transport by Road and Rail.

1.3 Regulatory Context

The entire wind farm development extent is designated as bushfire prone on the *Map of Bush Fire Prone Areas* (DFES 2024), due to native vegetation located within 100 m of the site which triggers bushfire planning requirements under *State Planning Policy 3.7: Bushfire* (SPP 3.7; WAPC 2024) and the *Planning for Bushfire Guidelines* (the WA Guidelines; WAPC 2024).

A Bushfire Management Plan (Linfire 2026) has been prepared to accompany the development application, as per SPP 3.7 Policy Measure 7(ii), given the proposed permanent buildings are sited in a designated bushfire prone area and would have a pre-development rating of BAL-40/FZ. The BMP demonstrates how the proposed buildings will comply with bushfire protection criteria of the WA Guidelines.

Given the renewable energy infrastructure (e.g. wind turbines) are not considered “habitable buildings” as defined in WA Planning Regulations, compliance with SPP 3.7 and the WA Guidelines isn’t triggered and the compliance pathway with respect to bushfire, is less defined. Current advice provided by DFES is that strict compliance is unlikely to be required or achieved with SPP 3.7 and the Guidelines, however application of the CFA *Design Guidelines for Renewable Energy Facilities v4* (CFA; 2023; CFA Design Guidelines) from Victoria fire brigade, is the best publication to demonstrate compliance with at this stage, albeit rationalised for WA context.

Under the *Dangerous Goods Safety (Storage and Handling of Non-Explosives) Regulations 2007*, the operator may also be required to complete a separate risk assessment that addresses risks other than bushfire for the proposed development and the associated Dangerous Goods, should the development trigger the need to do so, although it is noted that there isn’t significant quantities of any Dangerous Goods proposed at the facility.

Some high-level information from the following has been provided in the subsections below, regarding the following guidance documents with respect to renewable energy infrastructure bushfire risk management:

- CFA Design Guidelines for Renewable Energy Facilities
- WAPC Position Statement: Renewable Energy Facilities
- Shire of Augusta-Margaret River – Local Planning Policy 23 (Renewable Energy Systems)

1.3.1 CFA Design Guidelines for Renewable Energy Facilities

This guidance material developed by the CFA for renewable energy facilities, namely their publication *Design Guidelines and Model Requirements: Renewable Energy Facilities v4* (CFA 2023), requires that a Risk Management Plan is to be developed for renewable energy facilities which includes the following:

- Description of the risks and hazards at the facility to and from the facility and related infrastructure.

- Detail the following:
    - The location of the renewable energy infrastructure on-site and in the landscape.
    - Emergency vehicle access to and within the facility that:
        - Includes site access points of a number suitable to the size and hazard of the facility
        - Provides access to renewable energy infrastructure, substations and fire service infrastructure.
    - Firefighting water supply for the facility.
    - Asset Protection Zone/s of 10m or greater, based on radiant heat flux (output) as an ignition source:
        - Around the perimeter of the facility.
        - Between any landscape buffer/vegetation screening and renewable energy infrastructure.
    - The separation distance, based on radiant heat flux (output) as an ignition source, between:
        - Renewable energy infrastructure, buildings/structures, and vegetation.
        - All other controls for the management of on and off-site hazards and risks at the facility (including all proposed safety and protective systems).
- Provide an evidence-based determination of the effectiveness of the risk controls against the identified hazards, including justification for the omission of any battery safety and protective system/s.
- Form the basis for the design of the facility

While the facility Risk Management Plan is to address both onsite fires within renewable energy infrastructure and bushfires, this BRMP provides this relevant information detailed above for the bushfire-related risk to (and from) the proposed development.

The CFA Guidelines is organised with a number of sections as follows, each section containing guidance and what it terms “Model Requirements” for all renewable energy facilities as well as specific measures for wind, solar, battery energy storage (BESS) and substation/electric line infrastructure:

- Fire Risk Management
- Facility Location
- Facility Design
- Facility Construction and Commissioning
- Facility Operation
- Emergency Planning

A summary of the CFA Guidelines sections (relevant to this project) is provided in the compliance assessment on Table 2 in Section 4.0.

1.3.2 WAPC Position Statement: Renewable Energy Facilities

WAPC have released a Position Statement on renewable energy facilities, in which they note the following with respect to bushfire risk management:

- Renewable energy facilities in Western Australia are principally wind turbine and solar array systems.
- The objectives of this position statement include facilitate appropriate development of

renewable energy facilities while minimising any potential impact upon the environment, natural landscape, and urban areas

- Wind turbines and solar arrays in bushfire prone areas should be designed and maintained so they are not a bushfire risk to surrounding bushland, and where possible should not be in bushfire prone areas with an 'extreme' bushfire hazard level or bushfire attack level (BAL) - 40 or BAL- Flame Zone.
- A minimum 10 metres clearance to combustible vegetation in the form of an Asset Protection Zone (APZ) is recommended.
    - The APZ should be managed in a low threat state, in accordance with the Guidelines.

This BRMP will aim to comply with the WAPC Position Statement as much as practical.

1.3.3 Shire of Augusta-Margaret River – Local Planning Policy 23 (Renewable Energy Systems)

In 2012, the Shire of Augusta-Margaret River released LPP 23 relating to Renewable Energy Systems which they amended in March 2021. LPP 23 provides guidance on the appropriate location, scale and design of wind and/or solar energy systems in the Shire. There is no specific guidance relating to bushfire compliance or risk management, other than stating that a *"fire management plan"* may be required *"where planning approval is sought large renewable energy systems"*.

The preparation of this BRMP and the project BMP, is considered to satisfy the requirements of the Shire LPP 23 regarding preparation of a fire management plan for renewable energy developments.

1.4 Purpose

The focus of this BRMP is to apply and demonstrate compliance of the proposed renewable energy infrastructure with the Model Requirements of the CFA Guidelines, with summary of the derived bushfire management measures from this BRMP included in the project BMP, to provide a complete summary of the Proponents bushfire risk management obligations for this project.

Additionally, the preparation of the BMP and BRMP is considered to satisfy the requirements of the Shire LPP 23 regarding preparation of a fire management plan for renewable energy developments.

2.0 Renewable Energy Assets and Hazard Analysis

2.1 Onsite Renewable Energy Assets

The proposed development is expected to include the following onsite renewable energy infrastructure:

- ***Wind turbine generators***
  - 20 turbines
  - Maximum tip height of 250 metres (hub height up to 164 m with blade length of up to 90 m)
  - Turbines are steel tower casings to ground level, with fibreglass/aluminium/steel blades
  - All turbines are to have fire detection, alarm and suppression systems
- ***High voltage substation***
  - To be designed and constructed to relevant Australian Standards
  - Expected to contain infrastructure such as main transformer, STATCOM, switchroom, NSP room, harmonic filters, back-up generator/auxiliary supply.
- ***132 kV transmission line***
  - From proposed substation to existing high-voltage powerlines approximately 4 km north of the substation
  - Consisting of above-ground towers, poles and electrical lines
  - To be designed and constructed to Western Power specifications
- ***33 kV distribution lines***
  - Reticulated from each turbine to substation, preferably through use of underground cables.
  - If ground conditions are unsuitable for underground cables, portions of these 33 kV lines may need to be above-ground.

2.1.1 Wind Turbine Component Overview

A wind turbine (also known as a wind turbine generator), is a device that converts the kinetic energy of wind into electricity. In simple terms, the turbines blades use the aerodynamic force of the wind (much like an aeroplane) to turn a rotor, which spins a generator to produce electricity, which is typically fed into the mains power network as a source of renewable energy.

The horizontal axis wind turbine generators proposed at the wind farm consist of the following elements (see Plate 1):

- Tower
  - The tower supports the structure of the turbine
  - Constructed of steel
- Nacelle
  - The nacelle sits on top the tower, and houses the key mechanical elements: the gear box, generator, shaft and brake.
  - Typically constructed of metal, fibreglass or composite materials
- Hub
  - The turbine blades fit into the hub that is connected to the turbine's main shaft.
  - Typically of metal construction.
- Blades
  - Three blades located on top of the turbine, which connect to the turbine hub.

- When wind flows across the blade, the air pressure on one side of the blade decreases. The difference in air pressure across the two sides of the blade creates both lift and drag. The force of the lift is stronger than the drag and this causes the rotor to spin.
- The blade construction is generally proprietary, however typically the blade core structure mostly balsa wood or foam, with the outer shell generally fibreglass or composite material.

- Drivetrain
  - Rotor
    - The blades and hub together form the turbine's rotor.
  - Main bearing
    - The main bearing supports the rotating low-speed shaft and reduces friction between moving parts so that the forces from the rotor don't damage the shaft.
  - Shafts (low-speed and high-speed)
    - The low-speed shaft connects the rotor and hub to the gearbox
    - The high-speed shaft connects from the gearbox to the generator
  - Gearbox
    - The gearbox connects the main (low-speed) shaft to the high-speed shaft, thereby converting the low-speed incoming rotation to high-speed rotation required by the generator to produce electricity.
  - Generator
    - The generator, which is driven by the gearbox, houses copper windings that turn through a magnetic field to produce electricity.
  - The majority of the drive train components are metal, but there are a number of lubricants also contained in this system.
- Rotor Brake and Lock
  - A rotor brake keeps the rotor from turning after it's been shut down. Once the turbine blades are stopped by the controller, the brake keeps the turbine blades from moving.
  - The system typically consists of a friction disc brake that is often hydraulically activated.
  - In addition to the rotor brake, a rotor lock (or locking bolt) is required to manually fix the rotor in place for maintenance.
- Yaw System
  - The yaw drive rotates the nacelle on upwind turbines to keep them facing the wind when wind direction changes. The yaw motors power the yaw drive to make this happen.
  - Downwind turbines don’t require a yaw drive because the wind manually blows the rotor away from it.
- Controller
  - The controller manages the starting and stopping of the turbine, usually based on wind speed (i.e. sufficient wind to start and shutting off at excessive wind speeds).
  - Contains a number of sensors and a control system, to continuously monitor wind speed, direction, turbine performance, and other vital parameters.
  - This system adjusts the blade pitch and other aspects to optimize power generation while ensuring safe operation within wind speed limits.

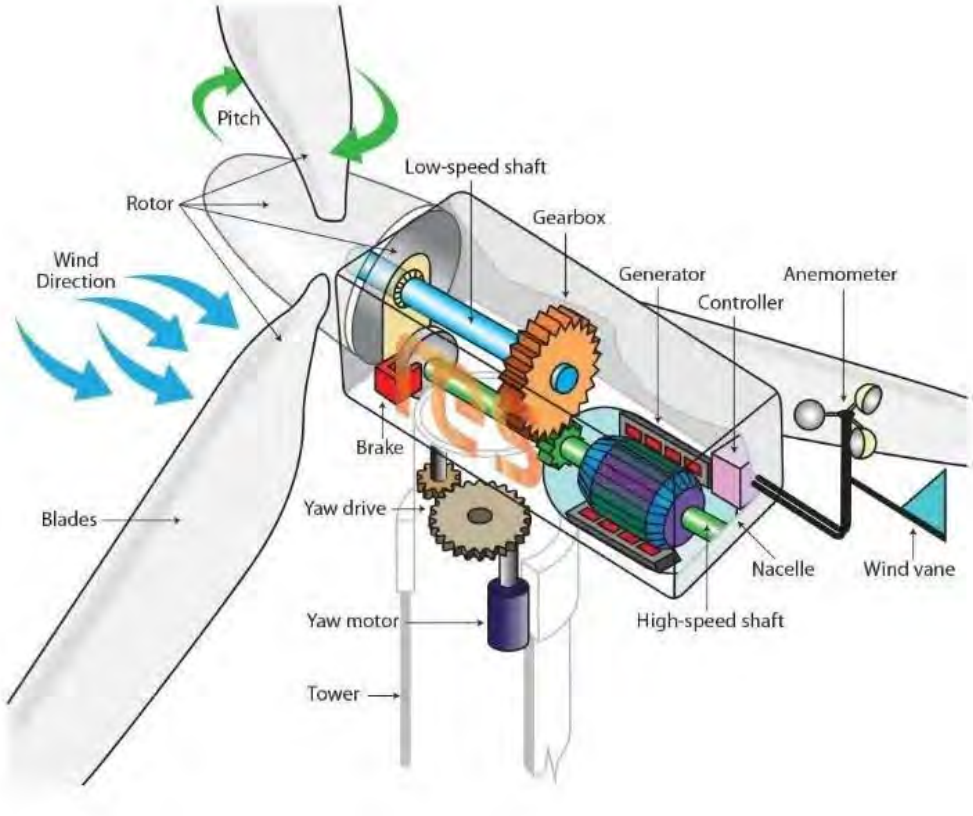

Plate 1: Wind Turbine Components

2.2 Wind Farm Site Description

A detailed description of the wind farm site is provided in Section 1.2.1 of the project BMP, with a brief summary provided below:

- The proposed wind farm extends over a number of existing lots as detailed in the BMP
- All the lots have been largely cleared of native vegetation and used by private landholders for agricultural purposes other than the following exceptions:
    - Lot 4269 in the north-western part of the wind farm, which currently contains existing timber plantations, which are relatively mature and while they are expected to be harvested in coming years, the exact timing is not confirmed.
    - Lot 4265 in the north-eastern part of the wind farm, which currently contains existing timber plantations, again which are relatively mature but with exact harvest timing not yet confirmed.
- Other lots located adjacent to the development boundary worthy of note include:
    - Lot 2 on Diagram 090280, Courtenay
        - Contains the existing Beenup substation
    - Lot 101 on Plan 038071, Scott River
        - Currently identified as a DBCA Lands of Interest (Register No. 2555/700), and potentially a future nature reserve.
    - Lot 4924 on Plan 217962, Scott River
        - Crown Reserve 42377
        - Zoned under local Shire planning scheme as “National Parks and Nature Reserves”
        - Flora reserve
- Surrounding the wind farm boundary:
    - To the east of Dennis Road is agricultural land and timber plantation and Pagett Nature Reserve and Chester Nature Reserve.
    - To the north of Lots 4266 and 4269 are existing agricultural lots largely cleared of vegetation, other than isolated forest plots, with Brockman Highway and South Blackwood State Forest further north.
    - To the west is Scott River Road, with largely cleared agricultural land further west other than some existing timber plantation in the north-west.
    - To the south is primarily cleared agricultural land, with some forest and scrub vegetation south of Lot 4260 and Governor- Broome Road, which fringes the Scott River.

Public road access to the wind farm is via:

- Brockman Highway from the north, which extends west to eventually connect to Bussel Highway at Karridale (17 km west), and east to Nannup (approximately 55 km away)
- Scott River Road, Governor Broome Road and Dennis Road forming a loop road arrangement around the perimeter of much of the wind farm.
    - Governor-Broome Road extends 12 km east of the wind farm to connect to Milyennup Coast Road, where travel can be undertaken 13 km north to connect to Stewart Road and Brockman Highway and on to Nannup.
- The only other public road near the wind farm is Coostien Road, which is an existing dead-end public road providing access to lots south of the Governor Broome Road.

Vehicular access within the various wind farm lots is currently via existing unsealed farm tracks, which provide access from a number of existing entrance gates along the public road network, into the lots.

There is no known reticulated town main water supply currently provided to any lots within the wind

farm development boundary, nor is there any existing street hydrants.

2.3 Bushfire Hazard

The proposed development is to be located across a number of existing rural land holdings, which have largely been cleared of vegetation for agricultural purposes and is now mostly grassland, with only Lot 4269 in the north-west and Lot 4265 in the north-east of the wind farm, containing blue gum plantations. These plantations are likely to be harvested in the future, but the timing is not confirmed so it will be assumed it is uncleared for this assessment.

Surrounding the wind farm lots is mostly a combination of rural land holdings largely cleared of vegetation, timber plantations, and areas of remnant native vegetation within land holdings but also in State Forest and Nature Reserves. The most notable bushfire hazard is to the east and north of the wind farm, where continuous forest vegetation exists within Pagett Nature Reserve, South Blackwood State Forest and Blackwood National Park, that extends to Nannup and beyond. Vegetation in other directions is typically more fragmented by agricultural development, with tracts of forest along the Blackwood River to the west of the wind farm and coastal scrub and forest to the south, presenting the only other significant bushfire hazards in the local area.

2.3.1 Bushfire Hazard Assessment

As the renewable energy infrastructure is not required to achieve target BAL ratings as per the CFA Guidelines, there is no specific requirement to provide BAL contour mapping. The CFA Guidelines do provide some high-level guidance on separation of turbines from unmanaged vegetation, so on that basis, vegetation and effective slope mapping using the AS 3959 site assessment methodology has been undertaken for the wind turbine site to inform the discussion and compliance assessment with CFA Guidelines.

2.3.2 Vegetation classification and effective slope

Linfire assessed classified vegetation, exclusions and effective slope within 150 m of the wind farm development boundary through on-ground verification on 12 & 13 June 2024, and 29 January 2025, in accordance with *AS 3959—2018 Construction of Buildings in Bushfire-Prone Areas* (AS 3959; SA 2018) and the *Visual Guide for Bushfire Risk Assessment in Western Australia* (DoP 2016).

Georeferenced site photos and a description of the vegetation classifications and exclusions are contained in Appendix 1 and Table 1, and depicted on Figure 1 and Figure 2. Effective slope results were cross-referenced with Landgate 5 m contour data and are depicted in Table 1, and depicted on Figure 1 and Figure 2.

It is noted that some construction infrastructure (site office, concrete batching plant, laydown) is proposed to the south and south-east of the building and substation envelopes, however this is expected to be decommissioned shortly after operation commences, and it is assumed will be subject to regrowth which will return it to the original grassland state (if not managed within an APZ).

Site observations indicate that land is undulating, with elevation decreasing from the north of the wind farm to the south-west. The effective slope for the remainder of the classified vegetation further than 150 m from the building and substation envelopes is not technically required, however has been provided to give some guidance of the general slope in the areas around the turbines which is almost always downslope 0°-5°.

The mapping has been conducted at a relatively broad scale, to provide some indication regarding the proximity of proposed renewable energy infrastructure, to continuous non-grassland vegetation.

2.3.3 Summary of inputs

Table 1 summarises the vegetation classifications and exclusions within 150 m of the proposed wind farm. The post-development vegetation classifications/exclusions and effective slope are illustrated

on Figure 1.

Table 1: Vegetation classifications/exclusions and effective slope (within 150 m of wind farm site)

Vegetation plot	Vegetation classification	Effective slope	Comments
1	Class G Grassland	Downslope >0–5°	Unmanaged grassland >100mm in height throughout much of the wind farm site, cleared of vegetation for agricultural purposes.
2	Class C Shrubland	Downslope >0–5°	Shrubland vegetation (<2 m high), primarily within Lot 4924 and small plots in Lot 101.
3	Excluded – Non-vegetated and Low threat (Clause 2.2.3.2 [e] and [f])	N/A	Land to be modified to low threat vegetation as part of proposed development within building and substation envelopes and associated APZs.
4	Class D Scrub	Downslope >0–5°	Plots of scrub vegetation (2 m to 6 m high) typically as isolated plots throughout the wind farm site.
5	Class A Forest	Downslope >0–5°	Multi-layered forest vegetation with trees >6m high, typically occurring as isolated plots within agricultural land and along roads, but as larger more continuous plots in plantations (until harvest) and retained native vegetation within surrounding nature reserves.
6	Class B Woodland	Downslope >0–5°	Trees >6m high, well-spaced with grassy or grazed understorey, typically occurring as isolated plots within agricultural land.
7	Excluded – Non-vegetated and Low threat (Clause 2.2.3.2 [e] and [f])	N/A	Existing public roads.

2.3.4 Bushfire Hazard Summary

The wind farm itself is comprised mostly of agricultural land, largely previously cleared of native vegetation other than isolated plots of retained shrubland, scrub and forest vegetation. The only significant plots of non-grassland vegetation within the wind farm site, are the timber plantations in the north-west and north-east.

Outside the wind farm site, the greatest bushfire threat to the site exists to the north, north-east and east of the site, where extended fire runs tens of kilometres long are possible through continuous forest vegetation within National Parks, State Forest and Nature Reserves, capable of creating landscape-scale bushfire behaviour. While the greatest bushfire threat to the development is from those directions, bushfire is capable of spreading toward the wind farm from any other direction over significant distances, which could also develop to steady-state bushfire behaviour.

Given the majority of proposed renewable energy infrastructure is located in the agricultural grassland areas, where any bushfire impact would be limited to grassfire behaviour with a very quick residence time, producing a brief exposure to elevated radiant heat, supplemented with some ember

attack from surrounding forest vegetation. The greatest potential bushfire impact will be on the two turbines proposed in the plantation in the north-west of the site, where surrounding forest vegetation could result in elevated radiant heat, potential flame impingement and ember attack on these turbines, if the risk is unmanaged.

2.4 Wind Farm Hazard and Risk Analysis

The CFA Guidelines notes that fire hazards at wind energy facilities may include the following:

- Electrical hazards, such as wind turbine electrical faults; power surges; hot surfaces; lightning strike
- Chemical hazards, such as the leakage of oils and lubricants within the turbine/ancillary equipment
- Potential fire spread, due to air flow impact or falling debris from fire-impacted turbines
- Landscape hazards, such as bushfire/grassfire ignition from fire within the facility, or external ignition of site infrastructure from embers or radiant heat
- Falling blades
- Wind turbines as a potential obstruction for aerial firefighting

From a bushfire risk assessment and management perspective, much of the above can be distilled into the potential impact of bushfire on the proposed turbines, and the ability for significant turbine fires to ignite a bushfire.

2.4.1 Wind Farm Fires in Australia

While there haven't been many significant fire events at wind farms in Australia (either ignited by wind turbines, or impacted by bushfire), or at least not many publicly reported, review of those reported fires do provide a useful tool to review potential risks, as well as the relevant learnings from such events. Below is a summary of several that have occurred and reported upon in the past 10 years.

2.4.1.1 Cape Nelson Wind Farm, Victoria (June 2024)

- Cape Nelson is a 195 megawatt (MW) wind farm in the Portland area of Victoria, that was constructed in 2009 and is owned by Pacific Blue.
- The wind farm site is home to native coastal Mallee scrub.
- The wind turbine fire occurred at the top of the turbine at approximately 8pm, and occurred in a Senvion MM82 turbine, which has a hub height of 69 metres and a maximum blade tip height of 110 metres.
- The fire destroyed the turbine and resulted in a blade falling off the turbine, and others expected to follow. Firefighters were called to the scene and allowed the turbine to burn out as there was nothing the firefighters could do to suppress the turbine fire.
- The Fire Rescue Victoria commander noted that:
    - This fire is the first in the Portland area since wind farms started to be built around 20 years ago
    - The rarity of wind turbine blazes mean they aren't a big fire risk.
- There were no reported injuries from the fire.

2.4.1.2 Clements Gap Wind Farm, South Australia (February 2024)

- Clements Gap Wind Farm was one of the first wind farms in South Australia, being constructed in 2010, and had 27 of the Suzlon S88 turbines.
- Smoke from the turbine was spotted by a maintenance crew at 8:30am, and emergency services were alerted at about 8.50am.
- The fire destroyed the wind turbine and ignited a grassfire underneath it due to debris from the turbine. The resultant fire turbine burnt about 30 hectares of grassland, with no one injured in the incident.
    - The Country Fire Service (CFS) created an exclusion zone around the wind turbine to enable firefighters are staying on top of spot fires created by falling debris, while remaining clear from the turbine collapse zones.

- The CFS noted that:
    - Wind turbine fires are uncommon, but can occur including in South Australia the previous year.

2.4.1.3 *Waterloo Wind Farm, South Australia (January 2017)*

- A bushfire started on a paddock near the Waterloo Wind Farm in South Australia. The fire quickly spread through the area due to gusty westerly and north-westerly winds, and including into area the wind farm was located.
    - The exact cause of the fire was never reported, but is not believed to be ignited by the Vestas wind turbines or any wind farm operations.
    - The fire burned approximately 50 hectares before it was controlled (around 2.45p the next day), including land beneath turbines as the northern end of the wind farm.
    - There had been no reported loss of structures but it was not clear what, if any, damage had been caused to turbines at the wind farm.
    - There were no reported injuries to any people.
- The bushfire was reported by a local farmer to the CFS just prior to 2pm, with the firefighting and wind turbine actions including the following:
    - CFS deployed water bombers to fire and requested that a number of turbines be shut down.
        - By 2.17pm, the wind farm operations had paused 18 wind turbines.
        - CFS also made contact with the wind farm General Manager to obtain approval for decisions relating to wind farm operations as much as required, including requesting that the turbines be paused and shut down remotely by applying their brakes.
    - CFS also requested that where safe to do so, all access gates within the wind farm site be opened to enable the CFS quick access to respond and manage the incident, without restrictions.
    - CFS worked to halt the fire advance with multiple runs of water bombing and ground-based firefighting, with fixed-wing water bombers able to manoeuvre through the turbines to target the grass fire and were followed by ground crew.
    - At 3.15 pm, CFS deemed it safe enough for the onsite crew to attend six of the paused wind turbines, to apply the brakes and set the blades in ‘rabbit ear position’, further assisting aircraft to pass through the turbines to continue water bombing.
    - The wind farm’s access tracks worked as a fire break and without these the CFS believes the fire would have likely spread further, creating a much bigger incident.
    - The turbine’s footings, with their clear line of site, were used by crews to coordinate air and ground crew actions.
    - Firefighting continued through the afternoon and, by 6 pm, the CFS approved the re-start of the turbines located outside of the fire ground area.

2.4.2 *Wind Farm Fire Risk*

The Australasian Fire and Emergency Services Authorities Council (AFAC) released a position paper titled *Wind Farms and Bushfire Operations* (AFAC, 2018) with the expressed intent to “*provide guidance relating to planning for bushfire prevention, preparedness, response and recovery operations in and around existing and planned wind farm facilities”*. This publication rightly stated that wind power is a rapidly expanding form of renewable energy production, and noted that *“…wind farms are not expected to adversely affect fire behaviour, nor create major ignitions risks”*. More

specifically AFAC noted the following:

- ***Ignition caused by wind farm infrastructure or operations***
    - It is possible that turbines can malfunction and start fires within the unit.
    - The above is generally considered a low risk given appropriate protection measures, with automatic shutdown and isolation procedures are generally installed within the turbine system.
    - Operation of winches and machinery during monitoring and maintenance tasks may also lead to ignitions.
- ***Lightning risks***
    - Wind turbines can attract lightning during thunderstorms.
    - If struck by lightning, turbine towers are generally not expected to start fires as they have built-in protection mechanisms.
    - On this basis, it is possible that wind turbines may reduce the risk of bushfires caused by lightning, particularly if turbines are located on a ridge or local high point.
- ***Hazards and firefighting limitations in and around the wind farm facilities***
    - Wind farms may result in aerial firefighting limitations due to aerial obstacles created by wind turbines and meteorological monitoring towers.
        - The bushfire at the Waterloo wind farm demonstrated that if conditions are clear and wind turbines are turned off, wind turbines are clearly visible from aircraft and are not likely to constrain aerial firefighting operations (Clean Energy Council 2017).
            - If wind turbines were not shut down, moving blades and wake turbulence would create significant hazards for low flying aircraft, thus the shutting down of wind turbines, in an emergency situation, is defined in wind farm emergency procedures.
        - However, transmission infrastructure, meteorological towers and guy-ropes were difficult to see (Clean Energy Council 2017) and this infrastructure does have potential to limit the effectiveness of aerial firefighting operations.
            - This can be addressed through appropriate marking of this infrastructure.
    - Access and egress challenges on the ground as well as water supply issues can also create firefighting limitations, if not planned for appropriately.
- ***Bushfire spread within wind farm facilities and impacts on wind farms as critical infrastructure***
    - Wind farms are not expected to adversely affect fire behaviour in their vicinity.
    - Local wind speeds and direction are already highly variable across landscapes affected by turbulence from ridge lines, tall trees and buildings.
    - Any potential for wake turbulence from wind turbines influencing fire behaviour is expected to be controlled through the shutting down of wind turbines in a bushfire event.
    - Sufficient planning for access roads and fuel modified buffer zones will reduce the risk of wind farm ignitions spreading beyond the property and reduce the risk of external fire impacting wind farm infrastructure.

2.4.2.1 Learnings from Past Wind Farm Fires

There are number of learning opportunities from the past wind farm fires, which can be used to

inform the bushfire risk management strategy.

With respect to bushfires impacting the wind farm site (such as the Waterloo Wind Farm fire), AFAC noted the following:

- *The wind farm's access roads were beneficial in helping fight the bushfire on the ground and provided an effective firebreak.*
- *The wind farm's turbines did not present a hazard to aerial firefighting and the turbines were clearly visible to the pilots involved in operations. However, transmission infrastructure, transmission lines and meteorological masts were difficult to see by pilots and did pose a safety risk.*
- *Improved communication protocols need to be in place between wind farm operators and fire and land management agencies to direct turbine shut-down procedures in an emergency situation and initiate emergency response plans.*
- *Wind farm operators should ensure that they have the capacity to respond to emergency events.*
- *Wind farm operators should ideally select turbines that can be rapidly shut down to the preferred position.*
- *Additional precautionary measures should be considered to allow for aerial identification of meteorological masts (measurement towers), guy wires and other infrastructure such as transmission lines that are not easily visible from air.*

Additionally, the Clean Energy Council also added the following comments:

- *Ensure aerial-friendly identification and markings for meteorological ("met") masts and guy wires is provided at wind farm locations.*
- *Review and update emergency management plans and protocols with a focus on:*
    - *Communications practices including advising state air-desk (who control aerial firefighting assets)*
    - *On site asset management/operations centre control procedures to pause, brake and 'lock' individual turbines*
    - *Best practice approaches to support aerial and ground-based responses*
    - *Water storage point signage, access track markings and site mapping.*
- *Ensure ongoing and regular engagement with local volunteer organisations and services.*

In addition to the comments above, the following is also noted:

- The considerable cleared areas at the base of turbines (footings and crane pads) provide useful areas for firefighting operations.
- While locking the turbines in the "Y" position is ideal, the CFS reported that the aerial operations were able to occur with the turbines "paused" which is understood to be with the turbines shutdown, but the blades not locked (i.e. turning very slowly).

With respect to turbine fires, the following is noted:

- Both the Victorian and South Australian fire services have noted that turbine fires are a low likelihood event, with very few having occurred.
- Most turbine fires have occurred in old turbines that are likely 20 years old, and which:
    - Have older technology without the and more advanced fault monitoring, detection, etc currently installed in most modern-day turbines in wind farms.
    - Likely lack nacelle suppression systems to control the fire and prevent escalation to an uncontrolled turbine failure event.
- Prevention of an uncontrolled turbine fire or failure event should be seen as the primary

objective to prevent potential bushfire ignition events and enable firefighters to approach the turbine as close as safe to do so.

- Early notification of local fire brigade, nearby farmers/landowners and the wind farm personnel is critical to ensure a rapid and coordinated response.

2.4.3 Likelihood of Wind Farm Fire

As noted by AFAC, the likelihood of turbine fires is considered to be relatively low, and while it is accepted the statistics around fire losses are based on historical estimates and incomplete datasets, the likelihood wind turbine fire per year is generally accepted to be around 1-in-2000, but potentially lower than that (Krcmar, 2020). There are varying levels of resultant damage associated with these fires, which can range from small fire events through to complete burnout of the turbine nacelle, with uncontrolled nacelle fires resulting in significant damage or total turbine loss much of the time.

The likelihood of bushfire impact on wind farms is tied to the potential for bushfires within the wind farm site. To provide some guidance on this, historical bushfires have been depicted on Plates 1 and 2, using the following publicly available datasets:

- Firewatch which is a Landgate service that uses satellite remote sensing imagery to detect fire hotspots and burnt areas, to track live bushfires but also to review the broad extent of past fire events from 1989 to present day.
- DBCA Fire History dataset which contains a collection of records of fire events (prescribed burns and bushfire) which were captured on departmental-managed land, and where available non-department managed land in Western Australia. The earliest records available are from 1937.

On the DBCA dataset depicted on Plate 3, it is worth noting:

- A number of the larger fires in the northern part of the site and to the west (on the) are from the 1950's and 1960's, when the landscape may been different and less developed.
- Some of the fires to the north, north-west and west of the subject site within forest vegetation, are prescribed burns within the Nature Reserves and State Forest dating back to the 1970's.

The historical data clearly depicts that while bushfires have occurred in the local area, few have ever spread into the wind farm site. This is likely due to the improved ability to manage the bushfire fires as they spread into the agricultural land from the forest areas due to reduced fire behaviour and increased access for attending firefighters. While there appear to be few historical bushfires within the wind farm site, this BRMP assumes that bushfire impact could occur in the future, and addresses the risk accordingly.

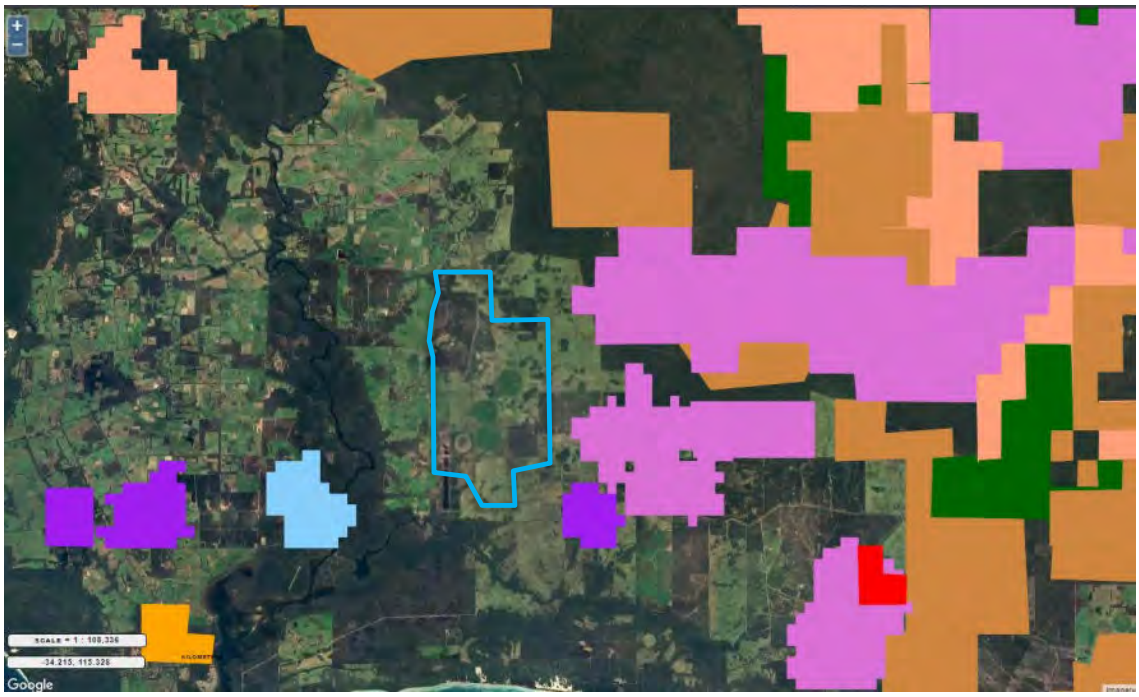

Plate 2: Bushfire History (Firewatch 2025)

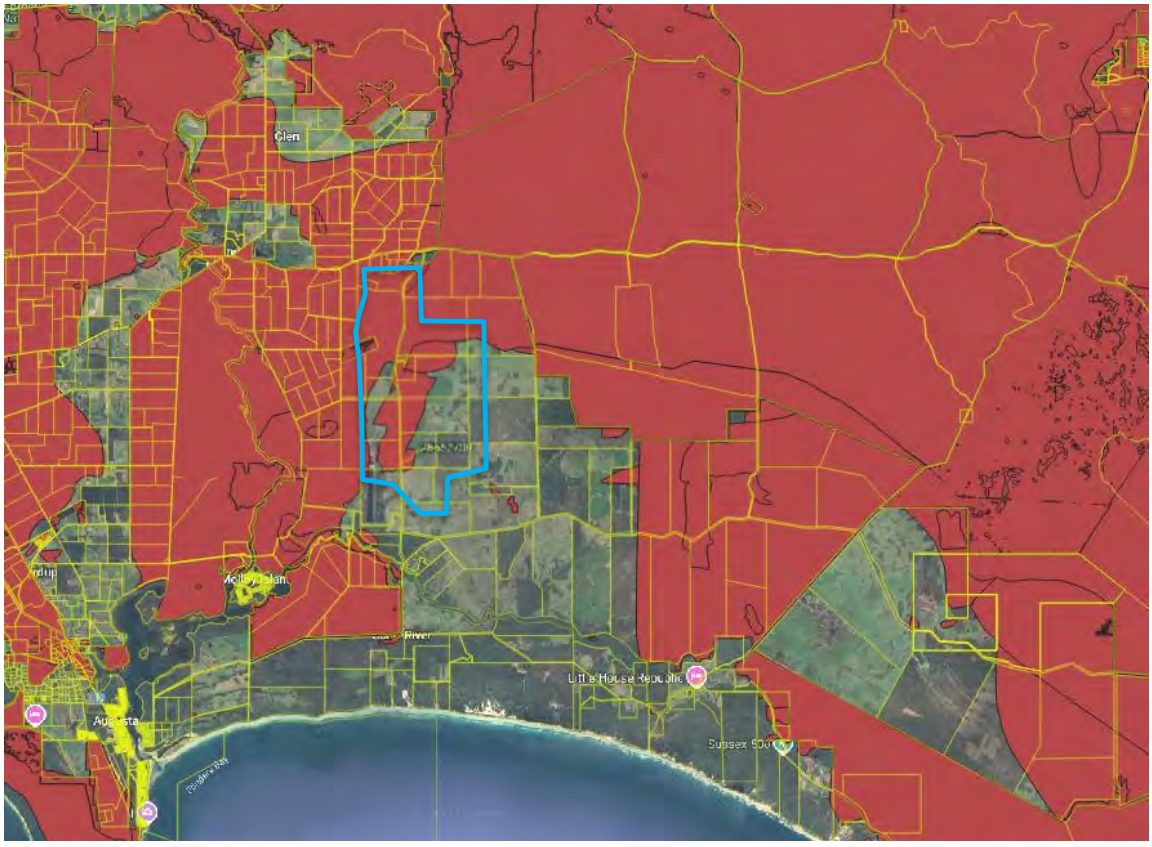

Plate 3: Bushfire History (DBCA 2025)

2.5 Bushfire Risk Management Requirements

Based on the analysis of the bushfire hazards and risk associated with wind farms, the following are considered key bushfire risk management requirements to be incorporated into wind farm proposals:

- Considered siting of renewable energy infrastructure to minimise bushfire risk as much as practical, noting the siting of wind turbines is based on a number of factors.
- Ensure suitable separation from nearby unmanaged vegetation to ensure bushfire impact on the infrastructure is appropriately managed commensurate to anticipated bushfire behaviour, in addition to providing sufficient separation to limit bushfire escape.
- Provision of appropriate vehicular access to each turbine for emergency services and wind farm operations vehicles, including permitting fire appliance turnaround.
- Provision of secure firewater supply for attending firefighters, to enable a rapid suppression response without extended turnaround times for appliance refills.
- Design and construction of turbines should ensure that the risk of uncontrolled turbine fire or failure events is mitigated, to avoid potential bushfire ignition events and enable firefighters to approach the turbine as close as safe to do so. This would be expected to include:
    - Remote monitoring of the operational status of the turbines, including any faults, with ability to remotely shutdown and de-energisation of turbine/s.
    - Fire detection, alarm and suppression system to provide early warning of internal fire and automatic response.
- Ensure all infrastructure that could potentially present a risk to pilots and aerial operations (e.g. turbines, meteorological monitoring towers etc) are recorded with relevant aviation authorities and provided with any required markers/lights etc to minimise risk during aerial firefighting operations,
- Ensure sufficient information is available for attending firefighters to assist any fire suppression efforts, including the following:
    - Key emergency contacts including wind farm personnel
    - General site plan including location of buildings and renewable energy infrastructure including transmission towers, meteorological monitoring towers etc.
    - Information on any fire/bushfire risk management measures including Asset Protection Zones, fire detection/suppression systems etc.
    - Firewater access locations, including hydrants, tanks and any other static water supplies suitable for firefighting purposes.
    - Access information including public roads, available entrance/exits, internal vehicular access routes and gates (locked/unlocked)
    - Any safety considerations and procedures
- Provision of mobile firefighting equipment and training for wind farm personnel to manage risk of onsite hot works, and potentially intervene any small ignitions until fire brigade arrive.
- Ensure an emergency management plan is established for the facility addressing all relevant hazards, including bushfires and turbine fires, that includes the following with respect to fire:
    - Housekeeping and routine maintenance actions (including ongoing compliance with project obligations)
    - Limiting any onsite ignition sources or fuel loads
    - Ensure communication protocols are established for contacting DFES, nearby farmers/landowners, and relevant agencies (e.g. Western Power, AEMO etc) to

enable management of emergencies, access to land and shutdown of turbines.

- Pre-emptive actions on days with forecast of elevated Fire Danger Rating or Total Fire Ban days
- Staff training and exercises of emergency management procedures
- Ensure DFES (and local fire brigade) familiarisation with the facility
- Response actions for in the event of bushfire in the local area with focus on:
  - Evacuation of staff offsite
  - Ensuring all onsite wind farm access routes are unlocked and available for attending firefighters.
  - Remote shutdown and de-energisation of turbine/s (in liaison with DFES, Western Power, AEMO) and facility closure, if safe to do so.
- Response actions for onsite turbine ignition or fire including
  - Rapid notification of wind farm personnel (including on-call technician), DFES and nearby landowners/ farmers
  - Remote shutdown and de-energisation of relevant turbine/s
  - Conduct first attack response on spot fires until DFES arrival etc.
- Ongoing review of emergency management plans (and any information relied upon by emergency services) on regular basis, including following changes to the wind farm or any fire events.

3.0 Bushfire Risk Strategy and Management Measures - Renewable Energy Assets

As detailed in Sections 1.3 and 1.4, the CFA *Design Guidelines and Model Requirements: Renewable Energy Facilities v4* (CFA, 2023) are currently seen as the best guidance for renewable energy facilities available at this point in time. The CFA Guidelines provide a comprehensive suite of design, construction, operation and emergency planning measures recommended for renewable energy facilities, that address the risk of fire within the infrastructure, but also bushfire risk to the development.

CFA (2023) notes that any planning applications for all renewable energy facilities proposed in bushfire prone areas, strengthened or additional risk mitigation measures will be required to address bushfire risk, and will also need to address the following:

- The impact of any ignition events arising from the renewable energy infrastructure on nearby communities, infrastructure and assets.
- The impact of bushfire on the renewable energy infrastructure (e.g. ember attack, radiant heat impact, flame contact).

CFA Guidelines Requirements for Wind Turbines

- ***Turbine Siting and Vegetation Modification***
  - CFA Guidelines recommend siting of turbines in "low-risk environments" which it defines as being in gently undulating grassland with good road access and away from "continuous" non-grassland vegetation (noting the term "continuous is not defined), which are considered "high-risk environments".
    - The CFA Guidelines don't preclude siting of renewable infrastructure in "high-risk environments", but note that strengthened or additional risk mitigation measures will be required.
  - A Non-Vegetated Zone (NVZ) must be established and maintained around the base of wind turbines.
    - In low-risk environments, this is to be 10m wide and at least the distance where radiant heat flux (output) from the vegetation does not create the potential for ignition of on-site infrastructure.
  - Where wind turbines are sited in high-risk environments (including timber plantations), strengthened or additional fire risk mitigations will be required as per the stage approach detailed in the CFA Guidelines, with the following recommended:
    - Implementation of an additional Asset Protection Zone (APZ; reduced-fuel zone cleared of trees and scrub [as permitted by authority] and grass to <100mm high in bushfire season) around the base of wind turbines, on the outside perimeter of the NVZ, with width:
      - no less than 20m, or
      - to the envelope of the wind turbine blades.
    - There is no further guidance on how to apply this.

Interpretation Note – Continuous and Non-Continuous Vegetation

- *Given the lack of definition around the term "continuous" vegetation, which is critical to the assessment of what is considered 'low-risk' and 'high-risk' environments as per CFA Guidelines it is recommend the following broad principles are considered as being "non-continuous" when assessing the siting and vegetation management around turbines:*
  - *Plots of non-grassland vegetation that are sufficiently small and/or isolated from other forest/woodland/scrub vegetation, by either grassland or low*

shrubland, such that the resultant bushfire passing through these plots would not be considered to be a significantly exacerbated or likely to reach steady state, or be uncontrollable by attending firefighters.

- *Consideration is given to the size and location of the plot, proximity to continuous non-grassland vegetation, access to and around the plot (either via roads, tracks or agricultural land).*
- *Examples are plots of paddock trees or isolated plots of forest/woodland/scrub vegetation within paddocks, where a bushfire passing through would not represent a significant escalation in bushfire behaviour, nor produce behaviour that would make the fire uncontrollable attending firefighters, who would be expected to have reasonable access and water supply.*

- ***Vehicular Access***
  - Suitable emergency vehicle access is required to each turbine and building on-site (with number and location of access point to be determined in liaison with fire brigade).
    - Specifications are similar to private driveways from WA Guidelines, but with passing bays permitted every 600 m in lieu of 200 m.
- ***Firewater***
  - At least one static fire water storage tank of at least 45,000L effective capacity at each site entrance
    - Additional static fire water storage tanks of at least 45,000L effective capacity must also be incorporated in facility design (in consultation with fire brigade)
- ***General Design***
  - Nacelles must be equipped with automatic fire detection, alarm and fire suppression systems.
  - Wind turbines must be located no less than 300 metres apart.
  - Wind turbines must be provided with automatic shut-down capability, and the ability to be completely disconnected from the power supply in the event of fire.
- ***Emergency Planning***
  - Include measures in Fire Management Plan for attending firefighters and Emergency Plan for onsite personnel
  - Training and Exercises

CFA Guidelines Requirements for Substations

- The entire substation must be surfaced to eliminate all vegetation including grasses.
- Firewater must be provided to cover substations

CFA Guidelines Requirements for Transmission Lines

- Comply with any local electricity supply legislation or guidance prescribing the vegetation clearance requirements for electric lines.

The CFA Guidelines provide the best guidance available to wind farm design at this current point in time, certainly in terms of infrastructure and bushfire risk management. On that basis, this BRMP seeks to apply the Model Requirements, and associated guidance, from the CFA Guidelines, as much as practical to the proposed wind farm.

It is noted that while most management measure relate to management of bushfire impact on the proposed renewable energy infrastructure, some also relate to internal hazards which is also critical to avoid ignition of bushfires.

Based on the guidance from the review of the assets and hazards in Section 2.0, and informed by the compliance requirements of the CFA Guidelines and the WA Guidelines, the following bushfire safety strategy and associated risk management measures are to be incorporated into the proposed facility to manage bushfire risk to the renewable energy infrastructure, while also managing the escape of fire within the infrastructure to ignite a bushfire.

The subsections below detail the proposed bushfire risk management measures to be adopted by the project, with a compliance assessment in Section 4.0 demonstrating how these measures align with the principles from the CFA Guidelines.

The risk management measures have also been summarised in the BMP, to provide a comprehensive list of the Proponents bushfire risk management obligations for this project.

3.1 Wind Turbines

3.1.1 Siting and Vegetation Modification and Management

Based on the guidance from the CFA Guidelines, in addition to the interpretation note on "continuous" and "non-continuous" non-grassland vegetation, the following vegetation modification and management philosophy is proposed around the base of the turbines, based on location and proximity to "continuous" non-grassland vegetation.

- Turbines would ideally be separated by at least 300 m from "continuous" non-grassland vegetation on the following basis, in order to minimise vegetation management measures:
    - CFA Guidelines require separation between turbines of 300 m and the maximum Non-Vegetated Zone (NVZ)/Asset Protection Zone (APZ) in high-risk environments is to the blade envelope.
    - The proposed turbines will have a maximum tip height of 250 m, which with a 10% safety margin, if they toppled would be a safe distance of 275 m.
- Given the above, and in the absence of any specific siting guidance, the following turbine risk categories and associated vegetation management measures are to be adopted:

  Low-Risk Turbine Site

    - ***A turbine is considered to be in a low-risk environment when it is sited further than 300 m from "continuous" non-grassland vegetation.***
    - If assessed as low-risk, implement the following measures, as per requirements of CFA Guidelines for low-risk environments:
        - ***10 m NVZ around base of turbine tower***
    - While target BAL rating is not specifically required, a 10 m NVZ would achieve BAL-29 at the turbine tower casing.
    - Currently 13 of the 20 proposed wind turbines are assessed as Low Risk, as depicted on Figure 1 and Figure 2.

  Transition Risk Turbine Site

    - ***A turbine is considered to be in a transition-risk environment when it is sited as follows:***
        - ***closer than 300 m to "continuous" non-grassland vegetation, (but not within this non-grassland vegetation) or***
        - ***within "non-continuous" non-grassland vegetation (e.g. small plots of forest, woodland, scrub or shrubland vegetation***
    - If assessed as transition-risk, implement the following measures, as per minimum requirements from the CFA Guidelines for high-risk environments:

        - ***10 m NVZ around base of turbine tower; and***
        - ***20 m APZ outside the 10 m NVZ***
    - While target BAL rating is not specifically required, the 30 m NVZ/APZ would achieve BAL-29 or lower at the turbine tower casing, and would generally provide a BAL-19 or BAL-12.5 impact.
        - The Transition Risk category is aimed more at providing greater separation from "non-continuous" non-grassland vegetation when turbines are sited in/near small plots of forest, woodland, scrub or shrubland vegetation, rather than the instances where turbines are still in grassland areas but within 300 m of "continuous" non-grassland vegetation, and the overall 30 m NVZ/APZ is probably greater than required. Notwithstanding, a consistent vegetation management approach is being applied to both occurrences.
    - Currently 5 of the 20 proposed wind turbines are assessed as Transition Risk, as depicted on Figure 1 and Figure 2.

<u>High-Risk Turbine Site</u>

- ***A turbine is considered to be in a high-risk environment when it is unavoidable to site turbines within "continuous" non-grassland vegetation (e.g. plots of forest/woodland/scrub/shrubland vegetation considered to be continuous).***
- If assessed as high-risk, implement the following measures, as per the maximum requirements from the CFA Guidelines for high-risk environments:
    - ***10 m NVZ around base of turbine tower***
    - ***APZ (or extension of NVZ) to the blade envelope (rotor diameter), outside the 10 m NVZ***
- While target BAL rating is not specifically required, the NVZ/APZ would achieve BAL-29 or lower at the turbine tower casing, more likely BAL-12.5.
- Currently 2 of the 20 proposed wind turbines are assessed as High Risk, as depicted on Figure 1 and Figure 2.
    - These 2 turbines are sited in existing timber plantations in the north of the facility, however the timing of harvesting has not yet been determined.
    - The risk to the turbines is likely to be significantly reduced following future harvesting, however given the uncertainty regarding the timing and future use, a High Risk rating has been applied.

- Should turbines be relocated:
    - The risk category of the turbine should be reviewed by a bushfire practitioner, and adjustments made to the NVZ/APZ as required.
    - Turbines could straddle the turbine risk categories above (e.g. turbine on edge of forest and grassland may be both high-risk and transition risk). In these instances, we propose that:
        - The NVZ/APZ be appropriate to the interfacing vegetation e.g. high-risk treatment in direction of forest, with transition (or low) risk treatment in direction of grassland, or
        - the highest risk category is blanketly applied
- All wind turbines must be located no less than 300 metres apart
- The Non-Vegetated Zone (NVZ) is to comply with AS 3959 Clause 2.2.3.2 (e) and the standards for "firebreaks" from CFA Guidelines as follows:

  - Non-combustible, constructed of concrete, mineral earth or non-combustible mulch such as crushed rock.
  - Free of vegetation and obstructions at all times.
  - No combustible plant or equipment.
- The Asset Protection Zone (APZ) is to comply with the APZ standards from the WA bushfire Guidelines
- All NVZ and APZ around turbines are to be established and maintained by the Proponent during bushfire season, for the life of the wind farm.

3.1.2 Vehicular access to turbines

- The following site entrances are to be established for the facility:
  - Main site entrance from Scott River Road, near the proposed building and substation envelopes
  - Three additional site entrances as follows:
    - One on Scott River Road, approximately 5.5 km north of the main entrance.
    - One on Governor Broome Road, providing access to turbines to the north.
    - One on Governor Broome Road, providing access to turbines to the south.
- All nominated site entrances are be fitted with gates as follows:
  - Provide at least 6m clear horizontal width
  - If locked, any keys are issued to DFES and any local fire brigade.
- Internal wind farm access driveways are to be provided to each turbine, from the nominated site entrances, as follows:
  - Driveways are either to be at least 6 m wide, or if less than 6 m wide, must be at least 4 m wide and require 20 m long passing bays every 600m that increase the overall driveway width to no less than 6 m wide.
  - Other than passing bay separation, all turbine access driveways are to comply with private driveway specifications of WA Guidelines
- A turning head is to be constructed at, or around the perimeter of, the base of each turbine to enable fire appliance turnaround.
  - The turnaround is to comply with the requirements of the private driveway specifications of WA Guidelines.
  - It is recommended that the turnaround be within the 10 m NVZ or at the crane pad of each turbine.
- The internal wind farm driveway network needs to provide vehicular access to each proposed firewater tank, with access is to be provided to within 4 m of the tank suction point.
- In addition to the internal wind farm access driveways, there are existing farm tracks and farm gates, also noted on the concept plan, that could be used in a bushfire emergency by attending firefighters.
  - These are shown for information purposes only, and it is noted that these are not being constructed or maintained by the Proponent as part of this project.
- Emergency Information Book and Signage (see Section 3.4.4) is to be provided at all site entrances (but not existing farm gates), for attending emergency services personnel.
- The internal wind farm access driveways, site entrances, gates and signage are to be

constructed and maintained by the Proponent in perpetuity (or for the life of the wind farm).

3.1.3 Firewater for turbines

- As detailed on Figures 8 and 9 in the BMP, firewater tanks as proposed in the following locations around the wind farm site (following initial consultation with DFES) to provide 180 kL of firewater capacity for the renewable energy infrastructure:
    - One (1No) 45 kL firewater tank in the northern part of the site, at an intersection of the internal driveways and the termination of the transmission line.
    - One (1No) 45 kL firewater tank at the wind farm building envelope, either collocated or combined with the firewater requirements for the proposed buildings.
    - One (1No) 45 kL firewater tank in the southern part of the site, at an intersection of the internal driveways to a number of turbines.
    - One (1No) 45 kL firewater tank south of Governor Broome Road, at an intersection of the internal driveways to the three turbines in this part of the site.
- While the firewater tank locations above represent the current siting approach, there remains flexibility to relocate or amalgamate the firewater tank/s, provided there is agreement with DFES, local fire brigades and the Proponent.
- All firewater tanks will comply with the standards from the WA bushfire Guidelines, and the following from the CFA Guidelines:
    - Must be an above-ground water tank constructed of concrete or steel and must comply with AS 2419.1 and signage indicating 'FIRE WATER' (or similar approved) and the tank capacity must be fixed to each tank.
    - Firewater tanks are to be at least 10 m from wind turbines
    - The tank suction point must be within 4 m of a driveway or hardstand
- All firewater tanks are to be sited in an area of BAL-29 or lower as follows:
    - Within a BAL-29 or lower area within the wind farm building envelope
    - Where outside the wind farm building envelope, have a 9 m wide APZ around the perimeter of the tank.
- Vehicular access to each firewater tank is to be via proposed internal wind farm driveways.
    - Access is to be provided to within 4 m of the tank suction point.
- Emergency Information Book and Signage (see Section 3.4.4) is to be provided at all site entrances (but not existing farm gates), for attending emergency services personnel.
    - This is to include the location of all onsite firewater tanks and the internal access routes to these tanks.
- The firewater tanks, and associated APZs, are to be constructed and maintained for the life of the project by the Proponent.

3.1.4 General turbine design and emergency management

In addition to the measures detailed above, the following are also required for the proposed turbines to manage the risk of turbine fires.

3.1.4.1 Automatic fire detection, alarm and suppression

- All turbines are to be fitted with an automatic fire detection and alarm to provide early warning of internal turbine fire.

- All turbines are to be fitted with a fire suppression system, to provide an automatic fire suppression response upon detection of internal turbine fire.
- Activation of fire detection and alarm system is to be monitored at all times, either by wind farm personnel onsite, or offsite monitoring.
    - A procedure to be incorporated to ensure that activation of the fire detection system results in notification being provided immediately to the following people that there is an onsite turbine fire:
        - Wind farm personnel (including on-call technician),
        - DFES and local fire brigades
        - Nearby landowners/ farmers

3.1.4.2 Operational Status Monitoring and Control of Turbines

- In addition to the fire detection, alarm and suppression systems, appropriate operational status monitoring for all turbines must be provided, to ensure that any electrical or equipment shorts, faults or failures with the potential to ignite or propagate fire are rapidly identified, controlled and relevant personnel notified.
    - Operational procedures are to be implemented to ensure any persistent faults or operational alarms, are addressed promptly including rapid notification of wind farm on-call technician.
- Monitoring of turbine operational status is to be able to be conducted both onsite and remotely offsite.
- Operational control of turbines should be able to be conducted onsite and offsite, to enable remote turbine de-energisation and/or shutdown should any faults or failures have potential to result in a turbine fire.
    - It is expected that any fault/s resulting in operation outside tolerable limits, would have automatic fail-safe procedures to de-energisation and/or shutdown the turbine to prevent turbine fire.

3.1.4.3 Turbine Shutdown and Disconnection from Power

- In addition to turbine operation status monitoring and control, all wind turbines are to be configured to automatically shut-down in the event of turbine fire, with the ability to be de-energised remotely from offsite.
    - The intent is that in the event of a turbine fire, only the affected turbine would automatically shut-down.
- There will also be ability to remotely shut-down and de-energise the turbines in a bushfire event (in consultation with DFES, Western Power, Australian Energy Market Operator [AEMO]).
    - This will result in the turbine blades turning very slowly but not generating any power nor supplying to the grid.

3.1.4.4 Aerial Notification and Marking

- Ensure the Civil Aviation Safety Authority (CASA) is notified of all installed weather monitoring stations and turbines as part of the wind farm.
- Ensure all guy wires and monitoring towers are compliantly marked to ensure visibility to aircraft.

3.2 Substation

- The substation envelope is proposed to be co-located with wind farm building envelope, which is a location surrounded by grassland vegetation.
- There are several buildings proposed within the substation envelope, and these will

comply with the WA Guidelines as follows:

- Provision of a compliant 9 m wide APZ around the perimeter of the substation envelope to ensure a rating of BAL-29 or lower is achieved on all substation infrastructure and buildings (e.g. switchroom, NSP building, Statcom building and harmonic filter room)
- All land within the substation envelope is to be non-vegetated
- Provision of compliant private driveway access to the substation envelope, from Scott River Road, that is compliant with the private driveway specifications of the WA bushfire Guidelines
- No specific firewater provided for the substation, however the firewater tanks within the wind farm building envelope, will provide nearby firewater for bushfire fighting around substation.

- Substation infrastructure is to be designed, constructed and maintained to relevant Australian Standards.

3.3 Above-ground Transmission Lines

- Above-ground transmission towers, poles and lines are to be designed, constructed and maintained in accordance with Western Power specifications, by Western Power.
- This infrastructure will comply with any vegetation clearance requirements as per Western Powers own standards.
  - It is noted that the majority of the proposed transmission line is over existing grassland so there is likely to be limited vegetation clearing required for construction or ongoing maintenance.

3.4 Additional Management Measures

In addition to the measures detailed previously for the specific renewable energy infrastructure, the following is also required to manage bushfire risk for the wind farm facility.

3.4.1 Provision of mobile fire trailer

- Provision of a mobile fire trailer (or similar approved) is required to enable wind farm staff to:
  - have on standby during any approved tasks that may ignite a bushfire (e.g. hot-works etc), or
  - provide a rapid first response to any small onsite ignition events while the fire is in the incipient stage to prevent growth and spread of the fire
- This firefighting infrastructure is not to be used by staff to fight developed bushfire i.e. staff not expected to fight bushfires.
- As a minimum, the fire trailer (or similar approved) should have:
  - No less than 1000 L tank
  - Fire pump and hose reel
  - Mounted on trailer or ute to enable easy transport around the site.
    - If on trailer, sufficient vehicles shall be onsite with capability to mount the trailer (e.g. equipped with appropriate tow balls).
- The Proponent is to supply the fire trailer (or similar approved) prior to commissioning, and ensure it is maintained and ready for use at all times during bushfire season, including ensuring a full water tank and pump fuel tank.

3.4.2 Construction and Commissioning

- Ensure an emergency communication system must be provided that is reliable and will

operate in the event of power failure

- Ensure all electrical equipment (e.g. electrical cabling, junction boxes, inverters and transformers) comply with relevant design, construction and installation standards of electrical equipment including relevant Australian Standards, and manufacturers recommendations.
- Install and commission fire detection, alarm and suppression systems as early as practical during construction, and prior to commissioning.
- Provide first response firefighting equipment (e.g. extinguishers) at all construction portables/buildings onsite, in the vicinity of all construction activities, and in site-based vehicles.
- Ensure sufficient training provided to relevant personnel on the use of on-site firefighting equipment and first-aid, and responsibilities during emergencies
- Provide required fire protection equipment for dangerous goods as per relevant Australian Standards.
- Adhere to restrictions and guidance during days of Fire Danger Rating of High to Catastrophic, and Total Fire Ban days and Harvest Movement Ban days
- Ensure tight ignition source control, including hot works and restriction of smoking to prescribed areas.
- Conduct any required vegetation management.
- Undertake all required infrastructure, equipment and vehicle maintenance.
- Incorporate emergency management procedures into the Construction Management Plan (or other relevant document) for the construction and commissioning phase of the facility which includes:
    - Emergency procedures for identified risks and hazards of the renewable energy infrastructure, including but not limited to
        - Onsite fire in renewable energy infrastructure (e.g. electrical infrastructure faults and fire in turbines or substation)
        - Bushfires
    - Emergency procedures for bushfires (adopting similar concepts to those detailed in the BMP for the operational wind farm)
    - Emergency procedures for fires within the renewable energy infrastructure and buildings.
- Provide wind farm mobile fire trailer (or similar approved) prior to commissioning of the turbines.
- Notification of fire brigade at least seven days prior to the commissioning of any renewable energy infrastructure at the facility, especially the wind turbines.
- Engage with fire brigade to offer a familiarisation visit prior to commissioning, as detailed in Section 3.4.5.

3.4.3 Operation and Maintenance

- Ensure ongoing compliance with the endorsed BMP is achieved, especially prior to, and during, bushfire season. This includes all vegetation management, internal driveway access, fire system and firewater obligations.
- Develop, implement and review the Emergency Management Plan including all preparedness, pre-emptive and response actions, as required, and ensure ongoing liaison with DFES and regular staff training and exercises are conducted (see Section 3.4.6 below).
- Ensure the Emergency Information Book and/or signage is appropriately stored at all

nominated site entrances, and reviewed on an annual basis (see Section 3.4.4).

- Ensure inspection, maintenance and any required repair activities are conducted for all renewable energy infrastructure (turbines, substation), associated equipment, fire systems, communication systems, and vehicles at the facility, in line with relevant Australian Standards and manufacturers requirements.
- Ensure any Dangerous Goods (if any) comply with all relevant legislation, Australian Standards and the requirements of the BMP.

3.4.4 Emergency Information Book and Signage

An Emergency Information Book and/or signage must be located at each nominated site entrance to the wind farm, with any plans or information books provided in a weatherproof container.

The Emergency Information Book and/or signage is intended to provide to emergency responders with an overview of the facility. This information should be developed in liaison with relevant emergency services representatives (if possible) and should seek to include the following:

- A description of the premises, its infrastructure and operations.
- Up-to-date contact details for site personnel and regulatory authorities.
- Site plans that depict the entire site layout, including:
    - Buildings, substations and renewable energy infrastructure,
    - Internal driveways and surrounding public roads
    - Fire protection systems and equipment, including firewater tanks
    - Grid connections, drains and isolation valves,
    - Dangerous goods storage areas
    - Landowners within wind farm, and neighbouring landowners, and any relevant infrastructure (e.g. dwellings), and
    - North direction and scale
- Details of any emergency equipment, including the type and location of fire and gas detection systems.
- Maximum (safe) operational wind speed and temperature conditions and operating procedures to limit fire risk.
- A manifest of dangerous goods (if required) and Safety Data Sheets (SDS) for dangerous goods stored on-site.
- Procedures for the management of emergencies, including evacuation, shelter-in-place (for facilities at risk of bushfire/grassfire), containment of spills and leaks, and fire procedures (including infrastructure/plant fires, vehicle fires, grassfire/bushfire)

A review of the information contained within the facility's Emergency Information Book and signage must be undertaken prior to commencement of bushfire season annually.

3.4.5 Emergency Services Familiarisation

Prior to commissioning of the facility, a familiarisation visit and explanation of the proposed facility, the specific hazards, the proposed fire safety systems and management measures, and the emergency procedures, is to be offered to local fire brigades and other emergency services.

The opportunity should be taken to ensure that the information in the proposed Emergency Information Book/Signage (see Section 3.4.5) is appropriate for their needs, and that they are familiar with where this will be located.

Additionally, it should be confirmed that any required keys or access codes to any secured parts of the site have been (or will be) supplied to the relevant fire brigade personnel.

A schedule for ongoing site familiarisation to account for changing personnel, facility infrastructure and hazards, and emergency exercises should be developed in conjunction with the local fire brigade.

3.4.6 Emergency Management Plan

An Emergency Management Plan is to be developed for the facility, which comprehensively details the following (noting this plan it to be for all emergencies and not specifically just to bushfire risk management):

- Facility details including technical support during an emergency, site plans, details of emergency resources and a manifest of dangerous goods.
- The identified risks and hazards associated with the renewable energy infrastructure.
- Detail preparedness and pre-emptive actions to address the above hazards, including the following for bushfire:
    - Ongoing compliance with approved BMP and BRMP, including ensuring NVZ/APZs are maintained, vehicular access routes and firewater is maintained and available, and conducting regular bushfire housekeeping inspections.
    - Ensuring ongoing maintenance of all fire and communication systems.
    - Determining forecast Fire Danger Rating Total Fire Bans (TFB) and Harvest Vehicle Movement Bans (HVMB), during bushfire season
    - Modifying Site Activities (based on Forecast FDR and TFB/HVMB) including limiting activities which may introduce bushfire ignition (hot works, unnecessary vehicle movement etc).
    - Monitoring DFES Bushfire Emergency Warnings (and/or bushfire activity within 50 km of the facility, during bushfire season, and the decision-making triggers
- Detail emergency response procedures to address the nominated hazards.
- For a bushfire emergency, the response should include the following
    - The immediate response to any onsite bushfire, or bushfire observed in the local area, is to notify DFES and local fire brigade immediately.
    - Conducting early offsite evacuation of all staff away from the bushfire if safe to do (preferred response), ideally to Margaret River, however Augusta, Busselton or Nannup may also be considered.
    - If there is insufficient time to safely travel offsite to Margaret River, Augusta, Busselton or Nannup, without being impacted by bushfire, conduct onsite shelter in place in the O&M building.
        - <u>It is noted that this building is not constructed for onsite refuge from bushfire and should only be considered as a last resort option only if offsite evacuation is not possible.</u>
    - If safe to do so prior to staff evacuation,
        - Unlock all access gates and ensure vehicular access routes and firewater tanks within the wind farm, are available for use by attending fire brigade.
        - Physically shutdown the facility including closing doors/windows of any buildings, storing combustible goods inside buildings etc.
        - Conduct shutdown and de-energisation of turbine/s (in liaison with DFES, Western Power, AEMO) remotely from offsite location.
- The response to onsite fire, including involvement of turbines, is to involve:
    - Immediately notify:
        - Relevant wind farm personnel, in addition to DFES and local brigade to

ensure a rapid turnout.
    - Any relevant nearby landowners.
- Confirm shutdown and de-energisation of turbine that is on fire.
- Conduct first attack response on spot fires until DFES/ local brigade arrival etc.

The emergency management plan is to be reviewed regularly and the relevant staff will need appropriate training and to conduct regular exercises to ensure everyone is fully conversant with the requirements of the plan and able to respond as required during all emergencies. Training should be conducted annually prior to bushfire season, and regular exercises conducted throughout the year.

Further specific detail on the requirements of the emergency management plan is provided in Section 5 of the project BMP.

4.0 CFA Guidelines Compliance Assessment

As detailed previously, the project is applying the Model Requirements from the CFA Guidelines to the renewable energy infrastructure of the project as much as possible as part of the bushfire risk management strategy, albeit rationalised for a WA context where required (e.g. use of WA standards for APZs, driveways, firewater tanks etc).

The proposed bushfire management strategy and mitigation measures have been detailed above in Section 3.0, with a compliance assessment of these measures against the Model Requirements of the CFA Guidelines provided below in Table 2.

As previously noted, not all Model Requirements relate to bushfire impact on the proposed development, however the management of many of these internal hazards is also critical to avoid ignition of bushfires, so have been discussed as much as relevant.

Table 2: Summary of Renewable Energy Facility requirements relating to bushfire and the development response (CFA, 2023)

CFA Guideline Section	Requirement	Type	Development Response
Section 2: Consultation	***Consulting with CFA*** • Early consultation with DFES, before developing a planning permit application.	***All Facilities***	• The Proponent has liaised with DFES regarding the proposal on several occasions as follows, and sought to incorporate their feedback as much as practical o Initial meeting and proposal presentation on 18th April, 2024 o Preliminary concept plan and bushfire risk management strategy issued to DFES on 15th August 2024 o Meeting held with DFES on 16th August 2024 o Follow-up concept plan and bushfire risk management strategy issued to DFES on 31 October 2024 o Meeting held with DFES on 13th November 2024 o Onsite meeting held with Shire of Augusta Margaret River Community Emergency Services Manager (CESM) on 29th January 2025. • ***Based on the above, all requirements with the CFA Guidelines have been met.***
Section 3: Fire Risk Management	***Risk Management Plan*** • A Risk Management Plan must be developed for the facility, before development starts. *Additional Guidance from CFA Guidelines* • A Risk Management Plan (RMP) is critical in informing fire risk management in the design and operation of facilities, particularly where infrastructure or operations pose additional hazards to the landscape, occupants and emergency responders.	***All Facilities***	• This Bushfire Risk Management Plan assesses the bushfire hazards and risks for the proposed renewable energy infrastructure against the requirements of the CFA Guidelines, and details how the risk has been appropriately managed. • The required mitigation measures for the renewable energy infrastructure, has been incorporated into the project Bushfire Management Plan, to ensure they are implemented and maintained for the life of the project. • ***Based on the above, all requirements with the CFA Guidelines have been met.***
Section 4: Facility Location	***Landscape Risk to Facility*** • An assessment that considers: o The impact of any ignitions arising from the infrastructure on nearby communities, infrastructure and assets. o The impact of bushfire on the infrastructure (e.g. ember attack, radiant heat impact, flame contact).	***All Facilities***	• The focus on addressing landscape risk of bushfire to the facility, is primarily through the provision of the following: o NVZ and APZs around renewable energy infrastructure to reduce bushfire impact to moderate levels, especially on the basis that the turbines are non-combustible materials at their base. ▪ The sizing of the NVZ and APZ is commensurate with the surrounding bushfire hazard (i.e. increasing in width to provide more separation from the hazard where it presents greater potential for significant bushfire behaviour). ▪ The concepts for the above are detailed in Section 3.1.1 of this BRMP and summarised in Section 5.1.1 of the project BMP. This involves the establishment of a 10 m NVZ around every turbine base, with the addition of an APZ outside the NVZ, either 20 m wide or extending out to the blade envelope, where proposed turbines are near or within non-grassland vegetation. o Vehicular access and firewater requirements for the renewable energy infrastructure have been determined through application of the CFA Guidelines and provide significant resources for attending firefighters to fight bushfires both within the wind farm site, and also throughout the local area: ▪ The internal driveway network enables attending firefighters to access all proposed turbines and the substation in a bushfire emergency, while also improving access throughout the wind farm site in general and to the surrounding public roads. ▪ The internal driveways and crane pads also provide significant cleared areas within the wind farm site, which in grassland areas, may also be useful in controlling bushfire spread. ▪ The onsite firewater supplies, provide a significant quantity of additional firewater for attending firefighters to refill appliances, without extended travel time. o All turbines will automatically shut-down upon detection of fire in the turbine. o During a bushfire emergency, all turbines can be remotely shut-down from offsite to limit risk to aerial firefighting appliances, from the turbines, as much as possible. o All turbines, monitoring towers are registered with CASA and compliantly marked, to manage risk to aerial firefighting appliances and enable them to move around the wind farm in a bushfire emergency. • ***Based on the above, all requirements with the CFA Guidelines have been met.***

CFA Guideline Section	Requirement	Type	Development Response

	Facility Risk to Landscape
	• As assessment of the fire risk from the proposed facility to the landscape
		All Facilities	• The focus on addressing risk to the landscape is primarily through prevention of uncontrolled turbine fire through the provision of the following:
			  ○ Operational status monitoring, fault monitoring etc, to ensure that any electrical or equipment shorts, faults or failures with the potential to ignite or propagate fire are rapidly identified, controlled and relevant personnel notified.
			  ○ Fire detection and alarm systems to ensure early notification to wind farm personnel and DFES/local fire brigade and enable early turnout.
			  ○ Automatic fire suppression system in the nacelle to prevent any ignition events from becoming uncontrolled turbine fires.
			• The above is supplemented by the provision of NVZ/APZ that are commensurate with the surrounding bushfire hazard.
			• Ensuring appropriate onsite response capabilities, through provision of:
			  ○ Emergency Information Book and signage at site access points, to assist firefighter when turning out, aided by DFES/local brigade familiarisation both prior to facility operation and regularly throughout operation as required.
			  ○ Compliant internal vehicular access and firewater supplies for attending firefighters,
			  ○ Mobile fire trailer and training, to enable a rapid response by onsite wind farm personnel to address any spot fires until firefighter turnout.
			• ***Based on the above, all requirements with the CFA Guidelines have been met.***

Section 4: Facility Design	***Non-Vegetated Zones (NVZ) and Asset Protection Zones (NVZ)***
	• The provision of NVZ and/or APZ that reduces the potential for fire to enter or leave an area:
	  ○ Around the perimeter of control rooms, electricity compounds, substations and all other buildings onsite.
	  ○ Of a width of at least 10m.
	• A NVZ must be:
	  ○ Non-combustible, constructed of concrete, mineral earth or non-combustible mulch such as crushed rock.
	  ○ Free of vegetation and obstructions at all times.
	  ○ No plant or equipment of any kind is to be stored in fire breaks.
	
	Additional Requirements for Wind Facilities
	• The provision of NVZ (and APZ if required) is not required around the perimeter of the wind energy facility, but must be established around the base of each wind turbine.
	• Where wind turbines are sited in high-risk environments, additional vegetation management must be considered, with the implementation of an additional reduced-fuel zone recommended around the base of wind turbines, abutting the fire break. The reduced fuel zone may be:
	  ○ No less than 20m, or
	  ○ To the envelope of the wind turbine blades.
		All Facilities
		Wind Energy Facilities
			• Vegetation modification and management requirements for the renewable energy infrastructure has been determined through application of the CFA Guidelines and detailed in Section 3.1.1 and 3.1.3 of this BRMP.
			  ○ Primarily this involves the establishment of a 10 m NVZ around every turbine base, with the addition of an APZ outside the NVZ, either 20 m wide or extending out to the blade envelope, where proposed turbines are near or within non-grassland vegetation.
			  ○ An APZ is also to be established around firewater tanks to achieve BAL-29 or lower.
			  ○ No perimeter NVZ has been provided for the wind farm, as permitted by the CFA Guidelines.
			• These vegetation modification and management requirements have been incorporated into Sections 5.1 and 5.3 of the project BMP, which are to be maintained in perpetuity (or for the life of the wind farm facility).
			• ***Based on the above, all requirements with the CFA Guidelines have been met.***

	Emergency Vehicle Access
	• Construction of a minimum four (4) metre perimeter road within the perimeter fire break.
	• Roads must be of all-weather construction and capable of accommodating a vehicle of fifteen (15) tonnes (e.g., no compacted earth).
	• Constructed roads should:
	  ○ Be a minimum of four (4) metres in trafficable width with a four (4) metre vertical clearance for the width of the formed road surface.
	  ○ Incorporate passing bays at least every 600 metres, which must be at least twenty (20) metres long and have a minimum trafficable width of six (6) metres. Where roads are less than 600 metres long, at least one passing bay must be incorporated.
		All Facilities
		Wind Energy Facilities
			• Vehicular access requirements for the renewable energy infrastructure have been determined through application of the CFA Guidelines and detailed in Sections 3.1.2 and 3.2 of this BRMP.
			  ○ Compliant internal driveway access is to be provided from the nominated wind farm site entrances, to each turbine and firewater tank, including turnaround.
			  ○ The specifications are to comply with the private driveway specifications of the WA bushfire Guidelines, with the only deviation from the WA bushfire Guidelines will be that if the internal wind farm roads are less than 6 m wide, passing bays will be provided every 600 m (6m wide x 20m long) in accordance with the CFA Guidelines.
			• These vehicular access requirements have been incorporated into Section 5.2 of the project BMP.
			• ***Based on the above, the proposed of wind farm driveway and site entrances, supplemented by the use of existing public roads, farm roads and entrances, is considered sufficient to provide a flexible vehicular***

CFA Guideline Section	Requirement	Type	Development Response
	○ Otherwise comply with the private driveway specifications of the WA bushfire Guidelines ○ Ensure any fencing along access routes allows for width of fire trucks. • Road networks must enable responding emergency services to access all areas of the facility, including fire service infrastructure, buildings, and related renewable energy infrastructure. • The provision of at least two (2) but preferably more access points to each part of the facility. *Additional Requirements for Wind Facilities* • Construction of a four (4) metre perimeter road is not required for wind energy facilities, however, suitable emergency vehicle access is required to each turbine and building on-site. • Constructed roads developed during the construction phase of facilities must be maintained post-commissioning and throughout the operational life of the facility, to allow access to each turbine for maintenance and emergency management purposes.		***access network to, and within the proposed wind farm, for emergency services use in a bushfire emergency.***
	Firefighting Water Supply • Water access points must be clearly identifiable and unobstructed to ensure efficient access. • Static water storage tank installations must comply with relevant Australian Standards (including AS 2419.1) and the technical requirements of the WA bushfire Guidelines: ○ The static water storage tank(s) must be an aboveground water tank constructed of concrete or steel. ○ An external water level indicator must be provided to the tank and be visible from the hardstand area. ○ Signage indicating 'FIRE WATER' and the tank capacity must be fixed to each tank. ○ Signage must be provided at each vehicle entrance to the facility, indicating the direction to the nearest static water tank(s). • The static water storage tank(s) must be capable of being completely refilled automatically or manually within 24 hours. • The static water storage tanks must be located at vehicle access points to the facility and must be positioned at least ten (10) metres from any infrastructure • The hard-suction point must be provided with a 150mm full bore isolation valve equipped with a Storz connection (or approved alternative), sized to comply with the required suction hydraulic performance. ○ The hard-suction point must be protected from mechanical damage where necessary. ○ The hard-suction point must be positioned within four (4) metres to a road or hardstand area and provide a clear access for emergency services personnel. • An all-weather road access and hardstand, compliant with the private driveway specifications of the WA bushfire Guidelines and at least 6 m wide and 8 m long, must be provided to the hard-suction point. ○ The road access and hardstand must be kept clear at all times. • Where the access road has one entrance, an 18 metre diameter turning circle must be provided at the tank. *Additional Requirements for Wind Facilities* • Fire water storage tanks of at least 45,000L are provided at each site entrance. • Additional fire water storage tanks of at least 45,000L are incorporated in facility design.	***All Facilities*** ***Wind Energy Facilities***	• Firewater requirements for the renewable energy infrastructure have been determined through application of the CFA Guidelines and detailed in Sections 3.1.3 of this BRMP. ○ At least 180 kL of firewater is to be provided for the renewable energy infrastructure, currently proposed to be stored in four (4) 45 kL firewater tanks across the site. ○ These firewater tanks will comply with relevant Australian Standards (including AS 2419.1) and the technical requirements of the WA bushfire Guidelines, supplemented by some requirements from the CFA Guidelines: ○ Rather than siting the tanks at the wind farm site entrances, signage will be placed at all wind farm site entrances to indicate to attending firefighters the location of the firewater tanks within the wind farm. The siting of the firewater tanks away from site entrances was noted as the preference of the Shire CESM who advised that water theft was a problem from publicly accessible firewater tanks. • These firewater requirements have been incorporated into Section 5.3 of the project BMP. • ***Based on the above, all requirements with the CFA Guidelines have been met, other than the siting of the firewater tanks away from site entrances in some instances, however signage will be provided to clearly indicate the location of the firewater tanks in the development.***
	Fire Detection and Suppression Equipment • Suitable fire detection and suppression equipment must be provided: ○ For on-site buildings and structures, according to the requirements of the National Construction Code. ○ For storages of Dangerous Goods, according to the requirements of any Australian Standards for the storage and handling of Dangerous Goods. ○ For electrical installations, a minimum of two suitable fire extinguishers must be provided within 3m-20m of each PCU. ○ In all vehicles and heavy equipment, each vehicle must carry at least a nine (9)-litre water stored pressure fire extinguisher with a minimum rating of 3A, or other firefighting equipment as a minimum when on-site during the Fire Danger Period.	***All Facilities***	***National Construction Code compliance*** • All buildings are to comply with the fire detection and suppression requirements of the NCC. • From a bushfire construction perspective, the NCC requires additional resilience to be added to Class 1, 2, 3, associated 10a and “certain” Class 9 buildings. None of these building classifications are proposed at the facility, however the Proponent may consider voluntary adoption of bushfire construction measures to some buildings. ***Dangerous Goods compliance*** • It is understood that no significant quantities are proposed at the facility, however if this changes in the future, it is expected it will be transported, handled and stored in accordance with relevant Australian Standards and Dangerous Goods legislation.

CFA Guideline Section	Requirement	Type	Development Response

			Portable fire extinguishers
			• Portable fire extinguishers are to be provided in (or near) the following in accordance with Australian Standards and Synergy requirements:
			  ○ Each wind turbine
			  ○ Each building
			  ○ Substation rooms (e.g. switchroom, control room)
			  ○ Wind farm vehicles
			
			• ***Based on the above, all requirements with the CFA Guidelines have been met.***

	Design Specific to Facility Type
	Additional Requirements for Wind Facilities
	• As wind energy facilities pose hazards for aerial firefighting operations in certain weather and terrain conditions, the following design requirements are to be incorporated:
	  ○ Wind turbines are located no less than 300 metres apart.
	  ○ Provision of automatic shut-down, and the ability for wind turbines to be completely disconnected from the power supply in the event of fire.
	  ○ Notification of installed weather monitoring stations to the Civil Aviation Safety Authority (CASA).
	  ○ Marking of all guy wires and monitoring towers.
	• Nacelles are equipped with automatic fire detection, alarm, and fire suppression systems.
		Wind Energy Facilities	***Turbine Siting***
			• The wind turbines will all be located further than 300 m from each other.
			Turbine Automatic Shutdown and Disconnection
			• Wind turbines will be automatically shut-down in the event of turbine fire, with the ability to be completely disconnected from the power supply.
			• There will also be ability to remotely shut-down the turbines in a bushfire event if required
			Installed Weather Monitoring Station Notification
			• While outside the scope of this bushfire risk management plan, it is noted that the Proponent will advise CASA of all-weather monitoring stations installed as part of the proposed development
			Marking Guy Wires and Monitoring Towers
			• While outside the scope of this bushfire risk management plan, it is noted that the Proponent will mark all guy wires and monitoring towers installed as part of the proposed development.
			Turbine Fire Systems
			• All turbines are to be fitted with fire detection, alarm and suppression system to provide early warning of internal fire and automatic response
			• Activation of fire detection systems will be remotely monitored at all times
			• An emergency management procedure will be incorporated into the wind farm Emergency Management Plan to rapidly notify DFES, wind farm personnel (including on-call technician) and nearby landowners/farmers, of the onsite turbine fire detection or suppression system activation.
			
			• ***Based on the above, all requirements with the CFA Guidelines have been met.***

Section 5: Facility Construction and Commissioning	***Emergency Plan (Construction)*** • An Emergency Plan must be developed for the construction and commissioning phase of the facility. *Additional Guidance from CFA Guidelines* • An emergency communication system must be provided that is reliable and will operate in the event of power failure. • Install and commission fire detection and suppression systems for the facility at the earliest possible stage of construction. • Provide first-aid firefighting equipment, such as fire extinguishers (and where possible, portable fire hose reels), appropriate to the identified emergency scenarios, at all construction portables/buildings onsite, in the vicinity of all construction activities, and in site-based vehicles. • Provide training for personnel in the use of on-site first-aid firefighting equipment, and responsibilities during emergencies. • Provide the required fire protection equipment for any storages of dangerous goods as per the relevant Australian Standards. • It is recommended the development of safe work procedures for the facility, encompassing but not limited to:	***All Facilities***	• Emergency procedures for the construction phase are to be incorporated in the Construction Management Plan as summarised in Section 3.4.2 of this BRMP. • It is recommended that the bushfire emergency management concepts detailed in the project BMP for the operational wind farm, are incorporated into the Construction Management Plan for bushfire preparedness and response, as much as applicable. ***Based on the above, all requirements with the CFA Guidelines have been met.***

CFA Guideline Section	Requirement	Type	Development Response
	○ Electricity and chemical management. ○ Vegetation management. ○ Ignition source control, including hot works. ○ Infrastructure, equipment and vehicle maintenance. ○ Emergency management • Adhere to restrictions on Total Fire Ban or days of elevated fire danger • Restrict smoking to prescribed areas and provide suitable ash and butt disposal facilities. • Fire brigade must be notified at least seven (7) days prior to the commissioning of any high-risk infrastructure at the facility (e.g., battery energy storage systems).		
Section 6: Facility Operation	***Fire Management Plan*** • A Fire Management Plan must be developed for the facility, in consultation with fire brigade, before development starts. *Additional Guidance from CFA Guidelines* • A Fire Management Plan is based on the outcomes of the Risk Management Plan and outlines the activities, processes and accountabilities for the ongoing management of fire risk at the facility including: ○ A summary of fire hazards and risks to and from the site, specific to its location, infrastructure, activities and occupancy. ○ Description of control measures to prevent fire occurring and limit the consequences of fire at the facility. ○ Description of control measures to prevent and reduce the consequences of external fire impacting the facility. ○ Details of equipment and resources to manage fire at the facility ○ Policies and procedures that ensure all control measures are appropriate and effective, and remain so. ○ Procedures for review of the Plan	***All Facilities***	• The bushfire related siting, design, construction and maintenance requirements for the renewable infrastructure, has been determined through application of the CFA Guidelines and summarised in Section 3.0 of this BRMP. • These bushfire risk management measures for the renewable energy infrastructure have also been summarised in Section 5.0 of the project BMP, including the nomination of responsible entities for implementation and ongoing management. • ***Based on the above, all requirements with the CFA Guidelines have been met.***
	Bushfire and Grassfire • If your facility is at-risk of bushfire, prevention and preparedness activities must be detailed in the Fire Management Plan. *Additional Guidance from CFA Guidelines* • Your facility may be at-risk of bushfire if it is: ○ Located in an area close to or amongst dense or open bush, unmanaged grassland, near coastal scrub, or at an urban fringe. ○ Identified as being in a Designated Bushfire Prone Area. • Address bushfire prevention and preparedness activities	***All Facilities***	• Bushfire preparedness and response actions for the renewable energy infrastructure has been determined through application of the CFA Guidelines and documented in this BRMP. • These bushfire preparedness and response actions have been incorporated into Section 5.8 of the project BMP. • ***Based on the above, all requirements with the CFA Guidelines have been met.***
	Vegetation Management • Facility operators must undertake the following measures during the nominated bushfire season (as per Local Government firebreak notice): ○ Grass must be maintained at or below 100mm in height during the nominated bushfire season. ○ Long grass and/or deep leaf litter must not be present in areas where heavy equipment will be working, during construction or operation. ○ Restrictions and guidance must be adhered to during the nominated bushfire season, days of High (and above) fire danger and declared Total Fire Ban days	***All Facilities***	• Vegetation modification and management requirements for the renewable energy infrastructure has been determined through application of the CFA Guidelines and detailed in Section 3.1, 3.2 and 3.3 of this BRMP. • These vegetation modification and management requirements have been incorporated into Section 5.1 of the project BMP, which are to be maintained in perpetuity (or for the life of the wind farm facility). • ***Based on the above, all requirements with the CFA Guidelines have been met.***
	Arc Flash Hazard Management • Where required, appropriate demarcation of arc boundaries to at least 10m from PCU arc flash outlet flaps (blow-out panels) must be provided.	***All Facilities***	• Not applicable – no PCU are proposed as part of this project (typically part of Battery Energy Storage Systems). • ***Based on the above, all requirements with the CFA Guidelines have been met.***
	Facility and System Monitoring • Appropriate monitoring for facility infrastructure must be provided, to ensure that any shorts, faults or	***All Facilities***	• The proposed wind turbines are to be remotely monitored, both onsite (during business hours) and offsite (at all times), with the following emergency response procedures included in the bushfire emergency management arrangements (documented in the BMP):

CFA Guideline Section	Requirement	Type	Development Response
	equipment failures with the potential to ignite or propagate fire are rapidly identified and controlled, and any fire is notified to 000 immediately.		○ Turbine fire detection and suppression systems will be remotely monitored at all times, and upon activation, the response procedure is to include immediate notification to DFES, wind farm personnel (including on-call technician) and local landowners/farmers (if required) of potential onsite turbine fire. ○ The wind turbine will be automatically shut-down in the event of turbine fire, with the ability to be de-energised remotely if required (in consultation with DFES, Western Power, AEMO). • The substation functionality will be monitored by wind farm operator. • ***Based on the above, all requirements with the CFA Guidelines have been met.***
	Maintenance • Inspection, maintenance and any required repair activities must be conducted for all infrastructure, equipment and vehicles at the facility. • Maintenance must be in line with any relevant Australian Standards, the manufacturer's requirements.	***All Facilities***	• The bushfire related siting, design, construction and maintenance requirements for the renewable infrastructure, has been determined through application of the CFA Guidelines and documented in this BRMP. • These bushfire risk management measures for the renewable energy infrastructure, including ongoing maintenance and management requirements, have also been summarised in the project BMP, including the nomination of responsible entities for ongoing management. • ***Based on the above, all requirements with the CFA Guidelines have been met.***
	Fire Risk Review • The Fire Management Plan is reviewed and updated regularly, in line with any reviews and changes to hazards and risk management as per the Risk Management Plan, and where there is a near-miss or incident at the facility. • The Emergency Plan is reviewed and updated to reflect any changes in the Fire Management Plan, including where fire risks emerge or change, risk controls are added or modified, or where there is a near miss or incident at the facility.	***All Facilities***	• Like any BMP or BRMP, if there are significant changes to the development, they should be reviewed to reflect those changes. • The Emergency Management Plan for the facility is to be reviewed and amended as summarised in Section 3.4.6 of the BRMP and Section 5.8 (in particular Section 5.8.5) of the project BMP. • ***Based on the above, all requirements with the CFA Guidelines have been met.***
Section 7: Emergency Planning	***Emergency Plan (Operational)*** • An Emergency Plan must be developed for the operational phase, specific to the facility, before development starts. *Additional Guidance from CFA Guidelines* • An Emergency Plan (EP) details the arrangements for managing emergencies, including the facility details, structures, procedures, resources and training. EP's must be specific to the infrastructure, operations and location of facilities, and informed by a sound risk management process. • The EP should address the following for each hazard: ○ Emergency Response Procedures (including evacuation or onsite shelter-in-place as required) ○ Personnel Training ○ Emergency Exercises • The EP is a 'living document' that must be regularly reviewed to ensure their currency and effectiveness. *Additional Requirements for Wind Facilities* • Any EP for a Wind Energy Facility must include: ○ Emergency procedures for fires within, and in the vicinity of, wind turbines. ○ Details of any triggers or circumstances for ceasing operation of wind turbines or shutting down the facility, such as on Extreme or above days or approach of bushfire/grassfire to the facility. ○ Maximum (safe) operational wind speed and temperature conditions and operating procedures to limit fire risk. ○ This information must also be provided within the facility's Emergency Information Book. ○ Wherever possible, rotors are to be stopped into a 'Y' pattern during emergencies	***All Facilities***	• Bushfire emergency management preparedness and response concepts for the renewable energy infrastructure has been summarised in Section 3.4.6 of this BRMP. • The bushfire emergency management preparedness and response concepts detailed in Section 5.8 of the project BMP, which cover both proposed buildings and renewable energy infrastructure, are to be incorporated into the overall wind farm Emergency Management Plan. • The additional requirements for Wind Facilities, documented in the CFA Guidelines, have been included in the Emergency Information Book and signage for attending firefighters, and the site Emergency Management Plan • The CFA Guidelines specifically notes that wind turbines should be capable of being stopped in the "Y" pattern ○ The process for placing the turbines in the "Y" pattern (rabbit ears position) is a manual one, that needs to be conducted by staff within each actual turbine, and climbing up to the nacelle. ○ Given staff need to be within each turbine, while all turbines will have the capability to be stopped in the "Y" pattern, this is not considered a safe procedure for wind farm staff to undertake in a bushfire emergency. • ***Based on the above, all requirements with the CFA Guidelines have been met.***
Section 8. Provision of Emergency Information	***Developing an Emergency Information Book*** • An Emergency Information Book must be developed and available to emergency responders, and include the following: ○ A description of the premises, its infrastructure and operations. ○ Site plans that include the layout of the entire site, including buildings, internal roads, infrastructure, fire	***All Facilities***	• The Emergency Information Book and signage, and emergency service familiarisation process for the renewable energy infrastructure, has been determined through application of the CFA Guidelines and detailed in Sections 3.4.4 and 3.4.5 of this BRMP. • These requirements have been incorporated into Sections 5.6 and 5.7 of the project BMP.

CFA Guideline Section	Requirement	Type	Development Response
	protection systems and equipment, dangerous goods storage areas, gas detectors, battery energy storage systems, substations/terminals, grid connections, drains and isolation valves, neighbours and the direction of north. ○ A manifest of dangerous goods (if required) as per Schedule 3 of the Dangerous Goods (Storage and Handling) Regulations 2022. ○ Procedures for the management of emergencies, including evacuation, shelter-in-place (for facilities at risk of bushfire/grassfire), containment of spills and leaks, and fire procedures (including infrastructure/plant fires, vehicle fires, grassfire/bushfire) ○ Details of emergency equipment, including the type and location of gas detectors. ○ Up-to-date contact details for site personnel, regulatory authorities and site neighbours. ○ Safety Data Sheets (SDS) for dangerous goods stored on-site. • Emergency Information Books must be located weatherproof container, at each vehicle entrance the facility • Prior to commissioning of the facility, a familiarisation visit and explanation of emergency procedures is to be offered to local fire brigades and other emergency services. ○ A schedule for ongoing site familiarisation to account for changing personnel, facility infrastructure and hazards, and emergency exercises should be developed in conjunction with the local fire brigade ○ A review of the information contained within the facility's Emergency Information Book must be undertaken prior to commencement of bushfire season annually.		• ***Based on the above, all requirements with the CFA Guidelines have been met.***

Disclaimer and Limitation

This report is prepared solely for the nominated client, and any future residents of the subject lot(s), and is not for the benefit of any other person and may not be relied upon by any other person.

To the maximum extent permitted by the law, Linfire Consultancy, its employees, officers, agents and the writer ("Linfire") excludes all liability whatsoever for:

1. claim, damage, loss or injury to any property and any person caused by fire or as a result of fire or indeed howsoever caused;
2. errors or omissions in this report except where grossly negligent; and the proponent expressly acknowledges that they have been made aware of this exclusion and that such exclusion of liability is reasonable in all the circumstances.

If despite the provisions of the above disclaimer Linfire is found liable then Linfire limits its liability to the lesser of the maximum extent permitted by the law and the proceeds paid out by Linfire's professional or public liability insurance following the making of a successful claim against such insurer.

Fire is an unpredictable force of nature. Changing climatic factors (whether predictable or otherwise) either before or at the time of a fire can also significantly affect the nature of a fire and in a bushfire prone area it is not possible to completely guard against bushfire. The mitigation strategies contained in this Bushfire Management Plan (BMP) are considered to be prudent minimum standards only, based on the standards prescribed by relevant authorities. It is expressly stated that Linfire do not guarantee that if such standards are complied with or if a property owner exercises prudence, that a building or property will not be damaged or that lives will not be lost in a bush fire.

Further, the achievement of the level of implementation of fire precautions will depend on the actions of the landowner or occupiers of the land, over which Linfire has no control. If the proponent becomes concerned about changing factors then either a review of the existing BMP, or a new BMP, should be requested. Linfire accepts no liability or responsibility whatsoever for or in respect of any use or reliance upon this report and its supporting material by any third party.

1.0 Proposal details

1.1 Background

Synergy Renewable Energy Developments Pty Ltd (SynergyRED; the Proponent) is seeking to lodge a development application (DA) for a new wind farm across a number of lots (the wind farm development boundary) in Scott River approximately 15 km north-east of Augusta, in the Shire of Augusta-Margaret River (the Shire).

The proposed wind farm development (see Figure 1) will require the installation of the following infrastructure:

- ***New Building/s***
  - At least one Operations and Maintenance (O&M) building
  - Potential for 1 or 2 other smaller buildings
- ***Wind turbine generators***
  - 20 turbines
  - All turbines are to have fire detection, alarm and suppression systems
- ***132 kV transmission line***
  - From proposed substation to existing high-voltage powerlines approximately 4 km north of the substation
  - Consisting of above-ground towers, poles and electrical lines
  - To be designed and constructed to Western Power specifications
- ***33 kV distribution lines***
  - Reticulated from each turbine to substation, preferably through use of underground cables.
  - If ground conditions are unsuitable for underground cables, portions of these 33 kV lines may need to be above-ground.
- ***High voltage substation***
  - To be designed and constructed to relevant Australian Standards
  - Expected to contain infrastructure such as main transformer, STATCOM, switchroom, NSP room, harmonic filters, back-up generator/auxiliary supply.
- ***Internal access driveways***
  - Upgraded internal driveway access to the proposed buildings and substation
  - Internal access driveways throughout the wind farm to all turbines, from various site access points
- ***Firewater tanks***

The make/model of wind turbines has not been finalised (is still under review), however the following information has been provided regarding the anticipated products:

- Maximum tip height of 250 metres (hub height up to164 m with blade length of up to 90 m)
- Turbines are steel tower casings to ground level, with fibreglass/aluminium/steel blades

All of the following buildings and infrastructure for the wind farm, will be sited within a nominated wind farm building envelope:

- O&M building
- Any other required wind farm buildings

- Any firewater tanks required for the buildings

Regarding onsite personnel, once operational, the following is expected:

- Occupant numbers likely to be 2 to 4 staff, 5 days a week (business hours)
- There will be at least one on-call technician allocated to the facility for all other times

During the construction phase, the following is also likely to be required:

- Site Offices
- Concrete Batching Plant
- Laydown Areas

These are currently proposed immediately south of the wind farm building and substation envelopes, and it is assumed that following completion of construction, these will be allowed to return to their current grassland state (in not required to be managed within a nominated Asset Protection Zone).

1.2 Site description

1.2.1 Overall Wind Farm

The proposed wind farm extends over a number of existing lots as follows (see Figure 2 and 3):

- Lot 4269 on Plan 209300, Courtenay
- Lot 6 (No 527) Scott River Road, Courtenay
- Lot 4266 on Plan 208480, Courtenay
- Lot 4152 (No 599) Scott River Road, Scott River
- Lot 4265 (No 598) Dennis Road, Scott River
- Lot 100 on Plan 038071, Scott River
- Lot 4261 on Plan 208478, Scott River
- Lot 4260 (No 119) Governor Broome Road, Scott River
- Lot 4263 on Plan 208478, Scott River
- Lot 1 (No 399) Governor Broome Road, Scott River
- Lot 4154 on Plan 207769, Scott River

All the lots nominated above are currently zoned as “General Agriculture” under the local Shire planning scheme, and have been largely cleared of native vegetation and used by private landholders for agricultural purposes. The only exception to this is Lot 4269 in the north-western part of the wind farm development boundary, which currently contains existing timber plantations, which are relatively mature and while they are expected to be harvested in coming years, the exact timing is not confirmed.

There are several other lots located adjacent to the development boundary worthy of note:

- Lot 2 on Diagram 090280, Courtenay
  - Contains the existing Beenup substation
- Lot 101 on Plan 038071, Scott River
  - Currently identified as a DBCA Lands of Interest (Register No. 2555/700), and potentially a future nature reserve.
- Lot 4924 on Plan 217962, Scott River
  - Crown Reserve 42377
  - Zoned under local Shire planning scheme as “National Parks and Nature Reserves”

- Flora reserve

Surrounding the development boundary:

- To the east is Dennis Road, with
  - Agricultural land and timber plantation further to the east of Lots 1 and 4263, and
  - Pagett Nature Reserve and Chester Nature Reserve further east and north-east of Lot 4266.
- To the north of Lots 4266 and 4269 are existing agricultural lots largely cleared of vegetation, other than isolated forest plots, with Brockman Highway and South Blackwood State Forest further north.
- To the west is Scott River Road, with largely cleared agricultural land further west other than some existing timber plantation in the north-west and the rehabilitated Beenup mineral sands mine between Strucels Road and Payne Road. The Blackwood River located approximately 4-5 km further west of the wind farm.
- To the south is primarily cleared agricultural land, with some forest and scrub vegetation south of Lot 4260 and Governor- Broome Road, which fringes the Scott River.

Public road access to the wind farm is via Brockman Highway to the north, with Scott River Road, Governor Broome Road and Dennis Road forming a loop road arrangement around the perimeter of much of the development boundary (see Figure 2). The only other public road near the wind farm is Coostien Road, which is an existing dead-end public road providing access to lots south of the Governor Broome Road.

Public road access from the wind farm is as follows:

- Brockman Highway extends:
  - west to eventually connect to Bussel Highway at Karridale (17 km west), where travel is possible south to Augusta (15 km south of intersection) and north to Margaret River (30 km north of intersection)
  - east to Nannup (approximately 55 km away)
- Governor Broome Road provides access along the southern boundary and extends 12 km east of the wind farm to connect to Milyennup Coast Road, where travel can be undertaken 13 km north to connect to Stewart Road and Brockman Highway and on to Nannup.
- Scott River Road provides public road access along the western wind farm development boundary and connects to Brockman Highway in the north, and also extends further south past Governor Broome Road, to East Augusta, as a long dead-end road.

Vehicular access within the various lots comprising the wind farm, is currently via existing unsealed farm tracks, which provide access from a number of existing entrance gates along the public road network, into the lots.

There is no known reticulated town main water supply currently provided to any lots within the wind farm development boundary, nor are there any existing street hydrants.

1.2.2 Proposed Buildings

The nominated wind farm development boundary includes the lots detailed previously in Section 1.2.1, however it is noted that it is only the proposed buildings located entirely in the wind farm building and substation envelopes (the wind farm building extent) sited in the north-east corner of Lot 4261 (see Figure 4) that trigger assessment against current bushfire policy as detailed in Section 1.3.

All other buildings associated with the project (e.g. site offices) will be required only for the construction phase, and will be decommissioned following operation of the wind farm.

1.3 Purpose

The entire wind farm development boundary is designated as bushfire prone (Area 2) on the *Map of Bush Fire Prone Areas* (DFES 2024; see Plate 1 and Plate 2). As the proposed building and substation envelopes are surrounded by unmanaged grassland, any pre-development BAL impact would be expected to be BAL-40 or greater without any management measures (i.e. Asset Protection Zones), which triggers the requirement to assess the proposal against *State Planning Policy 3.7: Bushfire* (SPP 3.7; WAPC 2024) and the *Planning for Bushfire Guidelines* (the WA Guidelines; WAPC 2024).

Given the renewable energy infrastructure (e.g. wind turbines) are not considered "habitable buildings" as defined in WA Planning Regulations, compliance with SPP 3.7 and the WA Guidelines isn't triggered and the compliance pathway with respect to bushfire, is less defined. Current advice provided by DFES is that strict compliance is unlikely to be required or achieved with SPP 3.7 and the WA Guidelines, however application of the CFA *Design Guidelines for Renewable Energy Facilities v4* (the CFA Guidelines; CFA, 2023) from Victorian fire brigade, currently provides the best design guidance, albeit rationalised for WA context. It is noted that the CFA Guidelines currently has no formal status in WA, however it is understood DFES are currently in the process of drafting their own version of the CFA Guidelines, and while the timing of this is unconfirmed, the content is expected to broadly align with concepts detailed by the CFA.

It is noted that the Shire of Augusta-Margaret River has a Local Planning Policy for renewable energy developments, namely *LPP 23 (Renewable Energy Systems)* dated March 2021, for the expressed purpose of guiding proponents, landowners and the community as to the requirements for such developments. It is noted that there is little guidance provided relating to structural or bushfire risk management for these renewable energy developments, other than stating that a *"fire management plan"* may be required *"where planning approval is sought for large renewable energy systems"*.

Based on the above:

- This BMP demonstrates compliance for the proposed permanent buildings against SPP 3.7 and the WA Guidelines;
- A Bushfire Risk Management Plan (BRMP) that accompanies this BMP, assesses the level of compliance of the proposed renewable infrastructure, against the relevant model requirements of the CFA Guidelines, to demonstrate the bushfire risk has been appropriately managed.
- The preparation of the BMP and BRMP is considered to satisfy the requirements of the Shire LPP 23 regarding preparation of a fire management plan for renewable energy developments.

This Bushfire Management Plan (BMP) has been prepared to address requirements for DA's under SPP 3.7 Policy Measure 7.1 (ii), Section 2.2 the WA Guidelines, in addition to Section 7 relating to Commercial/Industrial developments, including:

- The identification of any environmental, biodiversity or conservation values on the subject site(s).
    - Where relevant, details on how the clearing of native vegetation specifically for bushfire mitigation to achieve the bushfire protection measures, can be avoided through the use of siting and design measures.
    - Where the clearing of native vegetation cannot be avoided, details on how the proposal will minimise the clearing are to be provided.
- A BAL Contour Map or BAL assessment.
- The identification of any bushfire hazard issues arising from the assessment.

- Assessment against Bushfire Protection Criteria 7 (Development – Commercial and Industrial) demonstrating compliance of the following for proposed buildings:
    - Siting of all buildings in BAL-29 or lower, including provision of suitably sized Asset Protection Zones (APZ's; low fuel zones around buildings).
    - Justification of any native vegetation clearing to implement the APZ
    - Siting of all hazardous, flammable and/or combustible materials in BAL-29 or lower, and appropriate protection from radiant heat impact.
    - Provision of compliant vehicular access
    - Provision of suitable firewater supply.
- Summarise the bushfire management measures for the renewable energy infrastructure from the BRMP.

The focus of this BMP is to demonstrate compliance of the proposed buildings contained within the building and substation envelopes, with SPP 3.7 and the WA Guidelines, accompanied by a summary of the bushfire management measures for the renewable energy infrastructure derived from the project BRMP, to provide a complete summary of the Proponents bushfire risk management obligations for this project.

1.4 Other plans/reports

There are no known bushfire reports or assessments that have been prepared previously for the wind farm development area.

Linfire has prepared a Bushfire Risk Management Plan (Linfire 2026) detailing the level of compliance of the proposed renewable infrastructure, against the CFA Guidelines. The resultant bushfire management measures from the BRMP, have been incorporated into Section 5.2 of the BMP, to provide a collated summary of all risk management measures required for the proposed development. The BRMP should be read in conjunction within this BMP.

The following environmental reports have been prepared for the project:

- *Detailed flora and vegetation survey for a Proposed Wind Farm in Scott* River, prepared by Phoenix Environmental Services dated February 2025.

2.0 Environmental considerations

2.1 Native vegetation - modification and clearing

Most of the proposed development is to be sited in existing grassland areas, however there is expected to be some vegetation clearing required to accommodate the proposal.

Linfire assumes that all relevant environmental and heritage studies and all required environmental and heritage approvals will be obtained prior to commencing any on-site vegetation modification or clearing required to construct the development or implement the onsite Asset Protection Zones. Should any constraints be identified as part of the environmental or heritage studies that would prevent vegetation clearing or modification, the design is to be tailored to ensure the implementation of compliant APZs can be achieved.

2.2 Revegetation / Landscape Plans

No revegetation is proposed as part of the proposal.

All nominated Asset Protection Zones are to comply with APZ Standards from the WA Guidelines (refer to Appendix 2), with any other landscaping (if any) and vegetation management (outside of nominated APZs) to be low threat vegetation and managed gardens in accordance with AS 3959—2018 Clause 2.2.3.2 (f) (see Appendix 3).

3.0 Bushfire assessment results

3.1 Assessment inputs

As mentioned in Section 1.2, the overall development includes all the lots included in the proposed wind farm, however it is noted that the proposed buildings that trigger assessment against SPP 3.7 and the WA Guidelines will only be sited within the wind farm building and substation envelopes in the north-east corner of Lot 4261 (see Figure 4). Given the scope of this BMP is limited to the permanent buildings, the vegetation and BAL contour mapping is mostly focussed on that around the proposed building and substation envelopes.

While the renewable infrastructure is not required to achieve target BAL ratings, thus not required to have BAL contour mapping, Linfire has provided high-level vegetation mapping in the project BRMP to inform the discussion regarding the turbine siting and associated vegetation modification and management.

3.1.1 Vegetation classification

Linfire assessed classified vegetation and exclusions within 150 m of the wind farm building extent area through on-ground verification on 12 & 13 June 2024, and 29 January 2025, in accordance with *AS 3959—2018 Construction of Buildings in Bushfire-Prone Areas* (AS 3959; SA 2018) and the *Visual Guide for Bushfire Risk Assessment in Western Australia* (DoP 2016).

Georeferenced site photos and a description of the vegetation classifications and exclusions following proposed development works, are contained in Appendix 1 and Table 1, and depicted on Figure 5.

It is noted that some construction infrastructure (site office, concrete batching plant, laydown) is proposed to the south-east of the building and substation envelopes, however this is expected to be decommissioned shortly after operation commences, and it is assumed will be subject to regrowth which will return it to the original grassland state Unless within nominated APZs).

3.1.2 Effective slope

Linfire assessed effective slope under classified vegetation through on-ground verification on 12 & 13 June 2024, and 29 January 2025, in accordance with AS 3959. Results were cross-referenced with Landgate 5 m contour data and are depicted in Table 1 and Figure 5.

Site observations indicate that land is undulating, with elevation decreasing from the north of the wind farm, to the south-west. Effective slope near the building and substation enveloped has been assessed as downslope 0°-5° given the relatively gentle slope.

3.1.3 Summary of inputs

Table 1 summarises the anticipated post-development vegetation classifications and exclusions within 150 m of the proposed wind farm building and substation envelopes, following completion of development works and implementation of Asset Protection Zones. The post-development vegetation classifications/exclusions and effective slope are illustrated on Figure 5.

Table 1: Post-development vegetation classifications/exclusions and effective slope (within 150 m of building and substation envelopes only)

Vegetation plot	Vegetation classification	Effective slope	Comments
1	Class G Grassland	Downslope >0–5°	Unmanaged grassland >100mm in height. Included areas of proposed construction infrastructure (site

Vegetation plot	Vegetation classification	Effective slope	Comments
			office, concrete batching plant, laydown area), which are assumed to return to grassland state following decommissioning.
2	Class C Shrubland	Downslope >0–5°	Shrubland vegetation (<2 m high) within Lot 101. This vegetation is further than 100 m from the proposed building and substation envelopes, and could be excluded under Clause 2.2.3.2 (a).
3	Excluded – Non-vegetated and Low threat (Clause 2.2.3.2 [e] and [f])	N/A	Land to be modified to low threat vegetation as part of proposed development within building and substation envelopes and associated APZs.

3.2 Assessment outputs

3.2.1 Bushfire Attack Level (BAL) contour assessment

Linfire has undertaken a BAL contour assessment in accordance with Method 1 of AS 3959 for the wind farm building extent (see Figure 6 and 8). The Method 1 procedure incorporates the following factors:

- state-adopted FDI 80 rating
- vegetation classification
- effective slope
- distance maintained between proposed development areas and the classified vegetation.

The BAL rating gives an indication of the level of bushfire attack (i.e. the radiant heat flux) that may be received by proposed future development and subsequently informs the standard of building construction and/or setbacks required for proposed habitable development to potentially withstand such impacts.

The BAL contours are based on:

- the vegetation classifications and effective slope observed at the time of inspection
- the anticipated post-development vegetation based on proposed on-site clearing extent, and resultant vegetation exclusions and separation distances, achieved to implement the proposed development including APZ's.

The results of the BAL contour assessment are detailed in Table 2 and illustrated in Figure 6, with the highest BAL rating to any proposed buildings being BAL–29.

Table 2: BAL contour assessment results (to proposed buildings and substation envelopes)

Method 1 BAL determination				
Plot	**Vegetation classification**	**Effective slope**	**Separation distance**	**Highest BAL**
1	Class G Grassland	Downslope >0–5°	9 m	BAL–29
2	Class C Shrubland	Downslope >0–5°	>100 m	BAL–Low
3	Excluded – Non-vegetated and Low threat (Clause 2.2.3.2 [e] and [f])	N/A	N/A	N/A

Table 3 lists the BAL applicable to the habitable buildings within the proposed development.

Table 3: BAL applicable to buildings and substation envelope

Building / element	Initial BAL	APZ	Revised BAL
Building Envelope (including O&M building and firewater tank within envelope)	BAL–FZ	9 m wide APZ extending from the external perimeter of the Building Envelope. All land within the Building Envelope is to be non-vegetated land and/or managed low threat vegetation throughout the entire area. Alternatively, targeted 9 m APZs could be established around all proposed buildings and firewater tanks within the building envelope, so that they are sited in BAL-29 or lower without managing/clearing	BAL-29 to BAL-12.5

Building / element	Initial BAL	APZ	Revised BAL
		the entire envelope. This would require review by an accredited bushfire practitioner prior to occupancy.	
Substation Envelope	BAL–FZ	9 m wide APZ extending from the external perimeter of the Building Envelope. All land within the Substation Envelope is to be entirely non-vegetated land. Alternatively, targeted 9 m APZs could be established around all proposed buildings within the substation envelope, so that they are sited in BAL-29 or lower without managing/clearing the entire envelope. This would require review by an accredited bushfire practitioner prior to occupancy.	BAL-29 to BAL-Low

Should there be any changes in development design or classified vegetation extent that results in a modified BAL outcome, then the BAL contours will need to be reassessed.

4.0 Identification of bushfire hazard issues

4.1 Bushfire context

The overall wind farm development area contains, and is surrounded by, unmanaged vegetation in all directions, with extended fire runs available through mostly grassland vegetation, in addition to more discrete plots of shrubland, scrub and forest vegetation. The potential bushfire impact on the proposed buildings would be primarily from grassland fire, with the nearest non-grassland vegetation located approximately 130 m to the north-east. The fire runs from all directions could be kilometres long, with few natural or man-made features that currently exist near the proposed wind farm which would prevent bushfire behaviour reaching steady-state conditions. On this basis, the potential threat of fully developed bushfires to the proposed buildings could come from any direction.

Further review of the bushfire hazard to the renewable infrastructure is detailed in the BRMP (Linfire, 2026) that accompanies this BMP.

4.2 Bushfire hazard issues

Examination of the environmental considerations (Section 2.0) and the bushfire risk assessment (Section 3.0) has identified the following bushfire hazard issues:

1. Based on the existing extent of vegetation outside proposed buildings and roads, the proposed habitable buildings would have an initial BAL of BAL-FZ. Onsite vegetation modification and management will be required to ensure sufficient separation between proposed buildings and unmanaged vegetation, to limit the impact of bushfires on the development and prevent ignition and spread of a fire from proposed infrastructure.
2. Ensuring sufficient internal vehicular access to the proposed development, to enable egress by onsite staff, but as importantly, providing sufficient access to the infrastructure to enable attending bushfire fighting appliances to control or suppress any fires.
3. Ensuring access to bushfire fighting water supply, to limit the travel time to water supplies for appliance refills.
4. The proposed development contains renewable energy infrastructure, a separate BRMP has been prepared to demonstrate compliance with the CFA Guidelines (refer to Linfire 2026).

4.3 Bushfire safety strategy

The following bushfire safety strategy is proposed to demonstrate compliance with the Bushfire Protection Criteria of the WA Guidelines and address the bushfire hazards identified above:

1. Create sufficient separation between buildings from surrounding classified vegetation by establishing suitably sized APZs to achieve a compliant rating of BAL-29 or less.
2. Provide compliant vehicular access to the proposed building and substation envelopes, from the surrounding public road network, to enable occupant egress and to facilitate firefighter access.
3. Provide a secure bushfire fighting water supply, including use of firewater storage tanks to enable refill of bushfire fighting appliances.
4. Incorporate the bushfire risk management measures for the proposed renewables infrastructure detailed in the project BRMP, including appropriate bushfire emergency management procedures, into this BMP.

Based on the above, Linfire considers the bushfire hazards within and adjacent to wind farm building extent and the associated risks, are manageable through standard management responses outlined in the WA Guidelines and AS 3959. These responses will be factored into proposed development as early as possible to ensure an effective and compliant bushfire management outcome is achieved for protection of future life, property and environmental assets.

5.0 Bushfire management measures

The following bushfire management measures, informed by the compliance assessment in this BMP and the project BRMP for renewable energy infrastructure (Linfire, 2026), and are required to be implemented as part of the development and increase the level of bushfire risk mitigation across the site. Where possible, the management measures have been depicted on Figure 7 for building and substation Envelopes, with Figure 8 and Figure 9 displaying those for the renewable energy infrastructure.

5.1 Vegetation management

In order to manage the bushfire risk to the development, sufficient separation is to be provided between proposed buildings and infrastructure, and unmanaged vegetation, including the following requirements:

- Asset Protection Zones (APZs) around the perimeter of the following:
  - the nominated building envelope
  - the substation envelope (with the envelope to be a non-vegetated zone)
  - each firewater tank
- A non-vegetated zone (NVZ) and APZ around each wind turbine base
- Managed low threat vegetation within nominated building envelope
- Non-vegetated land within substation

Further information on vegetation management is provided in the sections below.

5.1.1 Asset Protection Zones and Non-Vegetated Zones (Building & Substation Envelope)

In order to ensure sufficient separation is maintained between proposed buildings and substation, and surrounding unmanaged vegetation, the following APZs will be required:

- A 9 m wide APZ, is to be established around the perimeter of the nominated building envelope to achieve BAL-29 or lower on all buildings and firewater tanks within the envelope.
- A 9 m wide APZ, is to be established around the perimeter of the substation, to achieve BAL-29 or lower on this infrastructure.
  - In order to limit the chance of electrical faults in the substation from igniting a bushfire, all other land within the nominated substation envelope is to be established as a Non-Vegetated Zone, consisting entirely of non-vegetated elements.

Alternatively, targeted 9 m APZs could be established around all proposed buildings and firewater tanks within the building envelope, so that they are sited in BAL-29 or lower without managing/clearing the entire envelope. This would require review by an accredited bushfire practitioner prior to occupancy.

All APZs can be either non-vegetated or managed low threat landscaping established in accordance with the APZ standards from the WA Guidelines (see Appendix 2) and AS 3959 Clause 2.2.3.2 (e) and (f) (see Appendix 3), however would preferably be non-vegetated where possible.

The NVZ in the substation envelope is to comply with AS 3959 Clause 2.2.3.2 (e) and the standards for “firebreaks” from CFA Guidelines as follows:

- Non-combustible, constructed of concrete, mineral earth or non-combustible mulch such as crushed rock.
- Free of vegetation and obstructions at all times.
- No combustible plant or equipment.

All nominated APZs and NVZs are to be implemented by the Proponent, who is also responsible for the regular ongoing management to ensure compliance in perpetuity, especially during bushfire season.

5.1.2 Asset Protection Zones and Non-Vegetated Zones (Turbines)

In order to ensure sufficient separation is maintained between proposed renewable energy infrastructure, and surrounding unmanaged vegetation, the following APZs will be required:

- NVZ and APZ is to be established around the perimeter of each of the wind turbine base on the following basis (see turbine risk ratings depicted on Figure 8 and Figure 9):

  Low-Risk Turbine Site

  - ***A turbine is considered to be in a low-risk environment when it is sited further than 300 m from "continuous" non-grassland vegetation.***
  - If assessed as low-risk, implement the following measures, as per requirements of CFA Guidelines for low-risk environments:
    - ***10 m NVZ around base of turbine tower***

  Transition Risk Turbine Site

  - ***A turbine is considered to be in a transition-risk environment when it is sited as follows:***
    - ***closer than 300 m to "continuous" non-grassland vegetation, (but not within this non-grassland vegetation) or***
    - ***within "non-continuous" non-grassland vegetation (e.g. small plots of forest, woodland, scrub or shrubland vegetation***
  - If assessed as transition-risk, implement the following measures, as per minimum requirements from the CFA Guidelines for high-risk environments:
    - ***10 m NVZ around base of turbine tower; and***
    - ***20 m APZ outside the 10 m NVZ***

  High-Risk Turbine Site

  - ***A turbine is considered to be in a high-risk environment when it is unavoidable to site turbines within "continuous" non-grassland vegetation (e.g. plots of forest/woodland/scrub/shrubland vegetation considered to be continuous).***
  - If assessed as high-risk, implement the following measures, as per the maximum requirements from the CFA Guidelines for high-risk environments:
    - ***10 m NVZ around base of turbine tower***
    - ***APZ (or extension of NVZ) to the blade envelope (rotor diameter), outside the 10 m NVZ***
- Should turbines be relocated:
  - The risk category of the turbine should be reviewed by a bushfire practitioner, and adjustments made to the NVZ/APZ as required.
  - Turbines could straddle the turbine risk categories above (e.g. turbine on edge of forest and grassland may be both high-risk and transition risk). In these instances, we propose that:
    - The NVZ/APZ be appropriate to the interfacing vegetation e.g. high-risk treatment in direction of forest, with transition (or low) risk treatment in direction of grassland, or
    - the NVZ/APZ for the highest risk category is applied entirely around the turbine.

- All wind turbines must be located no less than 300 metres apart
- The Non-Vegetated Zone (NVZ) is to comply with AS 3959 Clause 2.2.3.2 (e) and the standards for “firebreaks” from CFA Guidelines as follows:
    - Non-combustible, constructed of concrete, mineral earth or non-combustible mulch such as crushed rock.
    - Free of vegetation and obstructions at all times.
    - No combustible plant or equipment.
- The Asset Protection Zone (APZ) is to comply with the APZ standards from the WA bushfire Guidelines (see Appendix 2).

All NVZ and APZs are to be implemented by the Proponent, who is also responsible for the regular ongoing management during bushfire season to ensure compliance for the life of the wind farm.

5.1.3 Asset Protection Zones (Renewable Energy Infrastructure - Firewater Tanks)

In addition to the firewater tank for the future buildings, additional firewater is proposed for the renewable energy infrastructure (see Section 5.3.2 below).

All proposed firewater tanks are to be sited in areas of BAL-29 or lower, to be achieved as follows:

- Sited within the wind farm building envelope within an area of BAL-29 or lower, or
- Have an appropriately sized APZ established and maintained around the perimeter of the tank and suction connection, to achieve BAL-29 or lower.
    - Based on current tank locations in grassland, this would be a 9 m wide APZ

The APZs can be either non-vegetated or managed low threat vegetation, established in accordance with the APZ standards from the WA Guidelines (see Appendix 2) and AS 3959 Clause 2.2.3.2 (e) and (f) (see Appendix 3).

The APZs are to be established and maintained for the life of the project by the Proponent.

5.2 Vehicular access

5.2.1 Vehicular access – Buildings

The internal driveway accessing the future buildings in the nominated building and substation envelopes, is to comply with the requirements of Acceptable Solution A3.1 of the WA Guidelines, including the following:

- Comply with the requirements in Appendix B.3 Table 10, Column 5 (see Appendix 4 requirements for Area 2)
- Driveways are either to be at least 6 m wide, or if less than 6 m wide, must be at least 4 m wide and require 20 m long passing bays every 200m that increase the overall driveway width to no less than 6 m wide.
- Provide compliant turnarounds (see Appendix 4 requirements for Area 2) or loop roads within 30 m of each permanent building
- Provide access to the firewater tanks (or tank suction connection) in accordance with Acceptable Solution A4.1 of the WA Guidelines, to enable attending fire appliances to refill, and provide hardstand adjacent to tank suction connection and sufficient locations for fire appliance turnaround.
- All wind farm gates, including those at main site entrance but excluding existing farm gates, are to have clear opening of no less than 6 m.
    - If any nominated site entrances are to be locked, keys are to be provided to DFES/local fire brigades prior to operation.

The Proponent is responsible for the construction and ongoing management of internal driveways.

5.2.2 Vehicular access – Renewable Energy Infrastructure

The internal driveway network accessing the renewable energy infrastructure is to comply with the requirements of CFA Guidelines as follows:

- The following site entrances are to be established for the facility:
  - Main site entrance from Scott River Road, near the proposed building and substation envelopes
  - Three additional site entrances as follows:
    - One on Scott River Road, approximately 5.5 km north of the main entrance.
    - Two on Governor Broome Road, providing access to turbines to the north and south of the public road.
- Internal wind farm access driveways are to be provided to each turbine, from the nominated site entrances, as follows:
  - Driveways are either to be at least 6 m wide, or if less than 6 m wide, must be at least 4 m wide and require 20 m long passing bays every 600m that increase the overall driveway width to no less than 6 m wide.
  - Other than passing bay separation, all turbine access driveways are to comply with private driveway specifications of WA Guidelines
- A turning head is to be constructed at, or around the perimeter of, the base of each turbine to enable fire appliance turnaround.
  - The turnaround is to comply with the requirements of the private driveway specifications of WA Guidelines.
  - It is recommended that the turnaround be within the 10 m NVZ or at the crane pad of each turbine.
- The internal wind farm driveway network needs to provide vehicular access to within 4 m of the tank suction point for each proposed firewater tank.
- All wind farm gates, including those at main site entrance but excluding existing farm gates, are to have clear opening of no less than 6 m.
  - If any nominated site entrances are to be locked, keys are to be provided to DFES/local fire brigades prior to operation.
- Emergency Information Book and Signage (see Section 5.6) is to be provided at all site entrances (but not existing farm gates), for attending emergency services personnel.

The internal wind farm access driveways, site entrances, gates and signage are to be constructed and maintained by the Proponent in perpetuity (or for the life of the wind farm).

5.3 Firewater supply

5.3.1 Firewater – Buildings

Bushfire fighting water supply for proposed buildings in the nominated building and substation envelopes, is to be from static firewater tank/s as follows:

- The tank is to have no less than 10 kL per building (including those within the substation envelope).
- This firewater tank for the buildings, can either be collocated or combined with, the 45 kL firewater tank at the wind farm building envelope, required for the wind turbines (see Section 5.3.2)

The firewater tank within the building envelope is to comply with the relevant technical requirements from the WA Guidelines (see Appendix 5) and the requirements from the CFA Guidelines including:

- Must be an above-ground water tank constructed of concrete or steel and must comply with AS 2419.1 and signage indicating 'FIRE WATER' (or similar approved) and the tank capacity must be fixed to each tank.
- The static water storage tanks must be located at vehicle access points to the facility and must be positioned at least ten (10) metres from any infrastructure (e.g. wind turbines etc.).
- The hard-suction point must be positioned within 4 m to a hardstand area or internal driveway, and protected from mechanical damage where necessary, and provide a clear access for emergency services personnel.

The firewater tank is to be sited within the building envelope to ensure it is an area of BAL-29 or lower.

The firewater tank is to be installed, filled and maintained for the life of the project by the Proponent.

5.3.2 Firewater – Renewable Energy Infrastructure

Bushfire fighting water supply for proposed renewable energy infrastructure, primarily the wind turbines, is to comply with the requirements of CFA Guidelines as follows:

- Installation of the following firewater tanks around the site to provide 180 kL of turbine firewater capacity:
    - One (1No) 45 kL firewater tank in the northern part of the site, at an intersection of the internal driveways and the termination of the transmission line.
    - One (1No) 45 kL firewater tank in the southern part of the site, at an intersection of the internal driveways to a number of turbines.
    - One (1No) 45 kL firewater tank south of Governor Broome Road, at an intersection of the internal driveways to the three turbines in this part of the site.
    - In addition to the three turbine firewater tanks above, either a standalone 45 kL firewater tank is to be installed in the wind farm building envelope, for wind turbine firewater in the local area, or the 45 kL should be added to the building firewater tank.
- While the firewater tank locations above represent the current siting approach, there remains flexibility to relocate or amalgamate the firewater tank/s, provided there is agreement with DFES, local fire brigades and the Proponent.
- The turbine firewater tanks will comply with the standards from the WA bushfire Guidelines, including the following from the CFA Guidelines:
    - Must be an above-ground water tank constructed of concrete or steel and must comply with AS 2419.1 and signage indicating 'FIRE WATER' (or similar approved) and the tank capacity must be fixed to each tank.
    - Firewater tanks are to be at least 10 m from wind turbines
    - The hard suction point must be within 4 m of a driveway or hardstand
- Emergency Information Book and Signage (see Section 5.6) is to be provided at all site entrances (but not existing farm gates), for attending emergency services personnel.
    - This is to include the location of all onsite firewater tanks and the internal access routes to these tanks.
- All firewater tanks outside the wind farm building envelope, in their currently nominated locations, will have a 9 m wide APZ around the perimeter, to achieve BAL-29 or lower.

The firewater tanks, and associated APZs, are to be constructed, filled and maintained for the life of

the project by the Proponent.

5.3.3 Provision of mobile fire trailer

A mobile fire trailer (or similar approved) is required to enable wind farm staff to:

- have on standby during any approved tasks that may ignite a bushfire (e.g. hot-works etc), or
- provide a rapid first response to any small onsite ignition events while the fire is in the incipient stage to prevent growth and spread of the fire

This firefighting infrastructure is not to be used by staff to fight developed bushfire i.e. staff not expected to fight bushfires.

As a minimum, the fire trailer (or similar approved) should have:

- No less than 1000 L tank
- Fire pump and hose reel
- Mounted on trailer or ute to enable easy transport around the site.
    - If on trailer, sufficient vehicles shall be onsite with capability to mount the trailer (e.g. equipped with appropriate tow balls).

The Proponent is to supply the fire trailer (or similar approved) prior to commissioning, and ensure it is maintained and ready for use at all times during bushfire season, including ensuring a full water tank and pump fuel tank.

5.4 Renewable Energy Infrastructure Design, Construction, Installation & Commissioning

The following measures are required for the proposed renewable energy infrastructure to manage the risk of fires.

5.4.1 Wind Turbines

5.4.1.1 Automatic fire detection, alarm and suppression

- All turbines are to be fitted with an automatic fire detection and alarm to provide early warning of internal turbine fire.
- All turbines are to be fitted with a fire suppression system, to provide an automatic fire suppression response upon detection of internal turbine fire.
- Activation of fire detection and alarm system is to be monitored at all times, either by wind farm personnel onsite, or offsite monitoring, so notification to wind farm personnel (including on-call technician), DFES and local fire brigade, and nearby landowners/farmers can be provided.

5.4.1.2 Operational Status Monitoring and Control of Turbines

- Appropriate operational status monitoring for all turbines must be provided, to ensure that any electrical or equipment shorts, faults or failures with the potential to ignite or propagate fire are rapidly identified, controlled and relevant personnel notified.
    - Operational procedures are to be implemented to ensure any persistent faults or operational alarms, are addressed promptly including rapid notification of wind farm on-call technician.
- Monitoring of turbine operational status is to be able to be conducted both onsite and remotely offsite.
- Operational control of turbines should be able to be conducted onsite and offsite, to enable remote turbine de-energisation and/or shutdown should any faults or failures have potential to result in a turbine fire.

- It is expected that any fault/s resulting in operation outside tolerable limits, would have automatic fail-safe procedures to de-energisation and/or shutdown the turbine to prevent turbine fire.

5.4.1.3 Turbine Shutdown

- All wind turbines are to be configured to automatically shut-down in the event of turbine fire, with the ability to be de-energised remotely (i.e. offsite).
  - The intent is that in the event of a turbine fire, only the affected turbine would automatically shut-down.
- All wind turbines are to be able to be remotely shut-down in a bushfire event (in consultation with DFES, Western Power, Australian Energy Market Operator [AEMO]), if required.

5.4.1.4 Aerial Notification and Marking

- Ensure the Civil Aviation Safety Authority (CASA) is notified of all installed weather monitoring stations and turbines as part of the wind farm.
- Ensure all guy wires and monitoring towers are compliantly marked to ensure visibility to aircraft.

5.4.2 Substation

- Substation infrastructure is to be designed, constructed and maintained to relevant Australian Standards.

5.4.3 Above-ground Transmission Lines

- Above-ground transmission towers, poles and lines are to be designed, constructed and maintained in accordance with Western Power specifications, by Western Power.
- This infrastructure will comply with any vegetation clearance requirements as per Western Powers own standards.

5.4.4 Construction and Commissioning Requirements

The proposed facility will need to incorporate these general requirements during the construction and commissioning stages, to manage the risk of onsite fire and bushfire from the development:

- Ensure an emergency communication system is provided that is reliable and will operate in the event of power failure
- Ensure all electrical equipment (e.g. electrical cabling, junction boxes, inverters and transformers) comply with relevant design, construction and installation standards of electrical equipment including relevant Australian Standards, and manufacturers recommendations.
- Install and commission fire detection, alarm and suppression systems as early as practical during construction, and prior to commissioning.
- Provide first response firefighting equipment (e.g. extinguishers) at all construction portables/buildings onsite, in the vicinity of all construction activities, and in site-based vehicles.
- Ensure sufficient training provided to relevant personnel on the use of on-site firefighting equipment and first-aid, and responsibilities during emergencies
- Provide required fire protection equipment for dangerous goods as per relevant Australian Standards.
- Adhere to restrictions and guidance during days of Fire Danger Rating of High to Catastrophic, and Total Fire Ban days and Harvest Movement Ban days

- Ensure tight ignition source control, including hot works and restriction of smoking to prescribed areas.
- Conduct any required vegetation management.
- Undertake all required infrastructure, equipment and vehicle maintenance.
- Incorporate emergency management procedures into the construction management plan (or other relevant document) for the construction and commissioning phase of the facility to address risk of onsite fire and bushfire.
- Notification of fire brigade at least seven days prior to the commissioning of any renewable energy infrastructure at the facility, especially the wind turbines.
- Engage with fire brigade to offer a familiarisation visit prior to commissioning, as detailed in Section 5.7.

5.5 Renewable Energy Infrastructure Operation and Maintenance

The following shall be conducted as part of ongoing operation and maintenance phases:

- Ensure ongoing compliance with the endorsed BMP is achieved, especially during bushfire season
- Develop, implement and review Emergency Information Book and Signage (see Section 5.6) for attending emergency services personnel.
- Develop, implement and review the emergency management plan (see Section 5.8)
- Regular and ongoing inspection and auditing is to be conducted by the Proponent, with any routine maintenance and any required repair activities to be conducted for all infrastructure, equipment, vehicles and fire detection and suppression systems at the facility.
- Ensure all Dangerous Goods (if any) comply with all relevant legislation, Australian Standards and requirements detailed in Section 5.9.

5.6 Emergency Information Book and Signage

An Emergency Information Book and/or signage must be located at each nominated site entrance to the wind farm, with any plans or information books provided in a weatherproof container.

The Emergency Information Book and/or signage is intended to provide emergency responders with an overview of the facility. This information should be developed in liaison with relevant emergency services representatives (if possible) and should seek to include the following:

- A description of the premises, its infrastructure and operations.
- Up-to-date contact details for site personnel and regulatory authorities.
- Site plans that depict the entire site layout, including:
    - Buildings, substations and renewable energy infrastructure,
    - Internal driveways and surrounding public roads
    - Fire protection systems and equipment, including firewater tanks
    - Grid connections, drains and isolation valves,
    - Dangerous goods storage areas
    - Landowners within wind farm, and neighbouring landowners, and any relevant infrastructure (e.g. dwellings), and
    - North direction and scale
- Details of any emergency equipment, including the type and location of fire and gas detection systems.
- Maximum (safe) operational wind speed and temperature conditions and operating procedures to limit fire risk.

- A manifest of dangerous goods (if required) and Safety Data Sheets (SDS) for dangerous goods stored on-site.
- Procedures for the management of emergencies, including evacuation, shelter-in-place (for facilities at risk of bushfire/grassfire), containment of spills and leaks, and fire procedures (including infrastructure/plant fires, vehicle fires, grassfire/bushfire)

A review of the information contained within the facility's Emergency Information Book and signage must be undertaken prior to commencement of bushfire season annually.

5.7 Emergency Services Familiarisation

Prior to commissioning of the facility, a familiarisation visit and explanation of the proposed facility, the specific hazards, the proposed fire safety systems and management measures, and the emergency procedures, is to be offered to local fire brigades and other emergency services.

The opportunity should be taken to ensure that the information in the proposed Emergency Information Book/Signage (see Section 5.6) is appropriate for their needs, and that they are familiar with where this will be located.

Additionally, it should be confirmed that any required keys or access codes to any secured parts of the site have been (or will be) supplied to the relevant fire brigade personnel.

A schedule for ongoing site familiarisation to account for changing personnel, facility infrastructure and hazards, and emergency exercises should be developed in conjunction with the local fire brigade.

5.8 Emergency Management Plan

The Proponent is to develop an emergency management plan for the facility, which comprehensively details the procedures for preparing for, and responding to, hazards to the facility, including the following for off-site bushfire, and on-site fire, emergencies:

- Facility details including key contacts and technical support during an emergency, site plan, details of renewable energy infrastructure, details of fire and emergency systems, and a manifest of dangerous goods.
    - The identified risks and hazards associated with the renewable energy infrastructure, such as onsite fire and bushfires.
    - Detail preparedness and pre-emptive actions to address the above hazards, including the following for onsite infrastructure fires and bushfire:
        - Ongoing compliance with the approved BMP and BRMP.
        - Ensuring ongoing maintenance of all buildings, fire and communication systems.
        - Determining forecast Fire Danger Rating (FDR), Total Fire Bans (TFB) and Harvest Vehicle Movement Bans (HVMB), during bushfire season
        - Modifying Site Activities (based on Forecast FDR and TFB/HVMB).
        - Monitoring DFES Bushfire Emergency Warnings for bushfire (and/or other signs of bushfire activity) within 50 km of the facility, and understanding the decision-making triggers.
    - Detail emergency response procedures to address to all identified hazards (including for onsite infrastructure fires and bushfire).
    - For a bushfire emergency, the response should include the following:
        - The immediate response to any onsite bushfire, or bushfire observed in the local area, is to notify DFES and local fire brigade immediately.
        - Conducting early offsite evacuation of all staff away from the bushfire if safe to

do so (preferred response), ideally to Geraldton, however Dongara, Mingenew or Mullewa may also be considered in order to travel away from approaching bushfire.

- Essential staff should only remain onsite if directed by authorised DFES/local fire brigade personnel.

- Conduct facility shutdown, If safe to do so prior to staff evacuation:
  - Conduct remote shutdown and de-energisation of turbine/s (in consultation with DFES, Western Power, AEMO), should it be required.
  - Ensure all other buildings and plant are properly secured.
  - Ensure all vehicular access routes are open and available for use.
  - Ensure all fire and communications systems are ready for use.
- If there is insufficient time to safely travel offsite without being impacted by bushfire, conduct onsite shelter in place in the O&M building.
  - It is noted that this building is not constructed for onsite refuge from bushfire and should only be considered as a last resort option only if offsite evacuation is not possible.

- Response to onsite fire, including turbine fire, is to include:
  - Immediately notify DFES to enable a rapid turnout, and relevant wind farm personnel
  - Immediately shutdown and deenergise any turbine/s on fire, and any other relevant turbines
  - If safe to do so, trained wind farm personnel to conduct first attack response on any spot fires with mobile fire trailer, until DFES arrival.
  - Notify wind farm landowners and relevant neighbouring landowners.

The emergency management plan is to be reviewed regularly, and the relevant staff will need appropriate training and to conduct regular exercises to ensure everyone is fully conversant with the requirements of the plan and able to respond as required during all emergencies. Training should be conducted annually prior to bushfire season, and regular exercises conducted throughout the year.

The above is a high-level summary, with further specific detail on the requirements of the emergency management plan relating to bushfire and onsite infrastructure fire is provided in Appendix 7.

5.9 Dangerous Goods

While not currently planned, should the wind farm facility propose significant quantities of dangerous goods onsite such that the storage and use of these could potentially increase the risk of fire ignition at the proposed development, the Proponent will be required to:

- Ensure they are sited in areas of BAL-29 or lower as a minimum, and protected from bushfire impact, with the final siting and bushfire risk management to be reviewed by an accredited bushfire practitioner.
- Ensure there are strict controls on these potential ignition sources, such as storage and handling controls in accordance with the Dangerous Goods legislation, codes, and relevant Australian Standards.
- Restrictions on hot works and electrical equipment within any on-site hazardous areas.

5.10 Building construction standards

Bushfire construction provisions of the National Construction Code require that buildings comply with the A 3959 construction requirements, in accordance with the assessed BAL under AS 3959, provided the building is a Class 1, 2, 3 or associated Class 10a building.

The proposed buildings will not be Class 1, 2 or 3, therefore in accordance with the National Construction Code, and as such, there is no statutory requirement for proposed buildings to meet the construction requirements of AS 3959.

5.11 Compliance with annual firebreak notice

The Proponent is to comply with the current Shire of Augusta-Margaret River annual firebreak notice as amended (refer to Appendix 6). The firebreak notice provides requirements for perimeter firebreaks for lots, plantations and vineyard/orchards, APZs, and restricted and prohibited burning periods. The firebreak notice also provides enforcability to the Bushfire Management Plan, as it notes that properties with approved BMPs, must comply with their requirements.

Given the proposed wind farm is sited across small portions of a number of existing lots, most provisions of the firebreak notice will not directly apply to the proposed development, however the following is applicable:

- All proposed wind farm development and bushfire management measures should not interfere with the ability of the landowner/s to comply with the requirements of the firebreak notice, including perimeter firebreaks around lots and plantations.
- APZs and driveway access is to be provided to buildings, and maintained year-round.
- Gutters and rooftops are to be kept free of debris during bushfire season.
- Comply with Restricted and Prohibited Burning Periods, between the dates nominated in the firebreak notice.
- Comply with all Total Fire Ban and Harvest and Vehicle Movement Ban days as declared.

6.0 Assessment against the bushfire protection criteria

6.1 Compliance table

An acceptable solutions assessment against the bushfire protection criteria is provided in Table 4.

Table 4: Compliance with Bushfire Protection Criteria 7 (Development – Commercial and Industrial) of the WA Guidelines

Bushfire protection criteria		Development response	
Outcomes	**Acceptable Solutions**	**Method of compliance**	**Proposed bushfire management measures**
Element 1: Location			
Not Applicable	Area 1: Not Applicable Area 2: Not Applicable	**Not Applicable**	Not Applicable
Element 2: Siting and Design			
Outcome O2 Ensure siting and design solutions: • manage or mitigate the bushfire risk to people, property and infrastructure; and • avoid, or where unavoidable, minimises the clearing of native vegetation	A2.1a Siting and Design Every habitable building achieves radiant heat impact not exceeding 29 kW/m² (BAL-29). A2.1b Siting in an area with a radiant heat impact exceeding 29 kW/m² (BAL-40 or BAL-FZ) The siting of a commercial or industrial habitable building, with a radiant heat impact exceeding 29 kW/m2 (BAL-40 or BAL-FZ) should only be considered where: • the lot was created prior to December 2015; and • there are demonstrated site characteristics and/or biodiversity or conservation values that prevent the achievement of a radiant heat impact not exceeding 29 kW/m2 (BAL-29); and • it is demonstrated that the reduction of the building footprint or a redesign to manage or mitigate the risk, is not practical or appropriate. If the provision of an APZ in accordance with Acceptable Solution A2.2 cannot be achieved, then the vegetation immediately surrounding the building is to be managed as defendable space in accordance with Appendix B.2, Table 9 – APZ technical requirements.	**Acceptable Solution** **Not Applicable**	A2.1a Siting and Design The BAL contour map (see Figure 6) demonstrates that following completion of development including implementation of all nominated APZs and low threat vegetation: • The nominated building envelope will be compliantly sited in areas of BAL-29 or less. • The substation envelope will also be sited in areas of BAL-29 or less. Based on the BAL mapping, it has been demonstrated that the site has capacity to ensure all proposed permanent buildings (and the associated firewater tank) can be sited in BAL-29 or lower, and on this basis, compliance with A2.1a is achieved. Should any habitable building be required other than that nominated above, the required siting shall be assessed by an accredited bushfire practitioner. A2.1b Siting in an area with a radiant heat impact exceeding 29 kW/m² (BAL-40 or BAL-FZ) Not applicable as all proposed buildings will be sited in BAL-29 or lower.
	A2.2 Asset Protection Zone (APZ) Where a habitable building cannot be wholly within an area with a radiant heat impact not exceeding 29 kW/m² (BAL-29) in its predevelopment state, an APZ is to be provided and meet the following requirements: **Width**: the APZ is to be measured from any external wall or supporting post or column of the building, and of sufficient size to ensure the radiant heat impact of a bushfire does not exceed 29 kW/m² (BAL-29) to any part of the building, in all circumstances. **Location:** the APZ is to be contained solely within the boundaries of the lot, except in instances where: • the vegetation on the adjoining lot(s) is, and will continue to be, low threat as per Clause 2.2.3.2 of AS 3959 or the requirements of Appendix B.2, Table 9 – APZ technical requirements, or an alternative standard in a gazetted local planning scheme, on an ongoing basis in perpetuity; or • the adjoining land is and will remain in perpetuity, non-vegetated **Management:** the APZ is managed in accordance with the requirements of Appendix B.2, Table 9 – APZ technical requirements, or an alternative standard in a gazetted local planning scheme.	**Acceptable Solution**	On completion of development, sufficient separation between habitable buildings and unmanaged post-development vegetation will be provided by: • 9 m wide APZ around the perimeter of the nominated building envelope. ◦ All other land within the nominated envelope is to be either non-vegetated or managed low threat vegetation. The preference is that this area is kept as non-vegetated as possible. ◦ Alternatively, targeted 9 m APZs could be established around all proposed buildings and firewater tanks within the building envelope, so that they are sited in BAL-29 or lower without managing/clearing the entire envelope. This would require review by an accredited bushfire practitioner prior to occupancy. • 9 m wide APZ around the perimeter of the nominated substation envelope. ◦ All other land within the nominated substation envelope is to be non-vegetated elements. The proposed APZs and vegetation management are to be implemented and maintained by the Proponent in accordance with APZ standards from the WA Guidelines (see Appendix 2), AS 3959 Clause 2.2.3.2 (e) and (f) (see Appendix 3) and the Shire's firebreak (see Appendix 6). In addition to the requirements above for habitable buildings proposed as part of this development, the BRMP that accompanies this BMP also nominates additional vegetation modification and management requirements for the renewable energy infrastructure, which are

Bushfire protection criteria		Development response	
Outcomes	**Acceptable Solutions**	**Method of compliance**	**Proposed bushfire management measures**
			summarised in Section 5.0.
	A2.3 Clearing of native vegetation The development avoids, or where unavoidable, minimises the clearing of native vegetation.	**Acceptable Solution**	The APZs around proposed buildings are limited to BAL-29, which limits any clearing associated with the bushfire risk management. Additionally, the proposed buildings are sited in existing grassland areas (i.e. paddocks), where the implementation of APZs is likely to only require clearing or regular slashing of grassland.
	A2.4 Storage of hazardous, flammable and/or combustible materials Where a proposed land use will include the storage of hazardous, flammable and/or combustible materials as part of its ongoing day to day operations, the materials are to be stored in an area that: • is subject to a radiant heat impact not exceeding 29 kW/m2 (BAL-29); • is non-combustible and shields the materials to reduce their exposure to radiant heat from the bushfire to levels significantly lower than 29 kW/m^2 and prevents the entry of debris and embers; and limits to the degree necessary and practical, the escape of sources of ignition from the stored materials into bushfire prone vegetation.	**Not Applicable**	There are no significant quantities of hazardous, flammable or combustible materials associated with the proposed development. Notwithstanding, if any significant quantities of hazardous, flammable and/or combustible materials are introduced to the development, they should be sited in areas of BAL-29 or lower as a minimum and protected from bushfire impact, with the final siting and bushfire risk management to be reviewed by an accredited bushfire practitioner.
Element 3: Vehicular access			
Outcome O3 Ensure the design and capacity of vehicular access and egress provide: • for efficient and effective evacuation to a suitable destination(s) and/or • as a contingency measure for vulnerable land uses, an on-site shelter, where demonstrated appropriate, as a last resort option.	A3.1 Private Driveway There are no private driveway technical requirements (prescribed by these Guidelines) where the private driveway is within a lot serviced by reticulated water and is no greater than 70 metres in length between the most distant external part of the habitable building and the public road. In circumstances where the above conditions are not met, the private driveway is to meet all of the following requirements: • requirements in Appendix B.3 Table 10, Column 5; and • passing bays every 200 metres with a minimum length of 20 metres and a minimum additional carriageway width of 2 metres (i.e. the combined carriageway width of the passing bay and constructed private driveway to be a minimum 6 metres); and • turn-around area (Figure 30) and within 30 metres of the habitable building (Figure 38).	**Acceptable Solution**	Given there is no existing reticulated town main water supply in the local area, the internal driveway accessing the nominated building envelope is to comply with the requirements of A3.1, including the following: • Comply with the requirements in Appendix B.3 Table 10, Column 5 (see Appendix 4) • Driveways are either to be at least 6 m wide, or if less than 6 m wide, must be at least 4 m wide and require 20 m long passing bays every 200m that increase the overall driveway width to no less than 6 m wide. • Provide compliant turnarounds (see Appendix 4) or loop roads within 30 m of each permanent building • Provide access to the firewater tanks (or tank suction connection) in accordance with A4.1, to enable attending fire appliances to refill, and provide hardstand adjacent to tank suction connection and sufficient locations for fire appliance turnaround. • All wind farm gates, including those at main site entrance but excluding existing farm gates, are to have clear opening of no less than 6 m. The Proponent is responsible for the construction and ongoing management of internal driveways. In addition to the requirements above for access to the building envelope, the project BRMP that accompanies this BMP also nominates additional internal vehicular access arrangement for the renewable energy infrastructure, which are summarised in Section 5.0.
Element 4: Water			
Outcome O4 Ensure that sufficient water is available to enable people, property and infrastructure to be defended from bushfire.	A4.1 Water Supply Where a reticulated water supply is existing or proposed, a hydrant connection(s) should be provided in accordance with the specifications of the relevant water supply authority. Where these specifications cannot be met, a water tank(s) should be provided in accordance with the requirements of Appendix A.4, Table 11 – Water supply dedicated for bushfire firefighting.	**Acceptable Solution**	Given there is no nearby reticulated town main water supply or street hydrants, the bushfire fighting water supply for the future habitable buildings will need to be from static firewater tank/s as follows: • The tank is to have no less than 10 kL per building (including those within the substation envelope). • This firewater tank for the buildings, can either be collocated or combined with, the 45 kL firewater tank at the wind farm building envelope, required for the wind turbines (see Section 5.3.2) The firewater tank within the building envelope is to comply with the relevant technical requirements from the WA Guidelines (see Appendix 5) and the requirements from the CFA Guidelines including:

Bushfire protection criteria		Development response	
Outcomes	**Acceptable Solutions**	**Method of compliance**	**Proposed bushfire management measures**
			• Must be an above-ground water tank constructed of concrete or steel and must comply with AS 2419.1 and signage indicating 'FIRE WATER' (or similar approved) and the tank capacity must be fixed to each tank. • The static water storage tanks must be located at vehicle access points to the facility and must be positioned at least ten (10) metres from any infrastructure (e.g. wind turbines etc.). • The hard-suction point must be positioned within 4 m to a hardstand area or internal driveway, and protected from mechanical damage where necessary, and provide a clear access for emergency services personnel. The firewater tank is to be sited within the building envelope to ensure it is an area of BAL-29 or lower. The firewater tank is to be installed, filled and maintained for the life of the project by the Proponent. In addition to the requirements above for firewater to the building envelope, the project BRMP that accompanies this BMP also nominates additional firewater tanks around the overall wind farm for the renewable energy infrastructure, which are summarised in Section 5.0.

7.0 Responsibilities for implementation and management of the bushfire measures

Implementation of the BMP and BRMP applies to the Proponent to ensure bushfire management measures are adopted and implemented on an ongoing basis. A bushfire responsibilities table is provided in Table 5 to drive implementation of all bushfire management works associated with this project.

Table 5: Responsibilities for implementation and management of the bushfire measures

No.	Implementation action
	Proponent (Building & Substation Envelope) - prior to building occupation
1	Establish APZs and NVZ at the building and substation envelopes and the firewater tank, in accordance with the dimensions and standards detailed in Section 5.1.1 of the BMP.
2	Construct the internal driveway from the main site entrance to the wind farm building and substation envelopes, in accordance with the dimensions and standards detailed in Section 5.2.1 of the BMP. Construct the main site entrance gates to the standards stated in the BMP, and ensure keys to any locked gates are provided to all relevant staff and onsite personnel, as well as being made available to DFES and local fire brigade.
3	Install the static firewater tank for the building and substation envelopes in accordance with the requirements detailed in Section 5.3.1 and relevant Australian Standards.
4	Should a significant quantity of Dangerous Goods be proposed as part of development, comply with all relevant Dangerous Goods legislation, codes and relevant Australian Standards, and the additional requirements detailed in Section 5.9 of the BMP.
5	Comply with the Shire of Augusta-Margaret River firebreak notice as it applies to the wind farm facility only, as detailed in Section 5.11 of the BMP.
	Proponent (Renewable Energy Infrastructure) - prior to commissioning and facility occupation
1	Establish NVZs and APZs around all nominated renewable energy infrastructure (turbines, substation) and associated firewater tanks, in accordance with the dimensions and standards detailed in Sections 5.1.2 and 5.1.3 of the BMP.
2	Construct the internal driveway network to the renewable energy infrastructure (turbines) and associated firewater tanks, in accordance with the dimensions and standards detailed in Section 5.2.2 of the BMP. Construct the site entrance gates to the standards stated in the BMP, and ensure keys to any locked gates are provided to all relevant staff and onsite personnel, as well as being made available to DFES and local fire brigade.
3	Install the nominated static firewater tanks for the renewable energy infrastructure in accordance with the requirements detailed in Section 5.3.2 of the BMP and relevant Australian Standards.
4	Provide a mobile fire trailer for the wind farm in accordance with the requirements detailed in Section 5.3.3 of the BMP.
5	Incorporate all the renewable energy infrastructure design, construction, installation and commissioning requirements detailed in Section 5.4 of the BMP for the facility. • Turbine automatic fire detection, alarm and suppression • Operational status monitoring and control of turbines • Turbine shutdown • Aerial Notification and Marking • Substation and Transmission Line design and construction • Construction and Commissioning requirements
6	Prepare and install the Emergency Information Book and signage in accordance with the requirements of Section 5.6 of the BMP.

No.	Implementation action
7	Conduct the emergency services familiarisation site visit, in accordance with the requirements of Section 5.7 of the BMP.
8	Develop and implement the site emergency management plan, incorporating the recommended procedures for bushfire and onsite fire, detailed in Section 5.8 of the BMP
9	Comply with the Shire of Augusta-Margaret River firebreak notice as it applies to the wind farm facility only, as detailed in Section 5.11 of the BMP.
Proponent (Building & Substation Envelope) – ongoing	
1	Maintain APZs and NVZ at the building and substation envelopes and the firewater tank, in accordance with the dimensions and standards detailed in Section 5.1.1 of the BMP.
2	Maintain the internal driveway from the main site entrance to the wind farm building and substation envelopes, in accordance with the dimensions and standards detailed in Section 5.2.1 of the BMP.
3	Install the static firewater tank for the building and substation envelopes in accordance with the requirements detailed in Section 5.3.1 and relevant Australian Standards. Ensure the firewater tank remains filled at all times, especially during bushfire season.
4	Review whether there are any introduced Dangerous Goods to the wind farm, and comply with all relevant Dangerous Goods legislation, codes and relevant Australian Standards, and the additional requirements detailed in Section 5.9 of the BMP.
5	Comply with the Shire of Augusta-Margaret River firebreak notice as it applies to the wind farm facility only, as detailed in Section 5.11 of the BMP.
Proponent (Renewable Energy Infrastructure) – ongoing	
1	Maintain the NVZs and APZs around all nominated renewable energy infrastructure (turbines, substation) and associated firewater tanks, in accordance with the dimensions and standards detailed in Sections 5.1.2 and 5.1.3 of the BMP.
2	Maintain the internal driveway network to the renewable energy infrastructure (turbines) and associated firewater tanks, in accordance with the dimensions and standards detailed in Section 5.2.2 of the BMP.
3	Maintain the static firewater tanks for the renewable energy infrastructure in accordance with the requirements detailed in Section 5.3.2 of the BMP and relevant Australian Standards. Ensure the firewater tanks remains filled at all times, especially during bushfire season.
4	Maintain the mobile fire trailer for the wind farm in accordance with the requirements detailed in Section 5.3.3 of the BMP. Ensure the water and fuel tanks remain filled at all times, especially during bushfire season.
5	Undertake the ongoing operation and maintenance requirements for the renewable energy infrastructure as detailed in Section 5.5 of the BMP for the facility, including: • Ongoing compliance with the endorsed BMP • Regular and ongoing inspection and auditing • Conducting routine maintenance and any required repair activities for all infrastructure, equipment, vehicles and fire detection and suppression systems.
6	Review, and if required update, the Emergency Information Book and signage in accordance with the requirements of Section 5.6 of the BMP.
7	Continue the emergency services familiarisation visits, in accordance with the requirements of Section 5.7 of the BMP.
8	Review, and if required updated, the site emergency management plan, incorporating the recommended procedures for bushfire and onsite fire, detailed in Section 5.8 of the BMP
9	Conduct ongoing review of the project Bushfire Risk Management Plan (BRMP), to ensure it still accurately reflects the risks posed by the development.

No.	Implementation action
10	Comply with the Shire of Augusta-Margaret River firebreak notice as it applies to the wind farm facility only, as detailed in Section 5.11 of the BMP.

Appendix 2 APZ standards (from WA Guidelines)

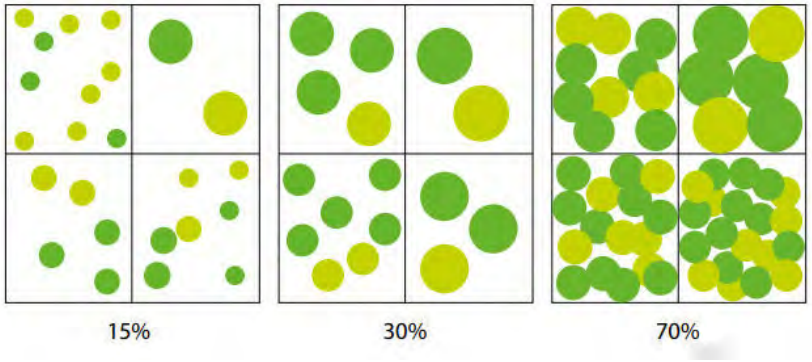
An APZ is a low fuel area maintained around a habitable building to increase the likelihood that it will survive a bushfire, by providing a defendable space and reducing the potential for direct flame contact, radiant heat exposure and ember attack. The APZ allows emergency services access and provides an area for firefighters and home-owners to defend their property.

An APZ should not be seen as an area entirely cleared of vegetation, but as a strategically designed space that considers how existing and future mature vegetation, and combustible and non-combustible features interact with and affect the building's resilience to bushfire.

Vegetation management within an APZ should provide defendable space and be maintained to a low threat state, in perpetuity, in accordance with the requirements outlined below.

Table 9: Asset Protection Zone Technical Requirements

- **Trees* (> 6 metres in height)**
  - Trunks at maturity should be a minimum distance of six metres from all elevations of the building.
  - Branches at maturity should not touch or overhang a building or powerline.
  - Lower branches and loose bark should be removed to a height of two metres above the ground and/or surface vegetation.
  - Canopy cover within the APZ should be <15 per cent of the total APZ area.
  - Tree canopies at maturity should be at least 5 metres apart to avoid forming a continuous canopy. Stands of existing mature trees with interlocking canopies may be treated as an individual canopy provided that the total canopy cover within the APZ will not exceed 15 per cent and are not connected to the tree canopy outside the APZ.



- **Shrub* and Scrub* (0.5 metres to 6 metres in height)**
  - Should not be located under trees or within three metres of buildings.
  - Should not be planted in clumps >5 square metres in area.
  - Clumps should be separated from each other and any exposed window or door by at least 10 metres.
  - Shrub and scrub >6 metres in height are to be treated as trees.
- **Ground covers (<0.5 metres in height)**
  - Can be planted under trees but must be maintained to remove dead plant material, as prescribed in 'Fine fuel load'.
  - Can be located within two metres of a structure, but three metres from windows or doors if >100 millimetres in height.
  - Ground covers >0.5 metres in height are to be treated as shrubs
- **Grass**
  - Grass should be maintained at a height of 100 millimetres or less, at all times.
  - Wherever possible, perennial grasses should be used and well-hydrated with regular application of wetting agents and efficient irrigation.

Table 9: Asset Protection Zone Technical Requirements

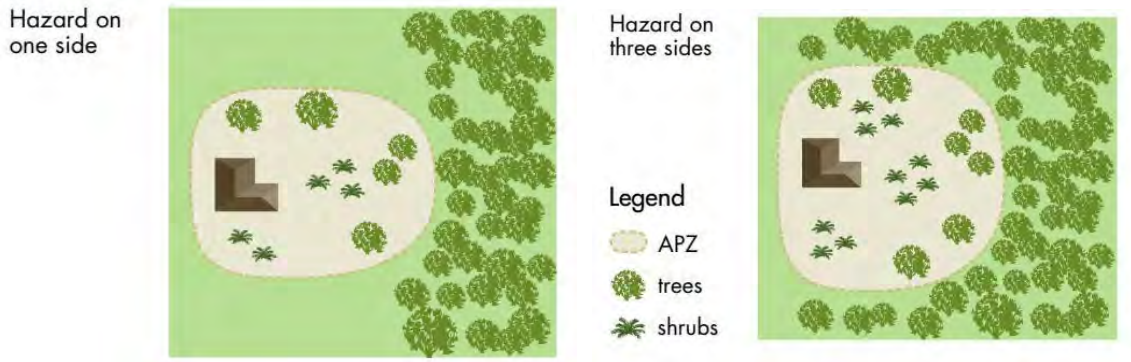
- **Fine Fuel load (combustible dead vegetation mater <6 mm in thickness)****
  - Should be managed and removed on a regular basis to be maintained as low threat vegetation.
  - Should be maintained at <2 tonnes per hectare (on average).
  - Mulches should be non-combustible such as stone, gravel, shells, rock or crushed mineral earth or wood mulch >5 millimetres in thickness.
- **Defendable Space**
  - Within three metres of each wall or supporting post of a habitable building, the area is kept free from vegetation, but can include ground covers, grass and non-combustible mulches as prescribed above.
- **Fences within the APZ**
  - Should be constructed from non-combustible materials (for example, iron, brick, limestone, metal post and wire, or bushfire-resisting timber referenced in Appendix F of AS 3959)
- **LPG Cylinders**
  - Should be located on the side of a building furthest from the likely direction of a bushfire or on the side of a building where surrounding classified vegetation is upslope, at least one metre from vulnerable parts of a building.
  - The pressure relief valve should point away from the house.
  - No flammable material within six metres from the front of the valve.
  - Must sit on a firm, level and non-combustible base and be secured to a solid structure.

** Plant flammability, landscaping design and maintenance should be considered – refer to explanatory notes*

*** Fine fuel load:*

- *is the combustible, dead or dry vegetation matter on the ground, near ground, or elevated. Fine fuel includes grass, leaves, bark and twigs less than six millimetres in diameter that ignite readily and are burnt rapidly when dry.*
- *Fine fuel should be maintained at less than 2t/ha (100gm/m^2 equates to 1t/ha).*
  - *To estimate a fuel load (in t/ha), collect the dry fine fuel from a representative one square meter and weigh (in grams using kitchen scales) and multiply the weight by 0.01.*

Figure 25: Design of an Asset Protection Zone



B.2.2 Designing an Asset Protection Zone

An APZ should not be seen as an area entirely cleared of vegetation, but as a strategically designed

space that considers how existing and future mature vegetation, and combustible and non-combustible features interact with and affect the building's resilience to bushfire.

An APZ should provide the greatest level of vegetation management within at least three metres of a habitable building, to ensure adequate unobstructed defendable space for emergency services to operate. This area should contain minimal vegetation and be free of combustible materials and obstructions. Within the remainder of the APZ, planting of vegetation can increase as you move farther away from the building.

The placement of plants within an APZ is a key design technique. Separation of garden beds with areas of low fuel or non-combustible material will break up fuel continuity and reduce the likelihood of vegetation within an APZ supporting a bushfire. It is important to consider the plant density and final structure and form of plants in their mature state.

Strategic landscaping measures can be applied, such as replacing weeds with low flammability vegetation to create horizontal and vertical separations between the retained vegetation.

Mulches used within the APZ should be non-combustible. The use of stone, gravel, shells, rock and crushed mineral earth is encouraged. Very fine or light mulch (such as shredded pine bark, pine needles, or poplar woodchips) less than five millimeters in diameter should be avoided. It is recommended that wood mulch is used in garden beds or areas where the moisture level is higher by regular irrigation, and these areas are separated with non-combustible elements, such as pathways and open spaces.

Incorporation of landscaping features, such as masonry feature walls, can provide habitable buildings with barriers to wind, radiant heat and embers. These features can include noise walls or wind breaks. Use of Appendix F of AS 3959 for bushfire resistant timber selection or the use of non-combustible fencing materials such as iron, brick, limestone, metal post and wire is encouraged within an APZ

B2.3 Management of an Asset Protection Zone

Ongoing maintenance of an APZ is usually enforced through a condition of a development approval, which should refer to Table 9 APZ technical requirements within this Appendix.

In addition to regular maintenance of an APZ, further bushfire protection can be provided by:

- ensuring gutters are free from vegetation
- installing gutter guards or plugs
- regular cleaning of underfloor spaces, or enclosing them to prevent gaps
- trimming and removing dead plants or leaf litter
- pruning climbing vegetation (such as vines) on a trellis, to ensure it does not connect to a building, particularly near windows and doors
- removing vegetation in close proximity to a water tank to ensure it is not touching the sides of a tank
- following the requirements of the relevant local government firebreak notice, which may include additional provisions such as locating wood piles more than 10 metres from a building.

Preparation of a property prior to the bushfire season and/or in anticipation of a bushfire is beneficial even if your plan is to evacuate. Embers can travel up to several kilometres from a bushfire and fall into small spaces and crevices or land against the external walls of a building.

Best practice recommends objects within the APZ are moved away from the building prior to any

bushfire event.

Objects may include, but are not limited to:

- door mats
- outdoor furniture
- potted plants
- shade sails or umbrellas
- plastic garbage bins
- firewood stacks
- flammable sculptures
- playground equipment and children's toys.

B2.4 Plant Flammability

There are certain plant characteristics that are known to influence flammability, such as moisture or oil content and the presence and type of bark. Plants with lower flammability properties may still burn during a bushfire event, but may be more resistant to burning and some may regenerate faster post-bushfire.

There are many terms for plant flammability that should not be confused, including:

- **Fire resistant** – plant species that survive being burnt and will regrow after a bushfire and therefore may be highly flammable and inappropriate for a garden in areas of high bushfire risk.
- **Fire-retardant** – plants that can absorb more of the heat of the approaching bushfire without burning, compared to more flammable plants.
- **Fire wise** – plants that have been identified and selected based on their low flammability properties and linked to maintenance advice and planting location within a garden.

Although not a requirement of these Guidelines, local governments may develop their own list of fire wise or fire-retardant plant species that suit the environmental characteristics of an area.

When developing a recommended plant species list, local governments should consult with ecologists, land care officers or environmental authorities to ensure the plants do not present a risk to endangered ecological communities, threatened, or endangered species or their habitat.

When selecting plants, private landholders and developers should aim for plants within the APZ that have the following characteristics:

- grow in a predicted structure, shape and height;
- are open and loose branching with leaves that are thinly spread;
- have a coarse texture and low surface-area-to-volume ratio;
- will not drop large amounts of leaves or limbs, that require regular maintenance;
- have wide, flat, and thick or succulent leaves;
- trees that have bark attached tightly to their trunk or have smooth bark;
- have low amounts of oils, waxes, and resins (which will often have a strong scent when crushed);
- do not produce or hold large amounts of fine dead material in their crowns; and/or
- will not become a weed in the area.

Appendix 3 Low Threat Vegetation (AS 3959 Clause 2.2.3.2)

2.2.3.2 *Exclusions—Low threat vegetation and non-vegetated areas*

The following vegetation shall be excluded from a BAL assessment:

(a) Vegetation of any type that is more than 100 m from the site.

(b) Single areas of vegetation less than 1 ha in area and not within 100 m of other areas of vegetation being classified vegetation.

(c) Multiple areas of vegetation less than 0.25 ha in area and not within 20 m of the site, or each other or of other areas of vegetation being classified vegetation.

(d) Strips of vegetation less than 20 m in width (measured perpendicular to the elevation exposed to the strip of vegetation) regardless of length and not within 20 m of the site or each other, or other areas of vegetation being classified vegetation.

(e) Non-vegetated areas, that is, areas permanently cleared of vegetation, including waterways, exposed beaches, roads, footpaths, buildings and rocky outcrops.

(f) Vegetation regarded as low threat due to factors such as flammability, moisture content or fuel load. This includes grassland managed in a minimal fuel condition, mangroves and other saline wetlands, maintained lawns, golf courses (such as playing areas and fairways), maintained public reserves and parklands, sporting fields, vineyards, orchards, banana plantations, market gardens (and other non-curing crops), cultivated gardens, commercial nurseries, nature strips and windbreaks.

NOTES:

1 Minimal fuel condition means there is insufficient fuel available to significantly increase the severity of the bushfire attack (recognizable as short-cropped grass for example, to a nominal height of 100 mm).

2 A windbreak is considered a single row of trees used as a screen or to reduce the effect of wind on the leeward side of the trees.

Appendix 4 Vehicular access technical standards of the WA Guidelines

Private driveways
Acceptable Solution A3.1
There are no private driveway technical requirements (prescribed by these Guidelines) where the private driveway is within a lot serviced by reticulated water and is no greater than 70 metres in length between the most distant external part of the habitable building and the public road. In circumstances where the above conditions are not met, the private driveway is to meet all of the following requirements: • requirements in Appendix B.3 Table 10, Column 5; and • passing bays every 200 metres with a minimum length of 20 metres and a minimum additional carriageway width of 2 metres • (i.e. the combined carriageway width of the passing bay and constructed private driveway to be a minimum 6 metres); and • turn-around area (Figure 30) and within 30 metres of the habitable building (Figure 38).
Explanatory note B3.8
Emergency services vehicles typically operate from the street frontage in areas serviced by reticulated water and where the distance from the public road to the farthest part of the habitable building is no greater than 70 metres. In the event the habitable building cannot be reached by hose reel from the public road, emergency services vehicles will need to gain access via the driveway to the property. Emergency services vehicles will also need to gain access to the property where access to water is provided by onsite water tanks. In these situations, the driveway and battle-axe access leg (if applicable) will need to be wide enough for access by an emergency services vehicle and a vehicle to evacuate. It is acceptable for a private driveway to have a carriageway width of four metres with a traversable verge of one metre on either side of the carriageway. Turn-around areas (**Figure 38**) should be available for conventional two-wheel drive vehicles and type 3.4 fire appliances and should be located within 30 metres of habitable buildings. Circular and loop driveway design may also be considered. Figure 38: Design requirements for a private driveway where required 
Private driveways

Figure 30: Design requirements for a turn-around area

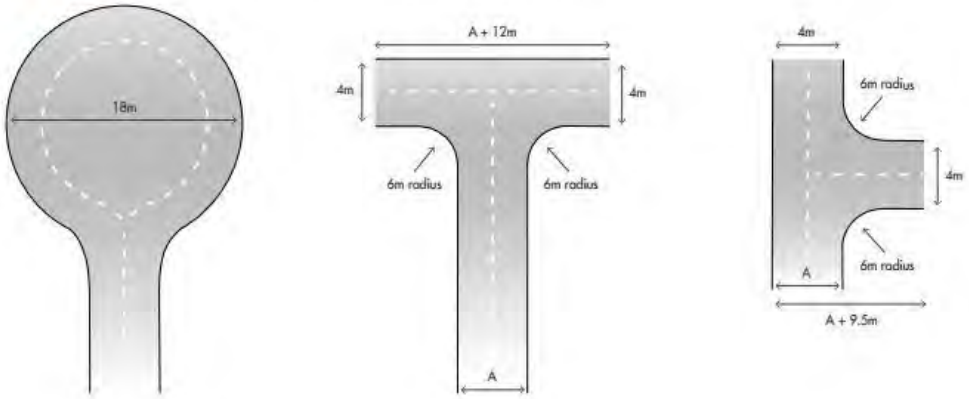


Table 10: Vehicular access technical requirements

	1		2		3		4		5	
TECHNICAL REQUIREMENTS	**PERIMETER ROADS**		**PUBLIC ROADS**		**EMERGENCY ACCESS WAY[3]**		**FIRE SERVICE ACCESS ROUTE[3]**		**BATTLE-AXE & PRIVATE DRIVEWAYS[1]**	
MAP OF BUSH FIRE PRONE AREAS DESIGNATION	**Area 2**	**Area 1**	**Area 2**	**Area 1**	**Area 2**	**Area 1**	**Area 2**	**Area 1**	**Area 2**	**Area 1**
Minimum horizontal clearance (metres)	12	8	See note 5		10	6	10	6	6	
Minimum vertical clearance (metres)	4.5									
Minimum weight capacity (tonnes)	15									
Maximum grade unsealed road[2]	See note 5		See note 5		1:10 (10% or 6°)					
Maximum grade sealed road[2,4]					1:7 (14.3% or 8°)					
Maximum average grade sealed road					1:10 (10% or 6°)					
Minimum inner radius of road curves (metres)					8.5					

Notes:

[1] Driveways and battle-axe legs to comply with the Residential Design Codes and Development Control Policy 2.2 Residential Subdivision where not required to comply with the widths in this Appendix or the Guidelines.

[2] Dips must have no more than a 1 in 8 (12.5% - 7.1 degrees) entry and exit angle.

[3] To have crossfalls between 3 per cent and 6 per cent.

[4] For sealed roads only the maximum grade of no more than 1 in 5 (20 per cent) (11.3 degrees) for no more than 50 metres is permissible, except for short constrictions to 3.5 metres for no more than 30 metres in length where an obstruction cannot be reasonably avoided or removed.

[5] As outlined in the Institute of **Public Works Engineering Australasia (IPWEA) subdivision guidelines, Liveable Neighbourhoods, Austroads Standards** Main Roads standard, supplement, policy or guideline and/or any applicable or relevant local government standard or policy.

Appendix 5 Water technical standards of the WA Guidelines

Appendix B.4 – Water Supply
B4.1 Construction and Design Technical requirements
• An above-ground tank and associated stand should be constructed of non-combustible material. • Below-ground tanks should have a 200 millimetres diameter access hole to allow tankers or emergency services vehicles to refill direct from the tank, with the outlet location clearly marked on the surface. • Above and below ground tanks may need to comply with AS/NZS 3500.1:2018. • An inspection opening may double as the access hole provided that the inspection opening meets the requirements of AS/NZS 3500.1:2018. • Where an outlet for an emergency services vehicle is provided, then an unobstructed, hardened ground surface is to be supplied within four metres of any water supply. B4.1.1 Pipes and Fittings All above-ground, exposed water supply pipes and fittings should be metal. Fittings should be located away from the source of bushfire hazard and be in accordance with the applicable section below, unless otherwise specified by the local government. B4.1.2 Fittings for above-ground water tanks • Commercial land uses: 125mm Storz fitting; or • Strategic water tanks: 50mm or 100mm (where applicable and adapters are available) male camlock coupling with full flow valve; or • Standalone water tanks: 50mm male camlock coupling with full flow valve; or • Combined water tanks: 50mm male camlock coupling with full flow valve or a domestic fitting, being a standard household tap that enables an occupant to access the water supply with domestic hoses or buckets for extinguishing minor fires. B4.1.3 Remote outlets In certain circumstances, it may be beneficial to have the outlet located away from the water supply. In instances in which a remote outlet is to be used, the applicant should consult the local government and DFES on their proposal.
B4.2 Use of Water Supply
• The combination of drinking water and water for firefighting purposes is not recommended, as stagnant water may alter the quality of the drinking water and the emergency services, by law, may not be able to take water from the water supply to suppress a bushfire. • Combining drinking water and water for firefighting purposes is contrary to provisions within clause 4.2.3 of AS/ NZS 3500.1:2021
B4.3 Independent Water and Power Supply
• Water tank/s are to be provided in accordance with Table 11, Water supply dedicated for bushfire firefighting purposes.
B4.5 Location of Water Tanks and Hydrants
• Surrounding vegetation should be considered when locating a water tank. • Avoid locations where the tank will be situated underneath existing vegetation or where vegetation will grow against or overhang the tank, (Figure 39). Where a tank is on the bushfire hazard side of a building, sufficient shielding for the protection of firefighters should be provided. In addition to the tank location, the fitting should be positioned and/or shielded from the bushfire hazard to allow access by emergency services.

Appendix B.4 – Water Supply

Figure 39: A good and bad example of landscaping around a water tank

Table 11: Water supply dedicated for bushfire firefighting purposes

SECTIONS FROM THE PLANNING FOR BUSHFIRE GUIDELINES					
SECTION 5[2] STRUCTURE PLANS AND SUBDIVISION APPLICATIONS		**SECTION 6[2] DEVELOPMENT – RESIDENTIAL**	**SECTION 7[2] DEVELOPMENT – COMMERCIAL & INDUSTRIAL**	**SECTION 8[2] – DEVELOPMENT – VULNERABLE LAND USES**	
One additional lot	10,000 litre water tank per lot	10,000 litre water tank per habitable building	For each habitable building - 10,000 litre per 1,500 m^2 of floor space up to 50,000 litre. Provided in a water tank.	Camping ground	At the discretion of the local government
Three to 24 lots	10,000 litre water tank per lot[1] **or** 50,000 litre strategic water tank				
25 lots or more	50,000 litre per 25 lots or part thereof, provided as a strategic water tank(s) **and/or** 10,000 litre water tank per lot			Other vulnerable land uses	For each habitable building - 10,000 litre per 500 m^2 of floor space up to 50,000 litre. Provided in a water tank.

Notes:

[1] Evidence that the identified water supply amounts in either column denoted is to be provided at the relevant planning stage.

[2] where more than one habitable building is proposed, strategic water tanks are to be provided in accordance with Section 5 requirements and at the discretion of the Local Government.

Appendix 6 Shire of Augusta-Margaret River Firebreak Notice

Firebreak Notice 2025-2026

BUSH FIRES ACT 1954

The following Notice is hereby given to all owners and/oroccupiers of land within the Shire of Augusta Margaret River.

PURSUANT to the powers contained in Section 33 of the Bush Fires Act 1954, you are hereby required and therefore ordered by the local government to carry out fire prevention work in accordance with the requirements of this Notice, on or before **30 November 2025** and maintain the requirements up to and including **12 May 2026** except for APZs which must be maintained all year round.

Inspections, appointments, education, and compliance

Owners and occupiers who would like an early inspection by appointment, for reasons including biosecurity, locked gates, and dangerous animals,or for an explanation on the requirements of this Notice, should contact Rangers as soon as possible and by no later than **1 November 2025**. Where inspections by appointment are not requested, Rangers are appointed as Bush Fire Control Officers with the power to enter land under the Bush Fires Act 1954 and will be inspecting properties for compliance without further notice from **1 December 2025**.

People who do not comply with this Notice or a Variation to this Notice may be issued with an infringement Notice ($250) or prosecuted with a penalty up to $5,000. The Shire of Augusta Margaret River may carry out the required work on the land at the cost of the owner/occupier.

Requirements of landowners and occupiers:

1.All landowners/occupiers must comply with the requirements in **Part A** of this Notice.
2.Owners/occupiers of Residential lots 4000m2 and under must comply with the requirements of **Part A** and **Part B**.
3.Owners/occupiersof Residential and Rural/Residential lots 4001m2 and over must comply with the requirements of **Part A** and **Part C**.
4.Owners/occupiers of Rural lots (excluding Plantations, Vineyards, Orchards,and Groves) must comply with the requirements of **Part A** and **Part D**.
5.Owners/occupiers of Plantations, Vineyards, Orchards, and Groves must comply with the requirements of **Part A** and **Part E or F**, depending upon the land use.

Definitions of terms referred to in Parts A, B, C, D, E and F of this Notice

Asset Protection Zone (APZ) - means an area of low fuel load within 20 metres from the external walls of any habitable building.
Habitable Building - means any building people reside in and any other building within 6m of that building, but excludes a water tank.
Flammable Material - means accumulated fuel such as dry grass, leaf litter, twigs, branches, trash, dead trees, firewood, stored fuels, that can be easily ignited or is likely to catch fire and burn. It includes any other thing deemed by an authorised officer to be likely to catch fire but excludes living trees, growing bushes, and plants in gardens and/or lawns under cultivation.
Bushfire Management Plan (BMP) - means a plan prepared specifically for a property in satisfaction of a development approval or subdivision condition.
Driveway/Access Way - means the access route from a road reserve to ahabitable building.
Firebreak - means an area of land that has been cleared of all trees, bushes, grasses, and any other object or thing which may be flammable, leaving a bare surface to a width specified under the requirements in Parts A, B, C or D with a 4 metre high vertical clearance.
Trafficable - means a firm, stable surface capable of allowing a 4WD fire appliance to enter, exit and turn any corner (10 metre radius) without reversing.
Variation - means an individual property-specific Firebreak Notice served by the Shire on an owner under s33(2) of the Bush Fires Act 1954.

Clearing permits and exemptions

Property owners that clear vegetation in compliance with this Notice will be exempt from the requirement to seek approvals or permits. Owners should attempt to minimise environmental impacts as much as possibleand should contactthe Shire if they believe that clearing beyond the requirements in this Notice are necessary to reduce fire risks or if they are aware of any protected flora or fauna. **Owners who clear beyond the requirements in this Notice without approval may be subject to prosecution.**

Firebreak Notice 2025-2026

Variations to the requirements of this Notice

Where compliance with the Noticeis not practical due to environmental considerations or site-specific constraints such as topography, water course or steep gradients, owners may apply to the Shire of Augusta Margaret River for a Variation to the Notice. Variations must provide an alternative means of meeting the objectives of the Notice, including bushfire risk mitigation and property access, considering site-specific constraints and advantages and not all properties will be able to accommodate Variations. Applications must be completed on the approved form, available upon request or downloaded via theShire's website. Applications for a Variation must be submitted **before 1 November 2025 or after 1 May 2026**.

Part A - Requirements applying to all properties in the district of Augusta Margaret River:

1. Asset Protection Zone (APZ) - The fuel loading (flammable material) in the APZ is to be reduced and maintained to less than 2 tonnes per hectare. Trees must not be closer than 2 metres to a building, and trees must not overhang a building within 4 metres of the external roof. **APZ requirements apply to all properties (excluding Vacant lots), regardless of size, and must be maintained all year round.** (Note: Numerous online resources assist in identifying excessive fuel loading and ideal APZ standards. Rangers can also visit outside of inspection periods to provide property-specific advice.)

2.Bushfire Management Plan (BMP) - properties subject to an approved BMP must comply with the requirements of their BMP in addition to the requirements of this Notice. (Note: At the discretion of the Shire, Variations may be issued that exempt some owners from compliance with requirements in this Notice where they are meeting alternate methods and requirements for compliance in an approved Bushfire Management Plan.)

3.Driveway/Access Way - any property with a habitable building must have a driveway/access way that is a minimum of 4 metres wide up to a maximum of 6 metres wide with a minimum 4 metre vertical clearance and a turnaround area to allow emergency vehicles to access buildings on a property and exit. There must be no encroachment into the driveway by any vegetation (living or dead) or any other object, this includes gates, which if installed, must open the entire trafficable width of the driveway.

4.Firebreak - 2 metre wide firebreaks are required around all piles of garden refuse and/or wood stacks, fuel and fodder.

5.Gutters and Rooftops - All gutters and roofs must be free of excessive twigs, leaves, and plant material.

Part B - Additional requirements applying to Vacant lots 4000m^2 and under:

1. Vacant cleared land - grasses maintained by means of slashing/mowing/grazing to less than 10cm in height. Slashed/mowed grasses are to be removed from the lot.

Part C - Additional requirements applying to Residential/Rural Residential lots 4001m^2 and over:

1.Firebreak - 3 metre wide trafficable firebreaks must be maintained within 10 metres of all boundaries.
2.Vacant cleared land - grasses maintained by means of slashing/mowing/grazing to less than 10cm in height.

Part D - Additional requirements applying to Rural lots (excluding Plantations, Vineyards, Orchards, and Groves):

1.Firebreak - 3 metrewide trafficable firebreak must be maintained within 100 metres of a boundary that abuts a road reserve. Where land is actively grazed or maintained to less than 10cm, the firebreak within 100 metres of a boundary that abuts a road reserve may be reduced to 2 metres.
2.Grasses to be maintained – slashed/mowed/grazed to lessthan 10cm in height.

Part E - Additional requirements applying to Plantations:

1.Firebreak - 10 metre wide mineral earth firebreak around each cell or block. 3 metres must be trafficable.
2.Grasses to be maintained - slashed/mowed/grazed to less than 10cm in height.

Part F - Additional requirements applying to Vineyards, Orchards, and Groves:

1.Firebreak - 5 metre wide mineral earth firebreak around each cell or block. 3 metres must be trafficable.
2.Grasses to be maintained - slashed/mowed/grazed to less than 10cm in height.

Appendix 7 Bushfire Emergency Management Plan Requirements

The Proponent is to develop an emergency management plan for the facility, which comprehensively details the procedures for preparing for, and responding to, hazards to the facility, including the following for off-site bushfire, and on-site fire, emergencies:

- Facility details including:
  - Facility description, including infrastructure details, operations, number of personnel, and operating hours.
  - Up-to-date contact details for facility personnel, and any relevant off-site personnel that could provide technical support during an emergency including contact information for 24/7/365 specialist technical support for the renewable energy infrastructure.
  - Site plans that depict the entire site layout, including:
    - Buildings, substations and renewable energy infrastructure,
    - Internal driveways and surrounding public roads
    - Fire protection systems and equipment, including firewater tanks
    - Grid connections, drains and isolation valves,
    - Dangerous goods storage areas
    - Landowners within wind farm, and neighbouring landowners, and any relevant infrastructure (e.g. dwellings), and
    - North direction and scale
  - The following wind turbine details and plans are to be provided:
    - Schematics and technical data for wind turbines, including the number installed on-site, and internal fire systems.
    - Maximum (safe) operational wind speed and temperature conditions and operating procedures to limit fire risk.
    - The shutdown and/or isolation procedures if the turbines are involved in fire or emergency incident, and appropriate personnel contact details to verify that the turbine has been shutdown and de-energised during emergencies.
  - Details of any emergency resources, including fire detection and suppression systems and equipment; gas detection; emergency eye-wash and shower facilities; spill containment systems and equipment; emergency warning systems; communication systems; personal protective equipment; first aid.
  - A manifest of dangerous goods (if required under the applicable Dangerous Goods legislation and codes, and relevant Australian Standards), including Safety Data Sheets (SDS).
- The identified risks and hazards associated with the renewable energy infrastructure, including but not limited to:
  - Electrical faults and renewable energy infrastructure fire,
  - Bushfire
- Detail preparedness and pre-emptive actions to address the above hazards, including the following for bushfire:

  - Ongoing compliance with the approved BMP and BRMP, including ensuring regular vegetation management requirements are achieved, vehicular access routes and firewater systems are maintained and available, and conducting regular bushfire housekeeping inspections.
  - Ensuring ongoing maintenance of all buildings, especially the onsite O&M building.
  - Ensuring ongoing maintenance of all fire and communication systems.
  - Determining forecast Fire Danger Rating (FDR), Total Fire Bans (TFB) and Harvest Vehicle Movement Bans (HVMB), during bushfire season
  - Modifying Site Activities (based on Forecast FDR, TFB and/or HVMB)
  - Monitoring DFES Bushfire Emergency Warnings (and/or bushfire activity within 50km of the facility, during bushfire season, and understanding decision-making triggers.
- Detail emergency response procedures to address the nominated hazards, including for:
  - Bushfire and
  - Onsite fire in renewable energy infrastructure

Bushfire preparedness and pre-emptive activities

Year-round (with focus on the month prior to bushfire season)

- Ensure ongoing compliance with endorsed BMP including:
  - Vegetation management must be conducted as per the BMP including maintenance of APZs and NVZs.
  - Gutters, roof surfaces and valleys, kerbs, traps, sumps, bunds, drains, rooves or any other accumulation points for leaf litter, dry vegetation, or any other combustible materials must be cleared, and the debris removed from site.
  - Extraneous or unnecessary materials (fuel loads) must be removed from site (e.g. dilapidated/stored vehicles, plant or equipment; excess fuel/chemicals; any combustible waste materials).
- Bushfire preparedness housekeeping inspections:
  - Ensure all vehicle site access points, including emergency access points, are clear and accessible.
  - Ensure that all fire protection systems and equipment is unobstructed, in service and performing optimally.
- Fire detection, alarm and suppression systems, and any other communication and emergency equipment must be maintained in accordance with relevant codes and standards, and be in effective working order at all times
  - Any defects, faults or matters affecting the performance of systems must be identified through routine testing and servicing, with any maintenance activities and rectifications to be closed-out prior to bushfire season.
- Ensure Emergency Information Book and signage is up to date with the latest information, especially key contact names and phone numbers, as detailed in Section 5.6.
- Ensure local fire brigade is engaged on an ongoing basis, to ensure they are familiar with the site layout, specific hazards and fire detection and suppression systems as detailed in Section 5.7.
- Ensure the wind farm has registered with the Shire of Augusta-Margaret River for SMS

notifications for Harvest Vehicle Movement Bans (HVMB).

During the bushfire season

Monitor Forecast Fire Danger Rating (FDR) and Total Fire Ban Days (TFB)

- A nominated person/role is to be responsible for identifying, responding to and communicating the Fire Danger Rating, ideally four days ahead:
  - http://www.bom.gov.au/wa/forecasts/fire-danger-ratings.shtml [4 day FDR forecast] or
  - https://www.emergency.wa.gov.au/index.html#firedangerratings [current/next day FDR]
  - https://www.emergency.wa.gov.au/#totalfirebans [Total Fire Ban]
- This information must be communicated to everyone likely to be present on-site, and relevant off-site personnel.
- Undertake any modification of site activities based on forecast FDR or TFB (see below).

Modifying Site Activities (based on Forecast FDR and TFB)

- ***Moderate FDR or No Rating***
  - No specific daily monitoring or actions unless conditions change.
- ***High FDR***
  - Alert all site personnel and visitors of bushfire risk
  - No specific daily monitoring but remain vigilant to potential bushfires through visual checks, occasional check of online resources for emergency warnings and bushfires in the local area.
  - Conduct daily checks of vegetation, rubbish and extraneous storage accumulation, vehicular access routes and fire systems to ensure they are fit-for-purpose in a bushfire emergency.
- ***Extreme FDR***
  - Alert all site personnel and visitors of elevated bushfire risk and communicate modified activities including requirement to be prepared for site shutdown and offsite evacuation, if required.
  - Conduct regularly visual checks throughout the day
  - Regularly check online resources for emergency warnings and bushfires in the local area.
  - Consider minimisation of site personnel and visitation requiring travel to and from the facility, as well as non-essential activities and high-risk maintenance activities.
  - Include bushfire ignition hazards in any Job Hazard Analysis or similar activity-based risk management process for site activities.
  - Conduct daily checks of vegetation, rubbish and extraneous storage accumulation, vehicular access routes and fire systems to ensure they are fit-for-purpose in a bushfire emergency.
- ***Catastrophic FDR and TFB declared days***
  - Alert all site personnel and visitors of elevated bushfire risk and communicate modified activities including requirement to be prepared for rapid site shutdown and offsite evacuation, if required
  - Conduct hourly visual checks throughout the day

- Conduct hourly check online resources for emergency warnings and bushfires in the local area.
- Postpone non-essential activities or high-risk maintenance activities at the facility.
- Minimise site personnel and visitation to only essential personnel.
- Include bushfire ignition hazards in any Job Hazard Analysis or similar activity-based risk management process for site activities.
- Conduct daily checks of vegetation, rubbish and extraneous storage accumulation, vehicular access routes and fire systems to ensure they are fit-for-purpose in a bushfire emergency.
- Comply with all Total Fire Ban requirements including:
  - no fire or flames allowed in the open air
  - no open fires for the purpose of cooking or camping are allowed
  - no 'hot work' such as metal work, grinding, welding, soldering, gas cutting or similar is allowed unless a formal exemption has been obtained
  - no use of chainsaws, plant or grass trimmers or lawn mowers in bushland areas
  - no other activities that may start a fire
  - ensure equipment or machinery is mechanically sound
  - ensure all reasonable precautions are taken to prevent a bushfire igniting, including postponing any activity that could result in a bushfire ignition.

Monitoring and Modifying Site Activities (based on HVMB)

- Nominated personnel are to monitor for SMS warnings from the Shire for declared Harvest Vehicle Movement Bans (HVMB).
- If declared, comply with all HVMB requirements of the Shire, which typically including no:
  - Operation or movement of internal combustion engines (motor bikes, quad bikes, excavators, chain saws, ride on mowers, generators, plant equipment) used off-road in bushland or paddocks.
  - Undertaking 'hot works' such as welding, grinding or activity that may cause a spark or ignition unless an exemption issued by Department of Fire & Emergency Service (DFES) for essential services work on a total fire ban day.
  - Fire or flames allowed in the open air
  - Cooking outside in the open air using an open fire (this includes under verandas and patios)
  - Harvesting

Bushfire Monitoring, Triggers and Decision-Making

Bushfire Monitoring

Bushfire monitoring involves the identification of the DFES Bushfire Emergency Warnings (ADVICE, WATCH & ACT AND EMERGENCY) and/or bushfire activity within 50km of the facility, through the use of the Emergency WA website app (https://www.emergency.wa.gov.au/), or ABC local radio.

- ***If ADVICE warning or bushfire is within 25 km – 50 km of the site***
  - Liaise with the DFES if fire travelling toward the site.

- Consider reducing numbers of onsite personnel to essential staff only, and relocate all other staff and visitors to nominated offsite safer location (e.g. Margaret River, Augusta, Nannup or Busselton townsites depending on direction of fire travel).
- Make preparations to shutdown facility and conduct offsite evacuation procedures, depending on bushfire location and direction of spread, including:
  - Prepare for potential remote shutdown and de-energisation of turbine/s (in consultation with DFES, Western Power, AEMO), should it be required.
  - Ensure onsite O&M building is properly prepared for onsite shelter, should it be required.
  - Ensure all other buildings and plant are properly secured.
  - Ensure all vehicular access routes are unlocked and available for use.
  - Ensure all fire and communications systems are ready for use.
- Continue monitoring and re-evaluating situation depending on bushfire behaviour, and liaising with DFES as required.

- ***If WATCH & ACT warning or bushfire is within 10 km – 25 km of the site***
  - Liaise with the DFES if fire travelling toward the site.
  - Prepare or commence shutdown facility, depending on bushfire location and direction of spread, including:
    - Prepare for potential remote shutdown and de-energisation of turbine/s (in consultation with DFES, Western Power, AEMO), should it be required.
    - Ensure onsite O&M building is properly prepared for onsite shelter, should it be required.
    - Ensure all other buildings and plant are properly secured.
    - Ensure all vehicular access routes are unlocked and available for use.
    - Ensure all fire and communications systems are ready for use.
  - Prepare or commence offsite evacuation procedures depending on bushfire location and direction of spread, including:
    - Early reduction of numbers of onsite personnel to essential staff only, and relocate all other staff and visitors to nominated offsite safer location, if safe to do so, otherwise they are to remain onsite.
      - Ensure relocation of all wind farm personnel to the offsite safer location ahead of any bushfire impact on road network (including smoke impact).
  - Continue monitoring and re-evaluating situation depending on bushfire behaviour, and liaising with DFES as required.
- ***If EMERGENCY warning or if bushfire is <10km or impact is imminent:***
  - Liaise with the DFES.
  - If safe to do so, commence or conduct facility shutdown depending on bushfire location and direction of spread, ideally in consultation with authorised DFES personnel (where possible), including:
    - Prepare to conduct remote shutdown and de-energisation of turbine/s (in consultation with DFES, Western Power, AEMO), should it be required.
    - Ensure onsite O&M building is properly prepared for onsite shelter,

should it be required.
    - Ensure all other buildings and plant are properly secured.
    - Ensure all vehicular access routes are unlocked and available for use.
    - Ensure all fire and communications systems are ready for use.
  - Urgently undertake offsite evacuation procedures (if safe to do so) depending on bushfire location and direction of spread, including:
    - Relocate all site personnel and visitors to nominated offsite safer location ahead of any bushfire impact on road network.
  - If unsafe to evacuate offsite, urgently commence onsite shelter in place procedures including:
    - Prepare onsite O&M building for onsite shelter
    - Relocate all site personnel and visitors to the O&M building on conduct all shelter in place actions.
  - Continue monitoring and re-evaluating situation depending on bushfire behaviour, and liaising with DFES as required.

Offsite Evacuation and Onsite Shelter-in-Place Procedures

Ahead of deciding to evacuate offsite or remain onsite to shelter-in-place (which is the last resort response if unsafe to evacuate offsite), the following should be conducted:

- Assess the bushfire situation:
  - Review available information to determine bushfire location, direction and speed of travel
  - Determine if there are any DFES Bushfire Warnings issued
  - Contact and liaise with DFES for further information and guidance
  - Make a decision whether it is safe to evacuate to nominated offsite safer location (e.g. Margaret River, Augusta, Nannup or Busselton townsites depending on direction of fire travel), or whether it is safer to shelter onsite in the O&M building (which should be a last resort action only).
  - Advise DFES of the decision, if possible.

Offsite Evacuation (and Facility Shutdown)

- Assemble all site personnel and visitors at the O&M control building
  - Brief them of the bushfire situation and the plan to shutdown facility (if sufficient time) and evacuate to nominated offsite safer location.
  - Ensure sufficient transport is available for all personnel to travel to nominated offsite safer location with sufficient fuel to travel 100 km, water, fire extinguishers (if possible)
- Conduct facility shutdown actions (if sufficient time) including
  - Ensure all vehicular access routes are unlocked and available for use.
  - Ensure all fire systems are ready for use.
  - Ensure all other buildings and plant are properly secured.
- Brief evacuees on offsite evacuation particulars including:
  - Confirm the offsite safer location (e.g. Margaret River, Augusta, Nannup or Busselton townsites depending on direction of fire travel)
  - The evacuation route to travel to the off-site safer location
  - The need to travel in convoys in case of vehicle failure

    - Where possible, the final evacuating personnel should leave in 2 vehicles.
- Monitor the leaving of site and arrival at nominated offsite safer location, and if anyone is missing, notify DFES immediately.

Onsite Shelter-in-place (and Facility Shutdown) – Last Resort Action Only

- Assemble all site personnel and visitors at the onsite O&M building
    - Brief them of the bushfire situation and the plan to shutdown facility (if sufficient time) but remain onsite to shelter in place.
- Prepare onsite O&M building for shelter
    - Check the perimeter of building and put away all external combustible items and any loose items that could be projectiles
    - Close all doors and windows
    - Ensure all firefighting, emergency communication equipment and first aid supplies are available and ready for use, including positioning the mobile fire trailer in an accessible location adjacent to the O&M building.
    - Ensure all internal access routes within the building are open to enable people move to the available spaces
    - If installed, ensure any evaporative air-conditioning (HVAC) can be easily shutdown ahead of the fire impact. If possible, keep the water running and turn off the fan, otherwise shutdown completely.
    - Begin storing water for drinking (in containers) and review food stores
    - Consider collecting any blankets and fire extinguishers from other buildings
    - Soak towels and rugs in water and lay them along the inside of external doorways or block any other gaps for embers or smoke
- Conduct facility shutdown actions (if sufficient time and safe to do so) including
    - Ensure all vehicular access routes are open and available for use.
    - Ensure all fire systems are ready for use.
    - Ensure all other buildings and plant are properly secured.
- As bushfire impacts the facility:
    - All occupants are to be at the O&M building
    - Immediately before the fire arrives, wet down building, decks and landscaping close to the building. Turn off evaporative air-conditioning if not already done.
    - Ensure occupants get down low to limit exposure to smoke and drink plenty of water to avoid becoming dehydrated.
    - Regularly inspect the condition of the building including:
        - Regular inspection of the inside of the building, including the roof space for sparks and embers, and extinguish where possible and safe to do so.
        - If safe to do so, organise for regular patrols of the outside of the building to check for any signs of bushfire ignition and extinguish where possible and safe to do so. Those conducting the patrols are to wear appropriate PPE.
- Stay inside while the fire front is passing and don't leave until advised by DFES or local fire brigade (or decided by Chief Fire Warden) that the fire is no longer a threat or offsite evacuation can be safely conducted.
- If the building catches fire and/or conditions inside become unbearable:

    - Leave through the door furthest from the approaching fire
    - Relocate all occupants away from the fire or previously burned land.
- Once the fire has passed, and approval is provided to leave the building:
    - Go outside and extinguish any fires on the building or in adjacent landscaping.
    - Regularly inspect the inside and outside of the building for several hours.
    - Do not approach the renewable energy infrastructure (turbines, substation, transmission lines) until advised by DFES.

Onsite Renewable Energy Infrastructure Fire Response

The emergency response to any onsite fire in renewable energy infrastructure (especially turbines), is to include the following:

- Immediately notify of onsite fire, including location:
    - DFES and local fire brigade to enable rapid onsite turnout.
    - Relevant wind farm personnel
    - Landowners
- Immediately shutdown and deenergise any turbine/s on fire, and any other relevant turbines
- If possible, ensure relevant vehicular access routes are open and available, to enable attending firefighters to gain access to the O&M building and relevant turbine/s.
- Ensure all fire and communications systems are ready for use.
- If safe to do so, conduct first attack response on any spot fires with mobile fire trailer, until DFES arrival.
- Ensure attending firefighters have access to any relevant wind farm personnel (onsite or offsite) for specialist technical advice.

Emergency Management Plan Review, Training and Exercises

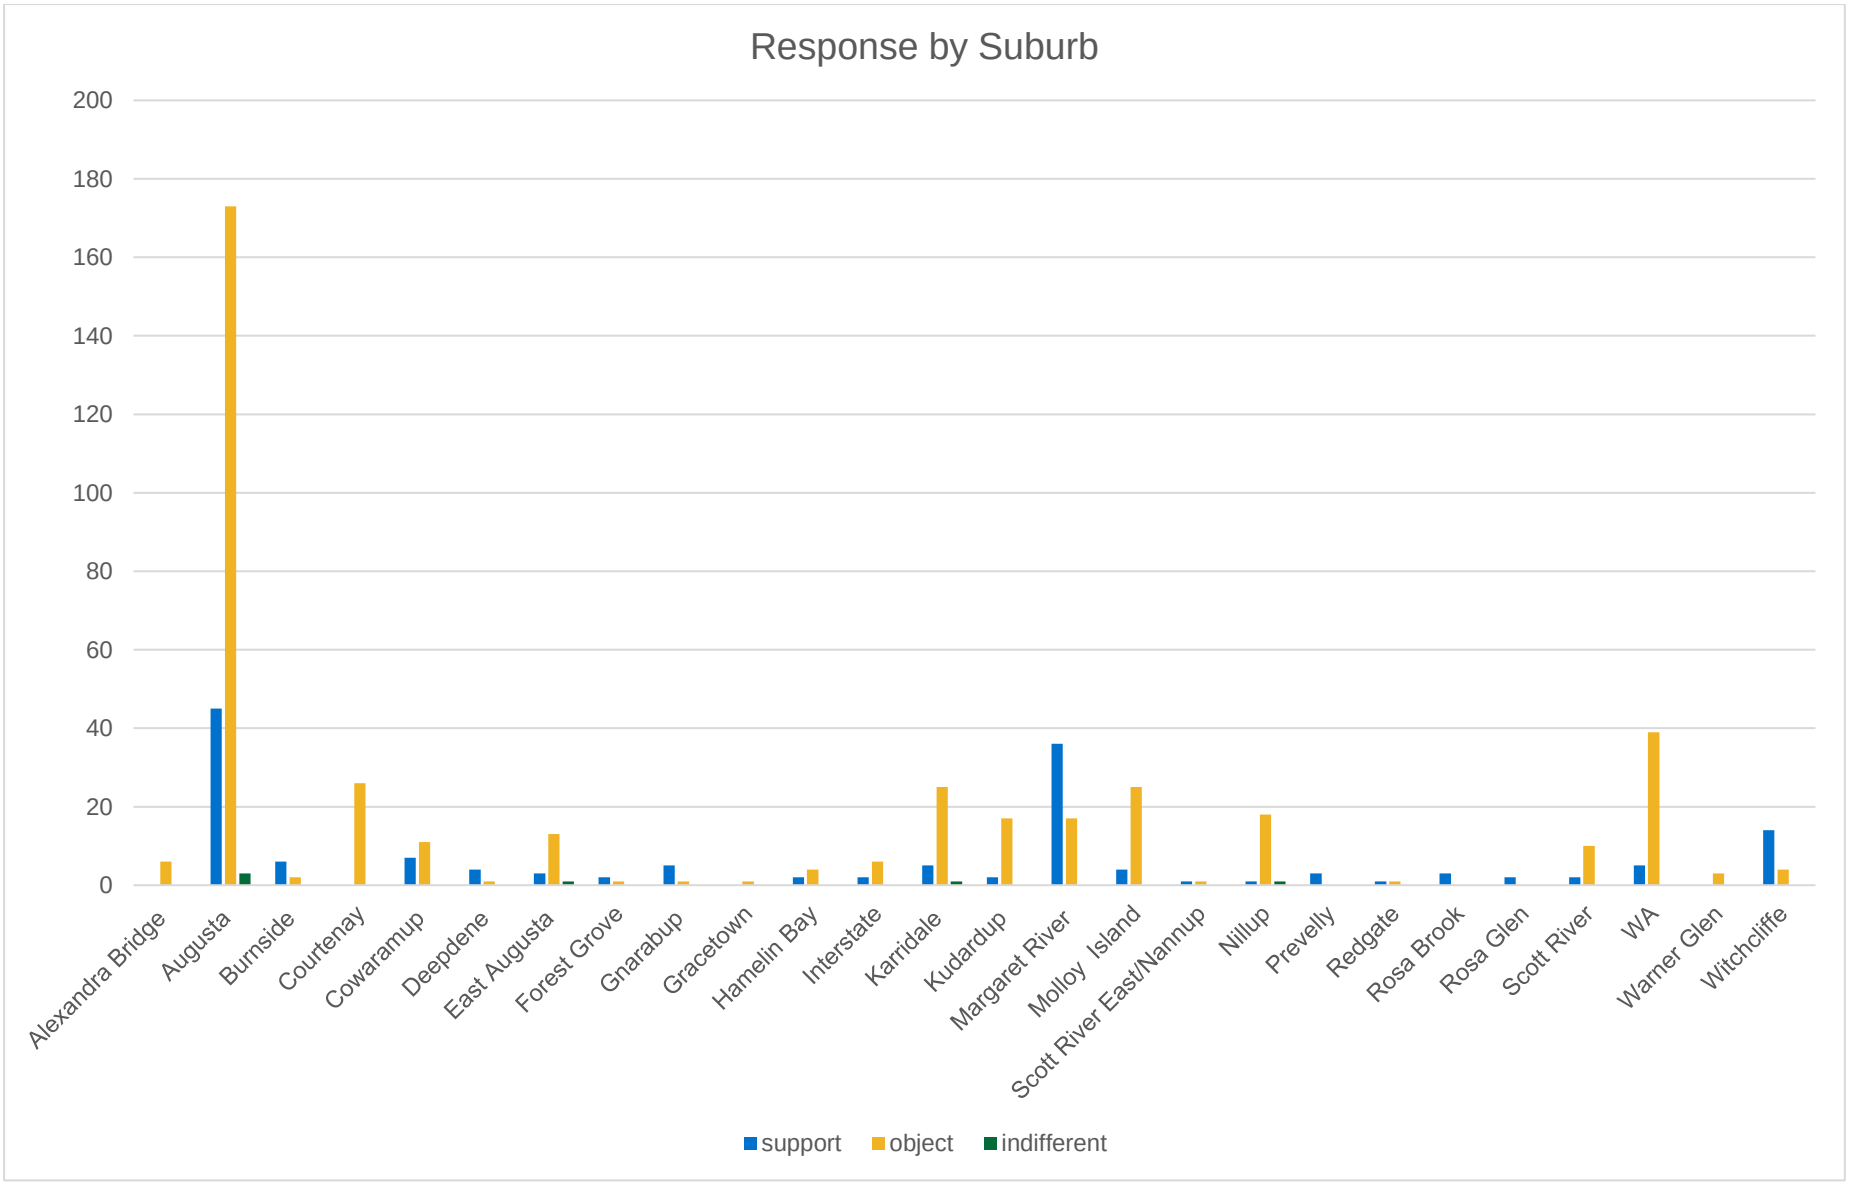
The emergency management plan is to be reviewed regularly as follows:

- At least annually to ensure currency and effectiveness
- Following any changes to the risk on-site pertaining to site infrastructure and operations
- After any activation of the plan or incident involving notification to the emergency services.
- After emergency exercises.

In addition to the review of the emergency management plan, it is critical to regularly train relevant staff and conduct exercises to ensure everyone is fully conversant with the requirements of the plan and able to respond as required during all emergencies. It also presents an opportunity to test the effectiveness of the plan and refine as required.

- Training should be conducted annually prior to bushfire season, as a minimum, and also at the commencement of employment.
- Exercises should be conducted annually prior to bushfire season, as a minimum, but ideally on a regular basis.

Attachment 5 – Summary of Submissions



Attachment 5 – Summary of Submissions

Theme	Number of mentions in submissions	Reasons
Visual Impact	218	• Excessive scale described as industrial and incompatible with the landscape. • Turbines of the proposed height would be highly visible over long distances and have dominance in views from Augusta. • Permanent, irreversible landscape change which would significantly change the existing rural and coastal landscape. • Concerns were raised about the loss of scenic views, dark-sky conditions and the open, undeveloped character of the area. • Visual assessment material was considered not to clearly demonstrate worst-case or cumulative impacts from multiple viewpoints.
Lack of certainty/not enough detail in application	218	• Key project details, including turbine numbers, locations and specifications, have not been finalised, preventing full scrutiny of the impact. • Reliance on management plans that will be worked out later. • The uncertainty undermines all the impact assessment/technical reports provided with the application. • Approval was perceived to be sought before all impacts were fully defined and assessed. • Insufficient detail means noise and health impacts cannot be verified. • Environmental risk is heightened by the lack of detail. • Community cannot meaningfully respond to an undefined proposal.
Acid Sulphate Soil risk	131	• Site described as high risk and well known for Acid Sulphate soils • Concern regarding disturbance for foundations, trenching, access road, dewatering and groundwater drawdown, and the exposure to ASS risk. • Contamination to groundwater, wetlands and water ways from ASS • Risk to agriculture use of the land • Inadequate investigation and site specific data
Noise	123	• Noise will be persistent and inescapable, setbacks considered inadequate. • In a quiet rural environment even small noise levels are intrusive

Attachment 5 – Summary of Submissions

		• Concerns particularly for night time impacts from noise, with noise perceived to be worse at night due to low background levels. • Noise modelling viewed as unreliable, calls for independent assessment/monitoring • Calls for commitments to independent and continuous monitoring after construction.
General environmental Impact	91	• The project was seen as introducing industrial activity into a sensitive natural environment. • Cumulative environmental impacts
Impact on Waterways and groundwater	76	• Excavation and dewatering may affect groundwater levels and connected rivers and wetlands. • Insufficient baseline data, seasonal surveys, groundwater modelling to define risks/impacts to waterways, TECs and wetlands. • Impact of ASS on waterways, wetlands and groundwater.
Impact on agriculture (loss of land)	70	• Turbine infrastructure, access roads and buffers could reduce flexibility in agricultural land use and future farm operations. • Risks to soil and water quality were highlighted, particularly in relation to acid sulphate soils and shallow groundwater systems. • Potential impacts on livestock wellbeing and normal farm management practices were raised.
Concerns from Beenup Mine	69	• The Beenup mine was cited as a local example of environmental harm caused by disturbing acid sulphate soils. • Long-term remediation at Beenup was referenced as evidence that impacts can be difficult to reverse. • The proximity of the proposed wind farm to the former mine raised concern about cumulative risk.
Not listening to locals / Insufficient consultation	64	• Some directly affected landowners indicated limited or no direct engagement. • Consultation timeframes were viewed as short for a project of this scale and longevity. • It was unclear how community feedback had influenced project design or assessment.

Attachment 5 – Summary of Submissions

Impact on biodiversity / TECs	61	• The project area was identified as environmentally sensitive, supporting important habitats and threatened ecological communities. • Potential impacts include bird and bat strike, habitat loss and fragmentation during construction and operation. • Existing environmental studies were considered to lack sufficient site-specific and seasonal data.
Impact on agriculture (environmental/animal health)	58	• Risk to soil, water and farm viability from acid sulfate soils • Impacts on groundwater levels affecting irrigation water, dams and bore water for agricultural use • Impacts on livestock health from infrasound/low-frequency noise and vibration.
Birds and Bats	57	• High risk of bird and bat mortality from turbine strike particularly raptors and migrating species. • Location in a major bird movement corridor with movement between wetlands and coastal areas. • Habitat disturbance and avoidance behaviour may reduce local bird populations over time.
Health/Wellbeing impacts from turbines	56	• Sleep disruption from night time turbine noise • Mental health impacts and stress from exposure to noise. • Impacts on vulnerable or sensitive individuals.
Impact on tourism	54	• The local tourism industry relies on a natural, non-industrial setting which may be affected by large-scale wind turbines. • The presence of turbines was seen as having potential to reduce visitor numbers and affect tourism-related businesses and investment. • Industrial development was viewed as inconsistent with current tourism branding focused on nature and tranquillity.
Infrasound	51	• Noise assessments were seen as not adequately addressing low-frequency noise, infrasound. • Health impacts from infrasound and vibrations.
Bushfire	42	• The project was seen as introducing additional bushfire risks in an already high-risk area. • Turbines were considered likely to restrict aerial firefighting due to no-fly zones.

Attachment 5 – Summary of Submissions

		• Emergency response and evacuation arrangements were not clearly demonstrated.
Blades cannot be recycled/impact of decommissioning	41	• There was limited clarity about turbine removal and site restoration at the end of the project life. • Concerns were raised about recycling and disposal of turbine blades and other materials. • Long-term responsibility for rehabilitation and funding arrangements was unclear.
General negative economic impacts for locals / no evidence of positive impacts	33	• The extent of long-term economic benefit for the local community was questioned. • Potential impacts on property values and existing local businesses were raised. • Community benefit contributions were seen as limited compared to the scale and duration of impacts.
Too close to neighbouring properties	28	• Turbines were considered too close to some neighbouring homes and properties. • Loss of quiet rural amenity, including visual dominance and noise intrusion, was identified. Existing setback distances were viewed as inadequate for turbines of the proposed size.
Plastic/shedding from blades	23	• Turbine blade erosion was raised as a source of microplastics entering soil and waterways. • Concerns were raised about contamination risks to farmland, livestock and ecosystems.
construction/traffic and Road impacts	20	• Increased heavy vehicle movements during construction were identified as a safety concern on rural roads. • Anticipated impacts include dust, noise, road damage and disruption for local residents.
Shadow flicker	17	• Moving shadows from turbine blades may affect nearby homes and outdoor areas. • Shadow flicker was associated with reduced amenity and possible health effects for some people.
Negative Personal Economic impacts	15	• Concerns about effects on individual property values. • Impacts on ability to sell, rent or develop property. • Financial impacts were seen as falling unevenly on nearby non-host landowners.

Attachment 5 – Summary of Submissions

Impact on planes/aerial firefighting	10	• Turbines could restrict aerial firefighting due to no-fly or exclusion zones. • Reduced effectiveness of water bombing during bushfire events was a concern. • Flight safety impacts for helicopters and emergency aircraft were raised.
Query impact on power supply and prices	9	• There was uncertainty about impacts on electricity prices for residents. • Some concerns related to intermittency and lack of storage capacity.
Dark Sky impacts	2	• Turbine aviation lighting may affect dark-sky conditions valued in the region. • Potential impacts on nocturnal wildlife.
Financial Risks / Cost	2	• Concerns were raised about who would bear costs if the project fails or is decommissioned early.
Electromagnetic interference	1	• Potential interference with telecommunications, radio and navigation systems • Rural areas with already limited mobile coverage

Attachment 6 – Schedule of Submissions

Submitter ID	Response	Comments
1	Object	Purchased in 2022. If i had know a windfarm was planned we would never have purchased here. Too many risks for me and the environment. I wish to lodge an objection to the proposed Scott River wind farm development from the perspective of a primary producer , with a strong interest in the long-term protection of productive agricultural land and national food security. Across Australia, high-quality farming land is increasingly under pressure from non-agricultural development. Once productive land is industrialised, fragmented, or contaminated, it is rarely returned to full agricultural use. This proposal represents another step in the cumulative loss of land capable of supporting food production, at a time when climate variability, biosecurity threats and global instability make domestic food security more important than ever. Of particular concern are the risks to soil and water quality, especially in an area acknowledged to have a high water table and acid sulfate soils. Any failure in managing excavation, dewatering, foundations or runoff could result in long-term land contamination, with consequences extending well beyond the project footprint. The implications of stock loss, reduced carrying capacity, and compromised pasture quality would be severe and irreversible for affected landholders, and would contribute to broader national impacts on food production. Farming depends on clean water, stable soils, and predictable land conditions. Industrial-scale infrastructure of this nature introduces risks that are incompatible with those requirements, particularly where final designs and management plans remain unresolved. These risks are borne not only by individual farmers, but by the wider community that depends on Australian agriculture. In addition to my concernsmy family has a long-standing personal connection to Augusta as a holiday destination. The region's natural landscapes, rural character and sense of remoteness are central to its appeal. Large-scale industrial development of this nature would fundamentally alter those qualities, with flow-on effects for tourism and the many small businesses that rely on visitors seeking an unspoilt environment. For these reasons, I do not consider the Scott River wind farm proposal to represent an appropriate or balanced use of this landscape. The loss of productive land, the risks to soil and water integrity, and the permanent change to the character of the region outweigh any claimed benefits. I urge the decision-maker to give serious consideration to the long-term national implications for agriculture and food security, and to refuse the Development Application in its current form.
2	Object	Objection to Synergy's Proposed Scott River Wind Farm We object to Synergy's proposed wind farm at Scott River for the following reasons: Potential health impacts associated with turbine infrasound, which we believe have not been adequately assessed.

		Risk to the delicate and biodiverse Scott River ecosystem, with insufficient understanding of the impacts during construction and operation. Negative impacts on tourism, as visitors value the area's pristine natural landscape and specifically seek environments free from large industrial structures. Inadequate and incomplete research, particularly regarding infrasound and health impacts, with concerns that financial and timing pressures are driving the project forward prematurely. The absence of further EPA investigation, despite unresolved concerns and contradictory evidence. We believe the information provided in Synergy's proposal does not adequately address these issues. Once constructed, the environmental, social, and financial consequences will be irreversible. There is no justification for rushing this project when more thorough investigation could prevent long-term harm and unnecessary expenditure. Concerns Regarding Infrasound Measurement and Health Impacts Evidence provided by Professor Ken Mattson, who has over 25 years' experience assessing infrasound from modern wind turbines, raises serious concerns about the methods currently used by Australian regulators to measure turbine noise. Professor Mattson's team uses specialised low-frequency microphones and advanced modelling techniques that accurately track how infrasound travels over land, through hills, and across water. In contrast, Australian regulatory assessments rely on standard noise meters designed to measure audible sound, which largely filter out or ignore very low-frequency infrasound. This can significantly underestimate the level of infrasound reaching homes and communities. While Synergy's report states that noise levels comply with Australian and South Australian guidelines, Professor Mattson argues that these conclusions are based on outdated measurement methods and inappropriate equipment. His modelling shows substantial discrepancies when true low-frequency sound is measured accurately. Health and Community Impacts Research into prolonged exposure to very low-frequency sound from large wind turbines indicates potential impacts on the body's balance and stress systems. Reported effects include poor sleep, chronic fatigue, headaches, anxiety, and difficulty concentrating—particularly among sensitive individuals, including those with ADHD, autism, or existing mental health conditions. A Finnish pilot study involving over 200 participants found higher rates of sleep disturbance, fatigue, and stress-related symptoms among people living within 15 kilometres of wind farms compared to those living further away. Based on this research and infrasound measurements, Professor Mattson identifies a primary risk zone extending approximately 15–20 kilometres from large wind turbines.

		The proposed Scott River Wind Farm is located: Approximately 5 km from the Molloy Island community About 8 km from East Augusta Less than 10 km from Augusta and Kudardup These distances fall well within the identified risk zone. Marine Environment and Tourism Infrasound is known to travel more efficiently through water than land, raising concerns about potential impacts on marine life, including whales. Whale migration and viewing are a significant ecological and tourism asset for Augusta, and any disruption to marine ecosystems would have serious environmental and economic consequences. Conclusion The proposed wind farm should not proceed without comprehensive, independent investigation into infrasound, health impacts, ecological risks, and tourism effects. We strongly urge that the approval process be slowed to allow detailed studies involving recognised experts, such as Professor Ken Mattson, working collaboratively with Synergy. A truly informed decision must be made before construction begins, not after irreversible damage has occurred.
3	Object	As a tourism operator in Augusta I strongly object. The Western Australian government pushes the SW particularly Margaret River/Augusta worldwide to attract tourism. In their words this region offers world class natural environments and landscapes. Augusta a small town that relies on tourists particularly trades on is amazing wild landscapes. To sit an industrial development of this size in this spot totally undermines and contradicts gov tourism policy's. The government is heading for a class action against them by residents, buisness owners, tourism development companies and a couple of billionaires who seek to keep this relatively untouched area just that. Short sighted and irresponsible government policy decisions are not above the law.. Best not push this through without proper procedures as the quiet powerful deep pockets friends of Augusta are watching very closely and taking meticulous notes.
4	Object	Adverse impact expected from Noise and visual. No proper consultation, impact of soil and water in the scott River due to the senstive nature of the site based on knowledgeable farmers prosepectives also based on the failed mine site area which is very close to the area.
5	Object	I agree with alternative energy producing options such as solar and wind farms but this wind farm is positioned too close to the spectacular views residents of Augusta have bought in the location for. How would you feel if you were in their position? Not happy I'm most certain. Why not locate the turbines further east so they can't be seen from Augusta's hillside? Please.

6	Object	We are long term owners of the above property. We purchased the property for its lifestyle and very unique surroundings. We are not against development but we are very concerned that unrestrained development without checks and balances will be a long term disaster for our pristine land. We are (as you are) custodions for future generations. The development application is nowhere near detailed enough to enable a clear picture on what is to transpire. The visual impact on the landscape is of major concern particularly as the proposal indicates a 250 metre blot on the landscape. Primarily because of the lack of detail, I request that the Shire defer the development application (or refuse the application) until all stake holders are in a better position to evaluate.
7	Object	We make this submission to formally and unequivocally object to the Scott River Wind Farm Development Application on environmental, ecological, and precautionary planning grounds. While renewable energy development has an important role in reducing greenhouse gas emissions, this does not diminish the obligation to ensure that projects are appropriately sited, thoroughly assessed, and demonstrably capable of avoiding unacceptable environmental harm. In this case, the proposal fails to meet those standards. The Scott River area is an environmentally sensitive landscape characterised by floodplains, wetlands, shallow groundwater systems, high biodiversity values, and a rural landscape of significant ecological and environmental function. Development of this scale and permanence demands an exceptionally high standard of environmental assessment. That standard has not been met. 1. Fundamental Deficiency of Information and Reliance on Deferred Assessment The Development Application does not provide sufficient detail to allow a complete, transparent, and scientifically defensible assessment of environmental impacts. Instead, it relies on future management plans, post-approval studies, and compliance mechanisms after construction has commenced. From an environmental protection perspective, this approach is fundamentally flawed. Environmental impacts must be understood and assessed before approval is granted, not managed reactively once harm has occurred. Where impacts cannot be confidently predicted or mitigated in advance, the precautionary principle requires that approval be withheld. 2. Noise, Low-Frequency Noise and Infrasound – Long-Term Environmental Exposure The noise assessment is largely theoretical and model-based, with limited site-specific validation. Of particular concern is the insufficient consideration of low-frequency noise and infrasound propagation, atmospheric conditions that may amplify sound transmission, and continuous long-term exposure over the operational life of the project. Noise represents a persistent environmental stressor with potential impacts on wildlife behaviour and ecological systems. The proposal does not demonstrate that such impacts have been adequately assessed or mitigated. 3. Proximity Impacts and Fragmentation of the Rural Environment The proposal relies on minimal separation distances and treats cadastral boundaries as effective environmental buffers. This fails to recognise that ecological processes do not align with property boundaries and that rural landscapes provide essential environmental function. The cumulative effect is increased fragmentation and gradual industrialisation of a functioning rural and ecological landscape. 4. Visual Impact and Irreversible Landscape Transformation The wind turbines constitute large-scale, visually dominant industrial structures that will permanently alter the character of the Scott River

		landscape. The assessment does not adequately account for cumulative impacts, night-time aviation lighting, or the permanent loss of dark-sky and landscape values. Once constructed, these impacts are irreversible. 5. Floodplain, Acid Sulfate Soils and Shallow Groundwater – High-Consequence Risk The Scott River area is characterised by complex hydrology, including floodplain processes, acid sulfate soils, and shallow groundwater systems. The application does not adequately demonstrate that excavation, foundations, and associated infrastructure will avoid long-term impacts on soil chemistry, groundwater quality, or floodplain function. In such an environmentally sensitive setting, uncertainty equates to high risk. 6. Bushfire Risk and Environmental Emergency Impacts The proposal inadequately addresses bushfire-related risks, including restrictions on aerial firefighting, increased suppression complexity, and the potential for delayed response during extreme fire events. These risks have direct implications for ecosystem protection and recovery. 7. Construction Impacts on Land, Roads and Waterways Construction will involve extensive earthworks, heavy vehicle movements, and prolonged disturbance. Local roads are not designed for industrial-scale traffic, and construction impacts pose risks of erosion, sedimentation, and long-term environmental degradation. 8. Wildlife and Biodiversity The environmental assessment does not provide sufficient baseline data or analysis to confidently conclude that unacceptable impacts on birds, bats, threatened species, or habitat connectivity will be avoided. In a high-risk ecological setting, a precautionary approach is essential. Conclusion The Scott River Wind Farm Development Application fails to demonstrate that environmental values will be protected or that risks can be effectively mitigated. The reliance on uncertainty, deferred assessment, and post-approval management is inconsistent with responsible environmental planning. For these reasons, we respectfully submit that the Shire of Augusta Margaret River should refuse the Development Application, or at minimum require a substantially revised proposal supported by comprehensive, independent, site-specific environmental studies. Thank you for the opportunity to make this submission.
8	Support	Renewable energy projects are critical not just for the future of our region but for the world. It’s time to start moving away from fossil fuels.
9	Support	Please approve the wind farm. We need green renewable energy! I am 100% for this proposal, and more like it. We need to act now for climate change. This project is a great environmental outcome. Let’s give it the green light!
10	Object	Scale of the wind infrastructure is too visually dominant for the scale of this remote town.
11	Object	You still don't know how to dispose of turbine blades. Blades leach BPAs and micro/nano plastics that are polluting our farms, food and water. We still don't know the affect of these on our bodies (BPSs are carcinogenic) So I don't support these turbines anywhere in Australia as the pollute the atmosphere and our bodies
12	Support	I'd suggest that farming and land clearing has had more impact on the natural environment of the Scott River locality than the proposed wind towers will. Not that I am suggesting that the farming area be returned to bush, but it's a bit rich for those with a vested interest to be touting environmental concerns over a development that will help us to move away from reliance on fossil fuel energy. 30-50 years from now it is likely the wind towers will have done their job and been removed as we have the benefit of a fully renewable, zero carbon energy system.

13	Object	This proposal is sited in a very envirionmental sensitive site and could be much beeter positioned. The envirionmental impact on Both the town of Augusta and the rural land as well as the land is extreme. Please listen to the community and do your upmost to have this proposal rejected for this site but reassessed for a site more acceptable. I object very strongly to the siting of this proposal.
14	Support	These turbines are in the right place for energy production and distribution. They have been successfully used all over the world and are one of the cheapest form of energy production. None of the naysayers objections have proved to be true.
15	Object	First and foremost I would like to say the proposal notification arrived 4 days ago which is not nearly sufficient time to educate myself with the matter let alone respond to your survey, particularly given how busy this time of year is. Like anything, it is impossible to make an informed decision without all the information provided. It is for this reason I oppose the initial plan. At present Augusta has a sub standard power supply which is regularly interrupted. I would like to know if the large amount of power generated by the wind farm is going to utilise the current infrastructure and also if it will improve the current power standards. My expectation, moving forward, would be, those affected to be privy to all the information the government has access to so we can also make the same informed decisions.
16	Object	The EPA should have assessed the proposed SynergyRED Scott River Wind Farm. There must be a Public Environmental Review (PER) by EXPERTS from a diverse range of backgrounds (specialising in infrasound, health risks, water pollution, air quality, forestry & conservation, biodiversity, birdlife, marine mammals, reptile species etc.) Research data & evidence from existing projects both nationally and internationally as it is a well known fact these are outdated and extremely destructive to the environment with an extensive carbon footprint!! Augusta and The Scott River is a biodiversity hotspot and pristine coastline that must be protected as a wildlife sanctuary and heritage site for future generations. Swedish research led by Professor Ken Mattsson at Uppsala University indicates that infrasound from modern wind turbines is significantly underestimated, travels much farther (50-90 km), and can cause health issues like headaches, sleep loss, and dizziness in sensitive individuals, challenging current noise assessments and highlighting a need for honest discussion about wind power's negative health impacts, even at levels below human hearing. Mattsson's team developed advanced modeling (SoundSim 360) to show higher levels than previously thought. This is most concerning and the SHIRE must take potential risks & health implications seriously!! It is the SHIRES responsibility, obligation & duty of care to protect the rate payers and community. Everyone is at risk!!! The Scott River floodplain is one of Western Australia’s most sensitive and ecologically valuable landscapes — a living wetland system that floods for much of the year and links the Scott and Blackwood Rivers.

		Destroying the environment is not protecting the environment!!! This area includes ecological communities protected under the EPBC Act, such as the Scott Coastal Plain Ironstone and Seasonal Wetland Communities, which support endangered species like the white-bellied frog, snake-neck turtle, black swans, and Baudin's and Carnaby's black cockatoos. This area is home to numerous raptors, including coastal species like the Eastern Osprey, and terrestrial species such as the Australian Hobby, Nankeen Kestrel, Wedge-Tail Eagles, Brown Goshawk and Owls & Falcons. There is Substantial documentation and evidence from existing projects that wind turbines significantly impact bird life: The 2023 Annual Compliance Report reveals that Kaban wind farm in Far North Queensland is killing more birds and bats than anticipated. The loss of bird species at Kaban wind farm site is at least partially due to the recent increase in human activity to construct the wind farm, the heavy vehicles, habitat destruction, then colonisation of aerial space by large turbines and maybe sound of turbines themselves. The sheer number of bird species observed in 2018 was huge: 85 species! But by 2023, 1 year after Kaban wind farm became operational, the number of species surveyed was only 39. It is well documented that birdlife simply disappear from wind turbines areas as they are affected by the sound and emf emitted. The construction and operation of wind farms create visual, noise, and vibration disturbances that can cause birds to leave the area. Even if birds aren't killed by collisions, they may avoid the area around turbines, leading to a reduction in available habitat. The devastating carnage of bird life has been well documented in the United States also, from turning blades and in particular raptors caught in currents created by moving blades as they mistake these for natural air thermals. These outdated structures are ecological & environmental disasters from their initial construction and devastation of the natural landscape, through to their installation and operation. Their short life span is well documented, 20 years as they deteriorate and disintegrate, spreading micro-plastics throughout this pristine coastal environment. The sheer amount of steel used per 250m turbine is the equivalent of 220 cars. How much coal does that use?? Not to mention tonnes of concrete! They are unstable, unreliable and hazardous! The long term consequences and disposal of deteriorated blades & decommissioned turbines become Landfill. Serious concerns of airborne contamination from asbestos as found in eastern states turbines. How can you guarantee the proposed ones are asbestos free??? The severe impact from infrasound, emf, noise, vibration and reverberation pre-construction, during and once erected to ocean dwelling creatures is less documented worldwide, but extremely obvious as the diverse populations of sea mammals and creatures including migrating and breeding whales which pass through this South West coastline including Southern Right and Humpback Whales, dolphins all use complex sonar communication and are extremely sensitive to noise and artificial changes to their environment. AUGUSTA HOSTS A WHALESONG PROJECT BI ANNUALLY honouring the migrating whales and the whales and their young must be

		protected by the infrasound which will drive them away from this area!! *READ THIS: https://capecodcommission.org/resource-library/file/?url=/dept/commission/team/Website_Resources/dcpc/Whales_and_Sound_KS_PCCS.pdf To pretend Turbines are environmentally friendly is 'green washing' - these projects are irresponsible and life threatening to an extremely diverse population of wildlife, wetlands and landscape. Not to mention the harmful affects wind turbines have on humans from migraines, tinnitus, emf, nausea, dizziness and numerous other health conditions & consequences. The site lies on acid-sulfate soils and an active pressurised superficial aquifer, connected to the Beenup and Jangardup mine sites, both declared Contaminated Sites by DWER. Disturbing these soils or groundwater could trigger contamination and irreversible damage. SynergyRED's referral relies on desktop data, lacks proper seasonal surveys and groundwater modelling, and fails to consider human health — ignoring risks from PFAS/BPA blade materials, vibration, and groundwater contamination. The Scott River floodplain is simply the wrong location for industrial infrastructure of this size and scale. Once disturbed, the wetlands, waterways and habitat cannot be restored. This pristine coastal region is untouched and should be retained as an environment ecosystem. The wildlife is incredibly diverse and should be protected at all costs for the future. I strongly urge the SHIRE to REJECT THIS PROJECT. IT IS DETRIMENTAL to the people, environment and wildlife and is most irresponsible and negligent to even consider approving it.
17	Object	I strongly oppose the application. The development application lacks sufficient detail to be lawfully assessed. The proposal seeks approval for a concept rather than a defined development. Final turbine models, heights, operating modes and exact locations are not confirmed and may be altered at the proponent's discretion. As a result, impacts on noise, shadow flicker, visual dominance, construction disturbance and environmental risk cannot be reliably assessed. Approving a "maximum case scenario" with key details deferred to later stages is not consistent with sound planning practice for a development that will operate for 30–60 years and permanently reshape the region. Approval should not proceed on a "work it out later" basis. In addition the noise assessment is hypothetical and does not provide adequate protection for neighbouring landholders. The proposal relies on outdated setback concepts that do not reflect the size and dominance of modern turbines. Locating turbines close to property boundaries shifts impacts onto neighbouring land, effectively treating private land as a buffer. Industrial wind facilities should contain their impacts within their own footprint. Rural homes and boundaries should not be treated as sacrifice zones.

		Turbines up to 250 metres high are skyscraper-scale structures that will dominate the landscape for kilometres and for decades. The Scott River / Augusta region is valued for its open rural character, natural horizons and tourism appeal. This proposal represents a permanent change of place, not a minor or reversible impact. Visual assessments and photomontages do not convincingly demonstrate worst-case impacts from key receptors. This application should be refused, or at minimum deferred, because it lacks the certainty, safeguards and evidence required to responsibly approve an industrial-scale wind facility in a sensitive rural and environmental setting. Approving this proposal would shift risk from the developer onto the community, the environment and future generations.
18	Object	I strongly object to this Development Application and request that: The application be refused, or At minimum, deferred until: Final turbine models and exact locations are known Comprehensive reassessment of visual, environmental and social impacts is undertaken Genuine community consultation occurs on a defined, not hypothetical, proposal The Scott River / Augusta region is a unique and irreplaceable landscape. Once industrialised at this scale, it cannot be restored.
19	Object	If the farmers don't support the wind turbines on their land this should be respected. These are so much bigger than other wind turbines creating more of an environment disruption - size of trucks to transport, larger foundations etc. also can it be guaranteed that the turbines don't contain asbestos. And given they can't be recycled & the size of the turbine it is an environmental hazard when at the end of life or when a fault occurs ie fire in the turbine. They still use fossil fuels for maintenance & daily running.
20	Object	I am not against wind farms but this one is too close to residental areas and farms
21	Object	Too close to farms and to Augusta and Kudardup
22	Support	
23	Support	I strongly support the Wind Farm renewable energy project in Scott River, as proposed by the MRCCE, Synergy and other groups. I is an excellent chance to push forward renewable energy generation and move away from fossil fuel dependency. As I see it, thro my eyes as a researcher with a PhD in sustainable economics and accounting policy, this project ticks all the boxes: renewable energy, community driven, utilising existing (abandoned) resources, and so on. And as I see it, the arguments against this proposal are short sighted, extremely self centred, and, from the tone of their arguments, based more at the disruptive conspiracy theory end of reality, rather than respecting the enormous amount of effort and good will that has gone

		into getting this viable project established. In my view the Scott River area has significant and valuable ecological values that will not be damaged by the wind farm. On the contrary, ending farming of hoofed animals in this region would be a significant step to protecting these environmental values. I am not advocating this, just offering a perspective that wind farm and conventional farming can be managed to ensure ongoing ecological and economic sustainability.
24	Object	I wish to lodge an objection to the proposed Scott River wind farm development from the perspective of a farmer operating outside the immediate region, with a strong interest in the long-term protection of productive agricultural land and national food security. Across Australia, high-quality farming land is increasingly under pressure from non-agricultural development. Once productive land is industrialised, fragmented, or contaminated, it is rarely returned to full agricultural use. This proposal represents another step in the cumulative loss of land capable of supporting food production, at a time when climate variability, biosecurity threats and global instability make domestic food security more important than ever. Of particular concern are the risks to soil and water quality, especially in an area acknowledged to have a high water table and acid sulfate soils. Any failure in managing excavation, dewatering, foundations or runoff could result in long-term land contamination, with consequences extending well beyond the project footprint. The implications of stock loss, reduced carrying capacity, and compromised pasture quality would be severe and irreversible for affected landholders, and would contribute to broader national impacts on food production. Farming depends on clean water, stable soils, and predictable land conditions. Industrial-scale infrastructure of this nature introduces risks that are incompatible with those requirements, particularly where final designs and management plans remain unresolved. These risks are borne not only by individual farmers, but by the wider community that depends on Australian agriculture. In addition to my concerns as a farmer, I also have a long-standing personal connection to Augusta as a holiday destination. The region's natural landscapes, rural character and sense of remoteness are central to its appeal. Large-scale industrial development of this nature would fundamentally alter those qualities, with flow-on effects for tourism and the many small businesses that rely on visitors seeking an unspoilt environment. For these reasons, I do not consider the Scott River wind farm proposal to represent an appropriate or balanced use of this landscape. The loss of productive land, the risks to soil and water integrity, and the permanent change to the character of the region outweigh any claimed benefits. I urge the decision-maker to give serious consideration to the long-term national implications for agriculture and food security, and to refuse the Development Application in its current form. The shire must reject this application.
25	Support	I support the development but maintain that the benefits of renewably wind generated power be made available to the community of Augusta and surrounds first as we are to be affected by landscape changes and infrastructure development. We are currently at the end

		of the power grid and with regularity, we have power outages due to development or damage which effects the power grid and cuts off power to Augusta.
26	Object	Re: Proposal for Scott River Wind Farm I strongly oppose the proposal by Synergy Renewable Energy Developments Pty Ltd for construction of a wind farm 15km northeast of Augusta in the South-West region of Western Australia for the following reasons: • The visual impact is significant. The findings of the Visual Impact Assessment for Augusta in the referral says: the landscape is of high quality with consistent, intact, well-defined attributes. The proposed development would be incompatible with the existing characteristics of the area and mitigation measures are unlikely to reduce the impacts of the change. . • The proposed 250m high turbines will tower over the landscape, will be visible from the town of Augusta, and impact the character of the town forever. The reason people choose to take up residence in, or visit, is to enjoy the peaceful, largely underdeveloped area of the prized southwestern corner of the state which offers a unique environment. • This construction would include a total disturbance of 107 ha and include up to clearing of 1 ha of remnant native vegetation within a 3,597ha development envelope. .There is a high environmental threat in relation to the flora and fauna of the area. The Scott River Ironstone Association Threatened Ecological Community is part of the catchment area which supports almost 60 listed species of flora of which five are threatened, as are twenty-six species of fauna. • The direct environmental threat posed to the Scott and Blackwood Rivers and Flinders Bay as when disturbed, sulphuric acid releases heavy metals into the waterway resulting in the destruction of both vegetation and aquatic life. The failed Beenup mine offers an example. • The risk of bushfire in this area is extremely high. The fact that no aerial firefighting is allowed over turbines and that there is limited ground access due to protected ecological zones results in a high risk to homes, farms and communities. • Very strong easterly winds are experienced in Augusta during the summer months. The fact that this site is prosed15km to the northeast of the township exposes the population, livestock and the environment to the contamination of microplastics shed by the turbine blades and carried over the town. • Health risks caused by infrasound which can travel up to 20k. and cause health problems for both humans and livestock and those caused by the electromagnetic emissions pose a serious threat to both humans and livestock. I ask that the level of assessment for the proposal be set at Public Environmental Review based on the significant impact on the environment and the high level of public interest and opposition.
27	Object	Having reviewed the information currently available, I do not support the proposal at this date, December 2025, because some of the studies mentioned have not yet been completed &/or made public. Consequently there is not sufficient information available to enable a fully informed decision about all aspects of the proposal.
28	Support	I support the project in principle from a holistic perspective but do have concerns about the perceived negative community impacts around the Augusta area especially in relation to the visual impacts to a tourism town. I would also like to be a bit more certain that there will be real benefits to the community going forward - not just in construction jobs or operational jobs but also some possible economic offsets for parts of the community that may be impacted the most.

29	Object	I have lived on a rural farming property on the Blackwood River on Hardy Inlet (Sussex Location 1704) all my life and very much appreciate the tranquil beauty and scenic attraction of the river and its utmost importance to the appeal of Augusta and its surrounding areas. My objections to the Wind Farm proposal are, 1) Consider the location highly incompatible given the inherent dangers from sulphate acid soils and the risks it impose on the future health of the Blackwood and Scott Rivers. 2) Visual amenity created by Turbines industrialises the appearance of Augusta in lieu of one of pristine wilderness and scenic natural beauty. 3) INFRASOUND and low frequency noise has as yet undetermined consequences. There are many other good reasons for more informed discussion on the need for an alternative site.
30	Object	I am utterly opposed to this Wind Farm proposal. The Scott River area is a designated Biodiverse Heritage area and as such, the noxious elements of wind turbines should not be contemplated. There are various noxious elements, which will affect the wildlife in the area. The noxious elements being Infrasound, which animals are very sensitive to; noise from the turbines; Flicker from the turbines. The Scott River is a breeding for the Black Swans, our state elblem. The swans will be decimated by the turbines. There are 3 aquifers under ground and the superficial aquifer is at great risk of being contaminated by the Acis Sulphate soils. This could be an environmental disaster and cause the whole area to turn into a desert. The BPA from the blades, over time, is released. another pollutant. This proposal should not go ahead.
31	Object	I write to formally object to the proposed wind farm development at Scott River. My objection is based on the scale and nature of the proposal, the lack of sufficient detail in the Development Application to allow proper assessment, and the significant and long-term impacts the development would have on the environment, groundwater and acid sulfate soils, visual amenity, rural character, community wellbeing, and future land use in the Scott River and Augusta region. The Development Application seeks approval of a largely conceptual proposal. Critical elements—including the number, location, height and specification of turbines, construction methodology, dewatering and water management arrangements, and environmental safeguards—have not been finalised. Without these details, it is not possible to assess worst-case impacts or impose effective and enforceable conditions on a development that would operate for decades. The proposal poses serious environmental risks. Large-scale excavation, trenching and dewatering have the potential to alter groundwater flow paths and water table levels in a known sensitive area. Disturbance of acid sulfate soils through excavation or groundwater drawdown could lead to acidification of soils and waterways, vegetation loss, contamination of agricultural water supplies and long-term environmental damage. The application lacks a site-specific acid sulfate soil investigation, a detailed hydrogeological assessment, and a robust dewatering and management plan. The scale of earthworks proposed is substantial, including extensive access roads, cable trenching and deep turbine foundations involving thousands of tonnes of excavation per turbine. Despite this, no clear method is identified for managing dewatering volumes or cumulative

		impacts across the site. Visual impact is also a major concern. The turbines and their blades would exceed the height of Perth's tallest buildings and introduce multiple skyscraper-scale structures into a rural landscape. This would fundamentally alter the character of the area, dominate views from surrounding properties and public spaces, and result in a permanent loss of rural amenity. The photomontages provided do not adequately convey the true scale, worst-case or cumulative visual impacts. Noise, shadow flicker and disturbance have not been adequately assessed, particularly given the absence of final turbine specifications. Risks to wildlife from strike, habitat disruption and indirect impacts from noise and vibration are insufficiently addressed. Construction traffic impacts on rural roads and inadequate community consultation further compound concerns. The application also fails to demonstrate clear economic or environmental benefit sufficient to offset these impacts. Claims of significant CO_2 savings are unsubstantiated, with no evidence provided as to how or where such reductions would occur. The shire needs to recommend to JDAP that they reject this proposal forever.
32	Object	I write to lodge a formal submission on Synergy Renewable Energy Developments Pty Ltd's (SynergyRED) Development Application (DAP pathway) for the proposed Scott River Wind Farm. My objection is based on the scale and nature of the proposal, the lack of sufficient detail in the Development Application to allow proper assessment, and the significant long-term impacts the development would have on the environment, including groundwater and impact of acid sulfate soils, visual amenity, rural character, community wellbeing and future land use in the Scott River and Augusta region. The Development Application seeks approval of a largely conceptual proposal. Key elements—including the number, location, height and specification of turbines, construction methodology, foundation design, dewatering volumes and environmental management measures—have not been finalised. As a result, the application does not provide a reliable basis for assessing worst-case impacts or for imposing effective and enforceable conditions on a development that would operate for several decades. The proposal poses serious environmental risks. Large-scale excavation, trenching and turbine foundations will require piling and dewatering, with the potential to alter groundwater flow paths and water table levels. The Scott River area is known to be sensitive, with shallow groundwater and acid sulfate soils. Disturbance of these soils through excavation or groundwater drawdown can generate sulfuric acid and mobilise heavy metals, causing long-term damage to soils, waterways, vegetation and agricultural water supplies. The application lacks a site-specific acid sulfate soil investigation, a detailed hydrogeological assessment, and a robust dewatering and management plan with monitoring, trigger levels and emergency responses. The scale of earthworks is substantial, including approximately 30 km of onsite roads, 30 km of cable trenching, and turbine foundations involving thousands of tonnes of excavation per turbine, potentially exceeding 7 metres in depth. Despite this, no clear method is identified for managing dewatering volumes or mitigating cumulative impacts across the site. Visual impact is a major concern. The proposed turbines would exceed the height of Perth's tallest buildings and introduce multiple skyscraper-scale structures into a rural landscape. This would fundamentally alter the character of the area, dominate views from surrounding properties and roads, and cause long-term loss of amenity. Structures of this magnitude do not "blend in" to a natural rural landscape. They fundamentally industrialise it. The photomontages provided are limited and do not adequately convey the true scale, worst-case or cumulative visual impacts. Approval of this development would also effectively sterilise surrounding land, constraining future rural, residential and tourism uses for decades.

		The proposal does not demonstrate compliance with the intent of the Shire's Town Planning Scheme, which requires wind turbines to be designed and sited so as not to detract from visual amenity. Even the developer acknowledges that the turbines will have significant visual impacts. Noise, shadow flicker and general disturbance have not been adequately assessed, particularly given the absence of final turbine specifications. The application does not provide confidence that impacts on nearby residents will be acceptable or enforceably managed. Community consultation has been inadequate. Many affected landowners report no direct engagement, and the application does not clearly document community feedback or demonstrate how concerns have been addressed. The first direct correspondence I received from the Shire was a one page letter sent less than a month ago. Why is the community consultation period for major infrastructure in such an environmentally sensitive area so short?? Finally, the application fails to demonstrate clear economic or environmental benefit to offset these impacts. Claims of up to 200,000 tonnes per annum of CO_2 savings are unsubstantiated, with no explanation of how or where such reductions would occur. The proposal is silent on impacts to tourism and land values as well as any planning or response plans for potential flow of acidic water into the Scott River and ultimately into the Blackwood river mouth at Augusta. For these reasons, I respectfully request that the Shire of Augusta Margaret River refuse the application.
33	Object	I write to formally object to the proposed wind farm development at Scott River. I am a long-term resident of the Shire of Augusta Margaret River, with a background in farming and longstanding involvement in local community committees. Through this involvement, I have seen firsthand how carefully this region must be managed to protect its environmental, agricultural and social values. I am deeply concerned that the proposed wind farm would irreversibly damage what makes Augusta and the surrounding region special. This area is valued for its natural beauty, productive farmland, quiet rural character and environmental sensitivity. Introducing industrial-scale turbines of this height and scale into this landscape would permanently alter its character and diminish its appeal for residents, farmers and visitors alike. Of particular concern is the acknowledged presence of acid sulfate soils in the Scott River area. This is not a theoretical risk. Many in the community, myself included, were here during the BHP period when inadequate understanding and management of acid sulfate soils nearly resulted in serious environmental damage. That experience demonstrated how quickly groundwater disturbance and soil excavation can escalate into a major environmental incident if not handled with extreme caution. Despite this known history, the current Development Application lacks a detailed, site-specific acid sulfate soil investigation, a comprehensive dewatering and groundwater management plan, and clear emergency response measures. Approving a project of this scale without these safeguards exposes the region to unacceptable environmental risk. The proposal also threatens productive agricultural land and places additional stress on an already sensitive landscape. Once constructed, the turbines, foundations, roads and underground infrastructure will remain for decades, constraining future land use and leaving long-term impacts that cannot be reversed. Augusta and the Scott River region are not appropriate locations for industrial development of this scale. This place is too special to

		destroy. It must be protected, not only for those who live and farm here now, but for future generations who deserve to inherit a healthy environment, viable farmland and a community that retains its unique character. For these reasons, I respectfully request that the Shire of Augusta Margaret River refuse the proposed Scott River Wind Farm. (I have used a friends email)
34	Object	I feel the visual impact will detract from one of Augusta and it's hinterlands unique aspects. An unspoilt natural environment. As more areas have windfarms, the unspoilt, coastal views that are a feature of this coastline will be spoilt. This impact will detract from tourism as an important, and increasing economic benefit, to the town and community.
35	Object	I write to formally object to the proposed wind farm development at Scott River. Augusta is valued for its natural beauty, rural landscape, wildlife and sense of peace. These qualities are not incidental — they are the foundation of the town's identity, its tourism economy, and the reason people choose to live here, visit here and invest in the region. The proposed wind turbines would introduce large-scale industrial infrastructure into a landscape that is currently quiet, scenic and environmentally sensitive. Turbines of this height and scale would dominate views, permanently alter the character of the area and fundamentally change the experience of Augusta and its surrounds. Once built, this change cannot be undone. The proximity of the turbines to Augusta and key natural assets raises serious concerns about noise, low-frequency noise and infrasound, visual intrusion, and the cumulative loss of amenity. These impacts would not be confined to the immediate turbine footprint — they would affect the wider region, including residents, visitors, recreational users and the tourism sector. People come to Augusta for its unspoilt environment, its connection to nature and its sense of escape. Industrialising the surrounding landscape places these values at risk and threatens to undermine the long-term appeal and reputation of the town. Approving a development of this scale would signal that Augusta's unique character is expendable. This place is simply too special to destroy. It should be protected, not industrialised, for the benefit of current residents and for future generations. For these reasons, I respectfully request that the Shire of Augusta Margaret River refuse the proposed Scott River Wind Farm. (I am using a friends email)
36	Support	As a concerned resident of the AMR Shire, I support this proposal because it is one of the most effective ways our community can reduce our contribution to the overwhelmingly serious repercussions of pollution from use of fossil fuels causing climate change. There is nowhere that renewables can be installed at thew scale required to replace coal and gas energy that will not effect locals. So there will always be a 'not in my backyard understandable local resistance to change. At the last election we were told by the opposition leader that nuclear power plants would be installed where government determined regardless of local opinion. That is not the case wrt the Scott River proposal. There has been a very long period of consultation and investigation. If the results of the feasibility studies and the impact assessment conclude that this is a suitable site, I am in favour of proceeding. elsewhere in Australia we have equivalent wind farms that

		are compatible with ongoing agriculture and provide additional, alternative income to land owners. The EPA has determined that the proposal does not warrant review. If the details of the potential environmental impact studies show impacts to be acceptable, manageable, and that any unforseen issues that arise can be addressed, we as a community will be proud to be contributing to a better future than our current trajectory, and proud that we showed leadership.
37	Object	I am writing to formally object to the proposed wind farm development at Scott River. on the specific grounds of environmental harm, disturbance of acid sulfate soils, and adverse impacts on the local water table and groundwater-dependent ecosystems. The developer (Synergy) has provided some generic information on the proposed devolvement however with the design not being completed it is unclear where the turbines will be going, how many there are, how they will be constructed and how water will be managed at the site. Environmental Impacts The project's likely effects on groundwater and connected ecosystems is not adequately assessed. Large-scale excavations will be required for these turbines, and piling and dewatering during the construction phase can change groundwater flow paths and levels, with potential long-term impacts on aquifers and groundwater-dependent ecosystems in the area. These impacts require a thorough, independent hydrogeological assessment that demonstrates the impacts on the local ecosystem. Acid sulfate soils (ASS) are a serious concern for this area. When ASS are exposed to air through excavation or lowered water tables they can generate sulfuric acid and mobilise iron, aluminium and heavy metals, causing severe acidification of soils and surface waters, vegetation loss, and infrastructure damage. Dewatering and earthworks can trigger ASS risks unless strict, site-specific controls are implemented. The application before the council lacks a clear, site-specific ASS investigation and a robust dewatering management plan that commits to monitoring, trigger levels, and emergency responses. There is also no information about how construction and operations will affect the local water table and surface–groundwater interactions. While there is a lack of detailed information in the Development Application we note that the project has: • Approximately 30km of onsite roads, • 30km of trenching for underground cables, • Foundations that would be a minimum 5m deep circa 2000 tonnes of excavation, for each turbine • Additional soil remediation if required could increase this by an additional 500 tonnes per site and the depth to in excess of 7m, • Significant dewatering requirements, and • No dam or other method identified of managing the dewatering volumes. Economic and Environmental Benefit The developer has not identified any economic benefit that will be brought to the region. The developer claims that up to 200,000 tonnes per annum of CO2 emission will be saved, but does not provide any evidence as to how and where these saving will be realised. The developer must disclose what facility in what location will now reduce its emissions by 200,000 tonnes per annum. If no information is provided then the Council is left weighing the detriment to the environment against no economic or environmental benefit and therefor the proposal should not be supported.
38	Object	I write to lodge a formal submission on Synergy Renewable Energy Developments Pty Ltd's (SynergyRED) Development Application (DAP pathway) for the proposed Scott River Wind Farm.

		My husband and I are currently considering both commercial and residential developments in the town centre and on Turner Street and this major windfarm development would have a significant impact on the amenity and value of these developments to the point where we are re-considering our investments given the substantial costs involved in completing our projects. In particular, we are looking to invest in creating an arts studio and cultural centre which we believe will become an important cultural hub and drawcard to the town which is currently lacking in this regard. Our objection is based on the scale and nature of the proposal, the lack of sufficient detail in the Development Application to allow proper assessment, and the significant long-term impacts the development would have on the environment, including groundwater and impact of acid sulfate soils, visual amenity, rural character, community wellbeing and future land use in the Scott River and Augusta region. The Development Application seeks approval of a largely conceptual proposal. Key elements—including the number, location, height and specification of turbines, construction methodology, foundation design, dewatering volumes and environmental management measures—have not been finalised. As a result, the application does not provide a reliable basis for assessing worst-case impacts or for imposing effective and enforceable conditions on a development that would operate for several decades. The proposal poses serious environmental risks. Large-scale excavation, trenching and turbine foundations will require piling and dewatering, with the potential to alter groundwater flow paths and water table levels. The Scott River area is known to be sensitive, with shallow groundwater and acid sulfate soils. Disturbance of these soils through excavation or groundwater drawdown can generate sulfuric acid and mobilise heavy metals, causing long-term damage to soils, waterways, vegetation and agricultural water supplies. The application lacks a site-specific acid sulfate soil investigation, a detailed hydrogeological assessment, and a robust dewatering and management plan with monitoring, trigger levels and emergency responses. The scale of earthworks is substantial, including approximately 30 km of onsite roads, 30 km of cable trenching, and turbine foundations involving thousands of tonnes of excavation per turbine, potentially exceeding 7 metres in depth. Despite this, no clear method is identified for managing dewatering volumes or mitigating cumulative impacts across the site. Visual impact is a major concern. The proposed turbines would exceed the height of Perth's tallest buildings and introduce multiple skyscraper-scale structures into a rural landscape. This would fundamentally alter the character of the area, dominate views from surrounding properties and roads, and cause long-term loss of amenity. Structures of this magnitude do not "blend in" to a natural rural landscape. They fundamentally industrialise it. The photomontages provided are limited and do not adequately convey the true scale, worst-case or cumulative visual impacts. Approval of this development would also effectively sterilise surrounding land, constraining future rural, residential and tourism uses for decades. The proposal does not demonstrate compliance with the intent of the Shire's Town Planning Scheme, which requires wind turbines to be designed and sited so as not to detract from visual amenity. Even the developer acknowledges that the turbines will have significant visual impacts. Noise, shadow flicker and general disturbance have not been adequately assessed, particularly given the absence of final turbine specifications. The application does not provide confidence that impacts on nearby residents will be acceptable or enforceably managed. Community consultation has been inadequate. Many affected landowners report no direct engagement, and the application does not clearly document community feedback or demonstrate how concerns have been addressed. The first direct correspondence I received from the Shire about the proposal in its current form was a one-page letter sent less than a month ago. Why has the community consultation period for such a major infrastructure proposal in such an environmentally sensitive area been so short?? Finally, the application fails to demonstrate clear economic or environmental benefit to offset these impacts. Claims of up to 200,000 tonnes per annum of CO_2 savings are unsubstantiated, with no explanation of how or where such reductions would occur. The proposal is silent on impacts to tourism and land values as well as any planning or response plans for potential flow of acidic water into the Scott

		River and ultimately into the Blackwood river mouth at Augusta. What significant benefits and assurances will Augusta get for the environmental risks and loss of amenity. Will this windfarm grow in the future and what other alternative sites in the Shire have been seriously considered? Will the development alleviate the constant power outages in the Augusta? For these reasons and queries, I respectfully request that the Shire of Augusta Margaret River recommend that RDAP refuse the application, or at minimum return it for major further information and re-advertising before any Responsible Authority Report (RAR) is finalised.
39	Object	I write to formally object to the proposed wind farm development at Scott River. I am a business owner in Augusta and, through my shop, I speak daily with local residents, farmers, and visitors to the region, including interstate and international tourists. From my shop window, people regularly stop to admire the surrounding landscape and comment on the exceptional natural beauty of the area. This view is central to why people come to Augusta and underpins the town's identity as a quiet, unspoilt destination. Since details of the proposal became known, the response from these conversations has been one of widespread shock and disbelief at the scale and proximity of the proposed wind farm. When visitors are told that industrial-scale turbines are proposed for the Scott River area, many cannot comprehend how infrastructure of this magnitude could be contemplated in such a visually and environmentally significant setting. In particular, European holidaymakers frequently express concern based on their lived experience with wind turbine developments overseas. They describe long-term changes to rural environments following turbine installation, including reduced wildlife presence, altered animal behaviour, and the loss of the quiet rural character that originally attracted them. These concerns are not ideological; they are grounded in direct personal experience. There is growing international recognition that infrasound and low-frequency noise associated with large-scale turbines can affect wildlife movement and behaviour. Given Scott River's recognised biodiversity and ecological sensitivity, there is a reasonable concern that similar wildlife displacement could occur here, resulting in permanent and irreversible changes to the character and environmental values of the region. Equally concerning is the lack of consideration given to farm animals that will remain permanently confined to paddocks near turbines. Unlike wildlife, livestock cannot relocate away from noise, vibration, shadow flicker or infrasound exposure. The potential impacts on animal welfare, behaviour and productivity have not been adequately addressed in the Development Application. People come to Augusta and the Scott River region for its natural beauty, open landscapes, wildlife and sense of peace. Tourism is fundamentally linked to these values. The consistent view expressed by locals and visitors alike is that a development of this scale would permanently diminish what makes the region special and irreversibly alter its identity for generations. My objection is therefore based on the scale and nature of the proposal, the lack of sufficient detail in the Development Application to enable proper assessment, and the significant and long-term impacts the development would have on the environment, groundwater and acid sulfate soils, visual amenity, rural character, community wellbeing, and future land use in the Scott River and Augusta region.

		The Development Application seeks approval of a largely conceptual proposal. Key elements—including the number, location, height and specification of turbines, construction methodology, dewatering and water management arrangements, and environmental safeguards—have not been finalised. As a result, the application does not provide a reliable basis for assessing worst-case impacts or for imposing effective and enforceable conditions on a development that would operate for several decades. I am also concerned about the cumulative effects of this proposal on the natural landscape, biodiversity, rural amenity, tourism values, and the long-term viability and use of surrounding land. The scale of the turbines proposed is unprecedented in this setting and would fundamentally alter the character of the area. Further, the consultation process to date has not provided affected landowners or the wider community with clear, complete and accessible information about the proposal or its consequences. Without a detailed and transparent design, the community cannot meaningfully assess or respond to a development that has the potential to permanently change the region. For these reasons, and for the detailed concerns set out below, I request that the Shire of Augusta Margaret River does not support the proposed wind farm in its current form.  2. Incomplete and Conceptual Nature of the Development Application The Development Application is lengthy but lacks sufficient detail to be properly assessed. The developer (Synergy) has not finalised: • the number of turbines; • turbine locations; • turbine height, model, operating parameters or colour; • construction methodology; • foundation design and excavation depth; • dewatering volumes or management methods; or • environmental management and rehabilitation measures. The developer advises that these matters will be resolved at a later stage. This approach is wholly inadequate for a development of this scale, duration and consequence. Council would not approve even modest commercial or residential developments without detailed and finalised design information, and this proposal should not be treated differently.  3. Groundwater, Water Table and Hydrogeological Impacts

		The likely effects of the project on groundwater systems and groundwater-dependent ecosystems have not been adequately assessed. Large-scale excavation, piling and trenching will be required, with associated dewatering. These activities have the potential to alter groundwater flow paths and water table levels, with long-term impacts on aquifers, surface waters, wetlands, drains, dams, bores and groundwater-dependent vegetation. The Development Application does not include a thorough, independent hydrogeological assessment demonstrating baseline conditions, surface–groundwater interactions, predicted impacts, cumulative impacts, and enforceable monitoring and response measures. Without this information, Council cannot responsibly assess environmental risk. 3M 4. Acid Sulfate Soils – High-Consequence Environmental Risk Acid sulfate soils are a known and serious risk in the Scott River area. Excavation or groundwater drawdown can release sulfuric acid and heavy metals, causing acidification of soils and waterways, vegetation loss, contamination of agricultural water supplies, and long-term environmental damage. The application lacks a site-specific ASS investigation, a detailed dewatering and ASS management plan, defined trigger levels, and a credible emergency response framework. Reliance on generic mitigation measures or post-approval plans is unacceptable given the high-consequence nature of ASS disturbance. One turbine host Ross Woodhouse quotes ‘we will throw a it of lime about” is a criminal statement. How much lime did BHP use? Where are you going to get the lime from? The shire disagreed with the possible lime pit at cosy corner. 3M 5. Scale of Earthworks and Dewatering Despite the absence of final design detail, the proposal indicates approximately 30 km of onsite roads, 30 km of trenching, turbine foundations involving around 2,000 tonnes of excavation per turbine (potentially exceeding 7 metres in depth), significant dewatering requirements, and no identified method for managing dewatering volumes. This represents a substantial disturbance of soils and groundwater in a sensitive environment, without adequate assessment or safeguards. 3M

		6. Visual Impact, Planning Scheme Conflict and Loss of Rural Character The visual impact of the proposal would be severe, long-lasting and unacceptable. The turbines and their blades would exceed the height of Perth's tallest buildings, introducing multiple skyscraper-scale structures into a rural landscape. The proposal does not comply with the intent of the Shire's Town Planning Scheme, which permits wind turbines only where they do not detract from visual amenity. The turbines would be dominant, intrusive and visually overwhelming, a detriment acknowledged by the developer. Approval would also effectively sterilise surrounding land, constraining future rural, residential and tourism uses for decades. 3M 7. Noise, Shadow Flicker, Wildlife, Traffic and Consultation The application does not demonstrate that noise and shadow flicker impacts will be acceptable or enforceably managed, particularly given the absence of final turbine specifications. Risks to wildlife from strike, habitat disruption and indirect disturbance are inadequately addressed. Construction impacts from heavy vehicles on rural roads are insufficiently detailed, and consultation has been inadequate, with many affected landowners not directly engaged and no transparent account of community feedback. 3M 8. Economic and Environmental Benefit Not Demonstrated The proposal does not identify any clear economic benefit to the region and is silent on impacts to tourism and land values. Claims of up to 200,000 tonnes per annum of CO_2 savings are unsubstantiated, with no evidence provided as to how or where such reductions would occur. 3M Request For all of the reasons outlined above, I respectfully request that the Shire of Augusta Margaret River refuse the proposed Scott River Wind Farm.

		We employed an expert to go through the Synergy DA. We would like to go over these findings with you before you go to JDAP please. We also still have a petition in my shop. Signatures are growing as people horrified at the thought.
40	Object	I am one of the registered proprietors of Lot 1184 Scott River Rd, Karridale. The property has a farm style house and a donga that can be used for accommodation. These buildings are amongst the closest dwellings to the proposed windfarm. The farm house is currently rented. The property is used for beef production. The property is surrounded on 2 sides by national park (west and south), river reserve (north) and Scott River Rd (east). Impact on my investment: The wind farm will have an adverse effect on the rental I can charge and the capital value of the property as currently used. From past experience, it is difficult to rent the farm house to a residential tenant. The visual impact of a wind farm and potential noise will greatly reduce my prospects of leasing the farm house. I am also concerned about the possible impact on the road reserve of Scott River Road near my property and in particular immediately adjacent to my eastern boundary. The length of road reserve from the bridge crossing the Scott River to bout 400m south of that point is one of the best stands of mature karri to be found in the area. If traffic flows increase then these trees may be at risk if road improvements are required. The Beenup mine has resulted in an acid plume spreading in the ground in a south west direction but is not affecting Lot 1184. I am concerned that the massive footings required for these turbines will, as a result of deep soil disturbance, collectively result is another acid plume but this time on a trajectory to my property. Effect on my future plans: I have for some time had in mind investing further on the property including converting the donga accommodation into a modern short stay venue with a farm stay theme. The area around my property is underdeveloped for tourism. The presence of a wind farm of any scale will impact on the attractiveness of the area for short stays. For example, the bitumen roads to the north of the property are well suited for road cycling events (which are becoming more difficult on rural roads in the Busselton and Margaret River regions) and the unsealed roads have, in the longer term, the potential to become a destination for gravel riding events such as “Backroads” in Geraldton and “Bike it at Ballidue” which attract a significant number of particpants and tourist dollars to those areas. The Scott River region has enormous potential for bushwalking, beach walking from East Augusta to Black Point and beyond, camping, birdwatching, and other low-impact tourism. It is difficult to comprehend why anyone would want to place a wind farm at the door step to such a pristine region. I will definitely not invest further in my property if there is a risk of a wind farm close by. Impacts of a Windfarm on the Environment: The Scott River area is environmentally sensitive, with rare flora, unique wetlands, and rare wildlife. It is also a harsh environment. I cycle 55km a day on most days along the Swan River commuting to and from work and see a significant amount of bird life. I can say from my own experience that the bird life along Scott River Road and on the adjacent farms is more diverse and the birds are in far greater numbers than my daily commute. Large turbines, access roads, and transmission lines will disturb the delicate balance of the ecosystem threatening this birdlife. The noise from the turbines may also impact the many magpies in the area. See for instance the article “Climate impact black and white for iconic maggies” on the UWA School of Biological Sciences website relating to the effect of noise and climate change on this bird. I do not see this addressed in Synergy’s documents. The area around my property has at least one endangered species, the ringtail possum. Again, I am not aware of any definitive study on

		the effect of windfarm noise on these delicate creatures. I assisted a program to assess the suitability of the Scott River National Park as a refuge for the endangered short neck tortoise. I do not know whether these creatures have gained a foothold or not. My concern is that an acid plume and the noise will have an impact on these reptiles and other creatures in the future that need a refuge from the effects of climate. Environment v Windfarm: It is generally accepted that the environment defeated BHP at the Beenup mine. Of particular concern to me is that I do not see any consideration in Synergy's documents of the effect of wind forces like tornados that have on two occasions damaged my property during my ownership. The first effortlessly plucked 3 very large Karri trees out of the ground. The second demolished my hay shed. My impression is that the impact of these types of forces in the area have not been fully considered by Synergy Summary: In my opinion, Synergy's proposal is unacceptable and will be environmentally destructive on a scale never experienced in the Shire of Augusta Margaret River. I cannot think of a single real benefit to the project. As regards the claimed benefits, they can all be achieved by other means. To approve the development application would be a mistake and a great disappointment to ratepayers, residents and regular holiday makers to East Augusta.
41	Object	I write to lodge a formal submission on Synergy Renewable Energy Developments Pty Ltd's (SynergyRED) Development Application (DAP pathway) for the proposed Scott River Wind Farm. My wife and I are currently considering both commercial and residential developments in the town centre and on Turner Street and this major windfarm development would have a significant impact on the amenity and value of these developments to the point where we are re-considering our significant investments given the substantial costs involved in completing our projects. In particular, we are looking to invest in creating an arts studio and cultural centre which we believe will become an important cultural hub and drawcard to the town which is currently lacking in this regard. Our objection is based on the scale and nature of the proposal, the lack of sufficient detail in the Development Application to allow proper assessment, and the significant long-term impacts the development would have on the environment, including groundwater and impact of acid sulfate soils, visual amenity, rural character, community wellbeing and future land use in the Scott River and Augusta region. The Development Application seeks approval of a largely conceptual proposal. Key elements—including the number, location, height and specification of turbines, construction methodology, foundation design, dewatering volumes and environmental management measures—have not been finalised. As a result, the application does not provide a reliable basis for assessing worst-case impacts or for imposing effective and enforceable conditions on a development that would operate for several decades. The proposal poses serious environmental risks. Large-scale excavation, trenching and turbine foundations will require piling and dewatering, with the potential to alter groundwater flow paths and water table levels. The Scott River area is known to be sensitive, with shallow groundwater and acid sulfate soils. Disturbance of these soils through excavation or groundwater drawdown can generate sulfuric acid and mobilise heavy metals, causing long-term damage to soils, waterways, vegetation and agricultural water supplies. The application lacks a site-specific acid sulfate soil investigation, a detailed hydrogeological assessment, and a robust dewatering and management plan with monitoring, trigger levels and emergency responses. The scale of earthworks is substantial, including approximately 30 km of onsite roads, 30 km of cable trenching, and turbine foundations involving thousands of tonnes of excavation per turbine, potentially exceeding 7 metres in depth. Despite this, no clear method is identified for managing dewatering volumes or mitigating cumulative impacts across the site. Visual impact is a major concern. The proposed turbines would exceed the height of Perth's tallest buildings and introduce multiple

		skyscraper-scale structures into a rural landscape. This would fundamentally alter the character of the area, dominate views from surrounding properties and roads, and cause long-term loss of amenity. Structures of this magnitude do not “blend in” to a natural rural landscape. They fundamentally industrialise it. The photomontages provided are limited and do not adequately convey the true scale, worst-case or cumulative visual impacts. Approval of this development would also effectively sterilise surrounding land, constraining future rural, residential and tourism uses for decades. The proposal does not demonstrate compliance with the intent of the Shire’s Town Planning Scheme, which requires wind turbines to be designed and sited so as not to detract from visual amenity. Even the developer acknowledges that the turbines will have significant visual impacts. Noise, shadow flicker and general disturbance have not been adequately assessed, particularly given the absence of final turbine specifications. The application does not provide confidence that impacts on nearby residents will be acceptable or enforceably managed. Community consultation has been inadequate. Many affected landowners report no direct engagement, and the application does not clearly document community feedback or demonstrate how concerns have been addressed. The first direct correspondence I received from the Shire about the proposal in its current form was a one-page letter sent less than a month ago. Why has the community consultation period for such a major infrastructure proposal in such an environmentally sensitive area been so short?? Finally, the application fails to demonstrate clear economic or environmental benefit to offset these impacts. Claims of up to 200,000 tonnes per annum of CO_2 savings are unsubstantiated, with no explanation of how or where such reductions would occur. The proposal is silent on impacts to tourism and land values as well as any planning or response plans for potential flow of acidic water into the Scott River and ultimately into the Blackwood river mouth at Augusta. What significant benefits and assurances will Augusta get for the environmental risks and loss of amenity. Will this windfarm grow in the future and what other alternative sites in the Shire have been seriously considered? Will the development alleviate the constant power outages in the Augusta? For these reasons and queries, I respectfully request that the Shire of Augusta Margaret River recommend that RDAP refuse the application, or at minimum return it for major further information and re-advertising before any Responsible Authority Report (RAR) is finalised.
42	Object	I write on behalf of Grevillea Blackwood Pty Ltd t/as the Augusta Hotel whose new owner has been engaged in developing a strategic vision for the property in order to create a high-quality tourism establishment that leverages Augusta’s unique natural beauty and coastal appeal. It has come to our attention that a large-scale wind farm is proposed for the Scott River/ East Augusta area, involving turbines up to 250 metres in height. While we recognise the importance of renewable energy and support Western Australia’s sustainability goals, we have serious concerns regarding the potential impact of this project on the area’s tourism economy and community character. Our key objections and concerns are as follows: Visual and Landscape Impact The proposed turbines, among the tallest globally, will significantly alter the iconic coastal vistas that attract visitors to Augusta. This visual intrusion is incompatible with the premium tourism experience we and other stakeholders aim to deliver. Tourism and Economic Consequences Augusta’s economy relies heavily on tourism. Any development that diminishes the area’s natural appeal risks undermining local businesses, employment, and long-term economic growth. Community and Investor Confidence This project is causing significant concern for the local community and for us as an investor in the region given the many millions of dollars envisaged for the Augusta Hotel development and construction.

		We respectfully request that the decision-making process fully considers these concerns and that the adverse visual, economic, and environmental impacts determine that the Wind Farm project is in fact proposed in the wrong location. At present our commitment to Augusta remains strong, and we hope to continue developing projects that enhance the region's appeal. To achieve this, it is important that future developments complement Augusta's unique character and support its long-term tourism potential. We would welcome the opportunity to participate in further consultations and provide detailed input on this matter.
43	Support	I support the DAP as a member of AMRCCE.
44	Object	I wish to lodge an objection to the Scott River Wind Farm Development Application. I am concerned this application is lacking the appropriate details required for a correct assessment. I am especially worried about any noise impacts on my health. I'm particularly concerned the application does not adequately address low-frequency noise and sub-audible infrasound impacts, despite growing worldwide evidence that large turbines are causing some people to report new adverse reactions, while others report the exacerbation of pre-existing health issues. There is overwhelming evidence that noise and vibration from large turbines can trigger pre-existing PTSD symptoms, cause sleep disturbances, sleep deprivation, fatigue, headaches, migraines, vertigo and memory loss, to name a few. Presently I am trying to manage the above health issues and this was the main reason for choosing to buy and live on Molloy Island as it provides the quiet and peaceful environment I require to best manage my symptoms. I am very concerned as Molloy Island is less than 6 kms from the proposed wind turbines and I do not want to abandon my home because of intense emotional and physical reactions due to the noise from large operating wind turbines exacerbating my pre-existing health issues. Also, there appears to be no plans for monitoring noise levels at any homes, nor any arrangements for shutdown if limits are exceeded. Furthermore, an avoidance-first design should be a priority for wildlife. In my opinion the Development Application does not provide adequate details to permit a true assessment of a project of this size and importance. For the above reasons I request that the Shire of Augusta Margaret River refuse, or at least defer the Development Application until noise plans are provided and an avoidance-first design supplied, and independently reviewed.
45	Support	Comprehensive and thorough studies have been completed on potential impacts (including environmental) of a Synergy windfarm at Scott River utilising experts in these fields including. Mitigation measures have been suggested and accepted by Synergy as appropriate and where required, detailed management plans have been provided from pre-construction, construction, commissioning, operation and decommissioning. All my concerns have been allayed or addressed by these thorough studies and plans. I also note that the EPA requested only minor amendment to one of these plans. The windfarm makes sense both economically and environmentally for local farmers as farming and renewable infrastructure can not only co-exit, but support each other.

		The windfarm would be good for the local community & the Shire both economically and environmentally, with the community benefit fund and local jobs plus the potential bonus of eco-tourism. It should also support ensuring a more stable power system locally. The windfarm would be good for our state both economically and environmentally, by utilising exisiting infrastructure eg the transmission line, the substation & the roads; by supporting the SWIS as old coal power stations are retired; and by reducing carbon emissions. AMR Shire has a wonderful opportunity to be part of the solution through the Synergy's proposed Scott River windfarm.
46	Object	As a farmer there will be a loss of agricultural land to go towards this new industry. farmers whether they know it or not, they will lose autonomy over their own land. One just has to look at the experiences of an eastern state famer who has been served with a trespassing infringement on his own property. (see Weekend Australian Dec 28/2024) He has lost the control over his own land, farming practices, his biosecurity, who goes on and where, and in the end he is responsible for its decommission at the end of its life span. sounds fair !!!!? Big companies and mostly overseas ones at that will win leaving this area bankrupt taking with them any gains and profits that maybe made. The size of these turbines make them an eyesore and no one will be able to escape their overbearing presence Please keep agricultural land for agricultural purposes
47	Object	We own property along the Hardy Inlet on the Blackwood River. We are concerned about the impact of the 250-meter wind turbines on this natural area. The Blackwood and Scott River regions are some of the most unspoilt areas in WA and should remain free from industrial development so future generations can enjoy them. The turbines may harm local wildlife, especially birdlife, and negatively affect biodiversity.
48	Object	I am writing to object to this proposal regarding the environmental, and ecological impact; the risks to energy security; and to oppose the fraud of wind turbines. Scott River is home to numerous native special of birds and animals that will be affected by the turbine blades directly, the noise of the turbines, the noise of the transmission lines, and the environmental devastation of transmission line corridors installed into bush lands and forests. Bird and bat populations will be at particularly high risk, and as Scott River is a green corridor for avian populations, there is particularly high risk of excess mortality for at risk native bird populations, and migratory bird populations. The assumptions made in the proposal need scrutiny as there is high risk of fraudulent statements in the report given regarding the risks to wildlife and human safety. Wind turbines are also a threat not just to human safety through exposure to high voltage emf and low frequency sound, but upon livestock in proximity to this turbine battery and transmission line corridor. Wind turbine blades are also manufactured in asia with high risks of contamination of asbestos and other hazardous products, such as fluorine based atmospheres writhing gearboxes, and risks of shedding of glass fibres and plastic resins from blades - particularly from blades exposed to salted air. Wind turbines themselves are a fraudulent industry with whistleblowers declaring that the energy generation on an annual basis is Net zero - as in zero net power generated on an annual basis, with the added cost of more than $750,000 licence fee per turbine per year, to foreign entities. This is largely due to shutdown in high wind conditions, and grid draw to spin blades up to speed prior to wind being able to turn wind turbines. The unstable energy generated risks the grid and consumers alike, with high risks of blackout in difficult conditions, plus risks of damage and destruction, including that if secondary bushfire and forest fires.

		The large size of turbines is a nauseous aesthetic abnormality to the South West landscape, with risks to tourism in the locale of Augusta, not to mention the possible risks to real estate prices, and insurance costs (or even insurance denial) for properties within bushfire range if a turbine failure event or accident. The shire has a long history of having to address bushfires in the region and locale of Augusta and Margaret River, with risks to properties, livestock, and families in the region. There is no good case for the installation if a turbine farm with such drastic consequences for the state, region, and locale of Augusta.
49	Object	I have lived in this shire for 29 years (Margaret River 23 years, Augusta 4 years and now Molloy Island) and have done considerable research with this attempt and the previous unsuccessful attempts for a wind farm at Scott River. I worked for the BHP Beenup Mine Manager and have done extensive wildlife surveys in the Scott River region, so I know the area and its farmers very well. This is the first time we have seen a Shire Council not make an effort to be accessible to listen to views of ratepayers in person, ones who will be affected most by this. The CEO I think was at one of our local meetings where I was a speaker, but did not make herself known to us. Most of us weren't impressed. When I hear comments that the President wants this wind farm. Is it for the right reasons or just kudos for the shire? As residents of Augusta, Molloy Island and Scott River, we are a small voice within the shire. I am aware that at least 50 percent of ratepayers in the Augusta region of our shire come under the heading of absentees (holiday homes) or AirBNBs. I have lived with that situation in all three parts of the shire. People I have spoken to in Margaret River aren't even interested in knowing about the wind farm at all. Some don't even know of one. As residents of our shire we are all well aware of 'net zero', but not to the detriment of residents health and safety. We were even unable to give an opposing view in the Pelican Post, when the proponent was able to advertise repeatedly in that publication. Rather than speak about the multitude of issues with the feasibility assessments, which I spent hours reading in the Augusta shire offices, and which are by no means an indicator this wind farm is viable, I will speak about only a small portion. I was a volunteer on one of the first panels for community mental health which did not provide me with any results as promised. We have seen other shires in WA that have proposed wind farms in their jurisdictions, standing by their ratepayers first, to ensure that proponents get it right and do not endanger the residents who are not part of actual wind farms. Safety and mental health is a priority as we live in a very pristine environment as shown in our recent Molloy Island Shire Draft Management Plan. So of course visual from high turbines, lack of silence, light infringement, shadow flicker, pulsating from turbines, possibility of infrasound should not be entertained at any cost. The generic pat on the head - "we will work it out later ..." is unacceptable. Environmentally there are numerous issues which have not been dealt with at all at this stage. First of all do we want to see the clearing of habitat (for turbine access), habitat sterilisation if there is a problem with acid sulphate leaching into the soil and surrounding rivers and wetlands. Where is the shire safety plan for any likely event? Also where is all the soil which will be needed for each turbine foundations coming from? Where is the concrete (which is not eco friendly) coming from? Where will the enormous amount of oil (which for net zero will be unavailable) for the smooth running of turbines come from and how will it be transported up such high turbines? Will the turbine brakes contain asbestos? Nothing has been addressed by the shire. One of the most important issues for me is the treatment of our prime producers in Scott River region. It has been appalling. This should not be a "them and us" situation. We should all be working together for the benefit of our capes region. The one thing I would have loved to have seen, was a co-operative arrangement where our towns reap the benefits of a wind farm as has been done in other parts of Australia and Scotland etc. I am not opposed to a wind farm as such, but all the electricity generated by this one will go off to Perth on the Transmission line which is already travelling east or south, not near us at all. And our outages will continue. I really do not have hours to go into more issues - I have only touched the surface. I am sure other residents I know here will touch on many other points. Why did the councillors over many years vote unanimously against any wind farm in Scott River? No-one has ever

		commented why? We have been researching for a long time and found out a lot about wind farms globally over the course of the number of wind farm proposals here.
50	Object	Family have property in Augusta. Been enjoying this special town for more than 15 years. Horrified by the plans that will destroy this natural unique town. It's a hidden gem , should not be destroyed. Concerns for the impact on birdlife.
51	Object	Wind farms look to be green and clean on the outside. but are infact anything but They have a limited lifespan, they are unrecyclable, they rely on fossil fuel to keep the cogs turning. they destroy the environment with all the 1000s tons of cement needed to just erect just one turbine, they need extra infrastructure to return this power to the people. roads buildings etc I have two German backpackers staying with me at the moment and they can't believe the quiet and tranquillity of the area with no whirring sound constantly day and night. This is what you will lose in our nice little place of paradise. They are ugly and a visual pollution, the Scott River area is known for its pristine environment seemingly untouched by the modern world It is important to keep this area significant for this reason Anne Patterson aug
52	Object	Introduction I write to formally object to the proposed wind farm development at Scott River. I am a farmer within the Shire of Augusta Margaret River, located approximately 15 kilometres from the proposed turbine area. While my property is not immediately adjacent to the turbines, my objection is based on the broader impacts of this development on agricultural land, livestock welfare, environmental systems, rural character, and the long-term viability of farming within the Shire. Large-scale industrial infrastructure of this nature has impacts well beyond its immediate footprint. For a farming region such as Scott River, those impacts must be considered in a cumulative and precautionary manner.

		3M 2. Loss and Fragmentation of Agricultural Land The proposed development would permanently industrialise productive agricultural land. Turbine foundations, access roads, underground cabling, hardstand areas and exclusion zones will fragment farmland and reduce flexibility in how land can be managed and used. Farming depends on adaptability—rotational grazing, crop changes, fencing, water infrastructure and future diversification. The introduction of turbines and associated constraints limits these options not only on host land but across surrounding farms due to access, amenity and operational impacts. Once agricultural land is industrialised in this way, it is effectively removed from productive use for generations. 3M 3. Livestock Welfare and Infrasound A significant concern is the effect of infrasound and low-frequency noise generated by large-scale wind turbines on livestock. Unlike people, farm animals are permanently confined to paddocks and cannot relocate away from sources of ongoing noise, vibration or shadow flicker. International experience and emerging research indicate that infrasound and low-frequency noise can influence animal behaviour, stress levels, feeding patterns and movement. The Development Application does not adequately address: • the potential impacts of infrasound on livestock welfare, • long-term exposure for animals confined within the broader infrasound zone, or • how any observed impacts would be monitored, mitigated or remedied. The risk to livestock health, productivity and welfare cannot be dismissed simply because turbines are not immediately adjacent to all farms. 3M 4. Impacts on Native Flora and Fauna The Scott River area supports significant native flora and fauna and forms part of a broader ecological system. There is increasing recognition that infrasound and turbine operation can influence wildlife movement, breeding behaviour and habitat use.

		The proposal does not adequately consider: • displacement of wildlife beyond the turbine footprint, • cumulative effects on ecological corridors and farm-adjacent bushland, or • indirect impacts from noise, vibration, lighting and altered groundwater conditions. The loss or displacement of wildlife would diminish both environmental values and the rural character that underpins farming and tourism in the region.  5. Groundwater and Acid Sulfate Soil Risk The Scott River area is known to have shallow groundwater systems and acid sulfate soils. Large-scale excavation, deep foundations, trenching and dewatering pose a high environmental risk. Disturbance of acid sulfate soils can result in: • acidification of soils and waterways, • mobilisation of heavy metals, • impacts on stock water, dams and bores, and • long-term degradation of agricultural land. The Development Application lacks a detailed, site-specific hydrogeological assessment and a robust acid sulfate soil management plan with enforceable monitoring, trigger levels and contingency responses. These risks extend beyond the turbine site and into surrounding agricultural systems.  6. Visual Impact and Rural Character While my property is some distance from the turbine locations, the scale of the proposed turbines means they will dominate the broader landscape. Turbines of this height exceed Perth's tallest buildings and are entirely out of scale with a rural farming environment. The industrialisation of the landscape affects: • the sense of place that supports rural communities, • the appeal of farming areas for future generations, and • the viability of diversification such as agritourism.

		Once rural character is lost, it cannot be restored.  7. Inadequate Detail and Conceptual Approval The Development Application seeks approval of a largely conceptual proposal. Key details—including turbine numbers, locations, final specifications, construction methodology, and environmental management measures—are not finalised. Council would not approve even modest agricultural or commercial developments without this level of detail. Approving a project of this scale on a “work it out later” basis is inappropriate and places unacceptable risk on landholders and the environment.  8. Consultation and Cumulative Impacts Consultation to date has been inadequate, particularly for landholders who may not be immediately adjacent to turbines but fall within broader impact zones. The cumulative effect of this development—on agriculture, wildlife, groundwater, amenity and rural character—has not been properly assessed. These impacts extend well beyond property boundaries and must be considered at a regional scale.  9. Economic and Community Considerations The application does not demonstrate clear, tangible benefits to the local farming community. Claims of emissions reductions are not supported by evidence identifying where or how such reductions will occur. There is also no meaningful assessment of the potential long-term economic cost to agriculture, land values, and the reputation of the Scott River region as a productive and environmentally sensitive farming area.  10. Conclusion The Scott River region is a highly valued agricultural and environmental landscape. Introducing industrial-scale wind turbines into this setting poses unacceptable risks to farming, livestock welfare, wildlife, groundwater systems and rural character.

		For these reasons, I respectfully request that the Shire of Augusta Margaret River refuse the proposed Scott River Wind Farm.
53	Support	
54	Object	1) Position and request I object to the proposed Scott River Wind Farm and request that the DAP refuse the Development Application. In the alternative, I request the application be deferred unless and until it is subject to appropriate environmental assessment and the proponent provides credible, independently peer-reviewed technical work demonstrating compliance with all applicable requirements (including noise). 2) Proposal overview (as advertised) The proposal is described as an onshore wind farm in the Scott River area, involving up to 20 wind turbines generating up to 100MW, with associated infrastructure (substation, transmission infrastructure, masts/towers, O&M buildings and roads). Public materials indicate turbine height up to ~250m, which is an industrial scale that is incompatible with the receiving environment and surrounding rural-residential uses. 3) Key grounds of objection A. Unacceptable visual / landscape impact and loss of rural character Turbines of this scale (up to ~250m) will permanently industrialise a currently rural landscape and materially alter views across the locality, including day and night (aviation lighting). This is inconsistent with protecting the amenity and landscape character values that underpin the wider Augusta–Margaret River identity and visitor economy. Request: Refuse the proposal due to unacceptable landscape and visual impact; alternatively require materially increased setbacks, reduced turbine number/height, and strict lighting controls supported by independent visual simulations from sensitive viewpoints (homes, roads, lookouts, tourism nodes). B. Residential amenity impacts: noise, low-frequency noise and tonality Noise impacts are a primary concern for residents and rural landholders. Given the scale of the proposal, the assessment must demonstrate compliance with the Environmental Protection (Noise) Regulations 1997 and must be robust to real-world operating conditions (wind shear, multiple turbines, cumulative effects). I am not satisfied, on the material presently available, that the risk of ongoing amenity impacts has been eliminated. Request: Refuse or defer pending (1) independent peer review of the noise assessment, (2) enforceable limits/conditions, (3) transparent complaint investigation and compliance monitoring regime funded by the proponent, and (4) conservative setbacks where any modelled uncertainty exists.

		C. Shadow flicker, blade glint and night lighting impacts Shadow flicker and blade glint can cause repeated nuisance impacts and reduce the reasonable enjoyment of homes and outdoor areas. Night lighting can also materially affect rural darkness values. Request: Refuse or require strict, enforceable flicker limits, conservative modelling assumptions, and legally binding curtailment (shutdown) protocols, with monitoring and reporting. D. Environmental risk and need for appropriate environmental assessment The Environmental Protection Authority is involved in the proposal pathway and (at minimum) the project is of a nature that warrants careful assessment of fauna (including birds/bats), vegetation, habitat connectivity, waterways/wetland systems, and construction impacts. Given the community concern and the scale of the infrastructure footprint, the precautionary approach should apply where information is incomplete. Request: Refuse or defer until environmental impacts are assessed to a standard that is transparent, independently verifiable, and addressable through enforceable conditions (including offset claims, if any, being clearly justified). E. Traffic, road safety, construction impacts and ongoing servicing Construction of turbines and associated infrastructure brings heavy vehicle movements, road upgrades, dust, vibration, drainage changes, and increased bushfire ignition sources. These impacts can be significant for local roads and rural residents. Request: Refuse or impose conditions requiring a detailed Construction Traffic Management Plan, road condition surveys and make-good obligations, limits on haulage times/routes, and binding dust/noise controls during construction. F. Bushfire and emergency management risk Wind turbines and electrical infrastructure in a bushfire-prone region introduce operational and emergency response issues (access, shutdown, asset protection, and the practical ability to fight fire safely near turbines). Request: Refuse or require comprehensive bushfire risk assessment and an enforceable emergency management framework (including clear shutdown triggers and communications protocols). G. Inadequate community benefit relative to scale of impact Public project information refers to a community benefit fund (e.g., $100,000 annually) and construction jobs. However, these benefits do not offset permanent amenity impacts borne by nearby residents and the long-term industrialisation of the landscape. Request: Give significant weight to the disproportionate local impacts versus proposed benefits. H. Decommissioning, rehabilitation and financial security

		Any approval must ensure that turbines and all associated infrastructure are fully removed at end of life and land is rehabilitated, backed by adequate financial security (bond) to prevent the burden falling on landholders or the community. Request: If not refused, impose conditions requiring a funded decommissioning plan, indexed costings, and a bond/financial security mechanism. 4) Conclusion For the reasons above—particularly unacceptable landscape/amenity impacts, unresolved noise and flicker risks, and the need for rigorous environmental assessment—I request the DAP refuse the application.
55	Object	Visually damaging to the vista. Harmfull to wildlife. Per MW/hr wind turbines are not efficient and cost effective. Baseload is what we need to invest in. The cost to destroy prime country and bushland, along with the beautiful scenery, and wildlife would be devistating. Wind turbines are not the solution.
56	Object	I object to the Scott River Wind Farm DA because it lacks detail needed for a proper assessment. The proponent has not fixed turbine locations, turbine specifications or a final design, yet seeks approval now and says details will be worked out later. This is not acceptable to me. This makes noise, shadow flicker and visual impacts impossible to properly assess, and it shifts risks onto neighbours. The noise assessment is desktop-based and relies on assumptions suited to older turbines, not modern 250 metre turbines. Actually aren't these the highest in the world? Therefore there can be no physical tests that have been done. It does not provide real time monitoring, independent verification or enforceable protections if limits are exceeded. The floodplain location, acid sulphate soils and shallow groundwater create high consequence risks to water quality and farming. There has been no proper research on the wildlife impact. This really distresses me. Australia has a lousy track record for allowing animals to become endangered and then extinct. The carnaby's being just one. Scott River is a major flora and fauna diversity location. It is home to the endangered ringtail possums. The disruption of construction and then the infrasound will drive these precious animals away and many of the migratory and resident birds will be killed by the turbines themselves. We attempted to have a pathway built to the lighthouse from Dead Finish approximately 15 years ago. We paid several thousand dollars for a feasibility study. It was not allowed to go ahead due to a rare frog that might have been negatively affected. So I know that the Shire used to care about our wildlife. This appears to not be the case anymore. I am very very distressed by the potential loss of bird and animal life due to these proposed turbines. I implore the shire to refuse or at the very least, defer the DA until a final design, verified noise framework, and ROBUST environmental and emergency plans are provided and independently reviewed. This proposal is not suitable for the Scott River floodplain, and the risks to community amenity, farming, water security, environment and

		landscape character are unacceptable. Karen Basford
57	Object	I am writing to express my objection to the Scott River wind farm development application, currently before the shire of Augusta Margaret River. The development application lacks sufficient details and is acting on a 'work it out later' strategy. No final turbine layout has been provided and can be changed upon the developers discretion, changing greatly who will be affected and what. Pulsating infrasound is becoming known internationally, with evidence suggesting that wind turbines of this size and capacity are an unaddressed risk for some people. Implementing a development like this can greatly affect not only people's health but also Augusta tourism and the pristine environment of proposed location. Another major concern is the possible and likely disturbance to the acid Sulfate soil which has already happened once before with the BHP sand mine which required a big clean up. This DA is in a pristine and sensitive ecological area. 26 species of flora and fauna are listed as either threatened, rare or at risk already within the Scott River area. This is only one small part of the ecological concern for this location and insufficient details have been provided to the community for such a high risk setting, there is NO evidence on long term effects. We require more transparent, independent and stronger research into these issues from the shire of Augusta Margaret River.l before this project commences.
58	Support	The site chosen is an ideal place for the residents of this Shire to contribute to lowering our own emissions using the most efficient power generation method we have access to - wind. The Shire residents and their representatives need to take responsibility to lower emissions and reduce the draw on the grid from energy generated outside our area. The Shire should base its decision on scientific evidence. SynergyRED has undertaken thorough research to address concerns with the impact of power generation at Scott River. The site is ideal, with minimal clearing, access to grid and transmission lines, and transport access all in place. Please base your decision on our responsibilities to future generations.
59	Object	The Blackwood River, along with Flinders Bay are icons of Western Australia and unique to the world, only one of two locations where a river flows into two oceans. The backdrop of 20 wind turbines up to a height of 250m will scar what is a truly a magnificent outlook. The decision to place the wind farm in the proposed position, appears to be based primarily on financial grounds i.e. by utilizing the existing Beenyup Mine infrastructure to connect to the South West Interconnected System (SWIS). The wind farm could be located further East, out of sight of the Augusta townsite and Flinders Bay, with connection to the South West Interconnected System (SWIS) at a point further East on the existing 132 kV Beenup to Manjimup transmission line. The wind farm, in the proposed position, will have a negative impact on the physical and visual environment. Residents and visitors alike come to Augusta because of its natural beauty and relaxed idyllic lifestyle, THIS WILL BE LOST!

		The added cost of moving the farm further east will be money well spent, to retain the unique place Augusta holds in the Augusta Margaret River region, as one of the worlds most beautiful places to visit.
60	Object	I am writing to lodge my objection to the proposed Synergy Scott River Wind Farm proposal. My view is that the Development Application does not contain the specifics required for any person to make an informed decision. The final number of turbines, their exact final location, the proposed height of the turbines or a detailed construction and operational plan, is missing the detail required to assess the validity of the proposal. If I am to understand the impact of turbine noise, the impact of infrasound on the fragile biodiversity that calls the proposed site home, the negative visual impact on the township and surrounding community or the impact of the turbines on natural ground water sustainability, or increased bush fire risk, then the proposal falls a long way short of providing me the information I need or the confidence that the developer has taken "all reasonable steps' to address these issues in their proposal. One of many other concerns I have is that these turbines, wherever they are proposed to be erected, will permanently alter the viability of the rich and fragile biodiversity of the Scott River area. To say that these details will be worked out later, leaves me with a feeling of dread that the project will forever alter the fundamental premise of Augusta's natural gifts, being its biodiversity and natural beautiful uninterrupted views to the horizon. How can these things be so easily dismissed and disregarded in the development application? I have also found more evidence to be concerned about the impact that these turbines will have on noise levels. The application doesn't address the growing concern of low frequency noise or infrasound on the community surrounding the structures despite growing international evidence that pulsating infrasound from turbines presents unaddressed health risks. The visual impact of the proposal is also a matter for my objection. Scott River is highly valued for its natural landscape and agricultural character. Industrialising this pristine landscape would result in a permanent loss of character that will undermine the eco-tourism appeal of the district. The sites floodplain location also raises further concerns. The Superficial shallow aquifer linked to the river system will be severely compromised by the digging of deep foundations and trenching. Farmers will most likely be negatively affected by dewatering and soil stability as well as ground water quality available to their bores and dams. I feel that Bushfire risk and Emergency response are also inadequately addressed in the proposal. The creation of Wind Turbines will create "no fly" zones which will restrict aerial firefighting and the internal access roads do not provide sufficient evacuation routes in the event of fire. It appears to me that Construction Impacts are also severely underdeveloped. The application lacks the detail on access routes, heavy vehicle movements, timing and duration of works, dust and noise management and protection for the local residence, road users and business effected by the construction. Finally, I've been concerned by the inadequate level of community consolation. Many effected landowners have reported no direct engagement. The Development Application, in my view, fails to clearly summaries community feedback or concerns. Given the

		magnitude and permanence of this proposal, the consultative process is seriously inadequate. For the reasons I've shared with you in my response, I strongly request that the Shire of Augusta Margaret River refuse or, at a minimum, defer the Development Application until: 1. A final Turbine layout be provided, 2. The Turbine specifications be confirmed, 3. The noise impact be adequately researched and results be provided, 4. A detailed environmental, bushfire and construction management plan be provided which has been independently reviewed. In conclusion, believe that the proposal is completely unsuitable for the Scott River floodplain, and the associated risks to community amenity, farming, water security, adverse impact to biodiversity and environment are just some of the contributory factors to my decision.
61	Object	The primary reason this proposal should not proceed is the unacceptable level of uncertainty regarding its environmental impacts, particularly in relation to protected wildlife and sensitive ecosystems. The Scott River and Augusta region contains significant ecological values, including remnant vegetation, waterways, wildlife corridors and proximity to coastal environments that form part of the annual migration route for protected whale species. These environmental assets are vulnerable to disturbance from large-scale infrastructure. The application seeks approval based on a “maximum case scenario” without confirmation of final turbine models, dimensions or precise locations. As a result, the potential impacts on fauna, including birds and marine mammals, cannot be accurately assessed. Given the scale of the proposed turbines and associated infrastructure, there is a real risk of irreversible environmental harm. In such circumstances, the precautionary principle applies. Where there is a threat of serious or irreversible damage, the absence of full scientific certainty should not be used as a reason to proceed. In the absence of clearly defined project details and robust, site-specific evidence demonstrating that environmental impacts can be avoided or adequately managed, the proposal should be refused or deferred.
62	Object	As owners of a property fronting Hardy Inlet on the Blackwood River and a commercial premises in the main street of Augusta we are very concerned about the aesthetics of 250 metre turbines on the natural beauty of the area. We consider the Blackwood and Scott river areas are some of the most pristine wilderness that we have left in Western Australia and do not want to see the visual pollution on this landscape that will come from the highly visible nature of these towers. We do not feel it is an area that should be industrialised. We would like future generations to be able enjoy the beautiful views and quiet solitude of the area as we have done over many years. The wildlife especially the prolific bird life on the rivers which form such an integral part of this environment will most definitely be affected by turbine damage causing issues to the biodiversity of the whole area. The effect on the water table and water dependent ecosystems especially during the construction phase concern us. The high acid sulphate soils in this area are also of concern. We remember that a mineral sands mine in this area was closed about 25years ago and has undergone rehabilitation ever since due to the high acid content of the soil and the detrimental effect on the water table. We

		understand that the proposed wind farm is adjacent to this former mine site. We feel these turbines are out of place in this area and urge the Shire to reject this proposal. Thank you for your consideration of our point of view.
63	Object	I STRONGLY object to Synergy Renewable Energy Developments' proposed Scott River wind farm. I support renewable energy, but this proposal is in the wrong place and is not defined clearly enough for the community to properly assess. The Scott River and Augusta area is valued for its natural, largely untouched landscape, quiet rural character and strong appeal to residents and visitors. A development of this scale is NOT compatible with those qualities. Approval is being sought for a "maximum case scenario" without final turbine models, heights or exact locations confirmed. This makes it difficult for the community to understand the real impacts, particularly in relation to visual impact, noise, shadow flicker and overall amenity. Turbines up to 250 metres high would dominate the landscape and permanently change the character of the area. Once built, this impact cannot be reversed and would undermine tourism, lifestyle properties and the natural appeal that defines the region. The proposal also involves extensive supporting infrastructure, including roads, foundations, substations and transmission lines, within an environmentally sensitive area that includes waterways, remnant vegetation and wildlife corridors. The cumulative impacts of this have not been adequately addressed. Using the DAP pathway for a development of this scale limits meaningful local input, despite the long-term consequences for the community. Renewable energy targets do not justify poor siting. There are more suitable locations for industrial-scale wind farms that would not permanently damage a unique and valued landscape. For these reasons, I ask that this application be REFUSED, or at least deferred until final details are known and the community can be properly consulted.
64	Object	I strongly object to the proposed Scott river wind farm due to the lack of details needed for an accurate assessment. The proposed location is a highly sensitive environment, which has not been given serious consideration. The location of the flood plane, the acid sulphate soil and shallow ground water create too much of a risk to water quality surrounding farm land and to tourism in Augusta. Synergy do not have a plan when it comes to emergency and acid sulphate contamination, adding lime from a limited resource isn't sustainable due to it's scarcity. Another very worrying concern is that infrasound has not been sufficiently addressed, emerging international evidence strongly suggests that large turbines are a risk when positioned too close to housing, and for some people creates sleep disturbances and physiological stress, which are much more common than acknowledged by synergy.

		I request the shire to refuse or defer the DA until a final design and a strong environmental and emergency management plan are provided INDEPENDENTLY assessed apart from Synergy.
65	Object	I object to the proposed Scott River Wind Farm due to environmental, procedural, and transparency concerns. The project has not undergone a full EPA assessment, leaving ecological risks insufficiently evaluated. The area contains remnant native vegetation and wildlife habitats, and turbine operations could harm birds and bats, as observed in similar projects like Tasmania's Robbins Island wind farm. Community consultation has also been limited, with many local residents becoming aware of the proposal late. all of my family live in Margaret River and Cowaramup and are completely unaware of the scale of the project. Adequate disclosure of environmental assessments, operational impacts, and monitoring plans is essential. While I support renewable energy, this development should not proceed without rigorous, independent environmental evaluation and proper community engagement. I request a formal EPA assessment and full public disclosure of ecological data prior to any approval. Thank you for considering my submission.
66	Support	Love clean energy! More please
67	Object	Will negatively affect the wildlife and they are very intrusive to the landscape.
68	Object	This will be a blight on the beautiful landscape & negatively impact local wildlife
69	Object	These wind turbines would be a blight on the beautiful landscape and would negatively impact local wildlife. Invest our resources into baseload power instead!
70	Object	I strongly wish to lodge with the Shire ,my objection to the Scott River Wind Farm Development Application submitted by Synergy . The Development Application lacks specific detail for an assessment to be made, especially when taking into consideration the size, scale and the immense impact such a project may have on the environment if errors of planning and judgement are made. Statements directing that issues will be , " worked out later ", are completely unacceptable and intolerable . If this development is accepted and the worst scenario should eventuate it will alter the ecological environment of the Scott River permanently and ruin lives and livelihoods of residents all along the Blackwood and Scott rivers. How do you 'work out later' an ecological disaster? Nothing has been confirmed. If the Shire agrees to this DA they are in effect giving the developers a ' blank cheque '. What will be the final number of windfarms , their location, final height, turbine model, how will they be constructed and what will be the operation methodology? Without this information how can assessments be made on the impact of noise, infra sound, shadow flicker, visual dominance, bushfire risk , groundwater impacts and the over all amenity ? The impact on an area well known for the sensitivity of the acid soil is one of my main concerns. BHP's failed Beenup Mineral Sands Mine , renowned for an ecological environment disaster in 1999 is on the same geophysical land as this proposed Windfarm. My home is on the banks of the Blackwood River (flood plain) at Seine Bay in Augusta . Mis-management of this major development will have long term life altering results for home owners, tourism, farmers, cattle, wineries,

		crops, orchards, native fauna ,flora and the fishing industry . If the acid soils and affected ground water from the site were to link with the superficial aquifer and the river systems, water quality in and around Witchcliffe , Karridale, Hamlin Bay and Augusta will be affected . As after the release of heavy metals the PH will lower to lethal levels . It Is a direct threat to the Blackwood and Scott Rivers , Flinders Bay, and over 26 listed threatened species. If the DA is accepted by the Shire and the worst should happen , that the disturbance of the soil in the development envelope results in the creation of acid sulfate soil, with the run off entering the shallow groundwater and aquifer flowing into the river system then .... a plan to counteract the disaster is essential ....Synergy do not have a plan when it comes to emergency acid sulfate soil mitigation . WHY? Synergies action plan .... "work it out later"! Too late when faced with an irreversible disaster example Beenup Mine ! Without a final design and dewatering plan there is NO credible risk assessment for volumes , disposal, treatment, monitoring and contingencies for managing water. The DA doesn't provide a credible , site-specific hydrogeological assessment or a believable acid sulfate soil and dewatering management plan. Indicating that lime will neutralise the problem of acid soil / water is not being realistic as it is not sustainable , economical or responsible. Who will pay to import the lime from Africa and compete with BHP and farmers ? Synergy the developer (taxpayers) .... Scott River farmers .... one of the Greenwinds Renewable Company's (Macquarie Bank)! Find another site where the soil is not sensitive acid sulfate and the impact on the local community is negligible. Bushfire Risk and Emergency response are further areas of concern. The DA doesn't address how fire ignition risk ,emergency response or rare flora protection would be managed in extreme fire conditions. Wind turbines create no-fly zones that may restrict aerial firefighting . Internal access roads are not necessarily safe evacuation routes . Construction impacts are not adequately planned. Little detail on access routes, heavy vehicle haulage issues on farm roads, dust , noise and duration of works ,protection of local residents, road users and businesses . Tourists and tourist coaches frequent Brockman Hwy . Movement of heavy haulage vehicles carrying turbine blades etc will be a constant danger for traffic in this area . These issues are not a short -term inconvenience . Windfarms in Sth East Queensland Macintyre project that commenced construction 3 years ago are still moving blades and turbine parts too and from the sites while battling through the commissioning process Some for repair others first installation after years have of disruption for the community. Finally, the consultation process is inadequate when the size , impact and permanence .of this proposal is taken into account. I have spoken with many affected land owners who have had NO direct contact with Synergy. The DA doesn't summarise with any clarity the community feedback process or outline how the many concerns raised have been meaningfully addressed. I request that the Shire of Augusta Margaret River refuse the Synergy Development Application and suggest another site be selected where sensitive acid sulfate soil will not cause major long term irreparable issues as is the case in the Scott River area. This proposal is not suitable for the Scott River floodplain , the risk to community amenity, farming, water security and quality , environment , ecology and landscape character are intolerable. .

71	Object	My main objection to the proposal is the potential impact on the hydrology of the 4 aquifers located in this area arising from acid sulphate soil (ASS) development during construction of the project. I believe there is a significant risk of the project negatively impacting these aquifers. This damage may require substantial mitigation or even be irreversible. One of the aquifers, the Yarragadee, is a substantial source of underground water for the south west of WA. It is likely this aquifer will play an increasing role in water supply and there limited or no alternatives available. Ecologically and strategically, this system is of much higher priority than another renewable energy project such as a wind farm, which could be located in another less environmentally sensitive area. Previous mining activity at Beenyup has highlighted the difficulties in managing ASS and the fragility of the aquifer system. I do not believe that Synergy, an electrical energy provider, will have the skills or resources to manage this risk. The operator of Beenyup, BHP, one of Australia's largest mining companies, was challenged to control the ASS developed by the project. This project should not proceed in this location.
72	Object	I would like to see a workable solution to the wind farm proposal and the environmental impact. I am not a scientist, however neither are politicians and businessmen experts particularly when it comes to innovation a d new technology. Surely the environment deserves respect and protection over quick solutions and making a fast buck. Bad decisions can cause destruction to the harmony of our environment. Where are the guarantees that this won't happen.? Will digging down 5 metres bring minerals to the surface once again causing algal blooms killing the waterways? Lessons must be learnt from past mistakes. SA has recently experienced a catastrophic algal bloom!! Has anyone considered the French design Vortex Wind Generator. There are no moving blades, they oscillate silently to create electricity and require little maintenance, are safe for birdlife and are less visually intrusive. All of these factors have been raised as grounds to object the proposed wind farm. An article from the EU Corner's post explains they are compact and easy to transport and install. I ask that serious consideration be made into the above alternative. Should this design not be implemented i strongly object to the current proposal. At what point will notice be taken of individuals speaking with one voice.
73	Object	This area is a high-value tourism, nature and cultural landscape. The DA and supporting LVIA/Social Values materials currently fail to demonstrate that local social and visual values have been rigorously and independently assessed and that residual harms will be prevented or appropriately mitigated. The EPA referral public submissions (321 requesting PER) show significant public concern; ignoring that concern risks long-term damage to local amenity and community trust. The responsible course is independent reassessment and stronger, enforceable conditions — not a simple tick-off based on the proponent’s current reports.
74	Object	The Landscape and Visual Impact Assessment acknowledges high to moderate visual impacts across a majority of assessed viewpoints, based on a limited number of visual receptors - this is not acceptable. The Social Values Assessment reports that only two neighbouring property holders participated directly, which is insufficient to represent affected residents. Further independent assessment and precautionary conditions have to be considered.
75	Object	Taken together, the visual, social and noise evidence demonstrates that the DA does not adequately characterise residual risk or demonstrate that impacts can be avoided or acceptably mitigated. In a high-value landscape with significant community & visitor concern, this represents a material deficiency.

76	Object	My property is 5km from the project. We are going to be significantly impacted by noise, flashing lights and infrasound. Who is going to compensate us for loss of ammenity.? I am concerned about the carbon fibre shedding from turbine blades and contamination into the soil of the farming host and neighbouring land. This is disgraceful.
77	Object	I strongly object to the Scott River wind farm. It ruins the visual amenity of the Leeuwin Naturaliste Ridge. And places the whole waterway system of the Scott and Blackwood Rivers at risk.
78	Object	I own and rent a property close to the proposed site for the wind turbines. If this proposal is implemented, it will clearly impact the property's rental viability, tenant interest, and long-term value. Also, only some parts of wind farm units (wind turbines) are recyclable when they break down or reach the end of their life. However other components are much harder to recycle. My other related concerns are numerous. a) Biodiversity impacts: The Scott River area is environmentally sensitive, with rare flora, wetlands, and wildlife. Large turbines, access roads, and transmission lines will fragment habitats and disturb ecosystems. b) Wind farms pose collision risks, particularly for migratory birds and bats that use river corridors and coastal–forest systems. c) Construction of a wind farm in Scott River will affect fragile soils, wetlands, and water flows that support the river system and surrounding park. d) The Scott River National Park is protected for conservation, recreation, and nature connection. Nearby industrial-scale infrastructure may be seen as undermining the purpose of the park. Even if turbines are technically outside the park boundary, their visual and white noise pollution, and ecological effects will extend into protected areas. e) Wind turbines are tall and highly visible. I believe that they will significantly alter the natural, and aesthetically pleasing landscape surrounding the park- that presently makes this area so unique and should be preserved without disruptions. f) While noise and shadow flicker may be regulated, these will still impact nearby residents and visitors seeking quiet and solitude. The region is valued for bushwalking, camping, birdwatching, and low-impact tourism. There are concerns that industrial infrastructure will affect visitor experience and local tourism economies. g) The Scott River area holds deep cultural significance for Traditional Owners. Inadequate consultation or perceived risks to cultural sites is perceived as a major concern for emerging elders. h) In 1999, BHP prematurely closed its Beenup titanium mine in Scott River due to environmental issues regarding the exposure of acid sulphate soils. When disturbed or exposed to air, acid sulphate soils can release sulphuric acid and other heavy metals into surrounding water bodies and groundwater. While Synergy's EPA submission includes plans to neutralise the exposed acidic soil with lime treatment during construction to avoid contamination, the management plan has not allayed the serious concerns of some nearby farmers and landowners living close to the closed titanium mine in Scott River. FIND ANOTHER LOCATION NOT AT THIS FRAGILE ENVIRONMENT!!

79	Object	1. This is an inappropriate site to place wind turbines , an industrial project in full sight of such an iconic , historical town such as Augusta. WA has few beautiful tourism towns , compared to the rest of Australia . Trashing one of the few we have is not ideal. Is it because it is far away enough from the gaze of Perth Citizens ? Out of sight , don't look over there. 2. Noticeably , wind turbine projects are "falling over" Australia & world wide , before they even get to preliminary construction phase ,reason being , they are not economically feasible. Even with the massive subsidies thrown by government at prospective developers. I'm an experienced business consultant , I've seen companies walk away from projects that have failed or are failing without having to clean up their mess and remediate. What happens to these turbines then ? 3. Considering the number or power brown outs we suffer in Augusta , it is more than likely that forcing out base load power supply and relying on renewables is NOT going to improve reliability . We are already being advised by Synergy (State Government) that we need to turn down our air conditioners. The grid obviously can't handle it when the sun goes down. 4. What reason was given for the failure to proceed of the Bunbury offshore wind turbines? Too much "in your face " for the local electorate ? As long as they are not in the face of the locals at Gnarabup , then it's all good for the plant ! 5. This proposal and its lack of detail is contempt for the residents of Augusta and their visitors.
80	Object	Please do not let this project go ahead. The adverse impact on Augusta is enormous. I am totally against this unsubstantiated project.
81	Object	A wind farm positioned in direct view of Augusta must not go ahead. Visual pollution, effect on wild life, financial justification is based on risky assumption which would make the project totally unviable amongst other detrimental impacts.
82	Object	I write to formally object to the proposed wind farm development at Scott River. I am a resident of the Shire of Augusta Margaret River, although I do not live in close proximity to the proposed turbine locations. I regularly holiday in Augusta and the surrounding region and have long considered relocating permanently to Augusta in the future. The natural beauty, rural character, sense of space and peaceful environment are the primary reasons this area is so highly valued by both residents and visitors. My objection is based on the scale and industrial nature of the proposal and the significant impacts it would have on visual amenity, landscape character and community wellbeing. The proposed turbines are of a scale that would dominate the surrounding landscape and permanently alter the character of the Scott River and greater Augusta region. Turbines of this height and prominence are not compatible with the quiet rural and coastal environment that defines the area and attracts people to live, visit and invest here. Visual amenity is a key concern. The presence of multiple skyscraper-scale turbines would fundamentally change views from roads, rural properties and public spaces. Once erected, this visual impact would be permanent and irreversible. The loss of open horizons and natural landscapes would significantly diminish the enjoyment of the area for residents, visitors and future generations. I am also concerned about the potential health and wellbeing impacts associated with large-scale wind turbines, particularly in relation to noise, low-frequency noise and infrasound. While I do not live immediately adjacent to the site, I am concerned about the broader impacts on the community and the uncertainty surrounding long-term exposure. These concerns would directly influence my decision to ever

		relocate permanently to Augusta if the turbines were constructed. The Development Application seeks approval of a proposal that is not fully defined. Key details such as turbine numbers, locations, specifications and final impact assessments are yet to be confirmed. Approving a development of this scale without clear and finalised information does not provide confidence that impacts have been properly assessed or that the values of the region will be protected. Augusta and the Scott River region are special places. They are valued for their natural beauty, rural character, sense of peace and strong connection to the environment. Approving industrial infrastructure of this scale would undermine those values and change the identity of the area forever. For these reasons, I respectfully request that the Shire of Augusta Margaret River refuse the proposed Scott River Wind Farm and protect the unique character, amenity and wellbeing of the region for current and future generations.
83	Object	I write to formally object to the proposed wind farm development at Scott River. I am a resident of the Shire of Augusta Margaret River, although I do not live immediately adjacent to the proposed turbine locations. I regularly use the Scott River area for recreation, including boating, camping and enjoying the natural environment, and I am concerned about the impact this proposal would have on the amenity and character of the area. The Scott River is valued for its quiet, natural setting. The introduction of large-scale wind turbines so close to the river and surrounding recreational areas raises serious concerns about ongoing noise, low-frequency noise and visual intrusion. Even where turbines comply with standard audible noise limits, experience elsewhere indicates that turbine noise can carry over long distances, particularly at night and in rural environments, diminishing the peaceful character of natural areas. The presence of turbines of this scale would also alter the experience of using the river and surrounding campsites. The constant movement of blades, aviation lighting and industrial character of the infrastructure would detract from the sense of remoteness and tranquillity that draws residents and visitors to the area for recreation. The application does not adequately demonstrate that noise and amenity impacts on recreational users and river-based activities have been properly assessed or will be effectively managed, particularly given that turbine locations and specifications are not finalised. For these reasons, I respectfully request that the Shire of Augusta Margaret River refuse the proposed Scott River Wind Farm, or at a minimum ensure that the Scott River and surrounding recreational areas are protected from noise, visual and amenity impacts.
84	Object	Wind farms are a great source of renewal energy but need to be located in areas that are not home to native species and wildlife. The location needs to take our irreplaceable native plants and animals into consideration and be situated where it will no little or no impact. The noise level and height of the turbines also should be modified to decrease the noise produced by the turbine activity. It should have little or no impact on the people, wildlife and buildings in the area. All negative factors should be taken into account prior to building the wind farm and not just decided during the process. We need a full breakdown of position, height, noise levels, impact on people and wildlife prior to the final decision about this

85	Object	I write to formally object to the proposed wind farm development at Scott River. My objection is based on the scale and nature of the proposal, the lack of sufficient detail in the Development Application to allow proper assessment, and the significant and long-term impacts the development would have on the environment, groundwater and acid sulfate soils, visual amenity, rural character, community wellbeing, and future land use in the Scott River and Augusta region. The Development Application seeks approval of a largely conceptual proposal. Key elements—including the number, location, height and specification of turbines, construction methodology, dewatering and water management arrangements, and environmental safeguards—have not been finalised. As a result, the application does not provide a reliable basis for assessing worst-case impacts or for imposing effective and enforceable conditions on a development that would operate for several decades. I am also concerned about the cumulative effects of this proposal on the natural landscape, biodiversity, rural amenity, tourism values, and the long-term viability and use of surrounding land. The scale of the turbines proposed is unprecedented in this setting and would fundamentally alter the character of the area. Further, the consultation process to date has not provided affected landowners or the wider community with clear, complete and accessible information about the proposal or its consequences. Without a detailed and transparent design, the community cannot meaningfully assess or respond to a development that has the potential to permanently change the region. For these reasons, and for the detailed concerns set out below, I request that the Shire of Augusta Margaret River does not support the proposed wind farm in its current form.  2. Incomplete and Conceptual Nature of the Development Application The Development Application is lengthy but lacks sufficient detail to be properly assessed. The developer (Synergy) has not finalised: • the number of turbines, • turbine locations, • turbine height, model, operating parameters or colour, • construction methodology, • foundation design and excavation depth, • dewatering volumes or management methods, or • environmental management and rehabilitation measures. The developer advises that these matters will be resolved at a later stage. This approach is wholly inadequate for a development of this scale and longevity. Council would not approve even modest commercial or residential developments without detailed and finalised design information, and this proposal should not be treated differently.

		 3. Groundwater, Water Table and Hydrogeological Impacts The likely effects of the project on groundwater systems and groundwater-dependent ecosystems are not adequately assessed. Large-scale excavation, piling and trenching will be required, with associated dewatering. These activities have the potential to alter groundwater flow paths and water table levels, with long-term impacts on aquifers, surface waters, wetlands, drains, dams, bores and groundwater-dependent vegetation. The Development Application does not include a thorough, independent hydrogeological assessment demonstrating: • baseline groundwater conditions, • surface–groundwater interactions, • predicted impacts from excavation and dewatering, • cumulative impacts across the site, or • enforceable monitoring, trigger levels and response measures. Without this information, Council cannot responsibly assess environmental risk.  4. Acid Sulfate Soils – High Consequence Environmental Risk Acid sulfate soils (ASS) are a known and serious risk in the Scott River area. When ASS are exposed through excavation or groundwater drawdown, sulfuric acid and heavy metals can be released, causing: • acidification of soils and surface waters, • vegetation loss, • contamination of waterways and agricultural water supplies, and • long-term environmental damage. The application lacks: • a site-specific ASS investigation, • a detailed dewatering and ASS management plan, • defined monitoring and trigger levels, and • a credible emergency response framework. Reliance on generic mitigation measures or post-approval plans is unacceptable given the high-consequence nature of ASS disturbance.

		 5. Scale of Earthworks and Dewatering Despite the absence of final design detail, the proposal indicates: • approximately 30 km of onsite access roads, • approximately 30 km of trenching for underground cables, • turbine foundations requiring excavation of approximately 2,000 tonnes per turbine to depths of at least 5 metres, • potential remediation increasing excavation by ~500 tonnes per turbine and depths exceeding 7 metres, • significant dewatering requirements, and • no identified dam or method for managing dewatering volumes. This represents a substantial disturbance of soils and groundwater in a sensitive environment, without adequate assessment or safeguards.  6. Visual Impact and Loss of Rural Character The visual impact of the proposed development would be severe, long-lasting and unacceptable. The turbines and their blades will exceed the height of Perth's tallest buildings, including QV1 and Central Park. The presence of multiple skyscraper-scale structures in a rural landscape would devastate visual amenity, property enjoyment and rural character for decades. The scale and siting of the turbines will dominate views from private properties, roads and public spaces, fundamentally altering the character of the area and reducing enjoyment and privacy. 6.1 Inadequate Visual Assessment It is extremely difficult to comprehend the true scale of 220–230 metre turbines. The photomontages provided are limited, selective and oriented to depict best-case scenarios. They do not show key viewpoints from private properties, approach roads or public vantage points, nor do they adequately assess worst-case or cumulative impacts. 6.2 Sterilisation of Surrounding Land Approval of this development would effectively sterilise neighbouring land uses for the remainder of the century. The presence of turbines would constrain future rural, tourism and residential development on surrounding properties. I cannot identify any other development in the Shire with such a significant offsite sterilising effect.

		7. Planning Scheme and Visual Amenity The proposal does not comply with the intent of the Shire's Town Planning Scheme. Clause 5.13.3 allows wind turbines only where they are designed and sited so as not to detract from the visual amenity of the locality. The proposed turbines will be dominant, intrusive and visually overwhelming. Even the developer acknowledges visual detriment in its documentation. On this basis alone, the proposal fails the Scheme's visual amenity test. 8. Noise, Disturbance and Shadow Flicker I am concerned about continuous turbine noise, particularly at night, and the risk of sleep disturbance and reduced amenity for nearby residents. The application does not demonstrate that noise impacts will be acceptable, particularly given that turbine specifications and operating parameters are not finalised. The proposal also lacks a robust, site-specific assessment of shadow flicker impacts and enforceable mitigation measures. Experience elsewhere in Australia demonstrates that assurances of "no offsite impacts" are often not realised once projects are operational. 9. Wildlife and Environmental Values The proposal is located near habitats used by birds, bats and other wildlife. The environmental assessment does not adequately address strike risk, habitat disruption, cumulative impacts, or the potential effects of noise, vibration and groundwater disturbance on fauna and flora. Given the ecological sensitivity of the area, a precautionary approach is required. 10. Traffic, Access and Construction Impacts

		Construction will involve heavy vehicles and oversized loads on rural roads not designed for such traffic. The application lacks sufficient detail on access routes, timing, staging, dust control, noise mitigation and road safety measures. These impacts will significantly affect residents, farmers, local businesses and visitors.  11. Consultation and Community Concerns The developer claims that consultation has occurred and has been adequate. As an affected landowner, I have not been consulted directly. The Development Application does not clearly document community feedback or demonstrate how concerns have been addressed. Consultation must be meaningful, transparent and responsive. This has not occurred, and the deficiencies are compounded by the absence of final design information.  12. Economic and Environmental Benefit Not Demonstrated The application does not identify any clear economic benefit to the region and is silent on potential impacts to tourism and land values. Claims of up to 200,000 tonnes per annum of CO_2 savings are not substantiated. No evidence is provided as to what facility, in what location, will reduce emissions by this amount. Without this information, Council is being asked to accept environmental harm without demonstrated benefit. There is too much documented evidence that the site at the Scott River is not suitable for such a project. I request the shire rejects the application and recommends that the RDAP reuse the application
86	Object	I write to formally object to the proposed wind farm development at Scott River. My objection is based on the scale and nature of the proposal, the lack of sufficient detail in the Development Application to allow proper assessment, and the significant long-term impacts the development would have on the environment, groundwater and acid sulfate soils, visual amenity, rural character, community wellbeing and future land use in the Scott River and Augusta region. The Development Application seeks approval of a largely conceptual proposal. Key elements—including the number, location, height and specification of turbines, construction methodology, foundation design, dewatering volumes and environmental management measures—have not been finalised. As a result, the application does not provide a reliable basis for assessing worst-case impacts or for imposing

		effective and enforceable conditions on a development that would operate for several decades. The proposal poses serious environmental risks. Large-scale excavation, trenching and turbine foundations will require piling and dewatering, with the potential to alter groundwater flow paths and water table levels. The Scott River area is known to be sensitive, with shallow groundwater and acid sulfate soils. Disturbance of these soils through excavation or groundwater drawdown can generate sulfuric acid and mobilise heavy metals, causing long-term damage to soils, waterways, vegetation and agricultural water supplies. The application lacks a site-specific acid sulfate soil investigation, a detailed hydrogeological assessment, and a robust dewatering and management plan with monitoring, trigger levels and emergency responses. The scale of earthworks is substantial, including approximately 30 km of onsite roads, 30 km of cable trenching, and turbine foundations involving thousands of tonnes of excavation per turbine, potentially exceeding 7 metres in depth. Despite this, no clear method is identified for managing dewatering volumes or mitigating cumulative impacts across the site. Visual impact is a major concern. The proposed turbines would exceed the height of Perth's tallest buildings and introduce multiple skyscraper-scale structures into a rural landscape. This would fundamentally alter the character of the area, dominate views from surrounding properties and roads, and cause long-term loss of amenity. The photomontages provided are limited and do not adequately convey the true scale, worst-case or cumulative visual impacts. Approval of this development would also effectively sterilise surrounding land, constraining future rural, residential and tourism uses for decades. The proposal does not demonstrate compliance with the intent of the Shire's Town Planning Scheme, which requires wind turbines to be designed and sited so as not to detract from visual amenity. Even the developer acknowledges that the turbines will have significant visual impacts. Noise, shadow flicker and general disturbance have not been adequately assessed, particularly given the absence of final turbine specifications. The application does not provide confidence that impacts on nearby residents will be acceptable or enforceably managed. Community consultation has been inadequate. Many affected landowners report no direct engagement, and the application does not clearly document community feedback or demonstrate how concerns have been addressed. Finally, the application fails to demonstrate clear economic or environmental benefit to offset these impacts. Claims of up to 200,000 tonnes per annum of CO_2 savings are unsubstantiated, with no explanation of how or where such reductions would occur. The proposal is silent on impacts to tourism and land values. For these reasons, I respectfully request that the Shire of Augusta Margaret River refuse thisapplication and recommend the RDAP refuse the application.
87	Object	I am writing to formally object to the proposed wind farm at Scott River. I request that the Shire of Augusta Margaret River rejects the project, and I have detailed my concerns below. My main objection is the visual amenity and the significant, adverse effect this development would have on the area if it is supported.

		It is extremely hard to perceive what a 220-230 meter high turbine would look like, and I note that all of the photomontages attached to the Development Application seem to have an incorrect scale, and are deliberately oriented to show a best case scenario. I am also concerned that the Town Planning scheme at Section 5.13 and other areas does not provide for this type of development and rightly so. Structures are generally limited to height of between 6-11 meters in the Shire, under the Town Planning Scheme and exemptions to the height restrictions are provided for in limited circumstances. However, clause 5.13.3 states: 'For the purpose of clause 5.13.1 above, a building or structure does not include reference to a chimney, mast, satellite dish (not exceeding a diameter of 4 metres), pole, wind turbine or signal receiving or transmitting tower provided that the structure or facility is designed, sited and/or treated so as not to detract from the visual amenity of the locality'. The proposed turbines height, scale, and siting, will be a dominant and intrusive feature in views from my home, business and the town, and fails the test above. Synergy as the developer also admits it will detract from the visual amenity in their submission. The development will substantially alter the rural character of the area, replacing open countryside and skyline with large industrial structures that are out of scale and out of place with the surrounding built and natural environment. The application documents do not demonstrate that the visual impact has been minimised., in fact they recognise there will be significant and long lasting impacts to the environment, and this comes with no economic benefit what so ever. The photomontages and visualisations provided are limited in number, and selective in viewpoint, and do not show key vantage points from my property, the main approach roads, or public vantage points used by local residents. The cumulative visual impact has not been properly assessed and is overwhelming to the surrounding landscape. Turbines visible from private properties and living spaces will diminish the amenity and value of outdoor areas and the enjoyment of views that residents have relied upon for many years. This visual pollution is a permanent change to the landscape that cannot be supported. I am concerned that the developer has not even provided us with the full picture, they have not finalised the number of turbines, the locations, the height, or even the colour. How can a development this large be allowed to go ahead with so little detail ? The council would not support the most basic of commercial or large residential properties unless sufficient design, colour and amenity was addressed. Why do these big developers think they can get away with it, and they should be told to go away and do their homework first. The application does mention any economic benefit to the area, and is silent on the detriment to land values and the regions from a tourism perspective. I therefore request that the Shire reject the proposal entirely. Please confirm receipt of this objection and ensure it is placed on the public record and considered in the planning determination. I wish to be notified of any hearings or decisions relating to this application.
88	Object	I am writing to formally object to the proposed wind farm at Scott River, which is located approximately (900meters) from my home at (address). I request that the Shire of Augusta Margaret River reject any support for the project in its current form, and I have detailed my concerns below.

		1 General Nature of the Development Application The Development Application is very long however it lacks sufficient detail to assess properly. The developer Synergy does not currently know the number of turbines, the location of the turbines, the height of the turbines, or have a detailed construction and operations plan in place. Instead, they advise the public that this will all be worked out later. This appears to be wholly inadequate for a development like this which will have such a profound and long lasting impact on the region. Council should not support an application with a full detailed design first taking place. 2. Visual impact The proposed wind turbines will be highly visible from my property and the surrounding locality. Is the council aware that the wind turbines and their blades will exceed the height of Perth's tallest buildings such as QV1 and Central Park? Having, up to 20 skyscraper sized structures so close to my property would have a devasting impact on the value, amenity and enjoyment of my property. The rural character of the area would be devastated for 60 years. The scale and siting of the turbines will dominate views from my property, reducing the enjoyment and privacy I and other residents currently enjoy. Further while the development appears to be getting assessed on current land use and density, approving any such development will effectively 'sterilise' adjoining and neighbouring properties land use for the rest of this century. How can I or anyone else further develop our properties in the shadow of such significant and imposing assets. 3. Noise and disturbance I am concerned about the potential for continuous noise and sounds from the turbines, particularly during the night. The proximity of the development raises the risk of disturbing sleep and daily life for nearby residents. The application does not provide sufficient evidence that noise impacts will be within acceptable for homes this close to the site, especially given that they design has not yet been finalised. In addition, the application does not address the growing evidence and community concerns across Australia. There appears to be a number of projects in the eastern states where developers have assured the public there will be no offsite impacts, only for the community to realise these were false promises post construction. 4. Shadow flicker Given the orientation and distance of the nearest proposed turbines, there is a risk of shadow flicker affecting my property at certain times of year. The application lacks a clear, site-specific assessment and effective mitigation measures to prevent or minimise this effect. 5. Impact on wildlife and local environment The proposed development is close to habitats used by local wildlife. I am concerned about potential impacts on birds, bats, and other species, and I believe the environmental assessment submitted is insufficiently detailed for a development of this scale. 6. Restrictions on future development The application does not adequately consider cumulative impacts with other future developments in the area. The combined effect on the landscape, and local character has not been properly assessed. How would the council deal with any further developments adjacent to the proposed wind farm – I suspect by not approving further land uses due to the turbines being in place. I cannot think of any developments in the Shire that would have such a 'sterilising' effect on future offsite developments. 7. Access, traffic and construction impacts Construction will require heavy vehicle movements and temporary works that will affect local roads, safety, and amenity. The application

		provides no detail on the proposed access routes, timing of works, and measures to protect residents from dust, noise, and disruption during construction. 8. Consultation and community concerns Synergy advises that there has been community consultation, rubbish. There has been very little and for such a large scale development the shire needed to have enforced synergy to have contact with all residents not just a casual drop in session. The application does not address what the community feedback has been – which we understand to be mainly against the development, and is inadequate. There is no evidence that the concerns of the community have been addressed. I request that the council refuse the application.
89	Object	Subject: Formal objection to planning application (reference number) for the proposed Wind Farm in Scott River. Dear Tessa I am writing to formally object to the proposed wind farm development at Scott River. on the specific grounds of environmental harm, disturbance of acid sulfate soils, and adverse impacts on the local water table and groundwater-dependent ecosystems. The developer (Synergy) has provided some generic information on the proposed devolvement however with the design not being completed it is unclear where the turbines will be going, how many there are, how they will be constructed and how water will be managed at the site. Environmental Impacts The project's likely effects on groundwater and connected ecosystems is not adequately assessed. Large-scale excavations will be required for these turbines, and piling and dewatering during the construction phase can change groundwater flow paths and levels, with potential long-term impacts on aquifers and groundwater-dependent ecosystems in the area. These impacts require a thorough, independent hydrogeological assessment that demonstrates the impacts on the local ecosystem. Acid sulfate soils (ASS) are a serious concern for this area. When ASS are exposed to air through excavation or lowered water tables they can generate sulfuric acid and mobilise iron, aluminium and heavy metals, causing severe acidification of soils and surface waters, vegetation loss, and infrastructure damage. Dewatering and earthworks can trigger ASS risks unless strict, site-specific controls are implemented. The application before the council lacks a clear, site-specific ASS investigation and a robust dewatering management plan that commits to monitoring, trigger levels, and emergency responses. There is also no information about how construction and operations will affect the local water table and surface–groundwater interactions. While there is a lack of detailed information in the Development Application we note that the project has: • Approximately 30km of onsite roads, • 30km of trenching for underground cables, • Foundations that would be a minimum 5m deep circa 2000 tonnes of excavation, for each turbine • Additional soil remediation if required could increase this by an additional 500 tonnes per site and the depth to in excess of 7m, • Significant dewatering requirements, and • No dam or other method identified of managing the dewatering volumes.

		Economic and Environmental Benefit The developer has not identified any economic benefit that will be brought to the region. The developer claims that up to 200,000 tonnes per annum of CO2 emission will be saved, but does not provide any evidence as to how and where these saving will be realised. The developer must disclose what facility in what location will now reduce its emissions by 200,000 tonnes per annum. If no information is provided then the Council is left weighing the detriment to the environment against no economic or environmental benefit and therefor the proposal should not be supported. I request the shire listen to concerns and recommend the RDAP refuse the application.
90	Object	I write to formally oppose the proposed wind farm at Scott River. My objection is based on the scale and nature of the proposal, the lack of sufficient detail in the Development Application to enable proper assessment, and the significant and long-term impacts the development would have on the environment, groundwater and acid sulfate soils, visual amenity, rural character, community wellbeing, and future land use in the Scott River and Augusta region. The Development Application seeks approval of a largely conceptual proposal. Key elements—including the number, location, height and specification of turbines, construction methodology, dewatering and water management arrangements, and environmental safeguards—have not been finalised. As a result, the application does not provide a reliable basis for assessing worst-case impacts or for imposing effective and enforceable conditions on a development that would operate for several decades. I am also concerned about the cumulative effects of this proposal on the natural landscape, biodiversity, rural amenity, tourism values, and the long-term viability and use of surrounding land. The scale of the turbines proposed is unprecedented in this setting and would fundamentally alter the character of the area. Further, the consultation process to date has not provided affected landowners or the wider community with clear, complete and accessible information about the proposal or its consequences. Without a detailed and transparent design, the community cannot meaningfully assess or respond to a development that has the potential to permanently change the region. For these reasons, and for the detailed concerns set out below, I request that the Shire of Augusta Margaret River does not support the proposed wind farm in its current form.  2. Incomplete and Conceptual Nature of the Development Application

		The Development Application is lengthy but lacks sufficient detail to be properly assessed. The developer (Synergy) has not finalised: • the number of turbines; • turbine locations; • turbine height, model, operating parameters or colour; • construction methodology; • foundation design and excavation depth; • dewatering volumes or management methods; or • environmental management and rehabilitation measures. The developer advises that these matters will be resolved at a later stage. This approach is wholly inadequate for a development of this scale, duration and consequence. Council would not approve even modest commercial or residential developments without detailed and finalised design information, and this proposal should not be treated differently.  3. Groundwater, Water Table and Hydrogeological Impacts The likely effects of the project on groundwater systems and groundwater-dependent ecosystems have not been adequately assessed. Large-scale excavation, piling and trenching will be required, with associated dewatering. These activities have the potential to alter groundwater flow paths and water table levels, with long-term impacts on aquifers, surface waters, wetlands, drains, dams, bores and groundwater-dependent vegetation. The Development Application does not include a thorough, independent hydrogeological assessment demonstrating: • baseline groundwater conditions; • surface–groundwater interactions; • predicted impacts from excavation and dewatering; • cumulative impacts across the site; or • enforceable monitoring, trigger levels and response measures. Without this information, Council cannot responsibly assess environmental risk.  4. Acid Sulfate Soils – High-Consequence Environmental Risk Acid sulfate soils (ASS) are a known and serious risk in the Scott River area. When ASS are exposed through excavation or groundwater drawdown, sulfuric acid and heavy metals can be released, causing:

		• acidification of soils and surface waters; • vegetation loss; • contamination of waterways and agricultural water supplies; and • long-term environmental damage. The application lacks: • a site-specific ASS investigation; • a detailed dewatering and ASS management plan; • defined monitoring and trigger levels; and • a credible emergency response framework. Reliance on generic mitigation measures or post-approval plans is unacceptable given the high-consequence nature of ASS disturbance.  5. Scale of Earthworks and Dewatering Despite the absence of final design detail, the proposal indicates: • approximately 30 km of onsite access roads; • approximately 30 km of trenching for underground cables; • turbine foundations requiring excavation of approximately 2,000 tonnes per turbine to depths of at least 5 metres; • potential remediation increasing excavation by approximately 500 tonnes per turbine and depths exceeding 7 metres; • significant dewatering requirements; and • no identified dam or method for managing dewatering volumes. This represents a substantial disturbance of soils and groundwater in a sensitive environment, without adequate assessment or safeguards.  6. Visual Impact and Loss of Rural Character The visual impact of the proposed development would be severe, long-lasting and unacceptable. The turbines and their blades will exceed the height of Perth’s tallest buildings, including QV1 and Central Park. The introduction of multiple skyscraper-scale structures into a rural landscape would devastate visual amenity, property enjoyment and rural character for decades.

		The scale and siting of the turbines will dominate views from private properties, roads and public spaces, fundamentally altering the character of the area and reducing enjoyment and privacy. 6.1 Inadequate Visual Assessment It is extremely difficult to comprehend the true scale of 220–230-metre turbines. The photomontages provided are limited, selective and oriented to depict best-case scenarios. They do not show key viewpoints from private properties, approach roads or public vantage points, nor do they adequately assess worst-case or cumulative impacts. 6.2 Sterilisation of Surrounding Land Approval of this development would effectively sterilise neighbouring land uses for the remainder of the century. The presence of turbines would constrain future rural, tourism and residential development on surrounding properties. I cannot identify any other development in the Shire with such a significant offsite sterilising effect. 7. Planning Scheme and Visual Amenity The proposal does not comply with the intent of the Shire's Town Planning Scheme. Clause 5.13.3 permits wind turbines only where they are designed and sited so as not to detract from the visual amenity of the locality. The proposed turbines will be dominant, intrusive and visually overwhelming. Even the developer acknowledges visual detriment in its documentation. On this basis alone, the proposal fails the Scheme's visual amenity test. 8. Noise, Disturbance and Shadow Flicker There is a significant risk of continuous turbine noise, particularly at night, resulting in sleep disturbance and loss of amenity for nearby residents. The application does not demonstrate that noise impacts will be acceptable, especially given that turbine specifications and operating parameters are not finalised. The proposal also lacks a robust, site-specific assessment of shadow flicker impacts and enforceable mitigation measures. Experience elsewhere in Australia demonstrates that assurances of "no offsite impacts" are often not realised once projects are operational.

		9. Wildlife and Environmental Values The proposal is located near habitats used by birds, bats and other wildlife. The environmental assessment does not adequately address strike risk, habitat disruption, cumulative impacts, or the potential effects of noise, vibration and groundwater disturbance on fauna and flora. Given the ecological sensitivity of the area, a precautionary approach is required.  10. Traffic, Access and Construction Impacts Construction will involve heavy vehicles and oversized loads on rural roads not designed for such traffic. The application lacks sufficient detail on access routes, timing, staging, dust control, noise mitigation and road safety measures. These impacts will significantly affect residents, farmers, local businesses and visitors.  11. Consultation and Community Concerns The developer claims that consultation has occurred and has been adequate. As an affected landowner, I have not been consulted directly. The Development Application does not clearly document community feedback or demonstrate how concerns have been addressed. Consultation must be meaningful, transparent and responsive. This has not occurred, and the deficiencies are compounded by the absence of final design information.  12. Economic and Environmental Benefit Not Demonstrated The application does not identify any clear economic benefit to the region and is silent on potential impacts to tourism and land values. Claims of up to 200,000 tonnes per annum of CO_2 savings are unsubstantiated. No evidence is provided identifying what facility, in what location, will reduce emissions by this amount. Without this information, Council is being asked to accept environmental harm without demonstrated benefit.

		I did not purchase in Augusta to be looking at wind turbines. A project that has such visual affects needed consultation from this shire. There has been none. I expect the shire to listen to the affected residents with all the concerns and not residents in the centre of Margaret River with their ideologies. Turbines can be placed on Gnarabup Hill for those that want it. Could this submission be made publicly available with personal details redacted. Please confirm receipt
91	Support	
92	Object	I've been a landholder at the Scott River for over 40 years. I've been visiting or working on the Scott River area for 58 years. I hosted a wind monitoring tower for 8 years from early 2000 on. My acquired knowledge of the potential harm turbines could do to the Scott River eco system has prevented me from accepting Synergy's offer to host turbines for them. This was worth approx. $170,000/ yr. From the outset Synergy have been elusive and deceptive about their plans. Anyone with half an ounce of common sense could see the flimsy detail in the Development Plan they submitted. So little detail- where are the turbines being sited exactly- not yet decided. What type of footings are to be used - we might use 1 of the 3 models listed. So few exploratory holes drilled. Most less the 2m. What are they playing at? A building permit requires detail down to almost the last tec screw, yet Synergy's DA is so loose it fails to define exactly what they propose to do despite the fact it is a project on a scale this Shire has never seen before, that is likely to affect businesses, the environment, wetlands and people's health. BHP drilled 100's of exploratory holes and even then didn't discover what beat them. BHP had the best geologists money could buy and expert engineers yet despite all their knowledge and skills Mother Nature beat them, forcing the closure of their mine site which is in the same location as this proposed wind farm. Yet Synergy DOESN'T have that sort of expertise and they think they can manage the situation. BHP thought they could manage it too. The partners who own 80.1% of this project are only there for the MONEY. They have no interest in the fragile environment in which they'll be constructing. Just the MONEY is too good to pass up. Unfortunately, by the time it's discovered they have harmed this area it's TOO LATE. Dams dug on the Scott River plain to water livestock have been known to turn toxic due to acid sulphates and cattle have been severely impacted and would have most certainly have died but for rapid intervention. There are 4 aquifers underlying the Scott River Plain. One of these is pressurised meaning no pumps are required to flow water to cattle troughs for drinking purposes. We have one such bore which was drilled in the 1950's and has maintained its pressure ever since. This water comes from a bore 6m deep.

		Synergy needs to put turbine footings down to 10-15m deep. How with they manage that without rupturing the pressurised aquifer. The Scott River depends on that water also. Then comes the MAJOR PROBLEM and that is Shire Staff and Shire Councillors will be making positions about this project whilst most have never been on site at the Scott River. Who will advocate for the Quokkas, Quendas, Possums, Black Swans, Red Tailed and Baudins Cockatoos and the most elegant and threatened Spoonbill??? Certainly not Shire Staff or Councillors or Nature Conservation Margaret River or Augusta Margaret River Community Clean Energy or local environmentalists. The silence has been deafening! Synergy has curbed their ability to speak out with confidentiality clauses tied to their inducements. In fact, they all have a Conflict of Interest. Renewable energy has a place but the Scott River has many unique features pertaining to it – Acid Sulphate Soils, Aquifers, River Systems, Threatened Ecological Species [with a Federal Govt Covenant], Unique fauna and Conservation Reserves, Wetlands and Diverse bird life that make it very different to other wind farm sites. Some things ought not be sited in certain locations. Would you allow a brothel near a school? NO! Then it follows, turbines ought not to be built on this ultra sensitive eco system at Scott River.
93	Support	No one wants electrical infrastructure in their backyard but we have to make the shift to renewable energy and away from polluting fossil fuels. Solar and wind power are the best options presently and we need them where they are most effective i.e. wind farms where it is windy so I support the proposal.
94	Object	We are long-term local residents of Courtenay who have invested our life savings into developing our Scott River property. In 2021 we bought our dream farm in the area, after selling our previous neighboring residence as a result of ongoing noise impacts from limetrucks on Brockman highway. We spent the first year of owning the property undertaking infrastructure upgrades, understanding the differing features on the land, before settling on the locations to build our house, and agritourism dreams. We entered into a building contract for our dream home in February 2022 and received approval from the shire in September 2023 with development commencing shortly after. At the same time we continued to work with architects to design chalets for our property. These chalets were approved by the Shire in September 2024. In January 2023 representatives from synergy met with us on our property to let us know they were considering a windfarm development nextdoor. They verbally guaranteed it would be small scale, with only 1 turbine intended for the very southeast corner on the property adjacent to us, in the location of WTG6 of the proposal (approximately 2.8km from our chalets). These representatives communicated they were aware of our house site, and we explained and showed them the location we would be building our chalets. In this conversation they promised the design the project to ensure no development buffers would be included within our property, and offered to complete baseline noise monitoring and visual impact assessments at our house and chalet sites to mitigate our nerves. Consultants took photographs from our property in the weeks that followed to do the visual renders of what the wind turbines will look like. A noise monitor was never installed. In early 2023, we had multiple conversations with Rowan and Whitney from Synergy. During these discussions, they offered us a restrictive “neighbour agreement” and suggested we relocate our approved chalets or even move or redesign our home. We sought

		advice from our builder, who confirmed that altering or revoking our contract would cost approximately $100,000. We asked Synergy if they would cover these costs, they refused. As a result, we made it clear that we would proceed with our plans as approved, declined to sign any restrictive agreement, and requested instead that Synergy ensure no part of our property was included within their development buffer or footprint. This was verbally agreed, with Synergy stating that the only turbine on our neighbour's property would be positioned in the south-eastern corner, well back from our boundary. You can imagine our shock when reviewing the documentation associated with this development approval, that there are now 3 turbines intended to be installed on our neighbours property, with the closest now intended to be only 1.2km from our approved chalets. Adding to our dismay synergy although very aware of our intentions for our property and having had transparent communication on the location of our chalet development have excluded these approved sensitive dwellings from all feasibility documentation, even though we gave them maps and exact locations and shared our development approval with them prior to the feasibility assessments being completed. This proposal would profoundly alter the outlook, amenity, safety, and viability of our home and tourism venture. We invite elected members, DAP decision makers, and Shire officers to visit our property (by appointment) to understand the terrain, aspect, and proximity of turbines to our dwelling and chalet sites, and the implications for noise, visual impact, telecommunication reliability, and fire response. We object to the proposed SynergyRED Scott River Wind Farm and request refusal on planning, amenity, and risk grounds. If not refused, we seek strict conditions to avoid, minimise, and fully mitigate impacts, with clear accountability to the proponent for costs where services or amenity are affected. Our property includes one of the identified 33 impacted dwellings along with approved tourist chalets 1.2 km from WG11, conveniently excluded in the developed application. Synergy had documented awareness of our approved chalet locations from project inception yet excluded them from 'sensitive receptor' assessments, despite our ability to commence construction immediately. This omission undermines the credibility and completeness of the DA and the public interest test. Beyond procedural gaps, the proposal poses unacceptable risks in noise (likely exceedances above WA thresholds at our house/chalets), electromagnetic interference (EMI) to already marginal mobile services, visual dominance (250 m turbines immediately opposite and uphill), fire safety risks, and consultation shortcomings inconsistent with WA guidance. The EPA's 'not assess' decision under Part IV of the EP Act does not replace proper planning scrutiny of amenity, noise, EMI, layout buffers, and social values, matters squarely within the DAP remit. Sensitive Receptors Omitted (Approved Chalets @ 1.2 km from WG11) Our approved chalets (tourism accommodation) at ~1.2 km from WG11 are noise-sensitive premises for planning and noise regulation purposes. They were excluded from the DA's sensitive receptor assessments despite Synergy acknowledging (in correspondence we hold) that it knew our approved locations from inception. WA planning expects complete identification and assessment of sensitive land uses; excluding approved chalets capable of immediate construction biases the noise, visual, and social values analyses and misleads decision-makers (AMR Shire DAP/RAR process; WAPC Position Statement). Remedy sought: Require Synergy to re-run all assessments (noise, EMI, visual, social values) including our approved chalets and our

		dwelling, with conservative assumptions and worst-case ground cover/status. Telecommunication/EMI Risk and Accountability Synergy's documents acknowledge potential electromagnetic interference (EMI) to mobile phones in areas with low coverage and in close proximity to turbines, which describes Scott River. Australian wind-farm EMI assessments (e.g., Willatook EES; Uungula EMI Study; Brewster EMI) show turbines can reflect/obstruct radio signals (mobile, microwave, broadcast), with mitigation requiring pre- and post-construction signal-strength surveys and rectification at the proponent's cost. Community wind guidance (C4CE) outlines that EMI exclusion zones must be mapped (ACMA licenses within 20–30 km) and siting adjusted to protect services; if issues occur, the proponent must rectify. Condition requested (if approved): • Baseline and post-construction signal-strength testing at our house and chalet sites; • Mandatory rectification by Synergy for any degradation (boosters/repeaters/antenna works or network upgrades), with bond/financial assurance to guarantee timely resolution—irrespective of baseline monitors being on our property. Noise—Likely Exceedances and Methodology Concerns DWER's Environmental Protection (Noise) Regulations 1997 set legal standards at sensitive premises; DWER is actively reviewing wind-farm noise management via its Wind Farm Noise Reform work. Synergy refused us baseline noise data and placed no monitors on our property, yet modelling reportedly shows, in most scenarios other than the lowest windspeed case, predicted noise at our dwelling and chalet sites exceeding 35 dB. The model assumes current blue-gum plantation height for ground attenuation rather than worst-case (post-harvest), uses 5 m contours over complex upwind/uphill terrain, and has not been stress-tested against exposure from our house facing the array. Further, the only baseline monitor was placed in the north-west quadrant adjacent to a working farm shed on a property set to benefit from the proposal. This raises serious concerns about impartiality and accuracy from the outset and undermines confidence in the modelling. WA Energy Policy references WHO's guideline of ≤ 45 dB Lden to minimise health impacts; many jurisdictions require conservative modelling and post-construction compliance verification with operational curtailment if required. Remedies/conditions sought (if approved): • Updated noise modelling including our approved chalets and dwelling using worst-case ground cover (post-harvest), refined terrain, and turbines at maximum height (250 m); • Independent compliance testing at our receptors during worst-case meteorology, with transparent data sharing; • Operational curtailment triggers to maintain legal compliance at sensitive premises; and no reliance on neighbour agreements to dilute compliance at non-involved properties. Setbacks & Buffers—Conservative Distances Are Required The DA proposes up to 20 turbines at heights of up to 250 m within a large envelope; turbine procurement is not finalised, which demands conservative setbacks. WA's Position Statement: Renewable Energy Facilities and local policies (e.g., West Arthur LPP No. 5; Wagin draft) emphasise minimising amenity impacts through adequate setbacks, visual sensitivity, and engagement. Australian commentary

		notes that as turbine size increases, buffers must extend beyond the commonly cited ≥ 1.5 km, with calls for 2 km or more for towers approaching 250–300 m. Importantly, the Joint Development Assessment Panel (JDAP) has set a clear precedent: in decision RDAP/74 (15 November 2022, Two Rocks Wind Farm), JDAP imposed a minimum setback of no less than 1.8 km from the nearest approved sensitive noise receptor. That project involved smaller turbines than proposed here, reinforcing that a precautionary approach is essential where turbine heights exceed 200 m and procurement details remain uncertain. Further, RDAP/74 also required Electromagnetic Interference (EMI) testing pre- and post-construction at all approved and existing sensitive dwellings within 5 km. This demonstrates that EMI risk is a recognised planning consideration and proactive mitigation is standard practice for projects of this scale. The EPA project page confirms a 3,597 ha development envelope with ~107 ha disturbance. Impact buffers (noise, EMI, visual/shadow) should be legally contained within the development footprint to protect off-site amenity and avoid creeping impacts onto neighbouring land. Condition requested (if approved): • Apply a mandatory minimum setback of 1.8 km from all non-involved adjoining properties and approved sensitive receptors, consistent with RDAP/74 precedent. • Require EMI baseline and post-construction testing at all approved and existing sensitive dwellings within 5 km, with full rectification obligations for any degradation in service. • Ensure all impact buffers (noise, shadow flicker, EMI, visual) are contained within the development footprint, with no encroachment onto neighbouring land. • Require micro-siting adjustments or turbine deletion where compliance cannot be achieved. Visual Amenity—Extraordinary Scale, No Practical Screening, and Scheme Non-Compliance Synergy's own materials show turbines up to 250 m and public photomontages. Under LPS21 and the Residential Design Codes (R-Codes), typical built forms are capped at approximately 6 m wall height and 9 m total height. Our approved chalets comply with these limits. The contrast in scale demonstrates visual dominance and inconsistency with the planning framework's intent for local built-form character. Synergy refused to share our property-specific visual facades and suggested we "commence screening"—impractical, as no vegetation can screen structures of 250 m. Condition requested (if approved): • Publication of full, property-specific visual facades for our dwelling and chalet sites; • Micro-siting or turbine deletion where visual dominance breaches acceptable thresholds; • Finish and lighting controls to minimise skyline intrusion. Shadow Flicker & Blade Glint Impact

		Shadow flicker and blade glint from turbines will significantly affect both our dwelling and approved chalets. These impacts occur when rotating blades cast moving shadows or reflect sunlight, creating visual disturbance and discomfort. For tourism accommodation, such effects are unacceptable and will degrade visitor experience, reducing the viability of our planned chalets. WA planning guidance and international best practice require assessment and mitigation of shadow flicker and glint impacts at sensitive receptors. Condition requested (if approved): • Comprehensive shadow flicker and blade glint modelling including our dwelling and chalet sites; • Operational curtailment during high flicker periods to maintain acceptable amenity; • Installation of anti-reflective coatings on blades and, where feasible, vegetative or structural screening; • Micro-siting or turbine deletion where modelling predicts unacceptable flicker/glint exposure. Environmental Sensitivities & Biodiversity Values The Scott River and surrounding Courtenay area is ecologically significant, supporting diverse habitats, wetlands, and species that contribute to the region's unique biodiversity. This landscape is valued for its environmental integrity and underpins local tourism and agritourism ventures. Large-scale industrial infrastructure such as 250 m turbines introduces risks of habitat fragmentation, bird and bat strike, and cumulative impacts on flora and fauna. These risks are amplified by the proximity of turbines to conservation areas and waterways, and by the absence of comprehensive biodiversity impact assessments in the DA. WA planning principles and State Planning Policy require developments to avoid or minimise impacts on environmental assets. The omission of detailed ecological studies and mitigation strategies in this proposal is inconsistent with these requirements and undermines the region's environmental and tourism values. Condition requested (if approved): Comprehensive biodiversity and habitat impact assessment prior to construction, including bird and bat collision modelling; Implementation of avoidance and mitigation measures (micro-siting, seasonal curtailment, habitat offsets); Ongoing monitoring and reporting of ecological impacts to the Shire and community. Fire Response & Safety Risk DFES has advised us that aviation support cannot operate within the proposed development area. The closest DFES ground response is over 30 minutes away, and local volunteer brigades can only respond to bush or grass fires, not complex turbine-related incidents. The Zone Response system was introduced in this region due to significant bushfire spread risk. Removing aviation support dramatically increases fire risk and may increase local insurance premiums, jeopardising tourism viability. State Planning Policy 3.7 (Bushfire, 2024) requires that bushfire risk be a key consideration in land-use decisions. Condition requested (if approved): • A comprehensive Fire Management Plan endorsed by DFES, including alternative suppression strategies where aviation is restricted; • Sufficient on-site water storage, rapid deployment systems, and funding for enhanced local brigade capability; • Insurance impact assessment and mitigation measures.

		Social Values & Consultation Deficiencies The AMR Shire notes the DAP pathway and the role of the RAR informed by community submissions. Independent reporting confirms this project is divisive and that consultation transparency has been questioned; many nearby residents only learned of details late, with concerns over noise, amenity, land values, and community cohesion. Our experience: Synergy consulted once (two years ago) while we were two months into a $1 million build, then refused to share baseline data or include our approved chalets in sensitive receptor lists; we were excluded from the social values assessment on the basis that "too many people had similar views." What We Bought Into vs. What Is Proposed We purchased knowing of a potential, community-designed, small-scale wind concept near Governor Broome Road (max height ≈ 120 m)—not an industrial-scale development with 250 m turbines next door. The scale change materially alters amenity and risk and is inconsistent with the intent to minimise impacts set out in WA planning guidance. We requested Synergy support neighbouring residents in covering the costs of independent property valuations and, should we determine to sell during the life of the project, a guarantee that any deficit from market value properties experience from the project will be compensated by Synergy. Closing & Relief Sought This proposal is not just a planning matter—it is deeply personal. We have invested our life savings and years of effort into creating our home and agritourism venture. The uncertainty and stress caused by this process have taken a significant toll on our mental health and our marriage. We share this not for sympathy, but to underscore the real-world consequences of decisions made without fully appreciating their impact on families and communities. We invite elected members, JDAP decision-makers, and Shire officers to visit our property (by appointment) to see firsthand what this development would mean for us—the proximity of turbines to our home and chalets, the visual dominance, and the risks to amenity, safety, and viability. Primary request: Refusal of the DA due to incomplete assessments, omitted sensitive receptors, unacceptable amenity risks (noise, EMI, visual), fire safety deficiencies, and consultation shortfalls. If approved: Conditions for sensitive receptor reassessment, telecommunications protection and rectification, noise compliance and curtailment, conservative setbacks, visual mitigation, fire management, biodiversity protection, and transparency.
95	Object	I oppose the Scott River wind turbine project because there are not sufficient protections in place to reduce negative impacts on surrounding neighbours. Neighbours should not have to deal with noise from the project, they should not have to deal with their views day and night changed with no compensation. Decrease in land value is a real threat and we should not have to deal with this negative impact without any compensation. Increased fire risk, delays during construction when our only access roads will be clogged up for years and again without any compensation!

		This project should not be built on prime farmland, the acide sulphate soils will destroy the Scott River and the Blackwood, and all the surrounding national park and bushland, including my 28 acres directly on the project boundary. Set backs to neighbouring residents are not big enough. This is a cash up and grab scheme by overseas investors and synergy red at the detriment to the highly fragile environment in which we live and should protect. It has already been seen what happens in this area with the Beenup mineral sands mine. Please stop this or forever live with guilt for allowing it go ahead and destroy the area. Could you live with that knowing you could have stopped it for the right reasons?
96	Object	I am concerned at the scale of the wind farm proposed, and the effect of placing a large industrial development in a key farming area. The siting of this project seems opportune, mainly because there is an existing transmission line nearby, from the defunct Beenup mine, rather than any study that makes this a suitable area otherwise. I am also mindful of the concern and stress of several of my neighbours and community members who have farming or other connections to the Scott River area, it seems this will have ongoing impacts for them and I'm not sure they will receive ongoing support? If the proponent is determined to build a wind farm, smaller and fewer turbines would have less local impact. Thank you for the opportunity to provide comment. Although, with the recent passing of the state's new Development Approval laws, projects like this may be pushed through anyway, despite the result of any local concerns, consultations or similar!
97	Object	These wind farms, cost too much to install, Go on fire, last for 10-15yrs ,concrete bases have to be poured for each turbine, can't use the old base, difficult to service,danger to environment when they fall over, danger to birds,eyesore on the landscape, don't employ Australians all overseas installers.
98	Object	I object to the Scott River Wind Farm Development Application (DA) as it lacks the necessary detail for a comprehensive assessment, particularly for a development of this magnitude and duration. As a financially invested individual in this area, I am concerned that the development may diminish the desirability and affluence of the region. The developer has not provided a detailed analysis of the visual and noise impacts of the twenty 250m tall wind turbines with 90m blades (no tower width was mentioned) on the future of Augusta, Molloy Island, East Augusta, and the surrounding agricultural land. The analysis should encompass and not be limited to the effects on land value in suburbs and areas, population fluctuations, town development, and the potential decline of vitality, job opportunities, and community cohesion. Additionally, it should consider the impact on tourism and recreational activities that require unspoilt natural beauty. I anticipated that the developer would have specified the turbine model and the installation plan in the DA, enabling the shire to conduct a thorough assessment. Furthermore, an updated map for the taller turbines should have been provided indicating the 5km, 10km, and 15km distances and impacts of the wind turbines on humans, wildlife, livestock, and marine life in each zone. Noise modelling should be conducted using the most advanced technology on the modern 250m tall turbines, with measurements calibrated to mimic local weather conditions and topography. Include continuous noise monitoring and enforce shutdowns if limits are exceeded. Ensuring those that live at close proximity are protected from damaging infrasound. The foundation design options presented in the Feasibility Assessment - Part 2 on page 13 are not to scale, which may be misleading and subject to change based on the selected turbine model. Without precise detailed drawings and comprehensive information on the

		foundations, construction, engineering, materials, contamination risks, and appropriate mitigation strategies, I request that qualified independent expertise be consulted to conduct assessments prior to any approval being granted. DWER should be included as a partner in this development. Distances between turbines and homes/dwellings/stock/nature reserves and Crown Land should be established based on the specific specifications of each turbine rather than being vague “guidelines” that allow for interpretation. Crown Land should be sanctioned as areas for wild life preservation and natural beauty. The developer states in the DA that they heard the communities concerns and addressed them in the "Feasibility assessment finding - part 2" however many were not consulted despite living at close proximity to the proposed development. More consultation is needed with those in close proximity and greater transparency of the concerns raised is required. The proposed community benefit fund warrants scrutiny, as its allocation appears to be influenced by political considerations. I ask that the shire refuse the Development Application until the turbine model and make is chosen, the layout planned, detailed analysis’ completed on the construction and possible water contamination and lowering ground water, noise and visual impacts the turbines will have to the construction site, town of Augusta and the surrounding areas and all its inhabitants including wildlife, stock and marine life.
99	Object	The wind turbines should be in a more arid and less populated area. They are too close in my opinion.
100	Object	I object to being asked to agree to the wind farm proposal because the development application is not detailed enough to assess properly. Approval should not proceed on “work it out later”. The shire is being asked to approve a concept, not final design….there is no business case. My concerns are….. No final turbine layout…. Turbine locations are not locked in & can be moved at the developer’s discretion which changes who is impacted by noise, shadow flicker & visual dominance…. No final turbine specifications….. The final turbine model….. Height & operating mode are not confirmed, yet these are the inputs that determine noise levels, low frequency noise, infrasound characteristics, shadow flicker, blade glint & safety risk. No detailed construction methodology….there is no clear, site specific construction plan for foundations, trenching, dewatering volumes, soil handling, acid sulphate management, traffic management & rehabilitation. Missing “worst case” impacts….without fixed turbine locations & specs, there is no credible “worst case” assessment for most affected homes & boundaries. Inadequate transparency…..telling the public “details will be finalised later” is not acceptable for a development that will reshape the region for 30 to 60 years.

		I am asking the shire to refuse or defer the DA until a final design, verified noise framework, & robust environmental and emergency management plans are provided & independently reviewed. There is no mention of a fire plan. Wind turbines do catch fire. As an ex firefighter of 30 years I would never send my crew into such a high risk zone as a turbine fire. Water bombers cannot operate safely within the turbine area. A detailed hydro geological assessment is essential…we request that be done before approval. Also require acid sulphate soil investigation & an enforceable dewatering/ASS management plan be done before any approval. BHP had to close their Beenup Mine because of acid sulphate entering local waterways. This is the same location of the proposed wind farm. What has changed? There is no detailed construction & management plan. Scott River residents need to be assured that there will be no road damage & that they will have full access from & to their homes, especially in the case of an emergency. The school bus will also need safe & efficient access. Bird & bat strike risk is not a theoretical issue; it is inherent to wind facilities & must be assessed transparently. 26 species of flora & fauna are listed as threatened, rare or at risk, occur within the Scott River. We require stronger, transparent monitoring conditions & avoidance-first design not "mitigate later" language. It would be abhorrent behaviour to not fully research potential endangered animal loss. Many affected landholders report no direct engagement. The DA does not clearly summarise community feedback or demonstrates how concerns were incorporated. The scale of opposition should be acknowledged & transparently addressed. No clear minimum standard with community engagement. Totally inadequate considering the scale of this project. We require genuine consultation outcomes & publish responses to key community concerns, not GENERIC assurances. I once again emphatically ask the shire to refuse or defer the DA until a final design, verified noise framework, & ROBUST environmental & emergency environmental plans are provided & independently reviewed. Kim Basford, Augusta
101	Object	Great resource doesn't need to be in view of Augusta.
102	Object	The proposed Scott River wind farm has raised concerns about potential negative impacts on both the environment and nearby residents. The construction could disturb sensitive soils and ecosystems, increasing the risk of water contamination and harm to local flora and fauna, including bird species. Residents are also worried about noise, visual impacts from large turbines, and possible declines in property values, as well as broader effects on the rural landscape and community wellbeing.
103	Object	I strongly oppose the installation of 250m-high wind turbines in the Scott River region, a unique agricultural and tourist area in south-western Western Australia. This landscape is a vital asset for the environment, agriculture, and tourism, and should be protected. Key Environmental and Social Concerns • Wildlife Fatalities: Tall turbines significantly increase the risk of bird and bat collisions, especially for migratory and threatened species. The exceptional height amplifies these risks. • Noise Pollution: Turbine noise, including low-frequency and infrasound, disrupts wildlife behaviour, reduces bird presence, and displaces animals from suitable habitats, threatening local ecosystems. • Visual Impact: The towering structures would dominate the landscape, causing irreversible visual pollution and reducing the region's

		appeal to tourists, which could harm the local economy. • Habitat Fragmentation: Construction and operation would fragment habitats, displace wildlife, and compound pressures on biodiversity. • Human Wellbeing: The psychological effects of living near such large industrial structures are not fully understood but should be considered. End-of-Life and Recycling Impacts • Blade Disposal Challenges: Wind turbine blades are typically made from composite materials (fibreglass, carbon fibre, epoxy resins) that are extremely difficult to recycle. Most blades end up in landfill at the end of their service life, contributing to long-term waste problems. • Volume of Waste: Each turbine can have blades weighing up to 20 tonnes each. With hundreds of turbines, this results in thousands of tonnes of non-biodegradable waste that must be managed. • Limited Recycling Technology: While some research is underway, current recycling options for blades are limited and costly. Mechanical recycling often results in low-value products, and chemical recycling is not yet widely available. • Hazardous Materials: Some turbine components contain hazardous substances (e.g., resins, lubricants, metals) that can leach into soil and water if not properly managed during disposal. • Decommissioning Impacts: The process of dismantling turbines requires heavy machinery, transportation, and energy, which can further disturb local habitats and increase carbon emissions. • Foundation Waste: Turbine foundations are made of large volumes of concrete and steel, which are often left in place after decommissioning, causing permanent land disturbance. • Resource Use: The recycling and disposal process consumes additional resources and energy, offsetting some of the environmental benefits gained during the turbine's operational life. Conclusion Given the documented risks to wildlife, local ecosystems, tourism, and the significant end-of-life waste and recycling challenges, I urge authorities to reject this proposal and instead site such developments in areas with minimal environmental and social impact.
104	Object	I am not convinced wind turbines are that green, and they are going to spoil another natural piece of coast line
105	Support	As the founding Chair of Augusta Margaret River Clean Community Energy, I am familiar with the area and the suitability of the site for construction of a wind farm. AMRCCE conducted a high level feasibility of establishing a wind farm at the site and gained approval for submitting 22.5 MW of power to the Beenup substation. The initial process included a rigorous criteria evaluation of the site. It is important that the site has an existing transmission line with sufficient capacity as this minimises the disruption to the existing agricultural industry. The project has minimal clearance of native vegetation. The wind generation of the area is high and the wind is generated in the late afternoon and evening which complements solar generation. The area does not have a high residential population and has good road access. It complements the dairy industry of the shire which is the shire's highest generating agricultural industry. From a Planning perspective, the Project demonstrates a high level of compliance and alignment with

		Federal, State, Regional, Local tate, Regional and other frameworks that are relevant in considering Wind Farm Projects It will benefit Augusta and Margaret River in providing more reliable electricity supply. The Project is an important renewable energy development which will make a significant contribution to the State's decarbonisation. The Project has been comprehensively considered at a technical level, and this Report demonstrates its general compliance with relevant technical and planning legislation and frameworks. I support the Development Application approval for the 'maximum case scenario' in terms of level of impact. The relevant technical studies that have informed this Project, appended to this report, have all been based on this 'maximum case scenario'. This includes investigation of the acid sulfate soils of the area. From a Planning perspective, the Project demonstrates a high level of compliance and alignment with Federal, State, Regional, Local and other frameworks that are relevant in considering Wind Farm Projects. In conclusion I feel that this project is highly compliant.
106	Object	Dear Sir/Madam, I am writing to lodge an objection to the Scott River Wind Farm Development Application currently under consideration by the Shire of Augusta Margaret River. As a young person who expects to live, work and raise a family in this region for decades to come, I am concerned that this proposal would permanently change the Scott River area without providing the level of certainty or detail needed to properly assess its long-term consequences. Although the Development Application is extensive, it relies heavily on broad parameters and future flexibility rather than confirmed, final design decisions. At this stage, the proponent has not confirmed the final number of turbines, their precise locations, turbine height, turbine model, or final construction and operational methods. These details are fundamental to understanding how the proposal would affect the environment, rural amenity and surrounding land over the long term. Approving a project of this scale without fixed design information shifts risk onto the community and future generations. Noise impacts are a particular concern. The noise assessment relies largely on desktop modelling rather than real-world, site-specific measurements under local conditions. The Scott River area is generally quiet, and even relatively small increases in background noise can have a significant impact on liveability. The modelling also relies on noise criteria developed for much smaller turbines and does not adequately reflect the scale of the turbines proposed. Low-frequency noise and infrasound are not properly addressed, despite increasing international research suggesting that these emissions may affect some people's health and wellbeing. The application does not clearly commit to independent, continuous noise monitoring at nearby homes, transparent reporting, or enforceable shutdown provisions if limits are exceeded. Without these safeguards, future residents are left without certainty that noise impacts will be managed responsibly. The proposed setbacks between turbines and property boundaries are also concerning. Allowing turbines of this size to be located close

		to boundaries places long-term impacts on neighbouring land and limits how that land can be used in the future. As someone who hopes to continue living and working in this area, I am concerned that this effectively locks in land-use constraints and reduced amenity for the rest of this century. The visual impact of the proposal would be significant and permanent. Turbines taller than Perth's tallest buildings would dominate the landscape and skyline for many kilometres. Scott River is valued for its rural character, natural environment and sense of openness. Industrialising this landscape would permanently change the identity of the area and reduce its appeal for future generations. I am also concerned about the environmental risks associated with the floodplain location. The presence of acid sulfate soils and a shallow aquifer connected to the Scott River system means that deep foundations, trenching and dewatering carry serious risks to water quality and ecosystem health. The Development Application does not provide sufficient site-specific information to demonstrate that these risks can be avoided or responsibly managed over the long term. Bushfire risk and emergency management are also important considerations for the future of the region. Wind turbines can restrict aerial firefighting and introduce additional risks in extreme fire conditions. The application does not clearly explain how emergency response, evacuation or environmental protection would be managed during major fire events. Finally, I am concerned about the level of community consultation undertaken. Many people who will live with the long-term consequences of this proposal feel their concerns have not been adequately heard or addressed. For a development that would affect the region for generations, consultation should be thorough, transparent and genuinely responsive. For these reasons, I ask the Shire of Augusta Margaret River to refuse the Scott River Wind Farm Development Application. At a minimum, any decision should be deferred until final turbine locations and specifications are confirmed, noise assessment methods reflect modern turbine scale, and robust environmental, bushfire and construction management plans are independently reviewed. This proposal would permanently alter the Scott River area. As a member of the next generation who will live with the consequences of today's decisions, I believe the risks to landscape character, environmental values, rural amenity and long-term land use are too great to accept in their current form.
107	Object	The Biodiversity of the Scott River region should be protected from further development (from what hasn't already been cleared). I applauded the work done by the AMR Shire in fining the Blue Water Whale Farm Plantation $141,000 in September 2024 for illegal clearing of areas of rare and endangered flora. Synergy (via their own documentation) appear to be doing the same clearing for the Wind Turbines, which reeks of double standards. The acidic sulphate soils that exist in the region are also of great concern, dating back to the BHP Beenyup mine development that has seen no progress made in fully containing the soils. My concern is that if BHP were not able to develop due to the soil type, then how are Synergy going to safely make it work in the same soils?
108	Object	I write to lodge a formal objection to the Scott River Wind Farm Development Application currently before the Shire of Augusta Margaret River.

		In my assessment, the Development Application does not provide the level of certainty or final design detail required to properly evaluate a proposal of this scale and long-term consequence. Although the application is substantial in length, it relies heavily on broad parameters, conceptual layouts and future discretion rather than confirmed, finalised information. The Scott River area is a sensitive rural landscape with high agricultural, environmental and hydrological value. Any development proposed for this location should therefore be assessed against a clear, fixed and transparent design. The current application does not meet this expectation. At this stage, the proponent has not confirmed the final number of turbines, their final siting, turbine heights, turbine model, foundation design, construction methodology or operational parameters. The application allows turbine locations and specifications to be altered after approval. These elements are fundamental to understanding impacts on noise, shadow flicker, visual amenity, bushfire risk, groundwater systems and surrounding land use. Deferring these decisions until after approval removes the community's ability to meaningfully assess the full impacts of the proposal. Noise impacts are of particular concern. The noise assessment is primarily based on desktop modelling rather than comprehensive, site-specific, in-field measurements under local conditions. Desktop modelling cannot adequately account for the coastal and inland weather patterns experienced in the Scott River area, nor for atmospheric inversion effects that influence noise propagation at night. Without baseline and ongoing real-world measurements, the accuracy of the predicted noise impacts cannot be verified. In addition, the assessment relies on Western Australian noise criteria developed for much smaller and older wind turbines. These standards do not adequately reflect the scale and operating characteristics of modern turbines approaching 250 metres in height. The application also fails to properly examine low-frequency noise and infrasound, despite increasing international research suggesting that such emissions may adversely affect some people, particularly in quiet rural settings. The Development Application does not include clear commitments to independent, continuous noise monitoring at nearby dwellings, transparent reporting, or enforceable shutdown provisions if noise limits are exceeded. This leaves affected residents without meaningful protection should impacts prove greater than predicted. The proximity of turbines to dwellings and property boundaries is also unreasonable. Adjacent landowners should not be expected to absorb the impacts of an industrial energy facility as an informal buffer. The setbacks proposed do not reflect the scale of contemporary turbines or reasonable expectations for rural amenity. Approving turbines close to boundaries transfers noise, shadow flicker and visual impacts onto neighbouring land and effectively constrains future land use for decades. The visual impact of the proposal is substantial. Turbines exceeding the height of Perth's tallest buildings will dominate the landscape and skyline across a wide area. The Scott River region is valued for its rural character, open landscapes and agricultural setting. Introducing infrastructure of this scale would permanently industrialise the area and result in an irreversible loss of landscape character, with negative implications for tourism, community identity and property enjoyment.

		The floodplain location of the proposal raises serious environmental concerns. The presence of acid sulfate soils and a shallow superficial aquifer connected to the Scott River system significantly increases the risks associated with deep foundations, trenching and dewatering. The Development Application does not provide a sufficiently detailed, site-specific hydrogeological assessment or a robust acid sulfate soil and dewatering management plan. Reliance on reactive measures such as emergency lime treatment is not a responsible long-term strategy, particularly given the importance of lime to local agricultural operations. Bushfire risk and emergency management have also not been adequately addressed. Wind turbines can restrict aerial firefighting operations and introduce additional ignition risks. Internal access tracks do not necessarily provide safe evacuation routes during fast-moving rural fire events. The application does not clearly demonstrate how emergency response, evacuation or the protection of significant environmental assets would be managed during extreme fire conditions. Construction impacts are similarly underdeveloped. There is insufficient information regarding access routes, heavy vehicle movements, traffic volumes, construction duration, dust and noise management, and protections for local residents and road users. These impacts may extend over long periods and should not be treated as minor or temporary disruptions. I am also concerned about the adequacy of community consultation. Many affected landholders report limited or no direct engagement. The Development Application does not clearly document community feedback or demonstrate how concerns raised have influenced the proposal. Given the scale and permanence of the development, the consultation undertaken to date is insufficient. For these reasons, I request that the Shire of Augusta Margaret River refuse the Development Application. At a minimum, any decision should be deferred until a final turbine layout and specifications are provided, noise assessment methods are updated to reflect contemporary turbine scale, and comprehensive environmental, bushfire and construction management plans are independently reviewed and made publicly available. In my view, the Scott River Wind Farm proposal is not suitable for the Scott River floodplain. The risks to rural amenity, agriculture, water resources, environmental values and landscape character are significant and enduring, and have not been adequately addressed in the current application.
109	Object	I am writing to formally lodge an objection to the Scott River Wind Farm Development Application currently under consideration by the Shire of Augusta Margaret River. This objection is made on the basis that the Development Application, as submitted, does not provide sufficient certainty, specificity or final design information to enable a proper, informed and transparent assessment of a development of this scale, duration and consequence. While the documentation is extensive in volume, it lacks critical settled details that are fundamental to understanding the full scope of impacts associated with the proposal. The Scott River area is a highly sensitive rural and environmental landscape, valued for its agricultural productivity, hydrological significance, ecological features, landscape character and quiet rural amenity. Any development proposed for this location must therefore

		be supported by a high standard of rigour, clarity and precaution. In my view, the current application does not meet that standard. At the time of assessment, the proponent has not confirmed the final number of turbines, their definitive locations, turbine heights, turbine model, foundation design, construction methodology or operational regime. Instead, the application allows for turbine locations to be altered, turbine models to change, and key construction decisions to be made at the proponent's discretion after approval is granted. These matters are not minor or administrative details. They are fundamental determinants of impact. Turbine height, rotor diameter, blade speed, spacing and placement directly influence noise emissions, low-frequency noise and infrasound, shadow flicker, visual dominance, bushfire risk, foundation depth, groundwater disturbance, road infrastructure requirements and long-term land use constraints. Approving a development of this magnitude without fixed and final design parameters effectively requires the community and the Shire to accept unknown outcomes, with impacts to be managed later rather than properly assessed upfront. This approach undermines meaningful public participation and the integrity of the planning process. Noise impacts represent one of the most significant and enduring concerns associated with the proposal. The noise assessment relies predominantly on desktop modelling and assumed inputs rather than comprehensive, site-specific, in-field measurements under local conditions. Desktop modelling cannot fully account for local meteorology, atmospheric inversion effects, terrain interactions, cumulative turbine effects or night-time propagation characteristics. The Scott River area experiences coastal and inland weather patterns that materially influence sound behaviour, yet the modelling has not been validated through long-term baseline monitoring. In addition, the noise assessment framework relies on Western Australian noise criteria developed for much smaller, older-generation turbines. These criteria do not adequately reflect the scale or operating characteristics of modern turbines approaching 250 metres in height. Applying legacy standards to infrastructure of this magnitude risks underestimating impacts on nearby residents and rural amenity. The Development Application also fails to adequately address low-frequency noise and infrasound. While scientific opinion continues to evolve, there is growing international literature indicating that pulsating infrasound from large turbines may adversely affect the health and wellbeing of some individuals, particularly in quiet rural environments. Regardless of differing interpretations, the precautionary principle requires these potential risks to be examined carefully rather than dismissed. The application does not demonstrate how such emissions would be monitored, managed or mitigated over the operational life of the project. Further compounding these concerns is the absence of clear, enforceable commitments to independent and continuous real-time noise monitoring at sensitive receptors, transparent public reporting of results, and mandatory shutdown or remediation mechanisms in the event of exceedances. Without such measures, affected residents have no meaningful assurance that noise impacts will be properly controlled. The proposed setbacks between turbines, dwellings and property boundaries are also unacceptable given the scale of the turbines proposed. Neighbouring land should not be treated as an informal buffer for industrial development. Locating turbines close to property boundaries displaces noise, shadow flicker and visual impacts onto adjoining land and effectively constrains surrounding land use for generations. This approach erodes rural amenity, diminishes property enjoyment and value, and creates long-term land sterilisation that is incompatible with the expectations of rural landholders.

		The visual impacts of the proposal are severe and unavoidable. Turbines and rotating blades exceeding the height of Perth's tallest buildings will dominate the landscape and skyline for many kilometres. The cumulative presence of turbines, access roads, hardstand areas, transmission infrastructure and aviation lighting will permanently industrialise a landscape currently valued for its agricultural character, openness and sense of place. These impacts cannot be mitigated through landscaping and will result in a permanent loss of landscape character, with flow-on effects for tourism, recreation and community identity. The location of the proposal within a floodplain raises serious environmental and agricultural concerns. The presence of acid sulfate soils and a shallow superficial aquifer connected to the Scott River system significantly heightens the consequences of ground disturbance. Deep turbine foundations, trenching and dewatering pose high-consequence risks to soil chemistry, groundwater quality, surface water systems, farming operations, dams and bores. The Development Application does not provide a sufficiently detailed, site-specific hydrogeological assessment or a robust acid sulfate soil and dewatering management strategy capable of addressing these risks over the long term. Reliance on reactive mitigation measures such as emergency lime treatment is not a responsible or sustainable approach, particularly given the competing demand for lime within the agricultural sector. Once acidification occurs, impacts may be irreversible. Bushfire risk and emergency management have also not been adequately addressed. Wind turbines introduce additional ignition risks and may restrict aerial firefighting operations through the creation of no-fly zones. Internal access tracks do not necessarily provide safe evacuation routes during fast-moving rural fire events, particularly in floodplain terrain. The Development Application does not convincingly demonstrate how turbine-related ignition risks would be managed, how firefighting access would be maintained, or how evacuation and protection of rare or significant flora would be achieved under extreme fire conditions. Construction impacts are similarly under-developed. The application lacks sufficient detail regarding access routes, heavy vehicle movements, traffic volumes, construction timelines, hours of operation, dust suppression, noise management and protections for local residents, road users and businesses. Construction impacts of this nature may persist for extended periods and cannot be dismissed as short-term or minor inconveniences. I am also concerned about the adequacy of community consultation. Many affected landholders report limited or no direct engagement. The Development Application does not clearly summarise community feedback or demonstrate how concerns raised have been meaningfully addressed or incorporated into the proposal. For a development of this scale and permanence, the consultation undertaken to date is inadequate. For these reasons, I respectfully request that the Shire of Augusta Margaret River refuse the Scott River Wind Farm Development Application. At a minimum, any decision should be deferred until a final turbine layout and confirmed turbine specifications are provided, an appropriate and contemporary noise assessment framework is applied, and comprehensive environmental, hydrogeological, bushfire and construction management plans are independently reviewed and made publicly available. This proposal is not appropriate for the Scott River floodplain. The risks to rural amenity, agriculture, water resources, environmental

		values and landscape character are substantial, enduring and, in my view, unacceptable. Planning approval should not be granted on the basis of uncertainty and future discretion, particularly where the impacts, once realised, cannot be reversed.
110	Object	The WA Government has disregarded its own policy safeguards to push this proposal forward. The EPA has failed to confront the severe risks posed by ASS disturbance. Heavy industry in this location is fundamentally incompatible with the landscape and community values. Previous ASS disturbance at this exact site resulted in decades long contamination and containment management costing BHP hundreds of millions in project failure and remediation. This proposal lacks scientific integrity and represents an unacceptable environmental, financial, and policy failure. It must be cancelled or relocated out of the region immediately Avoidance of ASS disturbance is the only scientifically defensible position.
111	Support	Climate change is real and needs to be addressed immediately. One way of doing this is by building clean energy projects like the proposed wind farm to replace aging and dirty power sources I believe the environmental impact on the area will be minimal. The main objection seems to be the visual impact. Opponents of the wind farm say otherwise and claim to be in favour of renewable energy projects, but really it more to do with a " not in my backyard " (NIMBY) attitude. It is imperative that government at all levels take responsibility for the implementation of these type of projects.
112	Support	I support the development of the wind farm as a form of sustainable energy production and to reduce our reliance on fossil fuels.
113	Object	
114	Object	I believe the proposed turbines contain lots of toxic products and they are an eyesore.
115	Support	We need the electricity to replace the coal fired power when Collie is closed down.
116	Support	I strongly support the proposal. The detailed process of site selection and feasibility assessment that followed the community proposal for a wind farm at a Shire- community workshop, and the rigorous surveys and assessment that followed, have convinced me that, subject to management of any potential impacts, the project should proceed. It is vital that we maximise renewable energy to contribute to phasing out fossil fuels. Climate change is impacting sw WA. The shire and community are committed to protecting the environment on which all aspects of our lifestyles and livelihoods depend. Vociferous minority opposition that has often been based on inaccurate or incorrect information has been a recent distraction in an orderly process over many years. It is time to move forward and show leadership in renewable energy development.
117	Support	As a dairy farmer in the area I am confident that renewable energy and the wind farm proposal in particular can co-exist. We view it as a great support for for diversifying our farming practices, providing a much needed strong and reliable power supply, reducing carbon emissions, and supporting financial sustainability. The road network proposed to access the turbines will assist us to farm more efficiently when harvesting fodder. The improved water supply outlined in the proposal would be very beneficial in the need of bushfires. The supply grid from Collie is challenged as demonstrated in the recent extended outage on 15/16 Dec 2025. It would be a huge benefit to farming to have local power generation and will provide opportunities for supply risk mitigation in future power challenges.

		We accept the visual impact. We actually view looking at them with a great sense of pride that we are contributing to sustainable energy, the greater economy, and sustainable change. Wind turbine are used all over the world and all over Australia in a safe and productive manner. They will have more positive impacts and fewer minor impacts.
118	Object	The WA Government has disregarded its own policy safeguards to push this proposal forward. The EPA has failed to confront the severe risks posed by ASS disturbance. Heavy industry in this location is fundamentally incompatible with the landscape and community values. Previous ASS disturbance at this exact site resulted in decades long contamination and containment management costing BHP hundreds of millions in project failure and remediation. This proposal lacks scientific integrity and represents an unacceptable environmental, financial, and policy failure. It must be cancelled or relocated out of the region immediately Avoidance of ASS disturbance is the only scientifically defensible position.
119	Object	Good Afternoon - My concerns regarding the P225771 windfarm submission are as follows: 1. The potential impact/displacement of our local wildlife with the construction, commissioning and operation of 20 wind turbines. 2. The potential impact to local farmers and their stock with the construction, commissioning and operation of 20 wind turbines. 3. Wind turbines on the horizon are an eyesore that will impact tourism for Augusta, a location synonymous with natures beauty. 4. The potential low noise disturbance that could be experienced on Molloy Island. Surely there is a more suitable location.
120	Object	Submission on Draft Local Planning Policy 23 – Large-scale Renewable Energy Facilities (LPP23) I am writing to make a submission on Draft Local Planning Policy 23 – Large-scale Renewable Energy Facilities (LPP23). I have owned my property at 1948 Brockman Hwy Courtenay since 1990 and lived there from 1992 till 2010 when we moved for business to Busselton. We have in 2025 made our farm house a short term farm stay. One of the thing we found was when we had visitors they all commented on how quiet it was. After visiting Albany and Jurien Bay wind farms i feel that the noise from the windfarm will destroy this tranquility. Ever as technology improves and noise levels are decreased there is still evidence of health affects. https://www.dailytelegraph.com.au/subscribe/news/1/?sourceCode=DTWEB_WRE170_a_DDG&dest=https%3A%2F%2Fwww.dailytelegraph.com.au%2Fnews%2Fnsw%2Fjet-engine-couple-wants-out-of-wind-turbine-deal-over-noise%2Fnews-story%2Fd1b18abf16509c7254cb8f05b6564265&memtype=anonymous&mode=premium&v21=GROUPA-Segment-1-NOSCORE As my property is located on the Northern side of the wind farm and the prominent wind direction is from the South i feel the noise will be constant. The issue of fire which can be quite common is also a concern as the prominent strong Southerly wind can blow it directly towards our property. The wind turbines proposed for the site are large and will have a negative visual impact on the natural environment around the area. Simply requiring compliance with the Environmental Protection (Noise) Regulations is not enough to protect rural amenity around very large turbines in a quiet landscape. Key gaps in the current draft include: • no explicit recognition of low-frequency noise, infrasound or amplitude modulation

		• no requirement for independent noise monitoring with public reporting • heavy reliance on proponent-prepared management plans. WA noise rules and typical modelling approaches are geared to audible dBA limits and older, smaller turbines, not modern 250 m-class turbines proposed for Scott River. Synergy has acknowledged infrasound in previous conversation • Desktop modelling only: the noise work is based on computer assumptions (inputs, propagation, operating modes) rather than field-verified measurements in local conditions (wind shear, temperature inversions, humidity, terrain, vegetation, background rural noise). • No confirmed turbine model: without a final turbine model and operating parameters, predicted noise levels are not reliable and cannot be meaningfully verified. • WA framework limitations: compliance is typically framed around audible noise metrics (dBA) that do not adequately address low-frequency noise and infrasound characteristics of large turbines. • Pulsating infrasound: emerging international evidence suggests amplitude-modulated/pulsating components from large turbines are an unaddressed risk for some people (sleep disturbance and physiological stress pathways are commonly raised concerns). • Post-construction reality: there are examples elsewhere in Australia where communities were told there would be no offsite impacts, yet post-construction complaints and disputes persisted because conditions and monitoring were insufficient. Minimum protections to demand: • A requirement for independent, continuous, real-time noise monitoring at representative nearby residences (not just at the boundary), including reporting and public transparency. • Mandatory post-construction compliance testing under a range of weather and operating conditions, with results published. • Enforceable curtailment/shutdown requirements if limits are exceeded, and a clear complaints response protocol with timeframes. Rural amenity is both visual and acoustic. I have chosen to live and farm in this district precisely because of its quiet, peaceful, rural character. I support the Shire having a clear local planning policy for large-scale renewable energy. However, in its current form LPP23 does not provide strong enough protection for floodplains, food production, water resources, bushfire safety, biodiversity or rural amenity. Many of the concerns raised by the community during the earlier Renewable Energy Issues and Options Paper process do not appear to have been carried through into this draft. If the Shire approves the current DA our they going to take responsibility for the issues raised?
121	Support	
122	Object	With regards to wind Turbines proposed being installed. Has the appropriate risk mitigation plan been made considering all factors including economic,environmental and social impacts. To look overseas the green agenda is dead in the water.It does not add up financially or environmentally. I strongly oppose the proposed project based on overseas withdrawal and dismantling of defunct projects. What are you people thinking!

123	Object	I think there would be better places to put the turbines if was going to happen . I just don't think it's necessary and there's other things that this town needs before wind turbines.
124	Object	I objection to the Scott River Wind Farm and inadequate Development Application currently before the Shire of Augusta Margaret River. I do not believe the Development Application provides sufficient detail to allow a proper assessment of a project of this scale and consequence. While the application is lengthy, it lacks the certainty, specificity and final design information required for informed decision-making. At present, the proponent has not confirmed the final number of turbines, their final locations, the final turbine height, the final turbine model, or a detailed construction and operations methodology. Turbine locations may be moved at the developer's discretion. These matters are fundamental to assessing impacts such as noise, infrasound, shadow flicker, visual dominance, bushfire risk, groundwater impacts and overall amenity. Telling the community that these details will be "worked out later" is not acceptable for a development that would permanently alter the Scott River area for decades. I am particularly concerned about noise impacts. The noise assessment relies on desktop modelling and assumptions rather than real-time, in-field measurements under local conditions. The modelling is also framed around WA noise rules that focus on audible dBA limits developed for much smaller, older turbines, not modern 250-metre turbines of the scale proposed for Scott River. The application does not adequately address thwe issue of infrasound, despite growing international evidence (Dr Ken Mattson) that pulsating infrasound from large turbines may present unaddressed health risks for up to 30% of people who are susceptible. There are no clear commitments to independent, continuous real-time noise monitoring at nearby residences, nor enforceable shutdown provisions if limits are exceeded. The proximity of turbines to homes and property boundaries is also unacceptable. Neighbouring land should not be treated as a buffer for industrial development. The setbacks proposed do not reflect the scale of modern turbines or reasonable expectations for rural amenity. Approving turbines so close to boundaries shifts noise, shadow flicker and visual impacts onto neighbouring landowners and effectively sterilises surrounding land use for the rest of this century. I live 10km from the proposed development and have received zero communications from the shire regarding this project. I had a shed building approval delayed by the shire because my two neighbors of a half and one kilometre away were formally given the option of objecting to the chosen colour of the shed, of which can't even be seen from their properties. Why have I not been formally notified of this project by the the shire? The visual impact of the proposal is significant. Turbines and blades exceeding the height of Perth's tallest buildings will dominate the rural landscape and skyline for kilometres. Scott River is valued for its natural landscape, agricultural character and quiet rural amenity. Industrialising this landscape would result in a permanent loss of character and would undermine tourism and the long-term enjoyment and value of surrounding properties. The site's floodplain location raises serious environmental concerns. The area contains acid sulfate soils and a shallow superficial aquifer that is linked to the river system. Deep foundations, trenching and dewatering pose high-consequence risks to soil stability, water quality, farming operations, dams and bores. The Development Application does not provide a credible, site-specific hydrogeological assessment or a robust acid sulfate soil and dewatering management plan. Reliance on emergency lime treatment is not a sustainable or responsible mitigation strategy, particularly given competing demands on lime for agricultural use.

		Bushfire risk and emergency response have also not been adequately addressed. Wind turbines create no-fly zones that may restrict aerial firefighting, and internal access roads do not equate to safe evacuation routes in a rural fire scenario. The application does not demonstrate how fire ignition risk, emergency response or rare flora protection would be managed in extreme fire conditions. Construction impacts are similarly under-developed. The application lacks detail on access routes, heavy vehicle movements, timing and duration of works, dust and noise management, and protections for local residents, road users and businesses. These impacts are not short-term inconveniences but could extend over months or years. And I remain concerned about the adequacy of community consultation. Many affected landholders report no direct engagement. The Development Application does not clearly summarise community feedback or demonstrate how concerns have been meaningfully addressed. Given the scale and permanence of this proposal, the consultation undertaken to date is inadequate. This proposed windfarm is not suitable for the Scott River floodplain, and the risks to community amenity, farming, water security, environment and landscape character are unacceptable. I acknowledge that Renewable energy projects are needed to mitigate climate, however, this is the wrong location for a project such as this.
125	Object	The WA Government has disregarded its own policy safeguards to push this proposal forward. The EPA has failed to confront the severe risks posed by ASS disturbance. Heavy industry in this location is fundamentally incompatible with the landscape and community values. Previous ASS disturbance at this exact site resulted in decades long contamination and containment management costing BHP hundreds of millions in project failure and remediation. This proposal lacks scientific integrity and represents an unacceptable environmental, financial, and policy failure. It must be cancelled or relocated out of the region immediately Avoidance of ASS disturbance is the only scientifically defensible position.
126	Object	The WA Government has overlooked key policy safeguards in fast-tracking this proposal. The EPA has not fully addressed the extreme risks associated with ASS disturbance. Heavy industry is incompatible with the proposed location of the Wind Farm and its surrounding landscape. Previous disturbance of ASS at this site resulted in contamination that has persisted for over 20 years and cost BHP an estimated hundreds of millions in project failure and remediation. This proposal lacks sufficient scientific credibility and poses serious environmental, financial, and policy risks. Avoidance of ASS disturbance is the only scientifically defensible position.
127	Object	I object most strongly to the Scott River Wind Farm DA chiefly because the in depth detail essential for a proper assessment is absent. Approval is being sort without any specific assessments in any of the key sticking points ,approval should NOT proceed on the premise of 'work it out later'. There are many issues that require addressing . I will unable address the following as time does not permit : Impact of proximity to homes , boundaries and rural lifestyle can not be used as buffers. Bushfire and emergency response : aviation restrictions and evacuation realities. Traffic ,access and construction disruption :local roads not built for heavy haulage. However , I will address in detail six other major issues The Shire is being asked to approve a concept , not a final design and to add to the insult there is no business case .The development

		lacks details of final turbine model or specifications . In addition there are no detailed construction and environmental management plans that can be assessed and conditioned. Included in this inadequate transparency with the public , is secrecy where farmers were directed not to disclose their interaction with Synergy to other local farmers ."Do not rely on neighbours agreements" position: private agreements should not be used to qualify offsite impacts. No comprehensive construction methodology for site specific foundations , trenching, acid soil management , rehabilitation and traffic management has been presented . These inadequacies only increase the reasons why the Shire should NOT approve the DA. Desktop modelling of Noise , low-frequency and infrasound created , are only based on computer assumptions rather than actual field-verified measurements in local conditions. Findings are based on older ,smaller turbines not the modern 250 m-class turbines proposed for Scott River. Compliances are limited as constructed around audible noise metrics that do not address low-frequency noise created by large turbines. The Shire must require independent continuous noise monitoring at nearby farms not just those on the boundary . Public reporting and transparency need to be part of this and enforceable shutdown requirements if limits are exceeded together with a complaints system enforced within a strict timeframe. These skyscraper-scale structures visible for kilometers will destroy the quality of the natural landscape for decades. This pristine rural Scott River landscape must not become known by tourists as a place to avoid owing to the domination of noisy swirling industrial giants, ' blots on the landscape'. Rather, as it is now, for the magnificent quiet rural character and open horizons ,sadly in decline all over Australia. Faulty visual assessments in the form of photos , often misleading (deliberately or otherwise) fail to address the real issues of scale . Destroying this distinctive landscape will not be a 'minor impact' but a major ecological failure by the Shire if they do not oppose this DA. This location has known soil sensitivity, as a result earthworks and dewatering can and has caused irreversible damage to the environment. The embarrassing failure of BHP's Beenup Mineral Sands Mine in the Scott River catchment in 1999 was a direct result of the mismanagement of sensitive acid sulphate soil. The mismanagement was at a cost of millions of dollars to BHP share holders. Neutralizing the dam water and acid soil with lime is still on going. Lime is imported from South Africa at great expense. Deep foundations planned for the windfarm structure, trenching and roadworks all require excavation and dewatering .Exposure of acid sulfate soil or lowering groundwater in this environment can generate acid and mobilise metals .Proven in the case of BHP's Beenup mine. Contamination of water quality is a risk for farmers . Bores , drains , dams, pathways and stock water can all be impacted . The DA does not have a final design, dewatering plan, there is no credible risk assessment to manage volumes of water , or disposal, treatment or monitoring of and contingencies for water. There has been no study undertaken of the linking of the superficial aquifer and the Scott River system . Who will carry the cost to correct any environmental travesties ? It appears the local farmer, not the developer , as Synergy hasn't presented plans covering such events. Synergy do not even have a plan to manage emergency acid sulfate soil mitigation . If the unthinkable should happen, where taxpayer funds have to be used to pay billions of dollars in an attempt to neutralize sulfate soil mitigation ,as is the case with BHP at Beenup (thankfully NOT our money.) then surely such a risky gamble with taxpayers funds could not possibly be contemplated by Synergy. (WA's share of GST will not last forever) . It is unthinkable that the lives and property of people in the Augusta area , could be put at risk of acidic sulfate soil ,river and ground water contamination if the Shire allowed Synergy to progress this application . Who will provide compensation for acid contamination that could last hundreds of years , possibly rendering the whole district infertile and uninhabitable. It is not beyond the realms of possibility that the Shire and representatives could be open to being individually sued by those owners impacted by such a monumental disaster. The Shire must demand from Synergy an in depth hydrogeological assessment , a thorough acid sulfate soil investigation and an enforceable dewatering /ASS management plan ' all independent assessments ' BEFORE any approval of the DA is contemplated.

		The wildlife and environment hasn't been given due consideration in the DA. What consideration has been given to monitoring impacts and enforcement? There is no mention of thresholds that will initiate mitigation or what form enforcement will take. Biodiversity is a hallmark of this area ; 26 species of flora and fauna are listed as threatened or considered rare and at risk. Bird and bat strikes are intrinsic to wind facilities , clearing and fragmentation of land inhabited by fauna adds further pressure. All issues must be assessed honestly with vigor and with a view to protecting the area at all costs .The Scott River area deserves strong crystal-clear monitoring as a prerequisite and a blueprint demanding 'avoidance -first ' requirement with NO reference to "mitigation later " too late when irreparable damage has occurred. Consultation with the community has been spasmodic at best. Many affected land owners report No direct engagement with Synergy. While others complain of the 'secrecy' involved with compensation/payment when they were first approached to allow wind turbines on their land. Secrecy, that could have the affect of turning longstanding neighbours against each other. It is noted the DA does not clearly summarise community feedback and in addition demonstrate how concerns were incorporated. Surely input from the community should ,at the very least, be accurate and clearly stated? The DA should concede the degree of opposition to the Windfarm and the responses from the community should be clearly outlined. The intensity of the community to engage in this project should not be underestimated , therefore genuine consultation outcomes and published responses to key community concerns are essential if the Shire is to retain credibility among the stake holders. Please no generic assurances. It would be most worthwhile for the Shire to investigate other Synergy Windfarm sites (if they haven't already done so) that are supposedly up and running, to see first hand how the projects are managed once Synergy palms the process off to independent companies. The Synergy Windfarms projects in the Collie area have created many issues windfarms being shut down ,as there was no means of storing the energy created . Only one battery had been installed in Collie while others were on order from China, yet here we are facing possible power shortages during a predicted extremely hot summer . The 'cart before the horse' would be a suitable analogy in this instant . Synergy or one of the Greenwinds Renewables Companies handling these projects seem to have 'dropped the ball'. Is this the type of mismanagement that will be accepted IF the DA goes ahead? Farmers in the Collie area NOT taking part in the Windfarm projects have been left to deal with satellite companies such as Ambrosia Windfarm Holdings and Moonies Hills Energy . It appears Synergy are not obliged or interested in dealing with demands for compensation from farmers whose property is impacted by the noise of the turbines, their proximity to habitable dwellings and the loss of value of their farms . Farms that in many cases form the basis of the families superannuation. Synergy ,it appears do the spade work for the project , then palm the accepted plan off to companies that have no interest in facing the obligations created by Synergy and outlined in the agreement. A personal farming friend who opted out of having windfarms has been in the process of attempting to lodge a compensation claim but is unable to contact any of the directors of the company now in control of the windfarms affecting his farm and life style. Will this scenario be repeated at Scott River if Synergy 's DA gets the go ahead and satellite companies at arms length from the negotiation process take control and fail to honor the agreements made by the government ? In conclusion, I ask the Shire to refuse outright the DA on the grounds that Scott River is an unsuitable site for a Windfarm project that will impact the greater area in unimaginable ways if the balance of nature in one of its rawest forms "acid Soil" is disturbed.
128	Object	I am strongly opposed to the proposed installation of 250m-high wind turbines anywhere in a pristine agricultural and tourist area, as would anyone purporting to have genuine concern for the environment. The southern western tip of Western Australia should be regarded as a treasure for its scenic landscapes, productive agricultural land and natural beauty that supports domestic tourism and biodiversity. I

		formally object to this development on the grounds of its negative environmental impacts, which are well documented in scientific literature. These impacts include: High Risk of Bird and Bat Fatalities from Collisions Wind turbines pose a serious threat to avian and bat species through blade collisions, with taller turbines (such as the proposed 250m structures) sweeping larger rotor areas and increasing risk, particularly for migratory and soaring species like raptors. Studies across multiple facilities have documented thousands of bird and bat deaths, including diverse species. In Australia, similar concerns apply to local wildlife, and the unprecedented height of these turbines would exacerbate collision risks in an area likely used by threatened or migratory birds. Noise pollution disrupting wildlife behaviour and ecosystems Wind turbine noise, including low-frequency and infrasound, can detrimentally affect wildlife by interfering with survival, social interactions, and breeding. Research has shown reductions in bird presence (up to 30%) near operating turbines due to noise, as well as avoidance and displacement of birds and mammals from otherwise suitable habitats. In a rural farming district, this could disrupt local ecosystems and species reliant on quiet environments. Visual intrusion and negative Impacts on tourism The massive 250m scale of these turbines would dominate the skyline, causing irreversible visual pollution in a region prized for its natural beauty and scenic views. Scientific studies indicate that visible wind farms reduce tourist appeal, with visitors less willing to rent accommodation or visit areas overlooking turbines, leading to potential declines in coastal or rural tourism. This would harm our local economy, which depends on agriculture and tourism drawn to unspoilt landscapes. Habitat fragmentation and ecosystem disruption Construction and operation of large-scale wind farms alter ecosystems through vegetation clearing, soil disturbance, and functional habitat loss, causing displacement of wildlife and fragmentation of movement corridors, particularly for soaring birds. In a farming district, these effects would compound existing pressures on biodiversity. These impacts are not speculative but supported by peer-reviewed research and observations from existing wind facilities worldwide. The exceptional height of 250m turbines amplifies many of these risks. The deleterious effects on the human psyche, living amongst such monstrosities, has not at this stage been fully measured, but should be a consideration for anyone accountable in making these decisions. I urge the Authorities involved to reject the proposal, it should be built in an area where the land is unproductive, not arable and has minimal impact on the environment and human and animal life.
129	Object	I have farmed in the Scott River district since the early 1970s. I am lodging this submission to object to SynergyRED's proposed wind farm Development Application. I am not against sensible progress, but this proposal is industrial in scale and it is being put into a working farming and high environmental

		value landscape. Turbines up to 250 metres high do not “blend in” to Scott River. They change the character of the district and shift real, long-term impacts onto neighbouring farms and families. 1) Protecting farms, livestock and families must come first Scott River is a working farming district. Our farms are homes and workplaces. Noise, shadow flicker and night lighting are not minor issues when you live and work on the land every day. This proposal risks turning a rural area into an industrial zone, with impacts that fall on people who did not choose to host the project. 2) Duty of care for farm workers and safety risks As farmers we have a duty of care to our workers and contractors. A large industrial facility next door introduces new safety and operational risks—construction traffic, oversized loads, changing access conditions, and the risk that farm work will have to be planned around turbine operations and constraints. This is not how rural land should be managed. 3) Fire and emergency risk is not resolved Scott River is bushfire-prone. Any development that increases complexity in emergency response must be proven safe before approval. The emergency planning in this DA is not strong enough to give confidence that suppression, access and response will be effective in a fast-moving fire. 4) Scott River is a special place for wildlife and needs protection from industrialisation This district has important waterways, wetlands and wildlife. Industrialising the landscape with turbines, roads and associated infrastructure risks long-term harm. Surveys and protections must be robust, transparent and genuinely precautionary. If the proponent cannot show strong avoidance-first protection, the proposal should not proceed here. 5) The DA is too flexible and should not be approved as lodged The DA seeks approval for a “maximum case” while leaving key details to be finalised later. That approach is not fair to neighbouring landowners and it does not provide decision-makers with a clear, final project to assess. If a proposal is going to change Scott River for decades, it must be assessed on a fixed design with clear and enforceable protections. For these reasons, I request that the Shire recommend the RDAP refuse the application as lodged, or defer it until the proponent provides major further information and a properly defined, assessable proposal that protects farmland, livestock, families, workers, fire safety and the environment—and then re-advertise it for community review.
130	Object	I’m 12 years old and I live on a farm at Scott River. I want to be a farmer here when I grow up. I’m writing because I don’t want this wind farm approved the way it is right now.

		These wind turbines can be up to 250 metres high. That is massive. You can't put something that big into a quiet farming area and pretend it won't change everything. Noise, shadows and stress on animals - On a farm, people and animals are outside all the time. If there is constant noise or the "shadow flashing" from the blades, we can't just escape it. Livestock can't move away from it either. The rules should keep big turbines far enough away so families and animals are protected. Scott River is full of wildlife and special places - This area has wetlands and animals that belong here. They are unique. I'm worried about what happens when they start clearing, building roads and digging. If the company says it will be "fine", they should have to prove it properly and show exactly what they've checked and what they will protect. Bushfires are real here - We get fires. Theres one burning right now down the raod. In an emergency you need firefighters to be able to do their job safely and quickly. I'm worried that huge turbines make that harder. A fire plan should be clear and strong before anything is approved. The plan is too vague - From what I understand, the company is asking for approval first and then working out the exact details later. That doesn't feel fair to families who will live next to it for years and years. If it's going to be approved, everyone should be able to see the final plan and comment on the real version. Please recommend that this application is not approved as it is. It should be stopped or sent back until the company provides a clear final plan that truly protects farms, families, animals, wildlife and safety.
131	Object	I am a landowner and working farmer directly adjacent to the proposed Scott River Wind Farm Development Envelope. I object to this Development Application (DAP/25/02933) as lodged and request that the Shire recommend the RDAP refuse the application or, at minimum, defer determination and require major further information with re-advertising before any decision is made. This proposal is an industrial development of exceptional scale—up to 20 turbines at 250m tip height—in a rural district that relies on farming, environmental values, rural amenity and the region's tourism and lifestyle brand. A project of this magnitude does not "blend in" and it must not be assessed or approved on a 'concept envelope' with key details deferred to later stages. The DA itself confirms that the final turbine make/model and the specific location of infrastructure will be confirmed later through procurement and further design, and that approval is being sought for a "maximum case scenario". In my view, this is an "approval first, argue later" approach. The DA is weak, overly flexible, and not fit for determination. 1) Consultation and social licence: weak engagement and dismissive conduct From my direct experience, Synergy's engagement has not met the standard expected for a project that will affect neighbours for decades. In a meeting with Synergy's project team, when setbacks and neighbour impacts were raised, the project manager said words to the effect

		of: “Did you know I can put these turbines wherever I like.” That was the moment I realised we were dealing with a company that was not listening to our concerns or the community’s concerns. It was dismissive and disrespectful, and it does not inspire confidence that neighbour impacts will be treated seriously. For a proposal of this scale, consultation must be meaningful and transparent—not a box-tick exercise. The Shire should treat consultation quality as a material planning consideration because it directly affects social licence and whether the Shire will inherit decades of complaints and disputes. What I am asking for: The Shire should require a public, auditable “issues raised / response / design change” schedule showing what concerns were raised, what commitments were made, and what design changes were actually implemented. 2) The DA is not properly assessable: “maximum case” envelope with key details deferred The proponent confirms the final turbine model and the precise location of infrastructure will be finalised after approval. Those are not minor details. They determine real-world impacts: noise, shadow flicker, visual dominance, ecological risk, aviation constraints, bushfire response, and enforceability. A DAP approval should not be granted when the final design that drives the impacts is unknown at determination. This approach leaves neighbours in a position where we can only complain after impacts occur, when the project is already built. What I am asking for: Refuse or defer. Require a revised DA with fixed turbine model(s), fixed turbine coordinates, fixed infrastructure alignments, and updated technical studies tied to the final design—then re-advertise. 3) Neighbour protection must be based on impact containment, not risk transfer Impacts should be contained within the project footprint. Any approval approach that allows noise, flicker, lighting and safety risks to spill over the boundary is not protecting neighbours—it is transferring risk and burden onto us. As a working farm directly adjacent, we are not passive receivers of impacts. Farming involves livestock welfare responsibilities, workers and contractors, machinery operations, and constant land management. Noise and shadow flicker are not abstract. They affect people living and working on the farm, and they can affect livestock behaviour and day-to-day operations. What I am asking for: The Shire should adopt an “impact containment” principle. If the proponent cannot meet conservative thresholds without relying on curtailment promises or future “management plans”, then the site/layout is wrong and the proposal should be refused or redesigned. 4) Groundwater, aquifers, ASS and dewatering: due diligence is not credible Scott River is a high water table landscape with known acid sulfate soil risk. The DA acknowledges “significant challenges”, yet the

		baseline investigation presented is not commensurate with the risk. It appears the proponent relies on only three core soil samples to characterise soil profile and acid sulfate soil (ASS) risk across a large multi-lot development envelope. That is not good enough. This district has a clear warning in the history of the Beenup mineral sands mine. The lesson is that “we will manage it” is not a substitute for conservative investigation, avoidance-first design and enforceable controls. I do not accept that this DA should be approved on minimal baseline sampling with critical controls deferred to later plans. Lime demand concern: If Synergy’s approach relies on agricultural lime (“aglime”) to neutralise PASS soils and treat dewater, the Shire must require full disclosure of expected lime volumes, sourcing, haul routes and storage risks, and the implications for local agricultural supply. Lime is essential for productive farming systems. It should not be diverted locally to backfill an inadequate investigation program and weak planning. What I am asking for: No approval unless the proponent provides a robust turbine-by-turbine ASS and geotechnical investigation program (including roads/cable corridors/borrow pits), independently reviewed, and a conservative hydrogeological assessment tied to final turbine coordinates, with enforceable monitoring triggers and contingency responses. 5) Public conservation estate inside the envelope: survey coverage must be proven and disclosed The Development Envelope includes public land managed by DBCA for conservation. That alone requires a higher threshold of evidence and transparency. Survey coverage must be proven and disclosed—survey dates, methods, effort, spatial coverage maps and results (with appropriate redaction for sensitive species). Public conservation land cannot be treated as a survey gap or left to “finalise later”. 6) Bushfire and emergency management: weak and reactive for 250m infrastructure This district is bushfire-prone. The DA relies on future bushfire planning and references turbine shutdown capability. That is not a credible emergency strategy for 250m infrastructure. Aerial firefighting is critical during major events. A 250m turbine field and rotor-swept airspace can constrain aircraft approach paths and safe drop zones. In practical terms, suppression may be unable to be applied where it is needed most and a fire may be forced to burn through the project footprint and be caught on the far side. That increases risk to lives, farms, conservation estate and firefighters. If infrastructure burns (turbines, nacelles, blades, transformers, cabling), toxic smoke and contaminated runoff risks must be addressed. These hazards extend beyond the project boundary and can affect neighbours, livestock, waterways and wetlands. What I am asking for: No approval unless DFES/land managers provide explicit operational confirmation that emergency response (including aerial operations) remains feasible and safe for the final turbine coordinates, and unless enforceable shutdown/exclusion protocols and contamination controls are in place.

		7) Long-term Shire and community burden: 30–60 years of ageing industrial infrastructure This proposal would operate for 30–60 years. If approved with flexible parameters and deferred plans, the community and the Shire will carry the long-tail impacts of an ageing industrial installation: ongoing complaints and disputes, pressure for independent monitoring, road and traffic impacts, environmental compliance conflict, bushfire/incident risk, and reputational and tourism impacts. Our region thrives on our tourism and environment brand—not on ageing industrial infrastructure. Respect for the environment and the community must come first. The Shire's job is to protect the public interest, not to make this project "viable" by allowing weak conditions and risk transfer. For the reasons above, I request that the Shire recommend the RDAP refuse the application as lodged, or alternatively defer determination and require major further information, with re-advertising once the application is fixed and properly assessable.
132	Support	I support the Scott River Wind Farm DA as a critical step toward ending WA's reliance on fossil fuels. The project will deliver decades of clean electricity, drastically cut greenhouse gas emissions, and provide local economic activity without toxic emissions. While some details will be finalised later, this is standard for modern infrastructure and ensures the adoption of up-to-date, efficient technology. Concerns raised about noise, wildlife, and construction are manageable within existing WA regulatory frameworks and are negligible compared to the health and environmental damage caused by petrol and diesel vehicles, coal-fired power stations, and gas extraction. The short-term changes to views and local traffic do not outweigh the urgent need for climate-safe energy. We cannot delay renewable transition for another decade of fossil fuel dependency. Approve the DA and hold the developer to strong environmental and social conditions during final design and construction, knowing that the overall benefit is immense and lasting.
133	Object	I'm not sure if I have already filled out this submission, seems I have been submitting objections over and over. And here we still are, with no EPA investigation of this possibly disastrous proposed wind "farm". Nothing like a farm of course, destroying for ever possible farmland by pouring thousands of tons of concrete into it, thousands of tons of reinforcing metal. Who is going to remove it all? No one, that's the eventual answer. You know about the acid sulphate soils and while I have no chemical knowledge, there are plenty of people who do and who have written ad nauseum of their concerns. And still, no EPA assessment. I live on Molloy Island, a peaceful, quiet existence that we have enjoyed for the past 22 years. Maybe I won't hear the turbines, I don't know. But my greatest fear is the obvious potential for environmental damage to the water table and the river systems that will be impossible to fix. It has taken 25 years as I understand it, to rehabilitate the Beenup mine area, and now Synergy and foreign investors with no connection with this land, want to risk it all again. It is insanity, and I plead, I implore, at least have a proper environmental study of the risks versus the dubious benefits. Thank you.
134	Object	Objection to Proposed Wind Turbine Development – Scott River, Western Australia To Whom It May Concern, I am writing to formally object to the proposed wind turbine development in the Scott River area of Western Australia. While I acknowledge the importance of renewable energy and the role it plays in addressing climate change, I have serious concerns

		about the suitability of this project in the Scott River region and the potential negative impacts it may have on the local environment, community, and landscape. The Scott River area is recognised for its unique natural environment, biodiversity, and rural character. Large-scale wind turbines would significantly alter the visual landscape and may detract from the area's scenic and ecological value. The construction and operation of turbines also raise concerns regarding noise pollution, shadow flicker, and long-term impacts on residents' wellbeing and quality of life. In addition, the region supports important wildlife habitats, including bird and bat species that may be adversely affected by turbine operation. I am concerned that the full environmental impact on local ecosystems has not been adequately addressed or mitigated. The Scott River community values its quiet rural setting and agricultural productivity. Industrial-scale infrastructure is inconsistent with the existing land use and may negatively affect property values, tourism, and farming activities. For these reasons, I respectfully request that this proposal be reconsidered and that alternative locations more suited to large-scale wind energy development be explored. I also ask that meaningful consultation with local residents and landholders continue before any decisions are made. Thank you for considering my submission.
135	Support	I think this is a great idea and much needed as we transition from a fossil fuel based energy economy.
136	Object	This area is a known hot spot for birds. Nesting grounds for black swans along Governor Broome Rd. All matter of wildlife use this area to acsses the old beelup mine dams which have been rejuvenated with over 3 million plants. I strongly object to this proposal, protecting this area for future generations must be done.
137	Object	The detail provided for this proposal is a joke, and can not be consider serious . Where is the business plan?? Where is the cost of production?? How can a project of this scale be consider viable when there's no mention of the price they hope to get for the end product. Why are the host property contracts so clouded in secrecy. Commercial confidentiality is a ruse, if something is good ,fair and honest it doesn't need hiding. The transmission line this project says they will connect into is forty year old infrastructure .How many millions of dollars will need to be spent upgrading this? Again, no mention. As a local, the only people I know that support the project, are either getting paid hundreds of thousands of dollars to host the project or don't live locally .Doesn't that tell you something ?? The project area is zoned Agriculture.People have bought into the area, because of this ,and the characteristics that comes with it, not a industrial park. The Properties in the area are too small and there are too many people living and working to close. Its not like this area is like the wheat belt where the properties are 10 times the size and there are far fewer people around. The shire seems to pride itself on its environmental credentials , and always goes on about, how we live in an environmental hotspot. How can the shire even entertain the proposals effects on the environment when the surveys mentioned are so clearly flawed and

		obviously designed in a way to get the project over the line.Any local with only basic awareness of the local environment can pick huge holes in any of them !! Has the shire even sought local knowledge from people who have lived locally their whole lives, or is the shire only interested so called experts who blow in for a few hours and need the survey to tell the right story, so they can get their next contract. No cockatoo roosting trees !!! what a joke, what about the many mobs of 40 or 50 that feed on the pasture paddocks in the late spring all over the project site. What about the hundreds of blacks swans that fly in from the northeast at night into swan lake and also the inlet when the inland habitats dry out in the drier rainfall years. Wait , the survey wasn't done at night , so we didn't see any!!! what a joke, if it was not so serious, and not effecting so many people and destroying the local community , it would be hilarious. The soil pit test hole report is another joke. How many could they even complete or get to the required depth? And then they have the ordasity to expect us to believe that they can manage any challenges they encounter as far as acid sulphate soils and pressured aquifers .We will treat it with lime, they say.Unbelievable!!!These problems are the same problems that stopped BHP at Beenup, surely the shire has learnt that lesson or is the shire going to risk it all again, with this crowd who don't even have the competency to present a credible environmental survey. Thats not even mentioning the lack of engineering detail, very open ended.Wonder what would happen if I applied for a building permit from the shire with such a lack of detail? Its clearly obvious that the proponents of this project hold the shire and the locals in contempt, and the whole thing seems like a forgone conclusion .Now that the state government has canned the community benefit fund , $100000 yearly bribe or blood money, or whatever else one would like to spin it as, don't really see any benefit really, only a real life lesson how dangerous all this net zero zealotism really is.
138	Object	Objection to Planning Application P 225771 Proposed DAP/25/02933 Wind Farm I would like to object to the development application for a proposed large scale industrial wind farm in the Scott River and Blackwood River catchment region. The multi-lot development will have significant adverse impacts on the sensitive ecology, fragile environment and designated Scott River National Park, which is immediately adjacent to the development lots. The development is inappropriate as it's scale is too large, environmental and health impacts have been underestimated or not assessed, and this has already occurred once at the Beenup mine with disastrous results. The bushfire risk is also unacceptable in this location, and there is a lack of planning policy in place currently to fully assess an Application that has been quickly put together using draft documents and with no firm design, layout or specifications, which means that accurate assessments such as noise modelling and acid sulphate soils management planning cannot be performed. An alternate site should be found for such a large scale industrial project. Scale too big: The scale of the proposed wind farm with up to 20 wind turbines at a height of 250 m is excessive for such a sensitive area adjacent to a national park. At 250 m the wind turbines would be the largest land-based turbines in the country and of similar height to a

		skyscraper in the Perth CBD. At this scale the development lots are too small in Scott River to safely host a project of this size (WTGs should 3x the turbine height ie. 750 m from the lot boundary). The turbines will tower over the national park, which will not only reduce the visual amenity of the preserved area, but will also create an adverse impact by the noise and vibration, which is inherently produced by such turbines. What is the point of preserving areas as national parks if industrial scale machinery is placed on the boundary? The Visual Assessment Report attachment to the DAP Application completely ignores the visual impact of the wind farm on the Scott River national park, which is a major deficiency of the report. 80% of Australians are against development in and adjacent to national parks, and protection of nature, saving threatened species, and quiet enjoyment of nature are the top reasons considered to be important (National Parks Australia Council Feb 2022). Environmental impact severe: The ecological impact of this proposed development will be significant and is entirely inconsistent with the sensitive nature of the local ecology, which is protected federally under the EPBC act of 1999. 26 fauna species are listed as threatened, which must not be further impacted by such a development, and this area is internationally considered to be a biodiverse hot spot. Review of the appendices attached to the DAP Application, including the EPA Report clearly indicates there is a risk of acid sulphate soil (ASS) release and the EPA strongly recommends that a detailed Acid Sulphate Soils and Dewatering Management Plan (ASSDMP) be developed, and yet only a preliminary document has been presented for approval. ASS make the area unsuitable for large scale construction and development, including underground cabling, and this area remains at risk from the previous failed development attempted at the Beenup mine (BHP), which has been likened internationally to the Ok Tedi environmental disaster. The fact that the Beenup mine site is still undergoing ongoing rehabilitation and monitoring is evidence enough that this area is too sensitive for large scale industrial development. Full assessment of the environmental risks has apparently been devolved by the EPA to other Regulatory bodies and the stated “lack of need” for EPA assessment gives false security that there is no environmental risk in the proposed development. The EPA response also clearly only considers the land use of the lots directly involved in the proposed site, and does not consider the implications for the co-located Scott River National Park. Health effects: The noise and vibrations produced by large wind turbines result in acoustic vibration and noise of both audible and sub-audible magnitude. Both of these emissions pass well beyond the boundaries of the development lots and will affect neighbouring properties and preservation areas to their detriment. Health effects on both domesticated livestock and native animals is likely to occur based on previous documented research. Nocturnal animals that hunt and feed at night are particularly susceptible to vibrations that disturb their ability to do so. This has been particularly well documented in desert animals in southwest USA, but no local data has been provided or sought on the effects on local fauna. To allow this to occur in a national park area would be negligent of an informed assessment body (DAP). The Noise Impact Assessment (Attachment 4 / Appendix S) specifically excludes noise testing procedures that have considered all frequencies (particularly low frequencies) in the assessment and only modelling has been performed rather than any real-world testing. The modelling input data was also provided by the Applicant who has a conflict of interest (SynergyRED - 1/3 octave source spectra) and this means this is not an independent noise assessment. The Applicant also claims that the “noisiest” WTG data was used, but provides no evidence to support this, and the WTG units to be installed remain completely unknown at this stage. The Assessment has also ignored “tonality” without any justification for this, which would reduce the noise limit by another 5dB. Without this omission, most of the modelled levels at the noise-sensitive receptors would in fact be over limit above wind speeds of 8 m/s. The Assessment also states that the smallest safety margin with their own chosen criteria is less than 1 dB! This unacceptable safety margin is at receptor R32 that sits

		directly on the border of the wind farm and the Scott River National Park. Therefore further environmental and noise impact assessments should be required in such a sensitive area, as the juxtaposition of a national park means this development cannot be assessed merely on the proposed rural land use in isolation. Fire risk: The Scott River, East Augusta and Molloy Island communities constantly live in fear of bushfires with limited escape routes. The single escape route out of East Augusta in fact is directly adjacent to this proposed development. Unsupervised and isolated electricity generating wind turbines feeding into an electrical sub-station are a huge fire risk and a bushfire disaster waiting to happen that is not acceptable under the existing geographic escape constraints. Western Power equipment-related fires have historically been one of the main causes of bushfires in the southwest, and this alone makes this site entirely unsuitable for such a development by Synergy. Also the ability for FESA and local volunteer fire brigades to fight these fires would be severely constrained, with issues of ground access due to geographic and road constraints, sensitive local bushland and irreversible spread of diseases such as dieback, and this puts communities and the Scott River National Park at further risk. No-flight zones above wind turbines facilities also exist and would further restrict FESA efforts to control a bush fire, either started by the facility or otherwise. Land use destruction: The proposed DA contains land access agreements with Synergy, which affect both the host lots and surrounding neighbours. These agreements currently state 33 years + 33 years duration, which makes future land use uncertain, and removes access to vital productive farm land. Food production, which relies on limited productive farm land, remains one of the most important items for our society, which cannot be produced on mountain ridges, uninhabited remote locations or at open-sea installations where wind farms are more suitable. Contamination from wind blade erosion is also significant, producing BPA micro-plastics, which are spread across adjacent land including the Scott River national park. This is entirely unacceptable given the risk these micro-particles will enter the food chain, as well as have local impact on humans, farm animals and native wild-life. Ultimate land ownership also remains unclear from the proposal, as host lots may be sold immediately after approval, with no safeguards for the community on future de-commissioning, decontamination or degradation. Lack of Planning Policy Framework: There is currently a lack of Shire or State planning instruments in place to guide large scale renewable energy development assessments. These instruments are however due to be in effect in 2026, and so assessment of this current policy needs to be made in line with the expected guidelines and policies, and in fact requirements should be more conservative where there are currently significant community concerns. The Department of Planning, Lands and Heritage have produced a Position Statement: Renewable Energy Facilities (March 2020) for the WAPC and this contains some objective guidance including requirement for 1.5 km separation between noise-sensitive land use (such as quiet enjoyment of the Scott River National Park) and wind turbines, and a minimum setback of 3x the turbine height (=750 m) from the lot boundary (with which many of the planned turbine sites do not comply). The DAP Application also indicates that the exact size and specifications of the wind turbine generators are currently unknown and that their location and number, as well as the placement of other infrastructure is also currently uncertain. It is difficult to see therefore how any objective assessment of these “unknowns” is possible. The Applications states the “maximum case scenario” (= worst case scenario) has been presented, but in the setting of so many “unknowns’ it is not possible to assess whether this is in fact the case! The lack of clear detail and certainty of design is also evidenced by the fact that many of the Attachments to the DAP Application (eg. Attachment 4/Appendix B) are still only in Draft format. This suggests that this Application has been “rushed” to the DAP to be assessed prior to proper and likely more onerous planning instruments and policies being put in place. This is entirely unacceptable and the Shire should insist that the DAP consider their Planning Policy, even if only in draft.

		Government subsidy causing conflict: This proposal also relies on significant government provided subsidies (as do all "sustainable energy" projects), as well as being "gifted" a parcel of Crown reserve, and the government and approving bodies are therefore particularly responsible for ensuring that public funds are not directed to private projects that have a direct detrimental impact on local communities and legally protected and endangered environmental assets. These projects should be required to provide direct benefit to the local community in the form of shared remuneration for the Shire or cheap electricity to the locality. Approving a subsidized industrial project adjacent to a national park (Scott River) that has already narrowly missed destruction (by the Beenup mine disaster) is also against the common good, and also against the entire rationale for having government designated national parks. An alternate site that uses non-productive wind swept land of which WA has much, and which does not consume productive farm land of which WA has little, should therefore be found for such a large scale industrial project. The concept of a government funded industrial power plant being approved on the boundary of a national park is ridiculous!
139	Object	Objection to Planning Application P 225771 Proposed DAP/25/02933 Wind Farm I would like to object to the development application for a proposed large scale industrial wind farm in the Scott River and Blackwood River catchment region. The multi-lot development will have significant adverse impacts on the sensitive ecology, fragile environment and designated Scott River National Park, which is immediately adjacent to the development lots. The development is inappropriate as it's scale is too large, environmental and health impacts have been underestimated or not assessed, and this has already occurred once at the Beenup mine with disastrous results. An alternate site that uses non-productive wind swept land of which WA has much, and which does not consume productive farm land of which WA has little, should therefore be found for such a large scale industrial project. The concept of a government funded industrial power plant being approved on the boundary of a national park is ridiculous!
140	Object	Objection to Planning Application P 225771 Proposed DAP/25/02933 Wind Farm

		I would like to object to the development application for a proposed large scale industrial wind farm in the Scott River and Blackwood River catchment region. The multi-lot development will have significant adverse impacts on the sensitive ecology, fragile environment and designated Scott River National Park, which is immediately adjacent to the development lots. The development is inappropriate as it's scale is too large, environmental and health impacts have been underestimated or not assessed, and this has already occurred once at the Beenup mine with disastrous results. The bushfire risk is also unacceptable in this location, and there is a lack of planning policy in place currently to fully assess an Application that has been quickly put together using draft documents and with no firm design, layout or specifications, which means that accurate assessments such as noise modelling and acid sulphate soils management planning cannot be performed. An alternate site should be found for such a large scale industrial project. Scale too big: The scale of the proposed wind farm with up to 20 wind turbines at a height of 250 m is excessive for such a sensitive area adjacent to a national park. At 250 m the wind turbines would be the largest land-based turbines in the country and of similar height to a skyscraper in the Perth CBD. At this scale the development lots are too small in Scott River to safely host a project of this size (WTGs should 3x the turbine height ie. 750 m from the lot boundary). The turbines will tower over the national park, which will not only reduce the visual amenity of the preserved area, but will also create an adverse impact by the noise and vibration, which is inherently produced by such turbines. What is the point of preserving areas as national parks if industrial scale machinery is placed on the boundary? The Visual Assessment Report attachment to the DAP Application completely ignores the visual impact of the wind farm on the Scott River national park, which is a major deficiency of the report. 80% of Australians are against development in and adjacent to national parks, and protection of nature, saving threatened species, and quiet enjoyment of nature are the top reasons considered to be important (National Parks Australia Council Feb 2022). Environmental impact severe: The ecological impact of this proposed development will be significant and is entirely inconsistent with the sensitive nature of the local ecology, which is protected federally under the EPBC act of 1999. 26 fauna species are listed as threatened, which must not be further impacted by such a development, and this area is internationally considered to be a biodiverse hot spot. Review of the appendices attached to the DAP Application, including the EPA Report clearly indicates there is a risk of acid sulphate soil (ASS) release and the EPA strongly recommends that a detailed Acid Sulphate Soils and Dewatering Management Plan (ASSDMP) be developed, and yet only a preliminary document has been presented for approval. ASS make the area unsuitable for large scale construction and development, including underground cabling, and this area remains at risk from the previous failed development attempted at the Beenup mine (BHP), which has been likened internationally to the Ok Tedi environmental disaster. The fact that the Beenup mine site is still undergoing ongoing rehabilitation and monitoring is evidence enough that this area is too sensitive for large scale industrial development. Full assessment of the environmental risks has apparently been devolved by the EPA to other Regulatory bodies and the stated "lack of need" for EPA assessment gives false security that there is no environmental risk in the proposed development. The EPA response also clearly only considers the land use of the lots directly involved in the proposed site, and does not consider the implications for the co-located Scott River National Park. Health effects: The noise and vibrations produced by large wind turbines result in acoustic vibration and noise of both audible and sub-audible magnitude. Both of these emissions pass well beyond the boundaries of the development lots and will affect neighbouring properties and preservation areas to their detriment. Health effects on both domesticated livestock and native animals is likely to occur based on previous documented research. Nocturnal animals that hunt and feed at night are particularly susceptible to vibrations that

		disturb their ability to do so. This has been particularly well documented in desert animals in southwest USA, but no local data has been provided or sought on the effects on local fauna. To allow this to occur in a national park area would be negligent of an informed assessment body (DAP). The Noise Impact Assessment (Attachment 4 / Appendix S) specifically excludes noise testing procedures that have considered all frequencies (particularly low frequencies) in the assessment and only modelling has been performed rather than any real-world testing. The modelling input data was also provided by the Applicant who has a conflict of interest (SynergyRED - 1/3 octave source spectra) and this means this is not an independent noise assessment. The Applicant also claims that the "noisiest" WTG data was used, but provides no evidence to support this, and the WTG units to be installed remain completely unknown at this stage. The Assessment has also ignored "tonality" without any justification for this, which would reduce the noise limit by another 5dB. Without this omission, most of the modelled levels at the noise-sensitive receptors would in fact be over limit above wind speeds of 8 m/s. The Assessment also states that the smallest safety margin with their own chosen criteria is less than 1 dB! This unacceptable safety margin is at receptor R32 that sits directly on the border of the wind farm and the Scott River National Park. Therefore further environmental and noise impact assessments should be required in such a sensitive area, as the juxtaposition of a national park means this development cannot be assessed merely on the proposed rural land use in isolation. Fire risk: The Scott River, East Augusta and Molloy Island communities constantly live in fear of bushfires with limited escape routes. The single escape route out of East Augusta in fact is directly adjacent to this proposed development. Unsupervised and isolated electricity generating wind turbines feeding into an electrical sub-station are a huge fire risk and a bushfire disaster waiting to happen that is not acceptable under the existing geographic escape constraints. Western Power equipment-related fires have historically been one of the main causes of bushfires in the southwest, and this alone makes this site entirely unsuitable for such a development by Synergy. Also the ability for FESA and local volunteer fire brigades to fight these fires would be severely constrained, with issues of ground access due to geographic and road constraints, sensitive local bushland and irreversible spread of diseases such as dieback, and this puts communities and the Scott River National Park at further risk. No-flight zones above wind turbines facilities also exist and would further restrict FESA efforts to control a bush fire, either started by the facility or otherwise. Land use destruction: The proposed DA contains land access agreements with Synergy, which affect both the host lots and surrounding neighbours. These agreements currently state 33 years + 33 years duration, which makes future land use uncertain, and removes access to vital productive farm land. Food production, which relies on limited productive farm land, remains one of the most important items for our society, which cannot be produced on mountain ridges, uninhabited remote locations or at open-sea installations where wind farms are more suitable. Contamination from wind blade erosion is also significant, producing BPA micro-plastics, which are spread across adjacent land including the Scott River national park. This is entirely unacceptable given the risk these micro-particles will enter the food chain, as well as have local impact on humans, farm animals and native wild-life. Ultimate land ownership also remains unclear from the proposal, as host lots may be sold immediately after approval, with no safeguards for the community on future de-commissioning, decontamination or degradation. Lack of Planning Policy Framework: There is currently a lack of Shire or State planning instruments in place to guide large scale renewable energy development assessments. These instruments are however due to be in effect in 2026, and so assessment of this current policy needs to be made in line with the expected guidelines and policies, and in fact requirements should be more conservative where there are currently significant community concerns. The Department of Planning, Lands and Heritage have produced a Position

		Statement: Renewable Energy Facilities (March 2020) for the WAPC and this contains some objective guidance including requirement for 1.5 km separation between noise-sensitive land use (such as quiet enjoyment of the Scott River National Park) and wind turbines, and a minimum setback of 3x the turbine height (=750 m) from the lot boundary (with which many of the planned turbine sites do not comply). The DAP Application also indicates that the exact size and specifications of the wind turbine generators are currently unknown and that their location and number, as well as the placement of other infrastructure is also currently uncertain. It is difficult to see therefore how any objective assessment of these "unknowns" is possible. The Applications states the "maximum case scenario" (= worst case scenario) has been presented, but in the setting of so many "unknowns' it is not possible to assess whether this is in fact the case! The lack of clear detail and certainty of design is also evidenced by the fact that many of the Attachments to the DAP Application (eg. Attachment 4/Appendix B) are still only in Draft format. This suggests that this Application has been "rushed" to the DAP to be assessed prior to proper and likely more onerous planning instruments and policies being put in place. This is entirely unacceptable and the Shire should insist that the DAP consider their Planning Policy, even if only in draft. Government subsidy causing conflict: This proposal also relies on significant government provided subsidies (as do all "sustainable energy" projects), as well as being "gifted" a parcel of Crown reserve, and the government and approving bodies are therefore particularly responsible for ensuring that public funds are not directed to private projects that have a direct detrimental impact on local communities and legally protected and endangered environmental assets. These projects should be required to provide direct benefit to the local community in the form of shared remuneration for the Shire or cheap electricity to the locality. Approving a subsidized industrial project adjacent to a national park (Scott River) that has already narrowly missed destruction (by the Beenup mine disaster) is also against the common good, and also against the entire rationale for having government designated national parks. An alternate site that uses non-productive wind swept land of which WA has much, and which does not consume productive farm land of which WA has little, should therefore be found for such a large scale industrial project. The concept of a government funded industrial power plant being approved on the boundary of a national park is ridiculous!
141	Object	Objection to Planning Application P 225771 Proposed DAP/25/02933 Wind Farm I would like to object to the development application for a proposed large scale industrial wind farm in the Scott River and Blackwood River catchment region. The multi-lot development will have significant adverse impacts on the sensitive ecology, fragile environment and designated Scott River National Park, which is immediately adjacent to the development lots. The development is inappropriate as it's scale is too large, environmental and health impacts have been underestimated or not assessed, and this has already occurred once at the Beenup mine with disastrous results. The bushfire risk is also unacceptable in this location, and there is a lack of planning policy in place currently to fully assess an Application that has been quickly put together using draft documents and with no firm design, layout or specifications, which means that accurate assessments such as noise modelling and acid sulphate soils management planning cannot be performed. An alternate site should be found for such a large scale industrial project. Scale too big: The scale of the proposed wind farm with up to 20 wind turbines at a height of 250 m is excessive for such a sensitive area adjacent to a national park. At 250 m the wind turbines would be the largest land-based turbines in the country and of similar height to a skyscraper in the Perth CBD. At this scale the development lots are too small in Scott River to safely host a project of this size (WTGs should 3x the turbine height ie. 750 m from the lot boundary). The turbines will tower over the national park, which will not only reduce the visual amenity of the preserved area, but will also create an adverse impact by the noise and vibration, which is inherently produced by

		such turbines. What is the point of preserving areas as national parks if industrial scale machinery is placed on the boundary? The Visual Assessment Report attachment to the DAP Application completely ignores the visual impact of the wind farm on the Scott River national park, which is a major deficiency of the report. 80% of Australians are against development in and adjacent to national parks, and protection of nature, saving threatened species, and quiet enjoyment of nature are the top reasons considered to be important (National Parks Australia Council Feb 2022). Environmental impact severe: The ecological impact of this proposed development will be significant and is entirely inconsistent with the sensitive nature of the local ecology, which is protected federally under the EPBC act of 1999. 26 fauna species are listed as threatened, which must not be further impacted by such a development, and this area is internationally considered to be a biodiverse hot spot. Review of the appendices attached to the DAP Application, including the EPA Report clearly indicates there is a risk of acid sulphate soil (ASS) release and the EPA strongly recommends that a detailed Acid Sulphate Soils and Dewatering Management Plan (ASSDMP) be developed, and yet only a preliminary document has been presented for approval. ASS make the area unsuitable for large scale construction and development, including underground cabling, and this area remains at risk from the previous failed development attempted at the Beenup mine (BHP), which has been likened internationally to the Ok Tedi environmental disaster. The fact that the Beenup mine site is still undergoing ongoing rehabilitation and monitoring is evidence enough that this area is too sensitive for large scale industrial development. Full assessment of the environmental risks has apparently been devolved by the EPA to other Regulatory bodies and the stated “lack of need” for EPA assessment gives false security that there is no environmental risk in the proposed development. The EPA response also clearly only considers the land use of the lots directly involved in the proposed site, and does not consider the implications for the co-located Scott River National Park. Health effects: The noise and vibrations produced by large wind turbines result in acoustic vibration and noise of both audible and sub-audible magnitude. Both of these emissions pass well beyond the boundaries of the development lots and will affect neighbouring properties and preservation areas to their detriment. Health effects on both domesticated livestock and native animals is likely to occur based on previous documented research. Nocturnal animals that hunt and feed at night are particularly susceptible to vibrations that disturb their ability to do so. This has been particularly well documented in desert animals in southwest USA, but no local data has been provided or sought on the effects on local fauna. To allow this to occur in a national park area would be negligent of an informed assessment body (DAP). The Noise Impact Assessment (Attachment 4 / Appendix S) specifically excludes noise testing procedures that have considered all frequencies (particularly low frequencies) in the assessment and only modelling has been performed rather than any real-world testing. The modelling input data was also provided by the Applicant who has a conflict of interest (SynergyRED - 1/3 octave source spectra) and this means this is not an independent noise assessment. The Applicant also claims that the “noisiest” WTG data was used, but provides no evidence to support this, and the WTG units to be installed remain completely unknown at this stage. The Assessment has also ignored “tonality” without any justification for this, which would reduce the noise limit by another 5dB. Without this omission, most of the modelled levels at the noise-sensitive receptors would in fact be over limit above wind speeds of 8 m/s. The Assessment also states that the smallest safety margin with their own chosen criteria is less than 1 dB! This unacceptable safety margin is at receptor R32 that sits directly on the border of the wind farm and the Scott River National Park. Therefore further environmental and noise impact assessments should be required in such a sensitive area, as the juxtaposition of a national park means this development cannot be assessed merely on the proposed rural land use in isolation.

		Fire risk: The Scott River, East Augusta and Molloy Island communities constantly live in fear of bushfires with limited escape routes. The single escape route out of East Augusta in fact is directly adjacent to this proposed development. Unsupervised and isolated electricity generating wind turbines feeding into an electrical sub-station are a huge fire risk and a bushfire disaster waiting to happen that is not acceptable under the existing geographic escape constraints. Western Power equipment-related fires have historically been one of the main causes of bushfires in the southwest, and this alone makes this site entirely unsuitable for such a development by Synergy. Also the ability for FESA and local volunteer fire brigades to fight these fires would be severely constrained, with issues of ground access due to geographic and road constraints, sensitive local bushland and irreversible spread of diseases such as dieback, and this puts communities and the Scott River National Park at further risk. No-flight zones above wind turbines facilities also exist and would further restrict FESA efforts to control a bush fire, either started by the facility or otherwise. Land use destruction: The proposed DA contains land access agreements with Synergy, which affect both the host lots and surrounding neighbours. These agreements currently state 33 years + 33 years duration, which makes future land use uncertain, and removes access to vital productive farm land. Food production, which relies on limited productive farm land, remains one of the most important items for our society, which cannot be produced on mountain ridges, uninhabited remote locations or at open-sea installations where wind farms are more suitable. Contamination from wind blade erosion is also significant, producing BPA micro-plastics, which are spread across adjacent land including the Scott River national park. This is entirely unacceptable given the risk these micro-particles will enter the food chain, as well as have local impact on humans, farm animals and native wild-life. Ultimate land ownership also remains unclear from the proposal, as host lots may be sold immediately after approval, with no safeguards for the community on future de-commissioning, decontamination or degradation. Lack of Planning Policy Framework: There is currently a lack of Shire or State planning instruments in place to guide large scale renewable energy development assessments. These instruments are however due to be in effect in 2026, and so assessment of this current policy needs to be made in line with the expected guidelines and policies, and in fact requirements should be more conservative where there are currently significant community concerns. The Department of Planning, Lands and Heritage have produced a Position Statement: Renewable Energy Facilities (March 2020) for the WAPC and this contains some objective guidance including requirement for 1.5 km separation between noise-sensitive land use (such as quiet enjoyment of the Scott River National Park) and wind turbines, and a minimum setback of 3x the turbine height (=750 m) from the lot boundary (with which many of the planned turbine sites do not comply). The DAP Application also indicates that the exact size and specifications of the wind turbine generators are currently unknown and that their location and number, as well as the placement of other infrastructure is also currently uncertain. It is difficult to see therefore how any objective assessment of these “unknowns” is possible. The Applications states the “maximum case scenario” (= worst case scenario) has been presented, but in the setting of so many “unknowns’ it is not possible to assess whether this is in fact the case! The lack of clear detail and certainty of design is also evidenced by the fact that many of the Attachments to the DAP Application (eg. Attachment 4/Appendix B) are still only in Draft format. This suggests that this Application has been “rushed” to the DAP to be assessed prior to proper and likely more onerous planning instruments and policies being put in place. This is entirely unacceptable and the Shire should insist that the DAP consider their Planning Policy, even if only in draft. Government subsidy causing conflict: This proposal also relies on significant government provided subsidies (as do all “sustainable energy” projects), as well as being “gifted” a parcel of Crown reserve, and the government and approving bodies are therefore particularly

		responsible for ensuring that public funds are not directed to private projects that have a direct detrimental impact on local communities and legally protected and endangered environmental assets. These projects should be required to provide direct benefit to the local community in the form of shared remuneration for the Shire or cheap electricity to the locality. Approving a subsidized industrial project adjacent to a national park (Scott River) that has already narrowly missed destruction (by the Beenup mine disaster) is also against the common good, and also against the entire rationale for having government designated national parks. An alternate site that uses non-productive wind swept land of which WA has much, and which does not consume productive farm land of which WA has little, should therefore be found for such a large scale industrial project. The concept of a government funded industrial power plant being approved on the boundary of a national park is ridiculous!
142	Object	Objection to Planning Application P 225771 Proposed DAP/25/02933 Wind Farm I would like to object to the development application for a proposed large scale industrial wind farm in the Scott River and Blackwood River catchment region. The multi-lot development will have significant adverse impacts on the sensitive ecology, fragile environment and designated Scott River National Park, which is immediately adjacent to the development lots. At 250 m the wind turbines would be the largest land-based turbines in the country and of similar height to a skyscraper in the Perth CBD. At this scale the development lots are too small in Scott River to safely host a project of this size (WTGs should 3x the turbine height ie. 750 m from the lot boundary). The turbines will tower over the national park, which will not only reduce the visual amenity of the preserved area, but will also create an adverse impact by the noise and vibration, which is inherently produced by such turbines. What is the point of preserving areas as national parks if industrial scale machinery is placed on the boundary? The Visual Assessment Report attachment to the DAP Application completely ignores the visual impact of the wind farm on the Scott River national park, which is a major deficiency of the report. 80% of Australians are against development in and adjacent to national

		parks, and protection of nature, saving threatened species, and quiet enjoyment of nature are the top reasons considered to be important (National Parks Australia Council Feb 2022). Environmental impact severe: The ecological impact of this proposed development will be significant and is entirely inconsistent with the sensitive nature of the local ecology, which is protected federally under the EPBC act of 1999. 26 fauna species are listed as threatened, which must not be further impacted by such a development, and this area is internationally considered to be a biodiverse hot spot. Review of the appendices attached to the DAP Application, including the EPA Report clearly indicates there is a risk of acid sulphate soil (ASS) release and the EPA strongly recommends that a detailed Acid Sulphate Soils and Dewatering Management Plan (ASSDMP) be developed, and yet only a preliminary document has been presented for approval. ASS make the area unsuitable for large scale construction and development, including underground cabling, and this area remains at risk from the previous failed development attempted at the Beenup mine (BHP), which has been likened internationally to the Ok Tedi environmental disaster. The fact that the Beenup mine site is still undergoing ongoing rehabilitation and monitoring is evidence enough that this area is too sensitive for large scale industrial development. Full assessment of the environmental risks has apparently been devolved by the EPA to other Regulatory bodies and the stated “lack of need” for EPA assessment gives false security that there is no environmental risk in the proposed development. The EPA response also clearly only considers the land use of the lots directly involved in the proposed site, and does not consider the implications for the co-located Scott River National Park. Health effects: The noise and vibrations produced by large wind turbines result in acoustic vibration and noise of both audible and sub-audible magnitude. Both of these emissions pass well beyond the boundaries of the development lots and will affect neighbouring properties and preservation areas to their detriment. Health effects on both domesticated livestock and native animals is likely to occur based on previous documented research. Nocturnal animals that hunt and feed at night are particularly susceptible to vibrations that disturb their ability to do so. This has been particularly well documented in desert animals in southwest USA, but no local data has been provided or sought on the effects on local fauna. To allow this to occur in a national park area would be negligent of an informed assessment body (DAP). The Noise Impact Assessment (Attachment 4 / Appendix S) specifically excludes noise testing procedures that have considered all frequencies (particularly low frequencies) in the assessment and only modelling has been performed rather than any real-world testing. The modelling input data was also provided by the Applicant who has a conflict of interest (SynergyRED - 1/3 octave source spectra) and this means this is not an independent noise assessment. The Applicant also claims that the “noisiest” WTG data was used, but provides no evidence to support this, and the WTG units to be installed remain completely unknown at this stage. The Assessment has also ignored “tonality” without any justification for this, which would reduce the noise limit by another 5dB. Without this omission, most of the modelled levels at the noise-sensitive receptors would in fact be over limit above wind speeds of 8 m/s. The Assessment also states that the smallest safety margin with their own chosen criteria is less than 1 dB! This unacceptable safety margin is at receptor R32 that sits directly on the border of the wind farm and the Scott River National Park. Therefore further environmental and noise impact assessments should be required in such a sensitive area, as the juxtaposition of a national park means this development cannot be assessed merely on the proposed rural land use in isolation. Fire risk: The Scott River, East Augusta and Molloy Island communities constantly live in fear of bushfires with limited escape routes. The single escape route out of East Augusta in fact is directly adjacent to this proposed development. Unsupervised and isolated electricity

		generating wind turbines feeding into an electrical sub-station are a huge fire risk and a bushfire disaster waiting to happen that is not acceptable under the existing geographic escape constraints. Western Power equipment-related fires have historically been one of the main causes of bushfires in the southwest, and this alone makes this site entirely unsuitable for such a development by Synergy. Also the ability for FESA and local volunteer fire brigades to fight these fires would be severely constrained, with issues of ground access due to geographic and road constraints, sensitive local bushland and irreversible spread of diseases such as dieback, and this puts communities and the Scott River National Park at further risk. No-flight zones above wind turbines facilities also exist and would further restrict FESA efforts to control a bush fire, either started by the facility or otherwise. Land use destruction: The proposed DA contains land access agreements with Synergy, which affect both the host lots and surrounding neighbours. These agreements currently state 33 years + 33 years duration, which makes future land use uncertain, and removes access to vital productive farm land. Food production, which relies on limited productive farm land, remains one of the most important items for our society, which cannot be produced on mountain ridges, uninhabited remote locations or at open-sea installations where wind farms are more suitable. Contamination from wind blade erosion is also significant, producing BPA micro-plastics, which are spread across adjacent land including the Scott River national park. This is entirely unacceptable given the risk these micro-particles will enter the food chain, as well as have local impact on humans, farm animals and native wild-life. Ultimate land ownership also remains unclear from the proposal, as host lots may be sold immediately after approval, with no safeguards for the community on future de-commissioning, decontamination or degradation. Lack of Planning Policy Framework: There is currently a lack of Shire or State planning instruments in place to guide large scale renewable energy development assessments. These instruments are however due to be in effect in 2026, and so assessment of this current policy needs to be made in line with the expected guidelines and policies, and in fact requirements should be more conservative where there are currently significant community concerns. The Department of Planning, Lands and Heritage have produced a Position Statement: Renewable Energy Facilities (March 2020) for the WAPC and this contains some objective guidance including requirement for 1.5 km separation between noise-sensitive land use (such as quiet enjoyment of the Scott River National Park) and wind turbines, and a minimum setback of 3x the turbine height (=750 m) from the lot boundary (with which many of the planned turbine sites do not comply). The DAP Application also indicates that the exact size and specifications of the wind turbine generators are currently unknown and that their location and number, as well as the placement of other infrastructure is also currently uncertain. It is difficult to see therefore how any objective assessment of these “unknowns” is possible. The Applications states the “maximum case scenario” (= worst case scenario) has been presented, but in the setting of so many “unknowns’ it is not possible to assess whether this is in fact the case! The lack of clear detail and certainty of design is also evidenced by the fact that many of the Attachments to the DAP Application (eg. Attachment 4/Appendix B) are still only in Draft format. This suggests that this Application has been “rushed” to the DAP to be assessed prior to proper and likely more onerous planning instruments and policies being put in place. This is entirely unacceptable and the Shire should insist that the DAP consider their Planning Policy, even if only in draft. Government subsidy causing conflict: This proposal also relies on significant government provided subsidies (as do all “sustainable energy” projects), as well as being “gifted” a parcel of Crown reserve, and the government and approving bodies are therefore particularly responsible for ensuring that public funds are not directed to private projects that have a direct detrimental impact on local communities and legally protected and endangered environmental assets. These projects should be required to provide direct benefit to the local community in the form of shared remuneration for the Shire or cheap electricity to the locality.

		Approving a subsidized industrial project adjacent to a national park (Scott River) that has already narrowly missed destruction (by the Beenup mine disaster) is also against the common good, and also against the entire rationale for having government designated national parks. An alternate site that uses non-productive wind swept land of which WA has much, and which does not consume productive farm land of which WA has little, should therefore be found for such a large scale industrial project. The concept of a government funded industrial power plant being approved on the boundary of a national park is ridiculous!
145	Object	The WA Government has disregarded its own policy safeguards to push this proposal forward. The EPA has failed to confront the severe risks posed by ASS disturbance. Heavy industry in this location is fundamentally incompatible with the landscape and community values. Previous ASS disturbance at this exact site resulted in decades-long contamination and containment management costing BHP hundreds of millions in project failure and remediation. This proposal lacks scientific integrity and represents an unacceptable environmental, financial, and policy failure. It must be cancelled or relocated out of the region immediately Avoidance of ASS disturbance is the only scientifically defensible position.
146	Object	Submission to Shire On renewable policy LPP23 . I have been a resident and business owner for 45yrs. I feel very compassionate about our previously untouched coastal surrounds, and are very concerned that this region is moving faster than we have infrastructure and staffing to manage these projects. I do feel the Shire employees have Augusta in their best thoughts but are tied by government promises and controls on renewables. Whilst I feel strongly for renewables hence(I have just installed solar panels) I feel the area being the proposed Scott River wind farm is far to fragile environmentally to take a risk as you can not guarantee that the sulfate will not be a problem again, just doing their best to avoid is not good enough protection, the fact that this is a point of discussion in the synergy presentation pamphlet means Synergy knows its a possibility . The 26 yrs that it has taken to bring the ponds /area back to watch an asses from the Beenup mine site disaster should be ring sirens on this project. It is great that they have had rehabilitation success, but it should never have happened in the first place. The loss of wildlife and fauna: the area is bordering nation parks water ways wet lands the rivers and oceans, all linked by one of a few rare ecosystems in the world. Hence I can not understand any environment group thinking its a good idea small in-packed or large . The EPA studies not going ahead is just unbelievable, as this should be a high level biodiversity concern. That alone should be enough concern "not" to go ahead, with out taking in consideration the environment visual pollution to an area that has always been sold as the wild natural beauty it is by all eg (Government /Local Shire / Tourism/ business) The ability to protect Augusta Town and surrounding locations from fire as a result of turbines. The financial affect on community is unknown. The infra sound is unknown due to the curvature of the Bay. I lived along side two turbines in the North West with in couple of Klm which required me to use ear plugs to sleep, not everyone was effected but a low hum did exist for some. Most wind farms are generally built along side a town not directly in front, I live on a property so will not see them from my home, i think but visually it will affect the community as a whole. I would also like to express my disappointment that this project started by group basically unknown to the community on behalf of shire and acting on behalf of the community was never transparent considering the time it has been worked on. I believe this is one of the option that was considered by the group and due to the Beenup battery in place is was the best option. Not sure who for. Please think out side the square and find a spot that is not a risk and is not so special. Thank you for your time Susan Roberts Augusta Resident and Business Owner.
147	Object	I write to formally object to the proposed wind farm development at Scott River.

		I am a farmer within the Shire of Augusta Margaret River, with agricultural land located within approximately 10 kilometres of the proposed turbine area. While my property is not immediately adjacent to the turbine sites, I am concerned about the broader impacts of large-scale wind turbines on livestock welfare, agricultural operations, and the surrounding natural environment. Of particular concern is the potential effect of infrasound and low-frequency noise generated by large turbines. While these emissions may not always be audible, there is growing international discussion regarding their potential to influence animal behaviour and stress responses. Livestock confined to paddocks cannot relocate away from ongoing exposure to noise, vibration, shadow flicker or infrasound, and the Development Application does not provide sufficient assurance that animal welfare, behaviour or productivity will not be adversely affected. The proposal also raises concerns for native flora and fauna in the Scott River area. This region supports a range of sensitive ecosystems and species. There is reasonable concern that infrasound, vibration, habitat disruption and ongoing turbine operation may alter wildlife movement patterns and ecological processes. The application does not adequately demonstrate that these broader environmental effects have been fully assessed or that effective mitigation measures are in place. In addition, the industrialisation of agricultural landscapes through turbine infrastructure, access roads, cabling and construction activities risks fragmenting farmland and reducing long-term agricultural flexibility. These impacts have not been adequately weighed against any demonstrated benefit to local agriculture. Given the scale of the proposal, the lack of finalised design detail, and the unresolved concerns regarding livestock, wildlife and agricultural land use, I respectfully request that the Shire of Augusta Margaret River refuse the proposed Scott River Wind Farm
148	Object	They are not clean energy, the take too much of our coal we send to Chine to make them with weiger labour- Nuclear would be more efficient and cleaner
149	Object	I write to formally object to the proposed wind farm development at Scott River. Although I do not reside in the area on a full-time basis, I have a strong connection to the region and am concerned about the long-term impacts this proposal would have on agricultural land, animal welfare and environmental values. The proposed development would permanently industrialise productive agricultural land. Large turbine foundations, access roads, trenching and associated infrastructure will fragment farmland, reduce flexibility of land use and constrain agricultural operations for decades. This represents a long-term loss of productive rural land that has not been adequately justified. I am also concerned about the impacts of infrasound and low-frequency noise generated by large-scale wind turbines on wildlife and farm animals. International experience and emerging research suggest that such emissions can influence animal behaviour and movement. Wildlife may be displaced from habitat, while farm animals confined to paddocks near turbines cannot relocate away from ongoing noise, vibration or shadow flicker exposure. The Development Application does not adequately address these risks or provide confidence that animal welfare will be protected. The application seeks approval of a proposal that is not fully defined. Key details regarding turbine locations, specifications, construction

		methods and operational controls have not been finalised, making it difficult to properly assess long-term impacts on agriculture and the environment. For these reasons, I respectfully request that the Shire of Augusta Margaret River refuse the proposed Scott River Wind Farm, or at a minimum require a substantially revised proposal supported by clear evidence that agricultural productivity, animal welfare and environmental values will not be compromised.
150	Support	I'd like to commend the Shire for the work done to date on renewable energy planning. The Issues and Options approach shows a genuine effort to balance community confidence, environmental outcomes, and the need for energy transition. In particular, large proposals such as the Synergy project demonstrate what can be achieved when proponents go above and beyond on technical assessment, community engagement, and long-term planning. These types of projects, when well considered, should not be discouraged, and there is a real opportunity for the Shire to build on this experience. I would encourage a clear distinction in policy between small, mid-scale, and large-scale wind energy systems, as their impacts, benefits, and use-cases are very different. Appropriately scaled, on-site systems can play an important role in reducing diesel and grid reliance for farms, businesses, and community facilities. Where community benefit is involved, prioritising locally focused outcomes — such as support for sporting clubs, community facilities, and electrification initiatives — can help ensure renewable energy delivers tangible benefits at a local level. Overall, the direction taken so far is positive. I would encourage the Shire to keep the framework as clear, flexible, and performance-based as possible, allowing for case-by-case assessment within sensible guiding principles, rather than relying on overly rigid rules that may unintentionally limit good projects.
151	Object	Please accept this form as my submission regarding the Scott River Wind Farm proposal. A detailed written submission has been provided separately.
152	Object	24 year resident of East Augusta. I can not even fathom that a proposal like this is considered for an area known for such natural biodiversity not to mention the natural beauty that will be ruined for local people and Augusta residents. There has been a ban on 2 story residences in East Augusta for as long as I know because it spoils the natural and beautiful view from Augusta town site and yet this proposal to turn the view into an industrial skyline is ok? We only get one chance to ruin or not ruin these natural green places, please do not make the wrong decision.
153	Object	I am writing to lodge an objection to the Scott River Wind Farm Development Application currently before the Shire of Augusta Margaret River. I do not believe the Development Application provides sufficient detail to allow for a proper assessment of a project of this scale and consequence. While the application is lengthy, it lacks the certainty, specificity and final design information required for informed decision-making. At present, the proponent has not confirmed the final number of turbines, their final locations, the final turbine height, the final turbine model, or a detailed construction and operations methodology. Turbine locations may be moved at the developer's discretion. These

		matters are fundamental to assessing impacts such as noise, infrasound, shadow flicker, visual dominance, bushfire risk, groundwater impacts and overall amenity. Telling the community that these details will be “worked out later” is not acceptable for a development that would permanently alter the Scott River area for decades. I am particularly concerned about noise impacts. The noise assessment relies on desktop modelling and assumptions rather than real-time, in-field measurements under local conditions. The modelling is also framed around WA noise rules that focus on audible dBA limits developed for much smaller, older turbines, not modern 250-metre turbines of the scale proposed for Scott River. The application does not adequately address low-frequency noise or infrasound, despite growing international evidence that pulsating infrasound from large turbines may present unaddressed health risks for some people. There are no clear commitments to independent, continuous real-time noise monitoring at nearby residences, nor enforceable shutdown provisions if limits are exceeded. The proximity of turbines to homes and property boundaries is also unacceptable. Neighboring land should not be treated as a buffer for industrial development. The setbacks proposed do not reflect the scale of modern turbines or reasonable expectations for rural amenity. Approving turbines so close to boundaries shifts noise, shadow flicker and visual impacts onto neighboring landowners and effectively sterilizes surrounding land use for the rest of this century. The visual impact of the proposal is significant. Turbines and blades exceeding the height of Perth’s tallest buildings will dominate the rural landscape and skyline for kilometers. Scott River is valued for its natural landscape, agricultural character, and quiet rural amenity. Industrializing this landscape would result in a permanent loss of character and would undermine tourism and the long-term enjoyment and value of surrounding properties. The site’s floodplain location raises serious environmental concerns. The area contains acid sulfate soils and a shallow superficial aquifer that is linked to the river system. Deep foundations, trenching and dewatering pose high-consequence risks to soil stability, water quality, farming operations, dams and bores. The Development Application does not provide a credible, site-specific hydrogeological assessment or a robust acid sulfate soil and dewatering management plan. Reliance on emergency lime treatment is not a sustainable or responsible mitigation strategy, particularly given competing demands on lime for agricultural use. Bushfire risk and emergency response have also not been adequately addressed. Wind turbines create no-fly zones that may restrict aerial firefighting, and internal access roads do not equate safe evacuation routes in a rural fire scenario. The application does not demonstrate how fire ignition risk, emergency response or rare flora protection would be managed in extreme fire conditions. Construction impacts are similarly underdeveloped. The application lacks detail on access routes, heavy vehicle movements, timing and duration of works, dust and noise management, and protections for local residents, road users and businesses. These impacts are not short-term inconveniences but could extend over months or years. Finally, I am concerned about the adequacy of community consultation. Many affected landholders report no direct engagement. The Development Application does not clearly summarize community feedback or demonstrate how concerns have been meaningfully addressed. Given the scale and permanence of this proposal, the consultation undertaken to date is inadequate. For these reasons, I request that the Shire of Augusta Margaret River refuse or, at a minimum, defer the Development Application until a final turbine layout, confirmed turbine specifications, verified noise framework, and robust environmental, bushfire and construction management plans are provided and independently reviewed. This proposal is not suitable for the Scott River floodplain, and the risks to community amenity, farming, water security, environment and landscape character are unacceptable. Note: Has the Council taken into account that the Wind Turbines and Solar Panels are made in China by forced slave labour by the Chinese Communist party, and both panels and wind turbines are not recyclable, so where will the spent turbines be buried? (Margaret River).

154	Object	Objection to Proposed Wind Turbine Development at Scott River, Western AustraliaTo Whom It May Concern,I am writing to formally object to the proposed wind turbine development in the Scott River area of Western Australia.While I acknowledge the importance of renewable energy and the role it plays in addressing climate change, I have serious concerns about the suitability of this project in the Scott River region and the potential negative impacts it may have on the local environment, community, and landscape.The Scott River area is recognised for its unique natural environment, biodiversity, and rural character. Large-scale wind turbines would significantly alter the visual landscape and may detract from the area scenic and ecological value. The construction and operation of turbines also raise concerns regarding noise pollution, shadow flicker, and long-term impacts on residents' wellbeing and quality of life.In addition, the region supports important wildlife habitats, including bird and bat species that may be adversely affected by turbine operation. I am concerned that the full environmental impact on local ecosystems has not been adequately addressed or mitigated.The Scott River community values its quiet rural setting and agricultural productivity. Industrial-scale infrastructure is inconsistent with the existing land use and may negatively affect property values, tourism, and farming activities.For these reasons, I respectfully request that this proposal be reconsidered and that alternative locations more suited to large-scale wind energy development be explored. I also ask that meaningful consultation with local residents and landholders continue before any decisions are made.Thank you for considering my submission.Yours sincerely,
155	Object	The WA Government has disregarded its own policy safeguards to push this proposal forward. The EPA has failed to confront the severe risks posed by ASS disturbance. Heavy industry in this location is fundamentally incompatible with the landscape and community values. Previous ASS disturbance at this exact site resulted in decades long contamination and containment management costing BHP hundreds of millions in project failure and remediation. This proposal lacks scientific integrity and represents an unacceptable environmental, financial, and policy failure. It must be cancelled or relocated out of the region immediately Avoidance of ASS disturbance is the only scientifically defensible position.
156	Object	I am writing to object to the proposed wind farm next to my farm. I have lived and worked on this land my entire life, and it is both my home and livelihood. This area is valued for its quiet rural character, open landscapes, and abundant wildlife. People come here to escape the city, enjoy nature, and experience the peace that defines this region. Large-scale wind turbines would fundamentally alter this character through noise, visual intrusion, shadow flicker, and increased traffic. And just an absolute annoyance the fact that we won't be paying any less for power. The development would also impact livestock and wildlife, and permanently change the landscape. Once established, these effects cannot be reversed, and they place a significant burden on long-term residents like myself. For these reasons, I respectfully request that the Shire consider the protection of rural amenity, environmental values, and the lived experience of local landholders when deciding on this proposal.

157	Object	I am writing to lodge my objection to the proposed Scott River Wind Farm. I have been a resident of East Augusta since 2007. Like most people I was drawn to the pristine environment of the Augusta area. An unspoilt landscape that is a feature and attraction of the Augusta region, with a community that is proud of the ecological integrity the pristine landscape offers. An undisturbed environment that is visible from both land and sea. I am regularly south of the lighthouse looking back at the land and marvel at the beauty nature has to offer. The marine life that migrates past the cape, the spectacular coast line and natural backdrop that has remained largely intact for centuries. Why would we spoil this environment with monstrous wind turbines? There is nothing attractive about a 250m high structure, built near a wilderness, that can be seen for 70km. Visible from numerous points from Augusta and surrounding area, including Flinders Bay and the Southern Ocean. The AMR Strategic Community Plan to achieve the vision of "One Community, standing together with nature", provides the guiding framework to protect our natural environment. The whole community should aspire to uphold the focus areas detailed in the Strategic Community Plan, while the shire's has the authority to enforce the three focus areas this plan, in particular the first of these "Caring for our environment". An extract of this section of the plan is "...it's more than where we live, it's who we are. We strongly believe that nature underpins our lives, and when nature thrives, we thrive. There is continuing demand to not only preserve our precious bushland, waterways and coastal areas, but to restore and revegetate where possible, paying special attention to wildlife corridors and management of non-native and invasive species. This also extends to our marine environment, with a call to better protect ocean health and marine biodiversity as part of our broader commitment to environmental stewardship." This is exactly what needs to happen now. Preserve this pristine environment. The road into East Augusta is the Scott River Road. A road that is traveled daily by some residents and very frequently by others. What a ghastly, abhorrent sight this would make - seeing them for almost the entire journey out of East Augusta and for part of the journey in. Why should residents be subjected to this. As stated in the Strategic Plan - "New development is concentrated within clearly defined areas to avoid impacts on remaining farmland and ecosystems." I have been made aware of studies done on infrasound - low frequency sound waves (1 to 20Hz). While the intrasound is below the frequency audible by humans, it is claimed to have potential negative effects on humans such as nausea and headache. It was interesting to note that one project in Norway, reported the indigenous reindeer have vacated the area for a 10km radius. Were you aware of this? The video was made by a Professor Ken Mattsson primarily to make people aware of infrasound and the effects this is having on the environment. No doubt this has been assessed as part of the Synergy submission?? I would like to know the results. IF THERE IS ANY DOUBT ABOUT POTENTIAL NEGATIVE EFFECTS, then a full and comprehensive study will need to be performed over months even years - not for a 10 minute period that I have been lead to believe is the time period companies use to ascertain impact of potential negative effects. Synergy has stated audible sound will be heard in East Augusta at a level of a ticking clock. Who wants that? Certainly not me. East

		Augusta is a place I reside, where one of the reasons is to strengthen my mental health. Augusta is a special place that needs to be protected from big business, who put profits before the environment. I have been told this Synergy project is 80% backed by Italian and Japanese Oil and Gas giants Eni and INPEX. The site for the proposed wind farm is no doubt selected to use the existing infrastructure put in place to support the failed Beenup mine project. So obviously selected as it's a lower cost option to alternate locations. This mentality is at odds with the Strategic Plan. It's the wrong philosophy - put the environment and community interests ahead of profit. Put people first and if the wind farm is a preferred renewable option then put it out of site, away from people and environmentally sensitive areas. There are a number of other reasons to support my objections: - Parts of the Application that I have read, while lengthy lacks specific details. - The EPA will not be assessing the proposal??? In an environmentally sensitive area? This is unheard of. - Potential noise impact from the proposed turbines which are claimed to be the tallest built in Australia. Surely the noise and infrasound generated from these would be different from smaller turbines?? - Bushfire risks and the only real way out of East Augusta is the Scott River Road.
158	Object	I oppose the Scott River wind farm because 250m turbines on a floodplain with acid sulfate soils, shallow groundwater and active farming is too risky. The noise modelling isn't real and the project has no enforceable protections for people living nearby. It threatens food and water security, bushfire safety, rural amenity and the environment.
159	Object	I relocated to Augusta just over three years ago due to its quiet rural character, favourable climate, high environmental values, and nationally significant scenic landscapes. These attributes are fundamental to my amenity, wellbeing, and lifestyle. I support the transition to renewable energy and acknowledge its importance in state and national policy. However, support for renewable energy must not come at the expense of unacceptable environmental, social, agricultural, and amenity impacts—particularly in highly sensitive rural and environmental landscapes such as the Scott River floodplain. SUBMISSION TO THE DEVELOPMENT ASSESSMENT PANEL (DAP) Relevant Authority: Development Assessment Panel (DAP) Related Agencies: Shire of Augusta Margaret River; Western Australian Planning Commission (WAPC); Environmental Protection Authority (EPA); Commonwealth Department of Climate Change, Energy, the Environment and Water (DCCEEW) _____ 1. PURPOSE OF SUBMISSION This submission is made in response to the proposed Scott River Wind Farm Development Application, anticipated to be lodged imminently. It is prepared for consideration by the Development Assessment Panel (DAP) and is intended to inform both State and Commonwealth decision-makers. The submission assesses the proposal against relevant Western Australian planning policy, Environmental Protection Authority (EPA) objectives, and potential referral triggers under the Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act). It also highlights matters warranting Ministerial and Parliamentary scrutiny. _____ 2. PLANNING CONTEXT AND POLICY FRAMEWORK 2.1 Western Australian Planning Policy

		The proposal must be assessed against, but not limited to: • State Planning Policy 2.5 – Rural Planning • State Planning Policy 2.7 – Public Drinking Water Source Policy • State Planning Policy 5.4 – Road and Rail Transport Noise and Freight Considerations in Land Use Planning • State Planning Policy 3.7 – Planning in Bushfire Prone Areas • State Planning Policy 3.4 – Natural Hazards and Disasters • Draft State Planning Policy – Renewable Energy • Local Planning Strategy and Local Planning Scheme provisions of the Shire of Augusta Margaret River These policies collectively prioritise protection of: • Prime agricultural land; • Environmental and landscape values; • Water resources and floodplain systems; • Community amenity and public safety; and • Rural character and tourism-dependent economies. The Scott River floodplain conflicts fundamentally with these objectives. _____ 3. SITE UNSUITABILITY AND ENVIRONMENTAL CONSTRAINTS 3.1 Floodplain and Acid Sulphate Soils The Scott River floodplain is characterised by acid sulphate soils, high groundwater tables and hydrological connectivity to the Scott River, Hardy Inlet and the Blackwood River system. Large-scale excavation, turbine footings, access roads, and dewatering present a high risk of: • Acid sulphate soil oxidation; • Saline groundwater up-coning; • Contamination of waterways, wetlands and farmland; and • Permanent hydrological disruption. These risks directly conflict with EPA objectives for inland waters, land, and environmental quality, and are inconsistent with the precautionary principle embedded in WA environmental assessment. Once triggered, these impacts are irreversible. _____ 4. EPA OBJECTIVES AND ENVIRONMENTAL IMPACTS The proposal is inconsistent with the EPA's key environmental factors, including: 4.1 Inland Waters • Risk of contamination through soil disturbance and altered drainage; • High connectivity between groundwater and surface water systems; • Potential long-term degradation of water quality. 4.2 Terrestrial Fauna and Flora • Habitat fragmentation and displacement from noise, infrasound and visual disturbance; • Direct mortality risk from blade strike; • Loss of breeding and foraging habitat.

		4.3 Threatened Ecological Communities The Scott River Ironstone Association is a Threatened Ecological Community listed under State and Commonwealth frameworks. Any excavation, drainage or infrastructure development places this TEC at risk of collapse, contrary to EPA objectives to avoid and minimise impacts on significant biodiversity. _____ 5. EPBC ACT – MATTERS OF NATIONAL ENVIRONMENTAL SIGNIFICANCE The proposal should trigger referral under the EPBC Act due to potential significant impacts on: • Critically Endangered Species: o White-bellied Frog (Geocrinia alba) o Western Ringtail Possum (Pseudocheirus occidentalis) • Endangered Species: o Carnaby's Black Cockatoo (Calyptorhynchus latirostris) o Baudin's Black Cockatoo (Calyptorhynchus baudinii) • Threatened Ecological Communities: o Scott River Ironstone Association • Hydrological systems connected to Ramsar-listed and nationally significant wetlands Given the scale of disturbance and cumulative risk, referral to the Commonwealth Minister is not optional but necessary. _____ 6. AGRICULTURAL LAND AND FOOD SECURITY The Scott River district forms part of Western Australia's prime agricultural land, supporting beef, dairy and grain production for domestic and export markets. Industrial wind turbines introduce unacceptable risks to: • Food safety and contamination; • Export market integrity; • Long-term agricultural productivity. Blade erosion and particulate shedding from imported turbine materials present contamination pathways into soils, pasture, livestock and crops. These risks have not been independently assessed and are incompatible with State policy protecting agricultural land. _____ 7. AMENITY, NOISE AND SETBACKS Current setback standards are outdated and were developed for turbines significantly smaller than the proposed 250-metre structures. Minimum requirements must include: • A minimum setback of 3 kilometres from dwellings; • A minimum of five times turbine tip height from property boundaries; • Full containment of noise, low-frequency noise, infrasound, vibration and shadow flicker within the project boundary. Neighbouring land must not be relied upon as an industrial buffer. _____ 8. BUSHFIRE RISK AND EMERGENCY MANAGEMENT The Scott River catchment is one of the most bushfire-prone areas in the South West. Fire response is severely constrained by environmental access limitations designed to protect sensitive habitats.

		Turbines introduce ignition sources into a landscape where evacuation, suppression and asset protection are compromised. This conflicts with SPP 3.7 – Planning in Bushfire Prone Areas and places unacceptable risk on residents, landholders and emergency services. _____ 9. TOURISM, LANDSCAPE AND COMMUNITY WELLBEING The Augusta–Margaret River region is internationally recognised for its scenic landscapes, tranquillity and nature-based tourism. A 250-metre-high industrial skyline would: • Permanently degrade visual amenity; • Undermine tourism viability; • Cause psychological and health impacts associated with noise and shadow flicker; • Devalue residential and rural properties. These impacts are incompatible with State and local planning objectives. _____ 10. CUMULATIVE IMPACT AND PRECEDENT Approval of this proposal would establish a precedent for further industrial-scale renewable energy development across the Scott River floodplain, Hardy Inlet and surrounding ridgelines. Cumulative impacts would result in irreversible transformation of the region, contrary to orderly and proper planning principles. _____ 11. CONCLUSION AND REQUEST The proposed Scott River Wind Farm is fundamentally inconsistent with Western Australian planning policy, EPA environmental objectives, and Commonwealth biodiversity protections. The site is unsuitable. The risks are irreversible. The impacts extend beyond the project boundary and beyond the present generation. Accordingly, it is respectfully submitted that: • The proposal should not be supported by the DAP; • The site should be excluded from industrial-scale renewable energy development; • Any proposal must be referred once more to the EPA... and the Commonwealth Minister under the EPBC Act; • The Shire's Renewable Energy Policy be strengthened to reflect these constraints. This matter warrants Ministerial and Parliamentary oversight to safeguard Western Australia's biodiversity, food security, community safety, and international reputation.
160	Object	I object to this proposal. The scale and nature of the project is inappropriate and there is not enough detail in the DA (which describes a conceptual project) to fully understand the impacts on issues such as acid sulphide soils and groundwater effects. This project is in an environmentally sensitive area. Where are details on exact location and specifications of the turbines and associated infrastructure, site specific acid sulphate soil investigation, detailed hydrological assessment, etc. The worst aspect of this proposal is the visual impact. These towers will be seen from Augusta town and beaches such as Flinders. These therefore fundamentally alter the character of the area, in a way which most residents and visitors would say is detrimental. thanks
161	Object	My Family and I have lived in East Augusta now since 2001, and enjoyed the peace and serenity and healthy living, with no noise pollution apart from the cicadas and whale song. We take great pleasure in the fact that although it is a n effort living here sometimes, we

		benefit greatly mentally from this, no traffic, or pollution associated with this and a complete escape from the rat race that we lived in so long so we could move here and live like this. We are opposed to the wind farm for these reasons: Noise Pollution - when I asked at a local info session given by synergy, a member from their team likened it to an air conditioning unit or leaves in the trees being blown by the wind. Two very different types of noise as you can imagine, wind in the trees yes please any time, but the constant whirr of an air conditioning unit is what we have escaped from. CONSTANT. No turning it off. tic tic tic tic. No thanks. Studies have shown that infrasound is real and that people suffer from nausea and other symptoms. I would like to see a much bigger study on the effects of the noise pollution in the vicinity. I believe the study or information given re the sound is for a much smaller scale turbine. These are said to be 250 meters tall. Surely the sound will travel further. What happens to the poor farmers/landholders who oppose the turbines and end up with one next door to them? Is there a boundary limit? or setback? What will the minimum be? A turbines height? I am not opposed to renewable energy; it is the way forward. I am opposed to massive 250 m turbines on prime biodiversity land when there is a huge country with empty spaces out there. The argument that there is already a power hub there on Scott River is weak as when questioned about it at the talk the member said that there would have to be a huge upgrade of the lines. So just build elsewhere, where there are no people affected by this. Augusta is a tourism destination, and the visual impact of these manmade turbines will literally be colossal. We are one of the last places with uninterrupted views for as far as the eye can see, why on earth would we change this / It adds to our uniqueness and is a major drawcard for tourism. The rules and regulations that common landholders have to jump through to build a shed or house is lengthy and arduous and incredibly strict on tree removal and height regulations and not to mention bushfire requirements, and yet here we have a proposal for 30 wind turbines. 30 skyscrapers. Welcome to the new gold coast. I believe the Beenup Mine was shut down due to the acid sulphate leaching into the local waterways, it took 10 years and who knows how many millions to mitigate that error, why is this even being considered on the same site ? It has already been shown that it is an environmental disaster waiting to happen AGAIN. I hope the shire has a plan for when this happens again or is asking for the right investigations before it starts. My husband and I are members of the EAVBFB, our brigade like most in the shire ids volunteer based. These volunteers are far and few to mention and not young. We have one truck. We depend on aerial support, what is the no-fly zone around these turbines? What about the RFDS getting to emergencies on farms in the Scott River? We need to know what the fire mitigation process will be. Renewable energy is evolving and happening and is not going to go away, if we are going to welcome it and have everyone on side, (impossible) we need policies and protection for the environment and the affected landholders that match and evolve with the times. If this is swept under the carpet and shuffled in a pile of papers because the policy is old and it goes ahead with restrictions that are not geared for such a huge project, we will NEVER get the land back to what it was.

162	Object	I do not have a problem with wind turbines or solar farms being built in our region. I do have a problem however with this proposed wind farm at Scott river.I think the Augusta Margaret River Shire should have been far more active in testing its residents reaction to this proposal,particularly those who live in the area that are going to be most affected. In this case the shire should not necessarily listen to the majority of ratepayers in the shire but to those close to the wind farm who will be affected both financially and in terms of health and lifestyle. This project would be a lot less controversial if it was moved east twenty or thirty kilometres.I know there is an argument about using existing infrastructure of roads and an old existing power transmission line and it is also much easier for our labour governments to make sure that renewable projects are constructed on what they love to call degraded farmland. I am sure our well respected farmers at Scott River object to this term being used.It is of concern that good farmland is being taken out of production at a time when there is an increasing worldwide demand for food. Australia wide this pattern of using “degraded farmland”for renewables is meeting with a lot of resistance.It would seem that it is not acceptable to Labour-Greens governments to locate renewable projects on environmentally sensitive areas of public land. On that matter the fact that the EPA are suddenly not required to have input into this decision as it is going onto “degraded farmland” seems very convenient. There are concerns of public health and safety, the fact that Synergy sneek around signing long term contracts(66 years)with people who won’t be alive at the end of the term,Synergy are only approximately 20% of the controlling corporate structure with the other 80% being two multinational oil and gas companies. I think this project should not proceed and the project partners should look at negotiating with the Western Australian Government for a more suitable location perhaps closer to Windy Harbour.
163	Object	I am objecting to this wind farm as it is totally incompatible with its surrounds; Molloy Island is surrounded by water courses and uninterrupted natural vegetation. Maximum building height in our shire is 8m and here the proponent is proposing to build rotating structures of 250m tall. Higher than any structure in Perth and in plain view, towering over the natural vegetation. Totally out of proportion in this tourism hot spot. All the modelling seems to have been done on a desktop as there is no precedent for these turbines. All the existing turbines are much more to a domestic scale and are for local purpose (Albany, Hopetoun, Denmark and Bremer Bay). I wouldn't mind 2 or 3 sixty-meter-tall turbines for local energy supply as these would disappear in the landscape and affect only the land there're located on. This mega farm is not for local purposes but for electricity for Bunbury/Perth. As these Turbines have an unprecedented scale and are largely untested on their impact, I dispute the expected noise findings in the proponent's report. Molloy Island is surrounded by water and flat natural vegetation, both of which do very little to block or reduce noise. The fact that these turbines are so elevated above anything else will make them audible from a very long distance more like how the noise of a plane travels. Molloy Island is one of the quietest places I have ever lived or stayed with no traffic or other noises to speak of. I know the turbines will be audible. My last concern is the regarding the acid sulfate soils that the foundations for the turbines will have to be constructed in. Regarding the proposed method of dealing with excess water from the dewatering that will need to be done: I have during my working life worked for the water authority in the Netherlands and have experienced firsthand how difficult it is to even in seemingly easy condition to re-inject water into unlaying aquifers. Here the proponent has to deal with treating the acid water with lime and then returning this in an area full of coffee rock and very high-water tables. I think the proposed methods for foundations is wishful thinking and hoping for the best. I hope the engineers have had a very good look at the failed Beenup mine and the potential costs of an environmental catastrophe. I would also point out that if the proponent manages to put these foundations in, they will be exposed to the natural acidity and will be prone to

		concrete rot with an obvious end result. Apart from being a windy location and the fact there is a substation to hook the wind farm into, the Scott River site is totally unsuited and will ruin 285 family's life on Molloy Island, many more in Augusta, Scott River, East Augusta and Alexandra Bridge. The Shire should not approve this project for no local gain at the expense of the enjoyment of all above mentioned residents that have lived or bought here on the assumption it was not going to be turned into an industrial landscape.
164	Object	I write to lodge a formal submission on Synergy Renewable Energy Developments Pty Ltd's (SynergyRED) Development Application (DAP pathway) for the proposed Scott River Wind Farm. My objection is based on the scale and nature of the proposal, the lack of sufficient detail in the Development Application to allow proper assessment, the lack of an assessment by the EPA and the significant long-term impacts the development would have on the environment, including groundwater and impact of acid sulfate soils, visual amenity, rural character, community wellbeing and future land use in the Scott River and Augusta region. The Development Application seeks approval of a very early stage proposal. Key elements—including the number, location, height and specification of turbines, construction methodology, foundation design, dewatering volumes and environmental management measures—have not been finalised. As a result, the application does not provide a reliable basis for assessing worst-case impacts or for imposing effective and enforceable conditions on a development that would operate for several decades. The proposal poses serious environmental risks and I am very concerned about the lack of a full environmental effects assessment. Large-scale excavation, trenching and turbine foundations will require piling and dewatering, with the potential to alter groundwater flow paths and water table levels. The Scott River area is known to be sensitive, with shallow groundwater and acid sulfate soils. Disturbance of these soils through excavation or groundwater drawdown can generate sulfuric acid and mobilise heavy metals, causing long-term damage to soils, waterways, flora, fauna and agricultural water supplies. The application lacks a site-specific acid sulfate soil investigation, a detailed hydrogeological assessment, and a robust dewatering and management plan with monitoring, trigger levels and emergency responses. The scale of earthworks is substantial, including approximately 30 km of onsite roads, 30 km of cable trenching, and turbine foundations involving thousands of tonnes of excavation per turbine, potentially exceeding 7 metres in depth. Despite this, no clear method is identified for managing dewatering volumes or mitigating cumulative impacts across the site. Visual impact is a major concern. The proposed turbines would exceed the height of Perth's tallest buildings and introduce multiple skyscraper-scale structures into a rural landscape. This would fundamentally alter the character of the area, dominate views from surrounding properties and roads, and cause long-term loss of amenity. Structures of this magnitude do not "blend in" to a natural rural landscape. They fundamentally industrialise it. The photomontages provided are limited and do not adequately convey the true scale, worst-case or cumulative visual impacts. Approval of this development would also effectively sterilise surrounding land, constraining future rural, residential and tourism uses for decades. The proposal does not demonstrate compliance with the intent of the Shire's Town Planning Scheme, which requires wind turbines to be

		designed and sited so as not to detract from visual amenity. Even the developer acknowledges that the turbines will have significant visual impacts. Noise, shadow flicker and general disturbance have not been adequately assessed, particularly given the absence of final turbine specifications. The application does not provide confidence that impacts on nearby residents will be acceptable or enforceably managed. These are unusually large turbines and if built to the proposed height, will be the tallest wind turbines in Australia, surpassing the Wambo Wind Farm in Queensland. It is staggering that this could be proposed without a full EES and substantive community review and engagement. Community consultation has been inadequate. Many affected landowners report no direct engagement, and the application does not clearly document community feedback or demonstrate how concerns have been addressed. This development has been kept under wraps for several years and the consultation is now entirely inadequate for the township of Augusta, the local community and appears to be rushed through this critical part of every renewable energy development process. Why is the community consultation period for major infrastructure in such an environmentally sensitive area been so entirely inadequate and condensed into a traditionally busy period for all communities in the lead up to Christmas and summer holidays? Finally, the application fails to demonstrate clear economic or environmental benefit to offset these impacts. The proposal is silent on impacts to tourism and land values as well as any planning or response plans for potential flow of acidic water into the Scott River and ultimately into the Blackwood river mouth at Augusta. For these reasons, I respectfully request that the Shire of Augusta Margaret River refuse the application. Please confirm receipt of this objection and ensure it is considered in the planning determination.
165	Object	Stop wasting money on so called renewable energy rubbish It is a lie!!! Go nuclear Go coal Go gas STOP
166	Support	I strongly support the proposed Scott River wind farm based on the following views. Overall, the proposed windfarm will: 1. Provide a net community benefit for people in the Scott River district and AMR Shire generally. 2. By contributing to the renewable energy transition and global action to mitigate climate change, provide a net benefit to local and global environments. One thing I don't agree with is the NIMBY view that, while transitioning to renewable energy is warranted, any projects should be in another district, region or country. I would be very disappointed if the AMR Shire were to follow a NIMBY path. Further details on my views on benefits to the community and the environment follow.

		Net community benefits. 1. For the landowners who wish to have one or more turbines on their property, this is a golden opportunity to diversify their income streams. For farmers, this is an opportunity for reliable annual income, i.e. drought proof income that is the same even in the poorest of years for agricultural crops. If the wind turbines are 'within regulation', I think 'it would unjust if neighbouring landowners or the wider community were allowed to deny a landowner the opportunity to diversify an agri-business with wind turbines'. 2. I understand that neighbouring landowners can feel aggrieved that their lifestyle will be negatively impacted by wind turbines, e.g. visual and noise impacts. However, I also understand that Synergy offers those landowners financial compensation through a 'neighbourhood agreement' and that such agreements will include few, if any, restrictions to farm operations and developments. 3. Primary production in the Scott River region includes agriculture, plantation forestry and horticulture ventures. The negative economic impacts of the proposed wind farm on those ventures will be minor, e.g. a relatively small loss of land for the turbines and access roads. However, primary production in the region is already suffering the effects of climate change, particularly the effects of a drying climate. Without action on climate change, the losses are only going to increase. Contrary to what we see from the anti-wind farm campaign, I think we need the wind farm to 'save our farmlands'. 4. Community benefits in the AMR Shire include the Community Benefit Fund of $100,000 per year, increased jobs around the wind farm and tourism opportunities. These are great opportunities in the Shire. My view is they provide more than adequate compensation to the people that don't want to see wind turbines. Personally, I expect to see the tops of some turbines from my home in Augusta if the project goes ahead, but I welcome that as I know how much good a wind farm will provide. Net environmental benefits 1. It was re-assuring to see the EPA's recent decision that the environmental effects of the wind farm are not so significant or unmitigated as to warrant formal assessment. 2. While there would be negative environmental impacts of a wind farm, these need to put in perspective compared to the environmental benefits, e.g. a. Loss of biodiversity: the claim that the wind farm should be stopped to save the biodiversity of the Scott River area seems extraordinary. If the biodiversity loss will be due to clearing of native forest, consider that less than one hectare of native forest will be cleared for the wind farm. Compare that to the tens of thousands of hectares of native forest that I understand have been cleared for farmlands in the Scott River region. I also note that it is fertiliser, other chemicals and sediments from farming operations that have substantially contributed to degradation and loss of biodiversity in the Scott River. b. Bird kills: While some birds may be killed by wind turbines, that can be compared to birds and other wildlife killed by cars and trucks. I understand that, in the Scott River area, more wildlife is likely to die from road kills than from wind turbines. However, there is little public concern expressed over road kills. I also note that Synergy has a comprehensive Bird and Bat Adaptive Management Plan to minimise risks to birds. In contrast to the loss of birds from wind turbines, the loss of plants and wildlife from climate change is huge. That includes species extinctions. Hence the importance of the proposed Scott River wind farm as part of global efforts to mitigate climate change. c. Acid Sulphate Soils - Naturally, given the problems with Acid Sulphate Soils (ASS) in the nearby Beenup mineral sands mine, concerns have been expressed that installing wind turbines will cause similar problems. However, the disturbance involved is quite different. E.g. the mine involved excavation to considerable depth (? 50 m) and the mine was never filled in. In comparison the reported plans for installing the wind turbines, will involve minimal disturbance, e.g. auger holes for inserting piles to anchor the foundation will be immediately filled to minimise exposure of any ASS to oxygen. In addition, I understand that the foundation plans for each turbine will require approval from the Department of Water and Environmental Regulation. I also note that, in the Scott River region there are pivot

		irrigation systems (including one in the wind farm area) and farm earth dams, apparently operating without ASS problems. d. Environmental benefits – while the proposed wind farm will not directly provide a substantial benefit to the environment of the Scott River area or the AMR Shire, global action on climate action will have a substantial benefit. It is vitally important that we make a responsible contribution to those global actions. 3. In summary, my view of the environmental impacts of the proposed Scott River wind farm, are that 'we need the wind farm to save the biodiversity and the environment in the Scott River area'. Thank you for the opportunity to comment on the proposed Scott River wind farm.
167	Object	I strongly oppose the proposed wind farm at Scott River. My concerns include the visual effect of the turbines in this pristine and picturesque setting that will be seen from iconic locations like flinders bay and colourpatch . Also I'm very concerned about the ongoing harmful effect to wildlife and marine life as not enough is yet known about the sound effects . The damages caused by installation and the short lifespan of the turbines along with the waste is also a concern .
168	Object	I strongly oppose the proposed wind farm at Scott River. My concerns include the visual effect of the turbines in this pristine and picturesque setting that will be seen from iconic locations like flinders bay and colourpatch . Also I'm very concerned about the ongoing harmful effect to wildlife and marine life as not enough is yet known about the sound effects . The damages caused by installation and the short lifespan of the turbines along with the waste is also a concern .
169	Object	I strongly oppose the proposed wind farm at Scott River. My concerns include the visual effect of the turbines in this pristine and picturesque setting that will be seen from iconic locations like flinders bay and colourpatch . The damages caused by installation and the short lifespan of the turbines along with the waste is also a concern .
170	Object	I strongly oppose the proposed wind farm at Scott River. My concerns include the visual effect of the turbines in this pristine and picturesque setting that will be seen from iconic locations like flinders bay and colourpatch . Also I'm very concerned about the ongoing harmful effect to wildlife and marine life as not enough is yet known about the sound effects . The damages caused by installation and the short lifespan of the turbines along with the waste is also a concern .
171	Object	I have concerns about this proposal for several reasons... 1. Acid Sulphate soil where the turbines are to be built could not be controlled by BHP previously, how can this project guarantee there will be no disaster. If this acid soil finds its way to the river and ocean the whole area will die. 2. Wildlife and farm animals in the area will be effected. Synergy says they will take injured wildlife to the local carers. I am a wildlife carer in Augusta, we are already under pressure and do not have capacity for more in jured animals. 3. Noise...the effects of turbine noise on humans and animals is insidious and is yet to be recognised as a condition. Many people living near turbines have adverse effects to their health. 4. It is unknown whether the turbines at a height of 200 - 250 Ms can withstand the wind speed in the area. 5. Asbestos contained in the turbines a hazard. 6. 20 plus of the tallest wind turbines in the southern hemisphere are going to be an eyesore. 7. Synergy is not being transparent or open with the local residents.
172	Support	I fully support a wind farm to enhance the State's renewable energy capabilities. I would like to think that an incentive for a wind farm near Augusta would be that those Communities that frequently experience power outages because they are at the end of the Grid "line" (ie Augusta) would ALWAYS receive first power thus reducing the number of times they have power outages.

173	Object	I write to formally object to the proposed wind farm development at Scott River. Below will be comments that have become common topics after research but I would like to add that I work as a contractor on some of the properties that are potential hosts. I have huge concerns about any large infrastructure being built on such wet lands\. We struggle at the best of times to complete tasks due to the water table. I also would like documented the large number of Black Swans that gather in these paddocks This is food growing land not wind turbine land! I object to the scale and nature of the proposal, the lack of sufficient detail in the Development Application to allow proper assessment, and the significant long-term impacts the development would have on the environment, groundwater and acid sulfate soils, visual amenity, rural character, community wellbeing and future land use in the Scott River and Augusta region. The Development Application seeks approval of a largely conceptual proposal. Key elements—including the number, location, height and specification of turbines, construction methodology, foundation design, dewatering volumes and environmental management measures—have not been finalised. As a result, the application does not provide a reliable basis for assessing worst-case impacts or for imposing effective and enforceable conditions on a development that would operate for several decades. The proposal poses serious environmental risks. Large-scale excavation, trenching and turbine foundations will require piling and dewatering, with the potential to alter groundwater flow paths and water table levels. The Scott River area is known to be sensitive, with shallow groundwater and acid sulfate soils. Disturbance of these soils through excavation or groundwater drawdown can generate sulfuric acid and mobilise heavy metals, causing long-term damage to soils, waterways, vegetation and agricultural water supplies. The application lacks a site-specific acid sulfate soil investigation, a detailed hydrogeological assessment, and a robust dewatering and management plan with monitoring, trigger levels and emergency responses. The scale of earthworks is substantial, including approximately 30 km of onsite roads, 30 km of cable trenching, and turbine foundations involving thousands of tonnes of excavation per turbine, potentially exceeding 7 metres in depth. Despite this, no clear method is identified for managing dewatering volumes or mitigating cumulative impacts across the site.

		Visual impact is a major concern. The proposed turbines would exceed the height of Perth's tallest buildings and introduce multiple skyscraper-scale structures into a rural landscape. This would fundamentally alter the character of the area, dominate views from surrounding properties and roads, and cause long-term loss of amenity. The photomontages provided are limited and do not adequately convey the true scale, worst-case or cumulative visual impacts. Approval of this development would also effectively sterilise surrounding land, constraining future rural, residential and tourism uses for decades. The proposal does not demonstrate compliance with the intent of the Shire's Town Planning Scheme, which requires wind turbines to be designed and sited so as not to detract from visual amenity. Even the developer acknowledges that the turbines will have significant visual impacts. Noise, shadow flicker and general disturbance have not been adequately assessed, particularly given the absence of final turbine specifications. The application does not provide confidence that impacts on nearby residents will be acceptable or enforceably managed. Community consultation has been inadequate. Many affected landowners report no direct engagement, and the application does not clearly document community feedback or demonstrate how concerns have been addressed. Finally, the application fails to demonstrate clear economic or environmental benefit to offset these impacts. Claims of up to 200,000 tonnes per annum of CO_2 savings are unsubstantiated, with no explanation of how or where such reductions would occur. The proposal is silent on impacts to tourism and land values. For these reasons, I respectfully request that the Shire of Augusta Margaret River refuse the application.
174	Object	I write to formally object to the proposed wind farm development at Scott River. My objection is based on the scale and nature of the proposal, the lack of sufficient detail in the Development Application to allow proper assessment, and the significant long-term impacts the development would have on the environment, groundwater and acid sulfate soils, visual amenity, rural character, community wellbeing and future land use in the Scott River and Augusta region.

		The Development Application seeks approval of a largely conceptual proposal. Key elements—including the number, location, height and specification of turbines, construction methodology, foundation design, dewatering volumes and environmental management measures—have not been finalised. As a result, the application does not provide a reliable basis for assessing worst-case impacts or for imposing effective and enforceable conditions on a development that would operate for several decades. Even the developer acknowledges that the turbines will have significant visual impacts. Noise, shadow flicker and general disturbance have not been adequately assessed, particularly given the absence of final turbine

		specifications. The application does not provide confidence that impacts on nearby residents will be acceptable or enforceably managed. Community consultation has been inadequate. Many affected landowners report no direct engagement, and the application does not clearly document community feedback or demonstrate how concerns have been addressed. Finally, the application fails to demonstrate clear economic or environmental benefit to offset these impacts. Claims of up to 200,000 tonnes per annum of CO_2 savings are unsubstantiated, with no explanation of how or where such reductions would occur. The proposal is silent on impacts to tourism and land values. My family has lived here for many many years and are horrified that this was even suggested. Too many concerns that the shire need to look seriously at before making a big big mistake. For these reasons, I respectfully request that the Shire of Augusta Margaret River refuse the application.
175	Support	
176	Object	We have farmed in this Shire for the past 50 years and purchased Scott River Station in 2000. Our property adjoins the proposed Windfarm envelope. We strongly oppose this Windfarm for the following reasons. 1. Potential disruption to the underlying aquifers. Our stock water on lot 1 is supplied directly via a pressurised bore from the superficial aquifer. This has been tested by DWER and is top quality water . Synergy's mapping shows a proposed wind turbine less than 100 meters from this bore. Any disruption to our water supply would have a detrimental effect on our ability to run cattle on that property. 2. We have a set of cattle yards less than 100 meters from a proposed turbine. It has been documented that infrasound and shadow flicker from wind turbines can affect animals and people and therefore hinder our daily livestock activities, our health and quiet enjoyment of our property. 3 Potential leaching of acid sulphates into the Scott and Blackwood rivers as this area is a floodplain in Winter. Synergy has only provided vague plans for mitigation of these acid sulphates, has not recognised that lime is a limited resource for mitigation and has completely ignored the lessons learnt by BHP in their adjoining failed mineral sands mine. 4. Our roads will not be able to accommodate the size and volume of vehicles and traffic associated with this project. 5. Loss of property value. We are wanting to retire and sell this property- we have already experienced buyer resistance with a Windfarm proposed next door. 6. Loss of threatened ecological communities - any disturbance of the topography and hydrology of the land could potentially cause damage to protected ecological communities. These are protected under a Commonwealth covenant.
177	Object	We were forced to sell our property at the Scott River due to financial pressure, financial risk and uncertainty caused by this Project..... It has shattered our lives....

		I oppose the Development Application for the Scott River Wind Farm . I do not support the DA, its supporting Landscape & Visual Impact Assessment (LVIA) and its Social Values / Social Impact Assessment which contain material shortcomings and methodological gaps that undermine confidence the project can avoid unacceptable and lasting harm to the visual amenity, social fabric and environmental values of the Leeuwin–Naturaliste / Augusta region. Given the level of community concern shown during the EPA referral and public consultation, the project should not proceed without: (a) independent, transparent reassessment of visual and social impacts; (b) a full public environmental assessment (EPA or equivalent) prior to any Development Approval; and (c) improved, independent community engagement and mitigation measures. The EPA referral record shows significant public concern and that 321 of 384 submitters requested a public environmental review. 1. Visual impact assessment — substantive shortcomings and “holes” The LVIA is central to judging whether the proposed turbines (up to 250 m tip height) will unacceptably degrade the special landscape and coastal setting. On careful review of the DA and LVIA references, the following major issues are apparent: 1.1 Limited / selective viewpoint sampling — potential bias The DA states the LVIA assessed 12 viewpoint locations selected from desktop work, fieldwork in March 2024 and “community feedback”. Twelve viewpoints is a modest sample given the project’s scale (up to 20 turbines, 250 m tip height) and the proximity to sensitive coastal routes, tourism vantage points and residential receptors across several corridors. Relying on 12 viewpoints risks missing key visual receptors (tourism vantage points, short-range views from valleys, vistas from Leeuwin–Naturaliste ridgeline approaches and private properties). Your Say Augusta Margaret River 1.2 Over-reliance on “maximum case” photomontages without documenting intermediate/peripheral views The DA includes simulations from selected viewpoints using the “maximum case” specification, but the LVIA documentation referenced does not transparently present a full suite of photomontages for peripheral or cumulative skyline views (e.g., long coastal vistas, views from approaches to Cape Leeuwin, and from local roads and tourist nodes). The absence of comprehensive photomontages from all likely tourist routes and private properties weakens any claim that visual impacts are “managed”. Your Say Augusta Margaret River +1 1.3 Visual magnitude and “High–Moderate” impact acknowledged but mitigation unclear The DA and LVIA themselves acknowledge “High–moderate visual impact across a majority of identified viewpoints”, yet the mitigation measures listed are generic (setbacks, non-reflective paint, underground cables “where practical”, retaining vegetation). The LVIA does not quantify residual visual dominance, nor commit to enforceable landscape conditions (planting schedules, maintenance obligations, replacement planting, guarantees on undergrounding of lines). A finding of high-moderate impact should trigger stronger, quantifiable mitigation or reconsideration of siting. Your Say Augusta Margaret River 1.4 Setbacks do not resolve landscape-scale or skyline impacts The proposal claims turbines will be set back 1.5 km from existing dwellings and 3× turbine height from boundaries. Setbacks to dwellings do not address visual dominance of turbines on skylines and long views from tourism routes, nature reserves and key public vantage points (e.g., coastal roads). A skyline-dominant turbine cluster 15 km NE of Augusta will still be highly visible from important Leeuwin–Naturaliste corridor vantage points. Setbacks to dwellings are a noise/amenity mitigation, not a full visual solution. 1.5 Cumulative and sequential viewing effects not robustly addressed

		The LVIA and RSD state that cumulative impacts were considered, but there is no thorough, published cumulative assessment showing how Scott River turbines would appear with other regional turbines (existing or proposed) across commonly experienced travel sequences (e.g., tourist drives, hikes). Sequential visual intrusion (multiple views experienced during a single trip) can amplify perceived impact but is not transparently modelled in the DA/LVIA materials. 1.6 Inadequate treatment of important visual receptors The site is within a region with high tourism and conservation value (Leeuwin–Naturaliste sub-region, proximity to reserves and national park). The LVIA acknowledges this but does not demonstrate how the turbines' presence would affect visual connectivity, sense of place, or tourism amenity—matters of particular importance for Augusta and the coastal tourist economy. The DA's mitigation commitments are framed as potential ("will investigate," "where practical") rather than mandatory conditions. Conclusion — LVIA: the LVIA does not meet the level of transparency and comprehensiveness required for such a high-profile scoping in a world-class tourism and biodiversity region. The acknowledged "High–moderate" impacts require further independent visual analysis, broader viewpoint sampling, cumulative/sequential visual modelling, enforceable landscape mitigation conditions, and transparent photomontage outputs for all sensitive receptors. 2. Social impact / Social Values Assessment — methodological gaps and insufficient data The DA references a Social Values Assessment (Appendix R) and a broad program of community engagement. However, the record reveals worrying limitations: 2.1 Extremely limited neighbour sampling in the SVA The DA records that "Two (2) neighbours took part in the Social Values Assessment." For a project spanning 3,597 ha and affecting multiple private properties and local communities, two adjacent-neighbour interviews are not an adequate representation of the most directly impacted residents. This is especially concerning because neighbours are the people most likely to experience visual, noise, and lifestyle impacts. 2.2 Consultation quantity ≠ consultation quality — no clear independent analysis of sentiment Synergy's engagement log lists a large number of activities (59 meetings, 11 drop-in sessions, ~372 drop-in attendees, ~2,866 page visits). However the DA does not make transparent how those interactions translated into a statistically robust, independently analysed measure of community sentiment (percent support/oppose, reasons for opposition/concern, distribution of views across localities, tourism operators, Indigenous stakeholders, small business operators). High attendance at sessions can mask polarized views; without publication of full survey instrument, raw responses and independent coding, the claim that engagement was "extensive" does not prove social licence. 2.3 Social Values Assessment: There is no published independent peer review or raw dataset for community surveys and interviews available in the DA public materials. Independent verification is essential where the proponent's social assessment underpins claims about community support or acceptability. 2.4 Key social issues insufficiently explored The DA/SVA references social surroundings impacts (noise, dust, vibration, visual amenity). But it does not robustly address: Tourism/economic risk to Augusta and coastal attractions from perceived loss of visual amenity.

		Cumulative amenity impacts if more large-scale renewable installations are proposed. Long-term sense of place / community identity concerns from residents and Indigenous custodians beyond token consultation. . Conclusion — Social Values Assessment: the social impact analysis is not demonstrably rigorous enough to justify a decision based on adequate social licence. The very small sample of nearby neighbours in the SVA and the lack of independent analysis of consultation outputs are material shortcomings. 3. Community consultation — numbers, transparency and interpretation the DA and the EPA referral materials shows a disconnect between the proponent's description of "broad engagement" and the public feedback recorded externally: The Shire/DA record shows numerous engagement activities (59 meetings; 11 drop-in sessions with ~372 attendees; 2,866 webpage visits). But the DA does not present disaggregated analysis by stakeholder type (landowners vs wider community vs business vs First Nations) that would allow a decision-maker to evaluate the scale and direction of concerns. The EPA referral public comment summary records a total of 384 submissions to the EPA referral: 39 "Do not assess", 10 "Assess" (referral), 14 "Assess - environmental review - no public review", and 321 requesting Public Environmental Review (PER). Those numbers show a strong public appetite for a more rigorous and independently scrutinised assessment than the proponent's referral/DA currently provides. The EPA elected not to assess under s.38 but recorded the high public interest. This is important evidence of community concern and indicates that the level of public unease is substantial. EPA WA Local and national media reporting documents that the project is divisive in the community. That community division and public request for a PER should be weighed heavily by the RDAP when considering whether the DA as presented provides adequate information and social licence. Conclusion — consultation: while the proponent ran many activities, the DA lacks transparency (raw consultation data, survey instruments, respondent demographics), independent analysis, and adequate sampling of nearest-affected residents. Public submissions to the EPA demonstrate strong community concern that is not reflected as resolved by the DA materials.
178	Support	It makes sense all round. It will bring clean energy, employment, and income for farmers. Great idea
179	Object	I attended a meeting with Synergy staff but was disappointed with their availability and knowledge. I believe that it has not been clear or transparent. There are so many problems with the proposal- it makes no sense economically and it will take good farm land out of production. Where is your food coming from? I can't accept that it is fair to proceed without completely explaining all the implications. The massive quantities of materials which ,in that environment, will have a limited life makes no sense. We in the regions are being asked to allow development that would never be considered in other electorates- it is quite insulting .It will have a huge negative impact on all of us in this area yet we have been excluded. I have read that many other places are moving away from building these wind farms and few are as big as these. This area has always been either farmland or natural environment. This is not the place to insert massive industrial development.

		This proposal has had a huge impact on the residents - we are heartbroken that you can even consider such a terrible destruction of our beautiful area. I don't think you understand how strongly the locals feel.
180	Object	I am permanent resident of Augusta 1. The turbines will be clearly visible from the town of Augusta. Augusta is on a ridge that faces where the proposed wind farm will be located. I DON'T WANT TO BE ABLE TO VIEW THE WIND FARM EVERY DAY !! 2. Could the Wind Farm be housed in the southern part of the poor bushland that grows between Sues Road, Brockman Highway and Mowen Road. That bushland is not productive or would have been cleared and developed. This bush still receives our strong SE south coast winds. The Wind Farm could possibly be designed to only clear a Minimum of vegetation and possibly become a productive and interesting tourist destination. ??? 3. I am amazed that Synergy has been able to even think of developing a wind farm at Scott River. BHP walked away from their mineral sands operation due to the acid soils in the area and the effects of that into the future. I have just read an article regarding Infrasound from Industrial Wind Turbines and health. That is all quite concerning as to what effect the wind turbines could have on people, land and marine animals and birds in the future. SO..... I do not want the Synergy Wind farm to be built in the Scott River Area.
181	Object	My objections to the project are due to the scale of what is proposed (i.e. 20 turbines at 250m height) and the impact it will have on the visual landscape and the surrounding natural environment. Molloy Island (with 240 property owners and over 200 dwellings) is located only 7km from the proposed site and the turbines will be visible from many locations on the island. A lot of effort has gone into preparing the Development Application, however key details are not provided and it appears to be more of a concept plan than a proper development plan. I cannot see how this can be objectively assessed on the basis that important details are not provided, i.e. turbine specifications, turbine locations, actual foundation construction methods etc. We are being told that there is no noise (including low-frequency and infrasound) impact expected for Molloy Island, however I am confused how that statement can be made without having confirmed a particular wind turbine model and turbine locations. Technical parameters will vary between turbine sizes, models, types, so any assurances being made to the community are based on assumptions and computer modelling, rather than available data. This is not adequate and appropriate for a very significant development that will impact not just current, but future generations. The AMR Shire's Renewable Energy Policy paper refers to turbine setback from boundaries of "3x height of turbine", which in this case would be 750m. The DA itself however proposes "blade length + 20/30m" which is a much shorter distance of 110-120m. Although I'm not directly affected as a neighboring landholder, I would not consider that an acceptable setback, given the excessive building height. The DA lacks the detail needed for a proper assessment and I ask the AMR Shire to refuse the application until a final design with all relevant details and verified noise framework have been provided.
182	Object	Only some parts of wind farm units (wind turbines) are recyclable when they break down or reach the end of their life. However other components are much harder to recycle. My other related concerns are numerous. a) Biodiversity impacts: The Scott River area is environmentally sensitive, with rare flora, wetlands, and wildlife. Large turbines, access roads, and transmission lines will fragment habitats and disturb ecosystems.

		b) Wind farms pose collision risks, particularly for migratory birds and bats that use river corridors and coastal–forest systems. c) Construction of a wind farm in Scott River will affect fragile soils, wetlands, and water flows that support the river system and surrounding park. d) The Scott River National Park is protected for conservation, recreation, and nature connection. Nearby industrial-scale infrastructure may be seen as undermining the purpose of the park. Even if turbines are technically outside the park boundary, their visual and white noise pollution, and ecological effects will extend into protected areas. e) Wind turbines are tall and highly visible. I believe that they will significantly alter the natural, and aesthetically pleasing landscape surrounding the park- that presently makes this area so unique and should be preserved without disruptions. f) While noise and shadow flicker may be regulated, these will still impact nearby residents and visitors seeking quiet and solitude. The region is valued for bushwalking, camping, birdwatching, and low-impact tourism. There are concerns that industrial infrastructure will affect visitor experience and local tourism economies. g) The Scott River area holds deep cultural significance for Traditional Owners. Inadequate consultation or perceived risks to cultural sites is perceived as a major concern for emerging elders. h) In 1999, BHP prematurely closed its Beenup titanium mine in Scott River due to environmental issues regarding the exposure of acid sulphate soils. When disturbed or exposed to air, acid sulphate soils can release sulphuric acid and other heavy metals into surrounding water bodies and groundwater. While Synergy's EPA submission includes plans to neutralise the exposed acidic soil with lime treatment during construction to avoid contamination, the management plan has not allayed the serious concerns of some nearby farmers and landowners living close to the closed titanium mine in Scott River. FIND ANOTHER LOCATION!!
183	Support	I support this and other terrestrial based alternative means of power generation.
184	Support	I fully support the proposal and the development of the Scott River wind farm. I see it as a near perfect location in terms of the world's best standards for wind conditions. All year around and almost all day every day the wind blowing over the proposed site is ideal for generating electricity. The other big positives for the location are the already cleared, flat landscape, the road access and the Beenup high voltage transmission lines. I also believe that the increase in tourism due to the location will help the small town of Augusta. The current situation of the rapidly increasing population and the approaching decommissioning of the Collie coal fired power stations can only be serviced by energy sources that can be quickly installed and commissioned. The only solution to this problem is renewable energy resources. I believe that this is of the highest priority for the regional development and security. In fact I believe that this proposal should be fast tracked, and planning for further wind farms in the region should be a high priority. I fully support the transition to renewable energy resources and the location of this project.

185	Object	The wind turbines will add no value, rather they will negatively effect the residents and fauna in the area. They are a fast depreciating structure that will be another environmental issue to solve when it ends up becoming obsolete and needs to be decommissioned.
186	Support	
187	Object	The DA is not detailed enough to assess properly (approval should not proceed on “work it out later”) The Shire is being asked to approve a concept, not a final design… there is no business case. Do not approve the DA, developer lacks detail of final turbine model/specs, and detailed construction and environmental management plans that can be assessed and conditioned. Noise, low-frequency noise and infrasound: modelling is hypothetical and protections are weak WA noise rules and typical modelling approaches are geared to audible dBA limits and older, smaller turbines, not modern 250 m-class turbines proposed for Scott River. A requirement for independent, continuous, real-time noise monitoring at representative nearby residences (not just at the boundary), including reporting and public transparency. We need: • Mandatory post-construction compliance testing under a range of weather and operating conditions, with results published. • Enforceable curtailment/shutdown requirements if limits are exceeded, and a clear complaints response protocol with timeframes. • A “do not rely on neighbour agreements” position: private agreements should not be used to legitimise offsite impacts. Proximity impacts: homes, boundaries and rural lifestyle are not buffers. The impacts of an industrial wind facility should be contained within its footprint. Neighbouring land should not be treated as a sacrifice zone. This is an important factor. We need: Modern setbacks proportionate to turbine height (for example, a minimum of 3x turbine height from boundaries) and sufficient separation from dwellings to protect amenity. We note that Synergy is trying to manipulate the outcome with Shire in regards to setbacks. Shire needs to advocate for community , not for the corporates. Visual impact and landscape character: industrial scale, permanent change These are skyscraper-scale structures in a rural landscape, visible for kilometres, for decades. Augusta and tourism and the natural environment is what brings people here, not an energy park. • Dominance: turbines and blades will exceed the height of Perth’s tallest buildings and dominate skyline views from rural homes and roads. Approving this development effectively constrains future rural and tourism land uses on neighbouring properties for the rest of this century. It doesn’t meet current local planning scheme and will have a devastating impact to the value of land, amenity and enjoyment. Floodplain, acid sulfate soils and shallow groundwater: high consequence risk This location has known sensitivity. Earthworks and dewatering can trigger irreversible impacts. Water quality and farming risk: contamination pathways can affect drains, dams, bores and stock water; the consequences fall on local landholders, not the developer. • Lack of detail: without a final design and dewatering plan, there is no credible risk assessment for volumes, disposal, treatment, monitoring and contingencies. • Linking of the superficial aquifer and the river system

		• Synergy don't have a plan when it comes to emergency acid sulfate soil mitigation… adding lime from a scarce resource is not sustainable or responsible… taking lime away from farmers. The shire should require detailed hydrogeological assessment, acid sulfate soil investigation and an enforceable dewatering/ASS management plan before any approval. Bushfire and emergency response: aviation restrictions and evacuation realities: No-fly or restricted airspace around turbines can impede aerial firefighting operations. • Emergency access: heavy infrastructure and internal roads do not equal safe evacuation routes for locals. • Fire ignition and spread: the DA should clearly address ignition sources, response capability, and how turbine operations interact with fire-weather conditions. • Rare flora is at threat from an established no go zone with fire trucks not permitted and restricted aerial suppression. The Shire should require a credible, independently reviewed bushfire and emergency response plan that addresses aerial firefighting constraints, evacuation, and response time realities. Traffic, access and construction disruption: local roads are not built for this. Especially Scott River Road. Construction impacts are not a side issue; they are months/years of disruption. The Shire should require a detailed traffic and construction management plan, with enforceable limits, routes, timing controls and compliance reporting. Wildlife and environment: insufficient detail for a high-risk setting This is a biodiversity-rich area; risk assessment must be robust and precautionary. Wildlife and environment: there is insufficient detail for a high-risk setting. Require stronger, transparent monitoring conditions and avoidance-first design, not "mitigate later" language. Consultation and community sentiment: inadequate engagement, no evidence. Many affected landholders report no direct engagement. • The DA does not clearly summarise community feedback or demonstrate how concerns were incorporated. • The scale of opposition should be acknowledged and transparently addressed. • No clear minimum standard with community engagement. Totally inadequate considering the scale of this project. WE: • Require genuine consultation outcomes and publish responses to key community concerns, not generic assurances.
188	Object	I would like to express my concerns regarding the Development Application for the Scott River Wind Farm and the lack of details and transparency by Synergy and potential consequences required to assess a project of this scale. Some of my concerns are: No final turbine locations, layout or specifications: these are not locked in and can be changed at the developer's discretion, changing who is impacted by noise, infrasound, shadow flicker, safety risks and visual dominance. That public have been told that "details will be finalised later" is not acceptable for a large-scale development that has such a dramatic impact on the region. Emerging international evidence suggests amplitude-modulated/pulsating components from large turbines are an unaddressed health risk for people and wildlife. There have been a number of international studies on this, yet they have been omitted in the proposal. Turbines and blades exceeding the height of Perth's tallest buildings will dominate the rural landscape and skyline for kilometres. The proposed height of the turbines are the tallest in the world, so there have been no studies or risk assessments done on these. Bushfire risk and emergency response have not been adequately addressed. Wind turbines create no-fly zones that may restrict aerial firefighting, and internal access roads do not equate to safe evacuation routes in a rural fire scenario.

		The Development Application does not provide a credible, site-specific hydrogeological assessment or a robust acid sulfate soil and dewatering management plan for this area. The site's floodplain location raises serious environmental concerns. The area also contains a shallow superficial aquifer that is linked to the river system We value the quality of our natural landscape. This is a biodiversity-rich area and risk assessment must be robust and precautionary. I do not believe the Development Application provides sufficient detail to allow a proper assessment of a project of this scale and consequence. The application does not adequately address low-frequency noise or infrasound, and there are no clear commitments to independent, continuous real-time noise monitoring at nearby residences, nor enforceable shutdown provisions if limits are exceeded. The application lacks detail on access routes, impact of heavy vehicle movements, timing and duration of works, dust and noise management, and protections for local residents, road users and businesses. Finally, I am concerned about the inadequacy of community consultation. Many affected landholders have reported no direct engagement. The Development Application does not clearly summarise community feedback or demonstrate meaningful addressed concerns, given the scale and permanence of this proposal. I ask the Shire to refuse or defer the DA until a final design, verified noise framework, and robust environmental and emergency management plans are provided and independently reviewed.
189	Support	Our community must embrace Renewable energy to transition from fossil fuels. The Beenup site makes sense logistically & is multifunctional as has been shown worldwide, livestock grazing is compatible with wind farms.
190	Support	Build the wind farm - it will be great for our shire to be using clean energy. There has to be places to build these if we want to be serious about climate change and this is a good location . Cheers
191	Object	We oppose the proposed Scott River Wind Farm. The location is unsuitable, it is a biodiverse rich hot spot within our South West. We have spent much time at that location over the years and can attest to the birdlife species that will be impacted. Operations of the project pose an unacceptable risk to all three Endangered species of Black Cockatoo, the hundreds of Black Swans that congregate on that farm land in the cooler months until Spring, also the up to 15 Wedge tailed Eagles that patrol the skies in that location. You cannot claim to be champions for the welfare of our Iconic and Threatened Black Cockatoos by supporting a project so detrimental to them - it is smack bang in the middle of their known flight corridors to their foraging habitat. Any loss of their numbers to turbine collision will be unacceptable collateral damage!! Placing 20 250m turbines on a floodplain with acid sulphate soils, shallow groundwater with active farming is too risky too. There is threat of contamination to the important Blackwood and Scott River waterways. The farm threatens food and water security.

192	Object	I have lived in Augusta for over 30years, my main Concerns are not just the Visual Impact on our beautiful Vista, but also the Mental Health Issue caused by the Sound created by these Turbines, it has been proven to be louder than going to a Music Event. Why Augusta? Why not Gnarabup???
193	Object	Scott River is the wrong location for a wind farm for environmental, ecological and health reasons: Two abandoned mining operations in an area high in acid sulphates. If these are liberated into the Scott river catchment? Proximity to people - infrasound health and mental health issues. Research from Professor Ken Mattson of Uppsala University, Sweden shows 30% of the population is highly sensitive to infrasound, experiencing symptoms such as insomnia, migraines, high blood pressure, heart problems, headaches, a pressure in their heads, and palpitations. Infrasound that can travel up to tens of kilometers depending on conditions. Endangered Baudin and Carnaby cockatoos. Only 3km from Chester and Pagett reserves. What value can be placed on lost pristine tourist views? Tourists love Augusta for it's pristine views. Realty values are likely to decline as who wants to buy real estate with industrial windfarm views? Money. Is it about building it cheaply? If it is, then expand the Colgar project in the wheatbelt as working infrastructure including a purpose built power transfer station is already there. Profit for shareholders of foreign companies INPEX and Enel that have a majority 80% holding in this project above all of this? I have no confidence in Julia Jean-Rice representing Augusta via DAP. It is well know that her objective is for this windfarm to go ahead. That would not be representing the community's interests. The shire has been deceptive about the true scale of this project from the onset with the number of turbines and that they are as high as the tallest buildings in the Perth CBD. And where is the EPA on this? They received 380 public submissions and 320 were against it. The EPA's decision not to assess this proposal has removed the only process designed for open, independent, whole-of-environment scrutiny and this has has plainly undermined community confidence in the EPA and the shire. I live 10km from the proposed project and have not received any correspondence from the shire on regarding this windfarm. I am not a climate denialist, however, Scott River is the wrong location for a project such as this.
194	Object	As a frequent guest of beautiful, untouched Augusta and surrounds - I oppose to the Scott River wind farm because of the sheer ugliness of it all! I also oppose to the Scott River wind farm because 250m turbines on a floodplain with acid sulfate soils, shallow groundwater and active farming is too risky. The noise modelling isn't real, and the project has no enforceable protections for people living nearby. It threatens food and water security, bushfire safety, rural amenity and the environment.
195	Object	I STRONGLY object to the proposed Scott River Synergy Wind power station. South West WA is a world recognised biodiversity hotspot and industry of this scale is demonstrably inappropriate. The region is a tourism and environment mecca also world renowned to site such impactful infrastructure in this area is unbelievable and does not at any stage meet the required "social licence" that is paramount for such a project of this scale and impact. As a resident of the south west and a regular traveller to the area for over 50 years I implore this Government Dept follow the precautionary principal. There simply is too much to lose. The size of over 250m is of note given there is no such turbines of this scale anywhere in WA presently. To suggest it is appropriate to locate in the Biodiversity Hotspot of WA Is inappropriate at every level and I implore that this proposal is rejected for the inappropriate and detrimental impacts it will have now and into the future.

196	Object	Stop destroying the beautiful Southwest by favouring multinational companies only interested in profit and not the community. Build one in Cottesloe instead.
197	Object	Per the Draft Local Planning Policy 23 – Large-scale Renewable Energy Facilities (LPP23). I live in the beautiful, undisturbed, pristine town of Augusta. Within 10 kilometres from this proposed wind farm. My family have a long history and residence here, like most of the locals who cherish it. I am a 'greeny' by and for nature. I vote green, I care more for the environment than myself. I support the gradual shift to renewables to try and slow human impact on our vulnerable earth. Though I keep an open mind on agendas such as this wind farm proposal and the chosen location and long term limitations are of great concern to me. It is not about the impact on my views, my real estate or my back pocket. It is the undeniable, factual research out there on the environmental impact that appears to have been brushed over in this instance. To learn that the EPA recently decided to not bother looking into the fragile ecosystems in the Scott River, is disturbing. I attended the Synergy led 'town talks' and got some prepared feedback on a few questions. I will outline my primary concerns: 1) the impact on our local and migrating birds - I was informed due to the size (250) that they 'won't impact the flight path' of all birds. Is this an assumption? Or a fact? 2) When I asked how/where these monstrous structures are disposed of when they break down/reach their end - I was informed 'there is a decommision plan' and that the 'technology was improving all the time so when these ones deteriorate there will be improved versions to replace them'. Not quite the answers needed on the waste disposable long term and the extraction plan. 3) The audible sound and strobe lighting from a 250m high mechanical structure, the direct impact on wildlife and people. There is a lot of concerning research on, not just the human biological impact for anyone near to them, but more concerning is the publicly available data on infrasound. It travels extensively underwater and through ground. What do you think this pulsating unnatural field will do to our local whale and sea life populations? There is clear evidence from European countries where these are located where entire populations of species have disappeared from the area. They are more sensitive than people to these waves. 4) the 'greenwash' that appears to be pushing this plan very hastily. It is public knowledge that the largest investors are overseas (Italian, Japanese) mining groups. Though this initiative is being sold to the public as a locally beneficial incentive. The deeper you look into the people invested in this project are in some way benefiting financially, even if indirect. Majority of whom do not live or have anything to do with, or care about Augusta. Overall, this smells like a large scale 'rubber stamp and rollout' campaign without the due diligence of reliable research (quantifiable, statistical scientific data on infrasound impact and spread, soil and water contamination, flora and fauna viability) and not thoroughly assessing the impact on local environment and community long term health, does not sit well and there is very little trust in future large-scale energy project planning in this district. I would sincerely ask this Council to reconsider the location of this plot. Why can't they be installed further from fragile, vulnerable habitats and communities? There is a very large landmass inland on this continent that is unused, available and ideal for the largest solar, wind, whatever farms with little to no threat to any species? Mining magnates will not hurt from a few additional overheads and longer cables. The irony of having to look at these everyday and know the energy isn't even supporting our town? Lowering our power bills? Watching our sea animals and birdlife disappear? Is it really to save $$ for the 'existing infrastructure'? Please can someone reveal where these things will be buried when they faulter? Is it true these larger ones have components of asbestos in this day n age? We all know this is NOT the long term solution. If anything at all, please reconsider the location of LPP23 before it is finalised. If it has been communicated that this local community are in support of this proposal then I would question the motives of the source this

		information has come from. Many in this community feel the federal govt has simply rubber stamped and there is no point in voicing objection.
198	Support	
199	Object	I am totally against the proposal and would hope this comment reflects the outcome
200	Object	i vehemently object to this proposal. it is in the wrong location - sensitive environment and too close to peoples homes. no consideration has been given to the wider community who has been told to just deal with it whist the farm owners get their pockets lined with money. This money should not go to the farmer but into a trust for the local community so everyone would benefit, note just the select few. noise and visual pollution. structures are way too big and will be a blight on the landscape. wind is outdated and inefficient power source. More effort should be going into solar panels on existing buildings and battery storage options. scott river is prime farm and should not be transformed into an industrial power plant.
201	Object	I oppose the Scott River wind farm because 250 m turbines on a floodplain with acid sulfate soils, shallow groundwater and active farming is too risky. The noise modelling isn't real, and the project has no enforceable protections for people living nearby. It threatens food and water security, bushfire safety, rural amenity and the environment.
202	Object	My husband and I are both opposed to the Wind Farm Development at Scott River. Our major concerns are the impact on birds and wildlife as well as the visual impact and emissions that will result, effecting our environment. Another concern is the fact that tis issue is dividing our close knit community. If this development is approved will the following technologies be utilised: Radar and cameras to detect bird movement & slow turbines when birds are detected Sonic deterrents to protect bat activity.
203	Object	I am writing to convey my strong objection to the Scott River Wind "Farm" development application submitted to the Shire of Augusta Margaret River. As I have stipulated in previous "have your say" submissions on the topic, there is a deceptive pattern of ambiguity from the proponents regarding community consultation and the development application its self. I feel the Augusta community has been poorly represented by the Shire and the resounding number of community members that will be significantly affected opposed to the development, trivialised. At best the submission is wishy washy, lacking no commitment to turbine specifications ie height/model number to reference, exact location of all structures within the development footprint. The scale of the structures will have a significant impact on the depth and concrete tonnage of each footing and associated trenching which leads to concerns regarding the consequences of earthworks and dewatering activities in high risk environments such as shallow groundwater, acid sulphate soils and the knock on effect of being located in a floodplain. There has been no definitive advisory on the effects this development will have on aviation flight paths (royal flying doctor, aerial firefighting operations). No clarity on light pollution, (I was told by a Synergy representative that the turbines do not require aircraft warning lights or any lighting for that matter). With a proposal standing to completely change the region, clarity regarding worst case scenario (disaster preparedness) should be transparent to community, thus far there have been no consultations regarding negative impact

		concerns regarding mitigation and rehabilitation. As it stands the DA lacks fundamental details to fairly assess and approve. Currently this is a concept and not something one can make an informed decision on. The town of Augusta has been designed with the aspect facing predominantly North East, directly at the developments proposed site. There are very few homes that from the town's design perspective that will NOT have their visual amenity affected. This has been downplayed by both the Shire and the proponent. Many of the permanent residents of this region have invested everything into their properties (which also fund the shire....). We live in a small town with very little amenity, sacrificing access to what people in the CBD take for granted, trading it for unindustrialised natural landscape .... this is also what brings tourists .... it's what keeps our town afloat. Safe guarding our visual amenity and historical view should be considered a primary planning factor in developmental proposals that seek to industrialise rural and natural landscape values as the same applies to building codes regarding height restrictions ect. Finally id like to express my concern regarding the apathy shown by the EPA on the topic of biodiversity with in the proposal site. Floodplains are a crucial part of this region's habitats, they are crucial for biodiversity, providing food, shelter, and breeding grounds for countless species, from fish and birds to mammals, while also acting as natural filters and buffers against floods, though often threatened by development. This environment relies on periodic flooding to distribute nutrients and maintain its ecological health. WA has historically viewed floodplains as wastelands and as a result many have been lost to development, harming ecosystems. Floodplains are vital to healthy river systems and are wildlife corridors connecting aquatic and terrestrial environments, serving as critical feeding, breeding and migration pathways for many animals, acting also as refuges during drought. **THIS PROPOSAL IS THE WRONG PROPOSAL IN THE WRONG PLACE**.
204	Object	I believe that a better fit for utilising the Beenup Power Line would be a large scale solar farm with battery infrastructure for the following reasons: 1) Minimal environmental impacts. 2) No visual impact. 3) No sound disturbance. 4) Bird life would be little effected. 5) Little Acid Sulphate soil disturbance. 6) Solar is taking energy direct from the Sun rather than via complex relationships with weather patterns and the atmosphere. Importantly it would not be polarising the Augusta Community. Please note importantly " AEMO slashes forecasts for wind farms as falling costs fuel solar and batteries" Link below:https://www.abc.net.au/news/2025-12-10/aemo-isp-slashes-wind-forecasts-as-solar-batteries-rise/106120076?utm_campaign=abc_news_web&utm_content=mail&utm_medium=content_shared&utm_source=abc_news_web
205	Object	Wind turbines, while often promoted as clean energy solutions, face several environmental sustainability challenges that their proponents would acknowledge. The manufacturing process requires significant amounts of steel, concrete, and rare earth materials, with substantial carbon emissions generated during production and transportation. The massive turbine blades, typically made from composite materials like fiberglass and carbon fiber, are notoriously difficult to recycle and often end up in landfills at the end of their 20-25 year lifespan, creating a growing waste management problem. Wind farms can also disrupt local ecosystems, causing bird and bat mortality through collisions, altering wildlife migration patterns, and requiring large land footprints that may involve habitat destruction. Additionally, the intermittent nature of wind power necessitates backup power systems or extensive battery storage, which carry their own environmental

		costs, and the infrastructure required for remote wind farm locations—including new roads and transmission lines—can fragment natural landscapes. However, it's important to note that most energy researchers and environmental scientists would argue that despite these legitimate concerns, wind energy still produces far less environmental harm over its lifecycle than fossil fuel alternatives, with studies showing it offsets its production emissions within months of operation and prevents substantial greenhouse gas emissions that drive climate change.
206	Object	First and foremost this is a total and complete disregard to the current environmental laws and requirements . It it well known that the area is known to contain acid sulphate, the BHP mine was closed due to this. The shire president and other council members have and are actively promoting this project . synergy has for reasons that I cannot fathom choosing not to have thorough environmental assessments and analysis not only carried out but also published and community comment sought. Any organisation other than a government entity would be required by law to do this. The pollution that acid sulphate release into our precious Scott and Blackwood rivers would be catastrophic. The import of blades is also problematic as it has been reported that asbestos has been identified within them. The potential for the turbines to catch fire is also real, as a volunteer fire fighter the sheer height of the towers and volume of flammable materials such a oils renders us unable for effectively fight and extinguish any fire . Not to mention the real danger to is volunteers… our focus is saving and preserving our bush. The promoters are either ignorant or ignoring the impact of these turbines on the heath of every living creature in the area. It is my view that those who ignore the laws and promote this potential environmental disaster should be investigated and if necessary removed from any involvement and prosecuted l, in the event that wrong doing is revealed. Wake up those involved you work for us your voters and are not elected to the position you hold to self serve your personal agendas" Be open and transparent and be prepared to listed not to dictate.
207	Object	This will be an eye sore from the coast of Augusta not to mention the impact this type of infrastructure will on the Scott River population, in using farm lands and water ways. I strongly oppose this development.
208	Support	With the ongoing expansion of rural/residential areas in the AMR shire, there will be a increased need of grid based electricity seeing that most new houses will all have airconditioning installed which greatly increase the electricity consumed especially during periods of extreme heat and or cold temperatures. Although grid services have been upgraded in recent years, the ever increasing demand will cause future blackouts especially during the night times when solar has shut down. We need extra baseload power for this.
209	Object	
210	Support	We need more wind generation and this is an ideal location.
211	Object	I STRONGLY object!. I'm a 70yr old, normally law abiding man, not a greenie and I lived in Scott River in the 80s. Do NOT destroy this pristine region of the southwest. I cannot say this strongly enough, I will join in any protest on site, should the proposal go further. I am prepared to go to prison to help stop you from destroying the area. I know of many others who say the same but will not openly say so in advance.
212	Object	I have lived in the Scott River district for 36 years and will be directly affected by how LPP23 is written. Large-scale renewable enery is something I support, but the current draft does not cover enough protection in relation to floodplains, farming and very importantly bushfire safety, biodiversity is another matter not covered enough. I ask that LPP23 be amended so that impacts are kept within the project footprint and neighbours' land and public roads are not treated as buffers. I know that the floodplains and land with acid sulphate soils are already subject to covenants, which in my opinion should not be

		considered for large scale industrial facilities. Setbacks should be in conjuction with 250 m turbines and the Shire's pattern of small rural lots, with significantly larger separations to both houses and boundaries, and no reduction through private neighbour agreements or curtailment arrangements.I ask that LPP23 be amended so that impacts are kept within the project footprint and neighbours' land and public roads are not treated as buffers A stronger protection for noise needs to be addressed in more depth including low frequency and infrasound.The policy should recognise farming and the access to water as most important. It should also require assessment of the impact on the Scott River so as not turned into an industrial energy zone. Please spend more time on LPP23 to make it stronger before it is finalised and used to assess the Scott River wind farm and any future proposals.
213	Object	I am totally apposed to the Scott River Wind Farm due to the scientific evidence stating that infrasound with effect neighbouring properties. It could also affect groundwater and fertility of livestock, wildlife and neighbouring population. What gives you the right to go ahead with a project of this magnitude without an environmental impact study?
214	Object	My home on Molloy Island is on the eastern side of the Island overlooking the Scott River Basin and the Scott National Park. The installation of the Wind Turbines will cause visual pollution for us and also devalue the property which presently has pristine views. This is one of the reasons that my wife, Dorelle, and I purchased the property approximately 33 years ago. Whilst the wind turbine may look small from the Augusta township, they will tower over our views from Molloy Island. I was also involved in objecting to the Minister about BHP Beenup, applying for and been granted approval by the State Environmental Authority to empty excess water overflow into the Scott River because of the sulphuric acid arising from the acid sulphate soils when exposed to air and water. BHP indicated that they had the best scientists in the world to resolve the problem. I responded to BHP stating that having the best scientists had never solved the problem in the past. BHP then withdrew its application to dump water into the Scott River but were granted permission to keep the acid sulphate water in retention ponds. It has taken over 20 years for these ponds to be restored and returned to nature. Initially, numerous truckloads of lime were used to try and neutralise the sulphuric acid. This has also been a major problem in NSW on the coastal plains and on which the NSW government now has strict controls on disturbing such soils. It is the NSW government that supplied me with all of the information that they had on acid sulphate soils when I was assessing the BHP project as the WA government had very little information on the problem at that time. For the above reason, I am extremely concerned about the disturbance and digging of the soil because it will expose acid sulphate soils to water and air thus causing major environmental problems. The other issue that will arise will be at the end of the life of the wind turbines as to who will be responsible for their removal, contamination issues and burial and will they have the funds to do this.

		I asked the same question of BHP as the entity of BHP conducting the Beenup project was a company with only a small paid up capital and could have been let go into liquidation thus leaving the state government with the costs of clean up. I suggested that the state government obtain the guarantee of the holding company in order to avoid the costs of clean up being left in the hands of the government.
215	Object	"I object to the Scott River Wind Farm DA because it has not had the proper thoroughness needed for a proper assessment. The proponal has not finalised turbine locations, their specifications or even a final design, how can approval be given when the details are not set in stone. The noise, shadow flicker and other impacts inc visual is impossible to make a decision on and as a neighbour I would like further investigation of the risks before a decision is made. Considering the noise assessment was based on a desktop assumption and suited to older turbines not these modern 250m turbines it is not up to date monitoring and where will the protections lie if limits are exceeded. Another big concern is the floodplain location with the history of acid sulfate soils andshallow groundwater, how will that affect the risk to water quality and neighbouring farms such as myself. All I ask is the Shire to refuse or defer the DA until a final design, verified noise framework, and robust environmental and emergency management plans are provided and independently reviewed."
216	Object	Dear Augusta-Margaret River Shire, We are part of a family who owns 58 and 60 Sabina Drive, Molloy Island, Augusta, WA 6290. We live here on more than an occasion and still do. We have more than basic researched these issues for a long period. Could you please consider the following when they draft the new energy policy. Draft Renewable Energy Policy We want the Renewable Energy Policy strengthened so that:- • Impacts are kept well inside the project footprint, • High-risk floodplains and acid sulphate soils are off limits, • Food and water security and bushfire safety come first, • Neighbour's properties are never treated as buffers for industrial developments, • Noise monitoring must be real, independently verifiable and enforceable, • A bond for end of turbine farm life to cover rehabilitation. • A communication and interface system with landholders is accessible and reasonable at cooperating with communicating if and after implementation occurs. Visually and audially we value our locality and lifestyle, industrialisation should considerate of this and the Scott River region. Augusta has long been a nature affiliated, picturesque and largely untouched area. Please allow consideration of our requests in the Council's deliberations. Our experience living in the shire has been more than remarkable, thank you, it has been a privilege.

217	Object	I have recently purchased at Karridale. One of the main features of this area I and others are drawn to, is the fact we live in a “relatively” pristine environment. Of all the areas in WA affected by mining, pollution, deforestation and contamination; Augusta Margaret River is faring far better. It is up to the council/ government to respect the community rights/wishes to protect our land, environment and the health of the community. This area is one of the main tourist areas of the state, and is important for generations to come that we hold firm and stand strong in protecting what is ours. The environmental and health risks are already obvious, it almost seems redundant to have to repeat them. Infrasound, asbestos, PFAS pollution will affect peoples health. The soils themselves are not suitable for this type of venture. Why not solar? Let’s face it, none of these inventions are “clean” but let’s choose the option with the least adverse affects to human health, let alone the environment and animals. This development in no way contributes to the community, economically or sustainably. Our community is clearly striving to move in a regenerative, eco conscious direction, with a pristine environment that has a lot to offer our country. We cannot let big corporations put profits over what we need to protect. Non polluted areas in our country are demonising. There are some towns/communities that have proudly stood up to coal seam gas, wind farms and mining, and they remain valuable pristine natural habitats for all to enjoy. Let’s be one of these communities that puts our foot down when it comes to letting our pristine environment be bought out with no benefit to our community. Lastly, if you wouldn’t have these in your backyard, why are you happy to approve it in someone else’s? Do you see wind farms being pushed in Sydney or the Gold Coast or other beautiful locations? No. You get them where there are less people who will stand up and say no and cause less of a scene. Let’s stand up as a strong community with a backbone and say no. We are not at the mercy of big corporations, people with decision making power need to rock the boat and make a difference.
218	Object	Wind farms have been proven to mot be environmentally friendly. WA should not be erecting any more windmills.
219	Object	This plan for 20 Onshore 250 meter tall wind turbines is the thin end of the wedge and is only possible with the dictatorial State and Federal Labor Government's undemocratic and indecently hasty tactics to railroad small communities. 20 turbines in this beautiful part of the world, is Too many. The number of submissions will always be small due to the population size. That does not mean that many West Australians, who are mostly unaware of this project, its location and its impact, will not be outraged by the wanten destruction of areas of natural beauty and biodiversity. (I count Roger Cook as one of these people who is unaware of the impact on Scott River, as he said on the radio, only a few days ago, that he was not familiar with the Scott River area issue.) The irreparable damage to this beautiful part of the world will be severe, with an industrial turbine site ripping through massive transportation to and from the area with steel, concrete, huge blades, support columns TRASHING the countryside that is supposed to be SAVED by these turbines, in its wake. Why is the Labor Government not held to account about despoiling the most green and biodiverse areas of Australia, like Scott River, when there are countless featureless, uninhabited, wilderness desserts that the Government and Planners can choose from. Apart from the visual impact and constant drone of these 250 meter tall hazards to aircraft, fire-fighters and wildlife, the Scott River area is home to many rare and endangered species of flora and fauna including Black Cockatoos and Wedgetail Eagles, which will be further depleted by turbine strikes. Intermittent wind turbines only work to about 30% effeciency which is no good to anyone, especially as their lifespan is only 15 to 20 years; after which time, turbines will have to be decommissioned, recyled, and replaced at huge expense. RECYCLING and the COSTS

		OF RECYLING IS A JOKE. There is NO CURRENT SENSIBLE PLANS to recyle BLADES and no one is addressing the environmental impact of the latest ASBESTOS SCANDLAL that surrounds wind turbines. Apart from porential asbestos pollution in this beautiful area, there is also the very real and shocking issue of the particle shedding from the coating on the turbine blades, which will pollute surrounding farmland and waterways. This shedding material includes BISPHENOL A which is known carcinogen and TOXIC TO HUMANS and has the ability to enter the foodchain. Why should Synergy, a monopoly power company be gifted a turbine contract that will not deliver cheaper power, will be given handouts of OUR TAX MONEY by the Labor Government? How will Synergy and the State and Federal Government plan to deal with the dangerous chemicals that will pollute the site over time, and has TRUE COSTINGS available to the public to show how much this Chris Bowen Vanity Project will end up costing. This Ponzi Scheme is not about clean and green power, it does so much more harm with little to show for the environmental impact, and yet another example of Government overreach at the taxpayers expense. This Synergy/Government backed project in Scott River (and others) will be seen by generations to come as criminal environmental vandalism and those associated with it should be held to account morally and more importantly FINANCIALLY. Australians want cheap power and we are being LIED TO, all we will get is HUGE DEBT, DESTRUCTION OF HABITAT, POLLUTION and BIG LITTER
220	Object	Object to the visual impact Object to the environment impact
221	Object	Hello. I implore you please, to NOT go ahead with the proposed windfarm in Scott River. Reason/s being, the techology is not there yet, it is not clean energy. And its an economic disaster. I have watched other windfarms around the globe. The spot you have chosen has a plethora of native flora and fauna, some critically endangered. Watching other windfarms, i see the birds that are killed, the massive oil leaks, the destruction to the ecosystem, the fact that it cannot be recycled adding to landfill and the economic disaster in maintenance. Some countries have banned windfarms from above reasons mentioned. It's going backwards! I do fear though that the deal has been made. After seeing the EPA backout, i can only imagine the deals going on under the table. We, the people are aware! My only hope is that "someone" sees this and in a quiet moment of reflection, truly asks if this is right? For their kids, their grandkids as they will be the ones dealing with the fallout and destruction of such a pristine environment. Only to hear of the distant memories of how clean and beautifull this area "used" to be. Please, do NOT let this go ahead.
222	Object	Scott River Wind Farm • I am concerned and apprehensive that a 250 metre high, multi turbine wind farm is proposed for construction on a sensitive flood plain with acid sulphate soils and a shallow superficial aquifer. • I am concerned and apprehensive that the installation will pose unacceptable risks to beef, dairy and cropping, from dewatering and contamination of dams, bores and drains. • I am alarmed that seasonal bushfire risks and no fly zones around the turbines impact aerial firefighting and evacuation. • I am concerned and apprehensive that noise and low frequency noise and infra sound from turbines are too close to homes and boundaries. • I am concerned and apprehensive that shadow flicker and 24/7 disturbance in a quiet rural environment. • I am concerned that Scott River being transformed from a food bowl and quiet rural landscape into an industrial power zone. • I am concerned that the Development Approval does not include a confirmed turbine model, this means that the noise model used is hypothetical. This is unconscionable. We need:- a) Real time Noise Monitoring at nearby homes, b) Mandatory post construction verification of actual noise levels, c) Enforceable protection and shutdowns if limits are exceeded.

		d) A bond for the land rehabilitation at end of turbine farm life. I oppose the Scott River wind farm as described above.
223	Support	Moving to renewable energy is essential in the transition to low carbon generation and reducing emissions. Climate change is resulting and will increasingly result in far more bushfires heatwaves and drought and consequently environmental damage to Scott River and the South West
224	Object	
225	Object	Please do not build these wind farms. They are harmful to wildlife and can be harmful to surrounding residents.
226	Object	I'm a long-term local shire resident and frequent visitor to Augusta to take advantage of its natural beauty and use the river and beaches to swim and generally enjoy outdoor pursuits. My sadness is that all the objections to this development will not stop it going ahead, but I do wish to convey my thorough disapproval and objection to this Wind Farm application. With all the space we have available in this state it seems ludicrous to place the proposed wind farm in such a sensitive area where it completely destroys the visual amenity of an area that has been largely untouched by large scale industrial development. I implore you to reject this application.
227	Object	On behalf of my family and myself, we have strong objections to the proposed wind farm in Scott River, Western Australia, citing several critical concerns. 1. Firstly, the area has high ecological value protected under the Environment Protection and Biodiversity Conservation Act 1999, jeopardizing endangered flora and fauna due to potential risks from construction and operation. 2. Secondly, the risk of increased fire hazards in the community and issues related to Acid Sulphate Soils that could affect sensitive waterways and surrounding farmland are alarming. 3. Additionally, neighboring landowners have legitimate health concerns regarding exposure to noise and disturbances from the 250m tall wind turbines. 4. The proposal threatens both the unique environment of the Scott River district and local wildlife, including endangered species within the federally protected ecological community. 5. The project is deemed unsuitable due to inadequate block sizes and anticipated alterations to the rural landscape, raising further issues of amenity and safety for residents.
228	Object	Wind farms are extremely detrimental to the environment, ineffective and inefficient. We want to preserve our efficient electrical generation in Western Australia with the use of coal and gas.
229	Support	I strongly agree that Synergy has thoroughly researched all aspects of constructing a wind farm in that particular area and mitigated any concerns. It is the perfect site for a wind farm and it is vital that the Shire supports this to combat the effects of climate change. The fact that infrastructure already exists at the old Beenup mine site, transmission lines are already in place and minimal clearing is required makes it ideal. It is also where the wind blows consistently. Areas in other parts of Australia that have wind farms in farming areas have found no adverse affects and in fact have found positive ones including land values increasing rather than decreasing.
230	Object	Insufficient impact studies and consultation with neighbor's directly impacted on this large scale development. Insufficient studies into the effect of interference with the water table and possible Acid sulfate disruption. Direct property value impact on neighboring properties with zero consultation potentially costing large losses in equity and investment or retirement planning
231	Object	I oppose the Scott River wind farm because 250 m turbines on a floodplain with acid sulfate soils, shallow groundwater and active farming is too risky. The noise modelling isn’t real, and the project has no enforceable protections for people living nearby. It threatens food and

		water security, bushfire safety, rural amenity and the environment. I moved to Augusta many years ago for the wonderful community, bush views and peace and quiet. As the local council you are responsible for this beautiful area and should not preside over a project that turns it into an industrial are with risks to the environment (acid soils), noise levels and visual aspects of the area. The proposal indicated that the visual impacts would be significant and not in keeping with the area. The local community will have minor benefits but major detriment from this project. There are many possible locations for wind farms without putting them 15 Km from a town like Augusta. Clearly this is just to reduce cost of transmission lines. This is just too many turbines on land that is valuable farming land and too close to people's homes and farms.
232	Object	I'm strongly against this wind turbine project @ Scott River due to the environmental destruction which will be caused, to an already fragile environment, these"so called green energy" is a lie, the eyesore from surrounding communities, the noise pollution & also the rain barrier that wind turbines create! No No No!!!!!
233	Object	Insufficient impact studies and consultation with neighbor's directly impacted on this large scale development. Insufficient studies into the effect of interference with the water table and possible Acid sulfate disruption. Direct property value impact on neighboring properties with zero consultation potentially costing large losses in equity and investment or retirement planning.
234	Object	I oppose the Scott River wind farm because 250 m turbines on a floodplain with acid sulfate soils, shallow groundwater and active farming is a risk to the environment and to the livelihood of the farmers nearby and the tourism industry of the nearby towns. The specification of the turbines is not detailed and therefore the noise modelling is just a guess. There is no real assessement of the affect on fire risk in the are or how the local firefighters would respond to it. The proposal itself said that the visual effect was not in keeping with the local environment. My mother lives in Augusta and does not want to look out over wind turbines instead of native bush. People go to Augusta for the natural views and peace and quiet. As the local shire you will know that the community benefit they are proposing is paltry and will in no way offset the damage, and potential damage done to the community. In order to protect the community there needs to be monitoring of noise, acid soil levels and any other environmental damage, with the power to shutdown if these are breached. This installation is just too close to homes and farms. It is not an appropriate location.
235	Object	These are toxic possibly asbestos filled with over 300 Litres of oil that can not be recycled when they stop working with a life span of 20 years at best. They are the most expensive of all forms of energy but the main thing is they are experimental. Some of these intermittent part time have never been built before so what could go wrong will go wrong. Leave our pristine oceans for our much loved marine animals especially our whales.

236	Support	Based on information provided, it appears a positive addition to the renewable energy mix, particularly as there is negligible impact on native vegetation. I trust that the WTG blades are constructed of recyclable material (decompostable resin base) as this aspect of WTG is a major environmental concern.
237	Support	Just hurry up and build it
238	Support	I fully support this project. Please disregard the fool's making any submission that claims it's an eyesore or a swindle factory. Please build it quickly.
239	Object	Come and see the damage all the high voltage lines are now doing to Karijini area. No way we want that in our beloved country side as well. It's not worth it. Think of your kids, kids. You will be leaving them a trashed environment. Anyone with common sense would say a Big NO to this plan.
240	Object	Nations across the Western world are turning their backs on wind and solar farms as the expense (lining the pockets of International Companies, not Australian) far outweighs any perceived benefits. While renewable energy generation is a lovely idealistic thought, the grim reality is that it is not reliable, ridiculously expensive and will have a negligible effect on reducing global emissions. China alone produces the same amount of CO2 in 12 days, that takes Australia 12 months. Scott River is a beautiful, isolated part of WA and the legacy of these obscenities will last far longer than the brief ,feel good moments when they are built. I also now understand they are made of a plastic that sheds microfibres and also asbestos. I think AMR shire should stand up for preserving their pristine and beautiful region.
241	Object	The Scott river area has been an area that my family has holidayed on for many years. It is a unique environment and should not be plundered for the labor governments net zero obsession. From the frogs to the bats this area needs to be saved from climate alarmists.
242	Support	
243	Support	I great idea 💡
244	Object	Submission – Objection to Scott River Wind Farm Development Application (Prepared by a young adult resident with concern for the environment, waterways, wildlife and future generations) I strongly object to the Scott River Wind Farm Development Application. As a young resident of this region, I am deeply concerned about the long-term environmental, ecological and social consequences of this project. The proposal fails to demonstrate that the full extent of impacts on ecosystems, water quality, aquifers, and endangered species can be properly assessed or managed, and it lacks the scientific detail needed for an informed planning decision under both Western Australian and Commonwealth environmental law. Lack of Scientific Detail and Risk Assessment The Development Application does not contain a final turbine layout, confirmed turbine specifications, or comprehensive construction and environmental management plans. Without these essential details, it is impossible to properly assess impacts on waterways, soils, groundwater, noise and vibration, fauna habitats, and landscape character. Approving an incomplete concept shifts risk onto residents, landholders, and the natural environment. Threatened Ecological Community: Scott River Ironstone Association The Scott River Coastal Plain supports the Scott River Ironstone Association, an Endangered ecological community listed under both the EPBC Act and WA Biodiversity Conservation Act. This community includes many rare and endemic plant taxa such as Darwinia ferricola, Lambertia orbifolia and Grevillea species, and depends on seasonal inundation and groundwater connectivity to survive. It is highly sensitive to hydrological change, soil disturbance and clearing. Disturbing this habitat for industrial infrastructure puts this unique ecological community at further risk of decline.

		Biodiversity WA Rivers, Aquifers and Aquatic Fauna The Scott and Blackwood Rivers form major parts of the Hardy Inlet catchment, which supports high ecological value aquatic biodiversity. Long-term monitoring under the Healthy Estuaries WA program shows that the lower Scott and Blackwood catchments host up to 19 native aquatic fish and crayfish species, many of them endemic to south-west WA and some of conservation significance, including the Balston's pygmy perch (Vulnerable under the EPBC Act), mud minnow, black-stripe minnow, salamanderfish and migratory pouched lamprey. Healthy Estuaries The Blackwood River system is one of only two river systems in the southwest coast drainage division that contains all eight freshwater fishes endemic to this region, highlighting its ecological importance. Healthy Rivers Groundwater connectivity is crucial to sustaining these populations; disruption from excavation, dewatering, sediment release or contamination could reduce water quality and degrade key breeding and refuge habitats. Historic data show that rivers like these serve as critical spawning and nursery grounds for native fish communities. Docslib Marine and Estuarine Environment: Hardy Inlet and Flinders Bay The Scott and Blackwood Rivers discharge into the Hardy Inlet, a permanently open estuary that then flows into Flinders Bay — an area used by migratory waterbirds and marine mammals, including whales and dolphins. Changes to freshwater inflows, water chemistry or sediment loads from land disturbance can affect estuarine and marine food webs, breeding cycles and habitat quality. Algal blooms and low oxygen levels have already been recorded in parts of the inlet, indicating existing stress on the system. Healthy Estuaries Soil, Acid Sulfate Soils and Chemical Risks The valley plains of the Scott River contain acid sulfate soils and shallow aquifers that are highly sensitive to disturbance. Excavation, trenching and dewatering associated with turbine foundations, roads and underground cabling risk mobilising acids and heavy metals into waterways and groundwater. This can degrade water quality for native fish, crustaceans, stock water and riparian vegetation. The DA does not provide an enforceable, site-specific plan to manage these high-consequence risks. Endangered and Threatened Species In addition to aquatic fauna, rare terrestrial flora associated with the Scott River Ironstone Association — such as Darwinia ferricola (Endangered under EPBC) — are highly restricted in distribution and vulnerable to habitat disturbance. Wikipedia There is also evidence of numerous threatened and priority fauna species in the broader Scott catchment, including 26 fauna species of conservation significance. openPetition Legal and Planning Responsibilities The DA in its current form fails to provide the environmental evidence required to satisfy: Environmental Protection Act 1986 (WA) — by not adequately assessing biodiversity, soil, water, and ecological risks. Environment Protection and Biodiversity Conservation Act 1999 (Commonwealth) — by not fully considering potential impacts on listed threatened species, migratory waterbirds, estuarine and marine mammals. Augusta-Margaret River Local Planning Scheme — by proposing industrial infrastructure that will significantly alter rural landscape and

		ecological values. Compliance with these laws requires full, evidence-based assessment of impacts on ecosystems, species and water systems, which the DA does not provide. Future of Young People and Long-Term Community Well-Being As a young adult who plans to live, work and contribute to the future prosperity of this region, I am deeply concerned about: Permanent degradation of river health, aquatic biodiversity and estuarine systems. Loss of unique ecosystems that cannot be replaced once destroyed. The cumulative environmental burden that my generation would inherit. The erosion of natural landscapes that support recreation, tourism and cultural identity. The rural and coastal environment of the Scott River area is part of what makes this place liveable, economically vibrant, and culturally significant. Its degradation jeopardises the future of young residents, future landholders, and the broader community. Request to the Shire In light of the above evidence: Refuse this Development Application until a final design and comprehensive, independent ecological, hydrological and environmental risk assessments are conducted and made publicly available. Ensure full compliance with WA and Commonwealth environmental legislation, including rigorous assessment of impacts on threatened species, rivers, aquifers, and coastal ecosystems. Actively oppose the project at state and federal levels, prioritising protection of biodiversity, waterways and community well-being over premature approval of an incomplete proposal. Closing Summary The Scott River Wind Farm proposal, in its current form, places unacceptable and irreversible risks on rivers, aquifers, unique ecological communities, endangered species and coastal environments, without the scientific detail necessary for responsible decision-making. The long-term environmental, social and economic costs — especially for young residents and future generations — are far too great. I strongly urge the Shire to refuse this application and advocate for the protection of our precious natural environment, waterways and biodiversity for the future.
245	Object	Submission – Objection to Scott River Wind Farm Development Application I am writing to strongly object to the Scott River Wind Farm Development Application. The proposal, as it currently stands, presents significant and irreversible risks to the environment, wildlife, water systems, and community amenity. It fails to provide the necessary level of detail for a proper assessment and does not comply with Environmental Protection Act 1986 (WA), the Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act, Commonwealth), or the Augusta-Margaret River Local Planning Scheme. Regulatory and Environmental Concerns Wind farm developments are required to demonstrate compliance with strict environmental and planning regulations, including: EPA Act 1986 – for assessment of impacts to terrestrial and aquatic ecosystems, particularly in areas with threatened species and sensitive habitats. EPBC Act 1999 – for protection of nationally listed threatened species, migratory birds, and marine mammals. Local Planning Scheme – for protection of rural amenity, landscape character, and tourism values. The current DA fails to provide the level of detail needed to comply with these regulations, making it impossible to assess potential impacts properly. Biodiversity, Threatened Species, and Habitat

		The Scott River region is part of the South West Australian biodiversity hotspot, a globally recognised area with high species richness and endemism. The area supports: 26–28 threatened terrestrial flora and fauna species, including Western Ringtail Possums, Carnaby's Black Cockatoos, and numerous priority plants. Migratory and endangered bird species, whose habitats could be lost or fragmented by turbine construction and cabling. Marine mammals, including whales and dolphins in Flinders Bay, whose communication, breeding, and feeding could be disrupted by noise, vibration, and sedimentation during construction and operation. Research and ecological surveys show that even limited clearing or disturbance in this area can have disproportionate effects due to the restricted ranges of many species. The project also poses a cumulative risk when considered alongside other regional developments. Soil, Groundwater, and Floodplain Impacts The project site includes acid sulfate soils and shallow groundwater systems that are highly sensitive to disturbance. Excavation, dewatering, and infrastructure installation could: Mobilise acids and heavy metals, contaminating stock water, dams, and waterways. Alter aquifer flows and compromise water quality for farming and ecosystems. Introduce permanent damage to fragile soils, similar to issues observed in other WA projects. The DA provides no enforceable management or mitigation plan for these high-consequence risks. Noise, Vibration, and Infrasound The proposed 250 m-class turbines generate noise, low-frequency vibrations, and infrasound that extend well beyond the project footprint. Current desktop modelling is insufficient and does not reflect real-world conditions: Noise limits rely on dBA metrics suitable for smaller turbines and do not account for low-frequency impacts on humans, livestock, or wildlife. No continuous real-time monitoring or independent verification is proposed. Evidence from other wind farms shows post-construction complaints about sleep disturbance, stress, and livestock impacts. Visual and Landscape Impact The turbines would dominate the rural landscape: Skyscraper-scale structures would be visible for kilometres, permanently altering the character of the Scott River region. Tourism, property values, and rural lifestyle would be negatively affected. Photomontages in the DA fail to adequately convey worst-case visual impacts. Approval would sterilise surrounding land, limiting future rural and tourism use for decades. Bushfire and Emergency Management Scott River is not an urban grid; in a fire emergency: Restricted airspace around turbines could impede aerial firefighting. Heavy infrastructure does not guarantee safe evacuation. Rare flora and fauna may be threatened where emergency vehicles are restricted. The DA does not provide a credible, independently reviewed bushfire and emergency response plan appropriate for this terrain. Construction, Traffic, and Community Disruption Construction impacts are extensive and prolonged: Heavy vehicles, oversize loads, dust, noise, and road upgrades will disrupt residents, farmers, and tourists. Safety risks increase on rural roads with increased truck traffic.

		The DA lacks detailed construction methodology, haulage routes, timing, and enforcement protocols. Cumulative Lessons from Other Wind Farms Other WA and Australian wind farms have demonstrated that: Agricultural productivity can be affected by noise, vibrations, and soil compaction. Livestock may experience stress and health impacts. Soil and aquifer contamination can occur due to excavation, dewatering, and cable installation. Habitat loss and bird/bat strikes can lead to measurable declines in local biodiversity. These documented outcomes highlight the irreversible environmental and social costs of industrial-scale wind projects in sensitive areas like Scott River. Strong Request to the Shire Given these serious concerns, I request that the Shire: Refuse the Development Application due to incomplete environmental, noise, visual, and construction impact assessments. Ensure compliance with EPA and EPBC regulations, including rigorous assessment of impacts to endangered and migratory species, aquifers, soils, and ecosystems. Actively oppose the project at state and federal levels, advocating for protection of our community, landscapes, and irreplaceable wildlife. Summarising Statement In conclusion, the Scott River Wind Farm proposal poses unacceptable and irreversible risks to terrestrial and marine biodiversity, groundwater, soils, and community amenity. The permanent industrialisation of the Scott River landscape, combined with threats to endangered species, migratory birds, whales, and dolphins, and the documented risks from infrastructure and cabling, far outweigh any potential benefits. Approval in its current form would impose environmental, social, and economic costs that cannot be justified, and it would violate EPA, EPBC, and Local Planning Scheme obligations. I strongly urge the Shire to refuse the application and act decisively to prevent this project, ensuring that our community, landscapes, and irreplaceable wildlife are fully protected for generations to come.
246	Object	Submission – Objection to Scott River Wind Farm Development Application I object to the proposed Scott River Wind Farm on planning, environmental, safety and community grounds. The development application seeks approval for an industrial-scale wind energy facility without providing the level of detail required for a proper, lawful and informed assessment. The proponent has not finalised turbine locations, turbine specifications or a final design, yet requests approval now with the intention of resolving key impacts later. This approach prevents meaningful assessment of visual impact, noise, vibration, environmental risk, bushfire response and construction impacts, and shifts unacceptable risk onto neighbouring landholders and the wider community. In planning terms, the absence of critical information prevents the Shire from making an informed decision. Approval in these circumstances would be premature, inconsistent with sound planning practice, and contrary to the principles of orderly and proper planning. Resident Impact and Sense of Place As a resident of the Augusta Margaret River region, I do not want to see industrial-scale wind turbines visible from Augusta, nor do I want to experience their associated noise, low-frequency vibration or operational impacts. The visual and environmental connection between Augusta and its surrounding natural and rural landscapes is fundamental to the town's identity, liveability and sense of place. Introducing turbines of this scale into the broader viewshed would erode that connection and diminish the quiet coastal and rural character valued by residents and visitors alike. Concerns regarding noise and vibration are material planning considerations. Modern turbines of this height are known to generate low-frequency noise and vibration that can propagate over long distances in quiet environments and

		under certain atmospheric conditions. The absence of a final turbine design, site layout and enforceable, independently verified monitoring framework means residents cannot be assured that visual dominance, noise and vibration impacts will be avoided or adequately managed over the life of the project. Residents should not be expected to accept permanent industrial visual intrusion, noise and vibration in order to accommodate a development that is fundamentally incompatible with the existing landscape and settlement pattern. Visual Impact and Landscape Character The proposed turbines are industrial-scale structures of skyscraper height that would permanently alter the rural landscape of the Scott River area. These turbines would be visible for kilometres and remain in place for decades, resulting in an irreversible change to landscape character. The Augusta Margaret River region is internationally recognised for its natural environment, scenic quality and rural identity, which underpin tourism, lifestyle appeal and land value. Industrialising the Scott River corridor would undermine these defining attributes. The turbines and rotating blades would exceed the height of Perth's tallest buildings and dominate skyline views from rural homes, local roads and public vantage points. Their scale and movement would overwhelm the existing landscape and cause a substantial loss of visual amenity. The visual impact assessment relies on photomontages that do not adequately represent worst-case scenarios or the true scale and dominance of the turbines. Key viewpoints, including roads, residences and public vantage points, are not convincingly or transparently represented. Without realistic visual modelling, the impacts cannot be properly assessed or accepted. Approval would also result in a sterilisation effect on surrounding land, constraining future rural and tourism uses on neighbouring properties for generations. This outcome is inconsistent with the intent of the Local Planning Scheme and represents a devastating impact on land value, amenity and enjoyment. Floodplain, Acid Sulfate Soils and Shallow Groundwater The Scott River area is a known floodplain environment with shallow groundwater and documented acid sulfate soil sensitivity. Construction activities involving deep turbine foundations, cable trenching and roadworks pose high-consequence environmental risks. Disturbance of acid sulfate soils or groundwater drawdown can generate acid and mobilise metals, leading to irreversible impacts on soils, waterways and agricultural productivity. Contamination pathways may affect drains, dams, bores and stock water supplies beyond the development footprint, with consequences borne by local landholders. The application lacks sufficient detail to assess these risks. There is no final design, no confirmed excavation depths, and no credible dewatering strategy. Without this information, there is no meaningful assessment of groundwater interception, discharge volumes, treatment, monitoring or contingency responses. The application also fails to adequately address the hydraulic connectivity between the superficial aquifer and the Scott River system. The proponent has not demonstrated a sustainable or credible emergency acid sulfate soil mitigation strategy. Reliance on lime is inappropriate in a region where lime is a scarce agricultural input essential to farming productivity. Bushfire Risk and Emergency Response Scott River is a rural area with limited access routes and heavy reliance on aerial firefighting during bushfire events. The introduction of large wind turbines raises serious concerns regarding emergency response capability. Restricted or no-fly zones around turbines can impede aerial firefighting operations, reducing response effectiveness during critical fire events. Internal service roads do not equate to safe evacuation routes for residents. The development application does not adequately address fire ignition risks, turbine operation under extreme fire-weather conditions, evacuation logistics, or realistic emergency response times. Rare and threatened flora is also at risk where turbine exclusion zones may

		restrict ground-based or aerial suppression. A credible, independently reviewed bushfire and emergency response plan is essential and has not been provided. Traffic, Access and Construction Impacts Construction impacts will extend over months or years and represent a significant disruption to the local community. Rural roads in the Scott River area are not designed for sustained heavy vehicle traffic or oversized turbine components. Increased truck movements, dust, noise and road modifications will affect residents, farm operations, tourism and local businesses. Safety risks for residents, school transport, farm machinery and visitors have not been adequately assessed. The application does not provide sufficient detail regarding haulage routes, staging, timing, road upgrades or protections for residents. Wildlife, Birdlife and Marine Environment The Scott River and broader Augusta–Flinders Bay area is environmentally sensitive and biodiversity-rich. At least 26 species of flora and fauna listed as threatened, rare or at risk occur within the area. Bird and bat strike risk is inherent to wind energy facilities and must be assessed transparently and conservatively. Habitat clearing, fragmentation and disturbance further compound these risks. The application does not demonstrate how impacts will be avoided, monitored or enforced over the life of the project. Flinders Bay is an internationally recognised marine environment and an important habitat for migrating whales. Construction noise, vibration, increased vessel activity and operational impacts have the potential to disturb marine mammals. The application does not demonstrate that marine impacts have been adequately assessed or that precautionary buffers and management measures are in place. The absence of a comprehensive, precautionary assessment of both terrestrial and marine fauna is inconsistent with accepted environmental assessment standards. Consultation and Community Engagement Community consultation has been inadequate given the scale, permanence and regional significance of the proposal. Many affected landholders report no direct engagement. The application does not transparently document community feedback or demonstrate how concerns have influenced the proposal. Generic assurances do not constitute meaningful consultation. Planning, EPA and Regulatory Compliance The development application does not demonstrate compliance with the objectives of the Local Planning Scheme, which seeks to protect rural character, landscape values, environmental assets and residential amenity. Further, the proposal does not provide sufficient information to demonstrate consistency with the Environmental Protection Act 1986 (WA) objectives, including the precautionary principle and the prevention of environmental harm. The lack of detailed environmental investigations, final design information and enforceable management plans means the environmental acceptability of the proposal cannot be established. Without this information, the Shire cannot be satisfied that the proposal meets the requirements of sound planning practice or that environmental risks can be effectively managed. Conclusion and Request This development application seeks approval for an industrial-scale wind farm without providing the information necessary for a lawful, transparent and defensible planning decision. The proposal would result in permanent landscape change, loss of rural and coastal character, environmental risk, compromised emergency response capability, and unacceptable impacts on residential amenity. In planning terms, the absence of critical information prevents the Shire from making an informed decision. Approval in these circumstances would be premature, inconsistent with sound planning practice, and contrary to the long-term interests of residents, the

		environment and the Augusta Margaret River region. I respectfully request that the Shire refuse the application, or at a minimum defer it until a final design and independently reviewed environmental, visual, marine, emergency and construction management plans are provided and made available for public review.
247	Object	Members of the Council, while I have no direct interest in the Scott River project. I would like to acquaint you with a number of facts, that show wind turbines are not electricity generators and are a definitely negative project to have in your Council area. A modern electricity Grid, requires a constant, reliable supply of baseload electricity 24hours, a day, 7 days, a week (24/7). That electricity can only be supplied by electricity generators, able to generate for 24hours a day. Such as Coal, gas, hydro and nuclear powered generators. Wind Turbines, ARE NOT 24/7 Electricity Generators. Wind Turbines are 'Fake', Intermittent, Unreliable, Uneconomic. Energy Converters. That are fueled by a weather fuel, the Wind. Because they can only produce electricity, when the wind speed is between 12kms/hr and 90kms/hr. The industry reports that Wind Turbines only produce electricity on average for only 35% of their rated capacity or on average for eight hours per day. Wind Turbines, experience wind droughts and can be becalmed for hours, days or even weeks at a time, producing no electricity. Likewise, if a gale blows for several days no electricity is produced. https://www.energysage.com/about-clean-energy/wind/pros-cons-wind-energy/ In addition, wind energy converters have other downsides. Such as environmental damage https://news.harvard.edu/gazette/story/2018/10/large-scale-wind-power-has-its-down-side/ and shedding a toxic epoxy resin bisphenol across surrounding land. https://gerardrennick.com.au/is-there-a-toxic-chemical-in-wind-turbine-blades/ Claims of electricity production made by wind energy converter operators are misleading. The claim a wind converter will power 395,000 homes (Spicers Creek Wind Farm https://www.squadronenergy.com/our-projects/spicers-creek-wind-farm) needs to be qualified to say that the wind converter may power the 395,000 homes for intermittently for an average of 8hrs a day. With the 395,000 homes needing at any time to seek a completely different source of power for the remaining 16 hrs of each day. A wind energy converter is completely unsuitable and uneconomic to supply baseload electricity 24/7 for a modern society. Wind turbines are designed to last 20 – 25years however with each turbine having over 8,000 parts, breakdowns may be earlier. It is reported that at 10 years of life, blades and gearboxes are needing to be replaced already so it is unlikely they will make it another 10 years. https://energyfollower.com/how-long-do-wind-turbines-last/ A wind energy converter is usually sited, hundreds of kilometres from the Grid. Extra HV Transmission lines have to be constructed across productive farmland and national parkland to connect the wind converter, causing havoc to farmers, including paying a rent fee. Altogether greatly increasing the cost to the consumer. NOTE: When practical commonsense, replaces fantasy when new High Efficiency Low Emissions (HELE) coal fired power stations and Small Modular Nuclear Reactors come on line, the new transmission lines, will become redundant. Will they be removed? Wind energy converters. Are known to increase the heating of surrounding land. It has been found that Wind Turbines actually increase

		the land temperature downwind of where they are operating. (It only stands to reason as we see how winds dry up the Country. Wind Turbines, chop and change the wind as it passes through the blades, causing a more drying effect. And it even has a global effect https://www.instituteforenergyresearch.org/renewable/wind/wind-farms-raise-temperatures-at-the-surface-level/ Decommissioning. The cost to teardown a single turbine is estimated at $A800,000. Wind Converters, proposers or actual operators, I believe, have an understanding in the industry that when it comes to decommissioning that the base will NOT be removed only covered up. Being covered up by only 75cms or 1m of soil, the area covered by the bases will not grow good crops or pasture It needs to be asked, have the proposers/operators have done a close analyse of how the removal of the wind turbines will done, where the debris will be taken too. In particular the huge fibreglass blades. Most of them may left in paddocks or go to landfill. With the host/landowner responsible for the cleanup and bankruptcy. https://stopthesethings.com/2023/10/31/touring-texan-turbine-graveyards-becomes-latest-green-tourism-venture/ The Wind Converters proposers/operators, need to be challenged. As to whether they have done any costing of the decommissioning, restoration and disposal/recycling. And it is misleading for the proposers/operators, to say to the Hosts. That two years before the closure of the Wind Farm, a fund will be set up to pay for the decommissioning, restoration and disposal. Is it feasible to put aside a sum of $800,000 per turbine, while paying dividends to investors? What if Government subsidies stop? What if new High Efficiency, Low Emissions (HELE) coal fired power stations, along with Nuclear Reactors are installed and bidding to supply is increased to six hour blocks of uninterrupted supply. What if the operators become insolvent? As they are only leasing the site, they can break the lease and walk away, leaving the Host, Augusta Council and Community with $billions costs to clean up a toxic rubbish heap. Or be left with a toxic wasteland.
248	Object	I oppose the Scott River wind farm because 250m turbines on a floodplain with acid sulphate soils, shallow groundwater and active farming is a risk. There has been no real modelling of impacts on the surrounding farms, people, livestock and wildlife. Why risk such a catastrophic environmental disaster in one of the most pristine parts of Australia. The impacts will be felt in the local community affecting small businesses, farms and tourism. This infrastructure should not be considered until all modelling, adequate risk assessments and complete transparency are provided and completed.
249	Object	Scott River Wind Farm • I am concerned and apprehensive that a 250 metre high, multi turbine wind farm is proposed for construction on a sensitive flood plain with acid sulphate soils and a shallow superficial aquifer. • I am concerned and apprehensive that the installation will pose unacceptable risks to beef, dairy and cropping, from dewatering and contamination of dams, bores and drains. • I am alarmed that seasonal bushfire risks and no fly zones around the turbines impact aerial firefighting and evacuation. • I am concerned and apprehensive that noise and low frequency noise and infra sound from turbines are too close to homes and boundaries. • I am concerned and apprehensive that shadow flicker and 24/7 disturbance in a quiet rural environment.

		• I am concerned that Scott River being transformed from a food bowl and quiet rural landscape into an industrial power zone. • I am concerned that the Development Approval does not include a confirmed turbine model, this means that the noise model used is hypothetical. This is unconscionable. We need:- a) Real time Noise Monitoring at nearby homes, b) Mandatory post construction verification of actual noise levels, c) Enforceable protection and shutdowns if limits are exceeded. d) A bond for the land rehabilitation at end of turbine farm life. I oppose the Scott River wind farm as described above.
250	Object	I oppose the Scott River wind farm because the 250 m turbines are on a sensitive flood plane. The asbestos in the brake pads are a risk to beef, dairy and cropping from dewatering and contamination of dams. The shadow flicker and 24/7 disturbances in a quiet rural environment. It threatens food and water security andis a bushfire risk.
251	Object	Too big and ugly, spoiling one of the views in Australia! Western Australia has access to massive gas fields, and no it's not running out! The government should be targeting the big multinational companies for way more domgas supply and run power generation off that. Get off the renewable bandwagon as it's not better for the environment especially Chinese built shit. No one wants it to go ahead, especially Augusta residents
252	Object	Please don't give the Scott River wind farm the green light! Positioning the 250m turbines on the flood plain with such shallow groundwater in acid sulphate soils is too risky as history has proven. The noise modelling is not adequate as it is too close to surrounding homes and work sites on neighbouring farms. Infrasound studies prove potential effects on people, livestock and wildlife. Other reasons include bushfire risks with lack of affective firefighting capabilities and shadow flicker from blades. Please don't allow this farming community to become an ugly industrial zone ruining the rural amenity and environment. The pristine coastline is the very reason thousands of tourists visit our unique region. Please don't spoil it.
253	Object	It is a recipe for disaster. With Acid sulphate soils, endangered and threatened flora and fauna it is clearly not a suitable location for this. Potential disruption to the acid sulphate soils and the consequential contamination of the Scott River/ Blackwood river would have a devastating impact on the entire region's ecology, economy and lifestyle. Combine this with the large quantities of oil contained in turbines the nearest structural fire fighting service (they are volunteers) is over 35 minutes away drive time. This could also lead to significant environmental damage not if but when 1 catches fire. The visual pollution of our pristine coastline would ruined for ever. I implore the shire to OBJECT to this.
254	Object	Thank you for the opportunity to"Have a say"in the proposed SRWF development. This proposal has become A very divisive community issue . I wished it would go a way, It wouldn't affect me, I would be dead and gone. I sat on the fence, I was complacent. And then Synergy Red came to town with their "road show". They we re nice people full of answers , glossy magazines and half truths. They were evangelising the "Wind Farm " industry giving all the pros and none of the cons.

		The whole process felt cultish. As in “We know what’s good for you” sit down shut up and the Wind Farm bosses will tell what they are going to take and what they would give for it after they’ve used our subsidised capital. By now the initial spiel of zero emissions by 2050 and we will save the planet from global warming was having little to do with the development compared to the noise and $ being made by the wind industry. Synergy Red own less than20% of the project the rest is owned by Japanese and Italian energy companies . The whole renewable energy industry is being hyjacked. The price this community and its environment is being told too much for what it is likely to gain. What is gained. 1. Electricity for houses. Better value if solar panels were fully funded 2.A $100,000 indexed yearly for community projects .That’s less than$20/person, that’s less than 20 “pieces of silver” surely not shut up money. 3. Granted some minuscule reductions would be gained re our carbon footprint 4.Some “warm fuzzy”feeling for doing our bit . 5. We will be able to say we were the “Guinea Pigs” for 250 meter high towers not yet tried out on other communities . ??? 6. A few farmers will have a financial gain. Let’s hope there is no “sting the tail “ 7. I can’t think of any other advantages. What will be lost is the next part of my findings. 1. Community cohesion. (This cohesion has been permantly lost in many other communities world wide) 2.An industrial vista with no removal clause when it goes wrong. 3. Potential risks. a. Release of acid soil. (Don’t forget the BHP disaster) b. The Hardy inlet ,Scott River , Molloy Island. are all at risk c. The four aquifers will , need special care d. Properties will be devalued (Real estate agents must disclose any affect or potential affect created by wind farms eg noise ,flicker, vista) e. It won’t be a selling point that sellers use. f . The sound emissions research is based on smaller mills with less and inconsistent recording machines . This science is out of date , however these results are being used for this proposel. The Nord2000 is redundant .The calibrated SoundSim360class is the current machine which consistently gives accurate readings. g.The warnings given by professors Ken Mattsson and Dr Hakan Enbom are surely red flags to be ignored at a great risk. If you have read this far Thankyou Dr Cliff Owen F.I.C.D PS I do hope I don’t have to explain to grandkids what went wrong
255	Object	We ride with Capel riders and come down here every year for charity toy run to this beautiful town. If proposed wind farm goes ahead. We wish not to return to Augusta as due envirmentao damage it will cause.

256	Support	The opponents of the Scott River Wind Farm have been very intimidating and abusive towards others in their community who do not hold the same views as themselves. Personally I think the location is perfect because of the consistency of wind in this area, the land is mostly already cleared agricultural land that will still be usable agriculturally. Many deliberate negative fabrications have been spread within the local community about the ongoing usability of that land. There will be comparatively little negative impact against local native species - it's long time farming land as such most of the negative impact on local native species occurred long ago by said farmers land clearing and ongoing farm practices ! Opponents are also spreading negative and false information regarding the impending destruction of the Scott River. I do not know how that can happen…., especially when compared to ongoing coal mining and traditional carbon intensive power generation. I could go on and on…., but my support for the Scott River Wind farm is wholly about decarbonising. I will support this proposal because it is a comparatively low impact renewable energy system ! It's the way of the future !
257	Support	We must act now to secure affordable energy that doesn't impact negatively on nature for the future. I also happen to think wind farms are beautiful.
258	Object	This should not happen in such a diverse area. This is farming land and the Blackwood and Scott River are there as is the wetlands in Scott River. This was almost destroyed once before by the Beenup mine and still bears the scars from that. Hardly any rehabilitation at all. People of the Augusta, Scott River, Karridale, Kudardup etc do not want or need this. If the MR councillors think it is so good for the community then put it smack bang in the middle of the Leeuwin Estate! How would they like these monstrosities in their backyard? They wouldn't and neither would you. The company proposing this is Inpex a Japanese fuel company. They are not a green company, far from it. Look them up. They have been given gas from the NT for years and sold it for billions to Malaysia, Singapore and the like. This is not renewable when you see how these turbines are constructed. 3000 tons of concrete and 800 tons of steel mesh just in the base for each turbine alone! How is that good for the planet? What happens in 15 years when their life span is over? How the hell do you get rid of all of that concrete and steel? Has that even been factored in, it doesn't like it. The visual aspect from the town of Augusta will be awful. Not what locals and tourists want to see at all. It will also not create local jobs in the long term. Once up and running they are controlled remotely. What benefit then for locals? Noise for those nearby. 1.5 km buffer is ridiculous. And what about the migratory birds? Please do your research. So many states are now rejecting these due to wildlife and health concerns. Your photos on your submission page also are laughable. They will look a lot bigger than that. My daughter lives in Merredin and she is 30kms from the Colgar Wind farm and they are clearly visible from her place. They did not provide local jobs, all came from interstate, overseas or Perth. 4 or 5 locals maintain it and thats it. You can't approve this and then make up N your Renewable Policy after. The horse will have well and truly bolted by the. This really shouldn't go a head. People living in Margaret River should not have a say, only those within the area. Thank you
259	Support	Renewable energy is urgently needed in WA.
260	Object	This should not be built in this area. It is close proximity to The Blackwood and Scott Rivers. There are farms nearby and wetlands with migratory birds.There are now serious doubts in other parts of the world with micro pollution from the blades. Noise and interruption to migratory birds flight paths.

		The company is Inpex who are a Japanese oil and gas company. They are not trying to save the planet they are here to make a profit. This makes them look "green" by investing in this. The NT has been ripped off for years by this company. It takes gas from there and then sells at a premium to there countries. Wake up Augusta Margaret River Shire! This will not do anything for your community. It will not create jobs in our shire. Look at Merredins windfactory. It employs 4 people locslly with 130 turbines. They are wirelessly controlled from the city. You are destroying farmland and wetlands. And dont talk to me about buffer zones. 1.5km as suggested is ridiculous. Have you actuslly been near these turbibes in full mode? Tge constant drone is horrendous. If you MR councillors are hell bent on having it, then put it amongst your vineyards up in MR. Visually it also is not appealing. Imagine tourists sitting on the banks of the Blackwood enjoying a beer at the Augusta hotel and in the distance all you can see is 200 metre turbines. That's not what they come to the south for.. yuk! There are studies out there if this Shire bothered to find regarding longterm health effects from the constant noise. What happens when this is decommissioned? If the EPA isn't involved now, who will oversee that. Each turbines needs 3000 tons of concrete and 800 tons of steel per base! How environmentally friendly is that? When they are decommissioned what happens to all of that? That isn't be rehabilitated! Wake up to yourselves. Do some research. When they are producing power yes its green, but look at all the destruction that goes into making them and building them. I am ashamed of this Shire. The govt bans old growth Forrest logging to protect the area, and then you allow these monstrosities. Don't be sheep, look at reports from NSW and QLD from people affected by these. Don't just say,"oh it will only effect a few people". That us do wrong, this has shattered and now divided our community, it has pitted neighbours against one another. You promote a nature inspired visit to this region, bike trails, walking trails, whale watching, getting back to nature and then you promote these safe infrastructures. Tell me or show me what happens when their is a fire on the top of a turbine? Planes won't help and neither will our fire fighters. This is all rushed. You dont even have a renewable policy in place or a anactio plan for when it all fails. That should have been done first before getting this happen. What do you the Shire stand to gain from this? Because the people of Augusta, Scott River, Molloy, Karridale dont stand to gain anything! Wake up and down your research before thinking this is green, when it certainly isn't. This isn't saving our planet, it is destroying it. Thank you.
261	Support	
262	Support	
263	Object	☑ WHAT TO SAY – QUICK GUIDE 1 Synergy Scott No turbines of this industrial scale, largest in Australia. 250 m turbines on a sensitive floodplain with acid sulfate soils and a shallow

		aquifer • Risks to beef, dairy and cropping from dewatering and contamination of dams, bores and drains • Bushfire risk and no-fly zones around turbines affecting aerial firefighting and evacuation • Noise, low-frequency noise and infrasound from turbines too close to homes and boundaries • Shadow flicker and 24/7 disturbance in a quiet rural environment • Scott River being shifted from a food bowl and quiet rural landscape into an industrial power zone The DA does not include a confirmed turbine model, which means the noise modelling is hypothetical. We need: • Real-time noise monitoring at nearby homes • Mandatory post-construction verification of actual noise levels • Enforceable protections and shutdowns if limits are exceeded No-one should be forced to “trust” untested data with turbines this close to homes, livestock “I oppose the Scott River wind farm because 250 m turbines on a floodplain with acid sulfate soils, shallow groundwater and active farming is too risky. The noise modelling isn’t real, and the project has no enforceable protections for people living nearby. It threatens food and water security, bushfire safety, rural amenity and the environment.” There is no clear plan for the damage done to birds or wildlife. There are no facilities / services to care for these animals when injured. The natural environment will be impacted ,at a time when we should be protecting it. Do no harm , in fixing the issue. First principle of medicine should apply here Nature is good for mental health that's why people come to augusta. Don't make it an industrial landscape
264	Support	Transition to renewables is essential for the ongoing survival of human and all other life on this planet. Small local inconveniences or aesthetics shouldn’t trouble us if it helps us phase out fossil fuels, which we absolutely must do.
265	Object	Huge impact on local farms that have been living uninterrupted for so long for this to happen. Research and updates show only problems have come from these installations. Area does not need this for now or future
266	Support	Definitely support such an important alternative power source- use nature to its best ! For a cleaner WA moving forward
267	Object	I oppose Synergy building 250m turbines on a sensitive floodplain with acid sulfate soils and a shallow aquifer I have concerns that risks to beef, dairy and cropping from dewatering and contamination of dams, bores and drains. A definite bushfire risk when no-fly zones around turbines affecting aerial firefighting and evacuation. It is a scientific fact that noise, low-frequency noise and infrasound from turbines too close to homes and boundaries effects peoples mental health. Shadow flicker and 24/7 disturbance in a quiet rural environment causing health problems. The Scott River being shifted from a food bowl and quiet rural landscape into an industrial power zone. The DA does not include a confirmed turbine model, which means the noise modelling is hypothetical. We need: • Real-time noise monitoring at nearby homes • Mandatory post-construction verification of actual noise levels • Enforceable protections and shutdowns if limits are exceeded

		No-one should be forced to “trust” untested data with turbines this close to homes, livestock and workplaces. I oppose the Scott River wind farm because 250 m turbines on a floodplain with acid sulfate soils, shallow groundwater and active farming is too risky. The noise modelling isn’t real, and the project has no enforceable protections for people living nearby. It threatens food and water security, bushfire safety, rural amenity and the environment.
268	Support	I strongly support the proposal for the Scott River wind farm. I have been a rate payer and resident of Augusta for 30 years and I look forward to being able to see the wind farm from my front yard, if I live long enough to see it built. While this wind farm would be a small contribution to reducing global carbon emissions Augusta should play our part. We cannot expect the rest of the world to do it for us. I believe we need renewables to reduce carbon emission as much as possible. This is also in line with the Shire's plan to decarb by 2030, which I am in favour of. Based on my conversations with those who don't support the wind farm, I understand that they don't believe that humans are causing climate change and their opposition is only serving their own self interest, not the bigger picture.
269	Support	The windfarm provides strong societal and future generation benefits: - Avoids approx 175,000 tonnes CO2-e per year from the current SWIS generation mix which, through climate change, is impacting natural ecosystems (reefs, forest), agriculture and communities (flooding, fire) - Avoids Coal-fired power generation pollutants such as fine particulate matter (PM2.5), sulfur dioxide (SO_2), nitrogen oxides (NO_x), mercury, and heavy metals, all of which are strongly linked to serious health impacts including heart disease, lung disease, stroke, asthma, and premature death - Avoids land impact of alternative generation such as coal or gas which require ongoing mining/drilling and transportation - Reduces wholesale electricity prices These effects are generally ignored by a vocal minority who oppose wind turbines as "harming the community" based upon unsubstantiated claims of harm caused by nano plastics, infrasound, etc.
270	Support	I’m generally supportive of the Scott River wind farm — it makes sense to add more renewables and use the existing transmission line — but my support really hinges on how they manage the acid sulfate soil (ASS) risk, which is the biggest concern for me. This area has a known history of problems, so the project needs strict monitoring, clear triggers, and strong management plans to make sure excavation and dewatering don’t create serious environmental impacts. These safeguards also need to be fully transparent and publicly available, so the community can see exactly what’s being monitored and how risks are being handled. The government must maintain solid oversight during the highest-risk phases, and if any triggers are breached, there must be legislated conditions that hold Synergy accountable for both management and full remediation. On top of that, the project should deliver tangible benefits to the local community, not just broad commitments. If all of that is done properly, then I’m comfortable backing the project.
271	Support	The anti turbine group is very noisy and has mislead and exaggerated the arguments. We are confident that the soil acidification issue can be managed appropriately and the infrasound issue is overstated, with little evidence of any adverse health effects. Although our property is one of those which will see the turbines more than any others we see this as a reasonable price to pay for the benefits. It is telling that the existing communication towers in Augusta, which are very prominent because of their location in town attract no adverse comment at all.

		We believe that it is important that our community contribute to reducing carbon emissions and that the site chosen has the appropriate attributes.
272	Object	Whilst windy this is an inappropriate location - shortsighted to say the least. Location was not discussed adequately in previous public consultation and requires further investigation.
273	Object	Dear AMR Shire Council, Subject: Objection to the Proposed Scott River Wind Farm Location I am writing to formally object to the proposed location of the Scott River wind farm. While I appreciate the need for sustainable energy solutions, I believe that the chosen site poses significant visual impacts that could detract from the unique character of Augusta and its surrounding natural beauty. One of Augusta's most cherished assets is its unspoiled vistas, particularly from the elevated areas that offer breathtaking views to the east and northeast. These panoramas are not just visually stunning; they contribute to the town's charm and appeal, drawing residents and visitors alike. The introduction of wind turbines in this landscape would disrupt these views, fundamentally altering the aesthetic experience that makes Augusta special. The visual impact of the wind farm would be felt from numerous elevated points within the town and surrounding areas, diminishing the natural beauty that residents and visitors have come to appreciate. This alteration in the landscape not only affects our immediate enjoyment of the environment but could also have longer-term repercussions on tourism and the local economy, which rely heavily on preserving our scenic views. I urge the Council to reconsider the proposed location of the Scott River wind farm and explore alternative sites that would mitigate the visual impact while still supporting renewable energy initiatives. Protecting Augusta's unique landscape should remain a priority as we move towards a sustainable future. Thank you for considering my objection. I hope to see a solution that balances energy needs with the preservation of our town's natural beauty.
274	Object	This project will have an unacceptable (and as yet not fully understood) environmental and visual amenity impact within the Shire. Much of the structure and components are produced overseas, where the standard of environmental (and industrial) practices are significantly lower than in Australia. This means that we are effectively outsourcing rather than reducing our carbon emissions. The reliability of the infrastructure is uncertain and is most likely to still require carbon emitting backup sources. The project is therefor unlikely to have any significant impact on decarbonisation.
275	Object	I do not believe windfarms are a viable way to secure our energy future. They are unsightly, damage the environment, and create a long term problem either in costly replacement or removal.
276	Object	I believe the use of Windfarms to be a totally wrong direction for future energy needs because of their damage to the environment, longer term pollution and ongoing replacement. They are also a visual eyesore and noise problem for those closer.

277	Support	We see the windfarm as a wonderful opportunity not to be missed in the perfect location for the following reasons: 1 The high power line to Manjimup already there. 2 Land already nearly all cleared. 3 Much better alternative than the previous proposal on the coastal dunes which would be very disruptive to native bush & wildlife. Also very expensive to construct in undulating terrain. 4 Where do objectors think future power should come from? Coal and/or nuclear? 5 Complimentary to solar, which is over supplied in the daylight hours in summer.
278	Support	The proposed project uses a large amount of existing, underutilised, infrastructure. This includes, significantly, major roads and high voltage transmission lines. It is also a low population location with a good wind resource on cleared agricultural land. If wind farms are to constructed anywhere, then this site meets the majority of the criteria.
279	Object	1. Location directly impact lots of surrounding properties including ours, I dont want to see massive wind turnbines on the horizon 2. Better locations would be available but they have chosen the cheapest. (Really only because of the Beenup Mine power distribution system with the 132KV line) 3. Cheapest option is not the best. We should only approve the best option, with low impact, if the costs doesn't stack up then, project shouldn't go ahead. 4. Politically driven, at the cost to the environment and community to meeting renewables targets. 5. I am for renewables but needs to low impact, smart and sustainable. 6. Wind Farms are ugly, they have a massive impact to surrounding properties and environment. 7. As technology evolves, there is a good chance that they will be obsolete before the 30-60 life span and its crazy to committ to such long projects, look how far we have come in the last 60 years. Local community and environment will be stuck with them 8. Not in my backyard - It won't be affecting the People that are making these decisions
280	Support	Although we will see the wind turbines from our house I fully support the project. The electrical infrastructure is mostly in place and the use as a wind farm is far less damaging to the environment than the current farming practices.
281	Object	On Holiday from UK and Spain. Frequent traveller to WA. Strongly object to inappropriate ill-thought out placement of Wind Turbines that affect the landscape and would deter me returning to this area. Green energy is the way ahead, but it cannot be excused for poor placement and without proper consultation with the local population.
282	Support	Wind as renewal alternative energy must be supported.
283	Object	Do not support this project , Visual pollution Disruption to farming practices In the long term do not believe renewables are the answer to our power and environmental problems
284	Object	The AMR planning scheme document states : Minimising Visibility: Development in areas of "Natural Landscape Significance" or along major tourist routes is mandated to be "visually inevident". This often means avoiding building on ridgelines (to prevent skylining) and requiring buildings to use non-reflective, muted materials that blend into the environment. I do not believe the proposed wind farm project will be “visually inevident” at its proposed location.

		If it were 20-30km further east, it might meet this criteria. I have no objection to wind power generation per se. However, the views to the east and north east of elevated areas of Augusta will be permanently changed if this project goes ahead as planned. People choose to live in Augusta because of the sense of beauty and peacefulness created by these views. Once this vista is spoiled by industrial scale wind turbines, Augusta will have lost this unique aspect of its character as an historic town. If I think about what makes Augusta so special, it's the feeling I get when I drive into town from the north and see the views across Hardy Inlet and out to Flinders Bay. When I sit at the Augusta Hotel or walk along the beach at Flinders, the feeling is the same. I strongly urge the AMR to request these issues be considered before allowing this project to proceed in its current location. There must be other locations that suit a wind farm and also preserve Augusta's unique natural visual landscape Kind regards Sue Knight
285	Object	I wish to lodge a formal objection to the proposed development of 20 wind turbine generators, each up to 250 metres in height, within the vicinity of Augusta and within 10 kilometres of my residence at 78 Albany Terrace, Augusta. The proposal represents a major industrial-scale development with long-term impacts on the unique environmental values, residential amenity, and community character of Augusta. After reviewing available project information, I have significant concerns that the development, in its current form, is unsuitable for this sensitive coastal and rural region. 1. Landscape and Visual Amenity – Incompatible With Augusta's Character Augusta is defined by its pristine coastal outlook, forested hillsides, and rural landscapes. Turbines up to 250 m in height would be visible from substantial distances, including residential areas, farmland, tourism outlooks, and public coastal viewpoints. Specific concerns include: Dominance of industrial-scale structures impacting the Cape Leeuwin and Flinders Bay visual corridor. Loss of Augusta's renowned low-impact coastal landscape, which is central to the town's identity, liveability, and tourism appeal. Night lighting and aviation beacons degrading dark sky values important for residents and astronomy-based tourism. Given the importance of scenic quality to the Shire's planning principles, this scale of development appears inconsistent with the region's landscape protection objectives. 2. Noise, Infrasound and Health Impacts Wind turbines of this height generate: -low-frequency noise -infrasound -amplitude modulation -night-time noise propagation enhanced by coastal temperature inversions Augusta's quiet residential environment means that even moderate turbine noise has disproportionate impact. There is no evidence the proposal has modelled:

		-worst-case meteorological conditions, -topographic reflection effects common in the Augusta hills, -coastal wind shear variability, or cumulative noise over time. This raises serious concerns regarding sleep, stress, wellbeing, and long-term amenity for nearby residents. 3. Shadow Flicker and Blade Glint Given the turbine height and the region's sun angles: shadow flicker may extend well beyond typical 1–3 km modelling thresholds, properties, roads, and rural dwellings may be intermittently exposed, blade reflections (glint) could affect residences and traffic during sunrise/sunset. The available documents do not show adequate shadow flicker mitigation or worst-case modelling. 4. Environmental and Wildlife Impacts – Critical in This Biodiversity Hotspot The Shire of Augusta–Margaret River is part of a globally recognised biodiversity hotspot. Concerns include: -risk to raptors, black cockatoos, migratory birds, and bats, -habitat disruption in a region already sensitive to fragmentation, -turbine-related mortality not adequately addressed, -insufficient baseline environmental surveys, -potential cumulative impacts with existing coastal and forestry pressures. Given WA's environmental constraints, this project warrants thorough independent ecological assessment before any approval is considered. 5. Increased Bushfire Risk Wind turbines of 250 m height introduce risks of: -mechanical failure, -transformer and nacelle fires, -lightning strikes, -blade throw during fire conditions. Emergency access during summer conditions is of particular concern in heavily vegetated areas around Augusta. Fire risk mitigation appears underdeveloped in the project documentation. 6. Negative Impact on Property Values A growing body of real estate evidence indicates that large wind farms can reduce residential and rural property values, particularly in areas reliant on scenery, lifestyle quality, and tourism appeal. As Augusta is a lifestyle, retirement, and tourism-supported economy, the negative economic impact on property owners deserves significant weight.

		7. Impacts on Aviation – Helicopters, Emergency Services, and Recreational Aircraft The Augusta area is serviced by: -RAC emergency helicopters, -firefighting aircraft, -recreational aviation activities. Turbines up to 250 m pose significant navigational and operational risks. The proponent documentation does not provide aviation safety modelling specific to Augusta's weather patterns and coastal fog conditions, which can require low-altitude operations. 8. Construction Impacts – Traffic, Roads, and Amenity Construction of turbines this size requires: -extreme oversize haulage, road widening, -major transport works on rural roads not designed for massive industrial vehicles, long-term dust, vibration, and noise impacts. These would impose substantial and prolonged disruption to the Augusta community without adequate demonstrated mitigation. 9. Inadequate Community Consultation The consultation process to date has been insufficient: -limited early notification to residents, -lack of accessible technical information, -absence of genuine engagement on alternative siting, turbine height reduction, or community concerns. Given the scale of this development, the community should have been more thoroughly involved from the outset. 10. Lack of Demonstrable Local Benefit The project provides minimal tangible benefit to Augusta: -no long-term employment or economic stimulus, -no guarantee of local power cost reductions, -no infrastructure investment tied specifically to community needs. The burdens appear to fall on locals, while most benefits accrue to the developer and external stakeholders. In conclusion; For the reasons outlined above — including landscape impact, amenity loss, environmental risk, bushfire concerns, aviation safety issues, construction disruption, and inadequate consultation — I respectfully request that the Shire of Augusta–Margaret River refuse the proposal or require substantial redesign and further assessment. Augusta is a unique coastal town with irreplaceable environmental, scenic, and community values. A development of this scale and industrial intensity is incompatible with the region and the expectations of its residents. Thank you for considering my objection.

286	Indifferent	Quite upset that there is to be no environmental study to be done for this proposed wind farm in Scott River. If were not to consider what potential damage to the environment and those who live this area maybe, how can this be a fair and reasonable process? It would appear the decision is already made to go ahead despite a lot of local objections. Which brings me to another alarming point that both reps from the shire which are meant to represent the whole of the community views are both pro wind farm Both Julia Jean Rice and Greg Bowland. This hardly seem fair when it's quite obvious there is quite a lot of local objections to the wind farm, at the very least they should have a voice at the table. I Know shire have no say if goes ahead or not. I think we should expect our Shirer to represent to the whole community and not just a section. Look forward to a reply
287	Object	As a geologist I am extremely concerned that the proposed wind farm will be using conventional foundations for its turbine towers rather than those employed in offshore developments. Tthis is in light of the experience gained from the failed sand mining attempt by BHP in the 1990's, the remediation of which tool almost 20 years at a cost not far short of a billion dollars in today's money. I am not convinced that similar consequences can be averted by heavy applications of lime in the excavation/dewatering operations. Under the circumstances I am amazed that the EPA has decided that they do not need to be involved in the approval process for this project. Despite the obvious attractions of this area for harvesting wind power, there are significant environmental risks.
288	Support	Disappointed that those opposing the wind farm are so vocal and disrespectful.
289	Object	I strongly oppose the Scott River Wind Farm. Inadequate Referral Assessments by SynergyRED and the severe risk to agriculture, environment, health, taxpayers and neighboring areas. Contamination: Cattle farmers are required to provide Vendor Declaration if wind or solar farms are on their property or neighboring (re fibre shedding from infrastructure). Other farming types will soon follow significantly effecting their income and operations. Contamination is a must disclosure for Rural sales of product & real estate. Synergy's claim is supported by a single study. Synergy have provided no biological impact studies concerning EMR, EMF, EMI, or PFAS blade pollution & shedding. Acid Sulphate Soils exist on the sites and this can't be ignored as not only a potential contaminant plus any dewatering like the failed neighbouring BHP mine, the location of transport of the soil spoil from infrastructure construction & Acid Sulphate Soils have corrosion on infrastructure once constructed. Left over contamination risks are real with real world examples of this let alone the neighbouring ex BHP mine. The 20 tests were dug to 2m in depth. This depth does not adequately reflect turbine foundation depth and the underlying Acid SS soils. Seriously, drill the sites for their footprint and required depth, not doing this with be inadequate let alone unprofessional. Imminent Environment Impact: Little info is given on bird-flight path assessment. True knowledge knows that there are many bird & bat species in the area & that most bird & bat movement occurs between 2.5hrs before last light & 2.5hrs after first light. No assessment has been done on indigenous Black-Swans or Baudin/Fire Tailed/Carnaby Cockatoos or local parrots or plovers, and they are crucial to this area. Full bird study data needs to be property & fully conducted & published. There is a vast ecology in the DCBA referred Scott River wetlands. Turbines risk this & increase to area risk with added Bushfire risk from turbines & the servicing of them. How can it be shown that costs to the wetland area and the water use are fully assessed? Human health & costs: Construction activities have a carbon cost to make, mix & transport vast amounts of concrete, then to build, ship, transport & construct the turbine themselves, plus the environment impact to the area & traffic due to all this. The assessment and the maintenance! Australia's Port Fairy wind farm was constructed 25yrs ago, now it's being decommissioned due to the costs for upgrades, is this not a lesson?!

		Synergy might have a decommissioning plan but what is the cost in time, in research, in consultation, in construction, in operation & in deconstruction, in money and to the environment let alone to the effected people, family & property along the way? There is no funded decommissioning plan or recycling strategy. Lets get real & make the environment assessment complete because costing it is part of it even though assessment of the people effect will most likely still be left out as it lacks measurability. Humas costs are noise (and not just those measured in decibels), visual, shadow flicker, farming contamination, residential/construction setbacks, mental health and loss of land value in the surrounding areas. These massive monoliths are seemingly without rules. There is no clear explanation of setback distances or how they were determined. Noise modelling lacks detail & independent verification, & shadow flicker & tonal noise impacts are not well addressed. These things could effect vegetation & animal growth & mating too with no research into these. The facts that Synergy disregards human-health impacts shows contempt for a full EPA assessment let alone that decarbonisation is even real by this project and others like it. Synergy is only using the science it wants and not inviting new science or conflicting views. Non-disclosure of Conflicts of Interest & failure of broader consultation including Indigenous consultation: 6 Stakeholder Organizations that participated in the 'In-Depth Interview' have financial interests in the project (Appendix-R, p68) and Community Engagement Failure with only 7 days to read and respond to 22 documents & over 3,000pages provided in the Oct 2025 EPA papers is ridiculous & legally appalling. There is a petition against this project with 1,377 signatures. Even Synergy's Corporate Strategic Pillars included Social Value commentary. 143 respondents shown with mixed views. Synergy is compromising their own policies given they are aware of opposition to this project & its also not declared the ownership of their proposed project if its 100% State owned or majority foreign owned through Bright Energy Investments and SynergyRED. Min information is provided on Heritage & Traditional Owner Engagement for heritage surveys or Traditional Owner involvement. Engagement lacking & its essential, especially in areas with cultural significance. There is a Heritage Act Breach. The Karri-Karrak are not the sole Indigenous stakeholder. Further to this, 4th & 5th generation farmers will feel indigenous to this broader area & have not been broadly consulted. Conclusion Synergy's feasibility study provides a surface overview only & lacks the rigour, transparency, & independent validation required to properly inform community therefore I don't support this. Key environmental including farming, heritage, & operational risks are not well reviewed at all in Synergy assessments, & community benefits are vague at best. The Synergy provided studies should have been better in the first place therefore its not genuine complete data. If you are the Peer review then fail this project. Clear commitments to holistic environmental protection & community equity is required. A full project life cycle analysis should have been prepared with results publicly presented. This is not a compatible nor warranted or wanted to Agriculture here either.
290	Object	This proposal should not proceed for the same reasons the Beenup Mine failed. That is highest risk for ground water disturbance/contamination and deleterious affects of acid soils runoff into the Scott and Blackwood Rivers and the Hardy Inlet.
291	Object	this renewable energy has a huge affect on landfill in the future. Damage to environment damage to wildlife, including birds noise to people living close by people need to reduce the amount of energy they use. Landfill it a huge problem
292	Object	I have serious concerns about the project. The towers are too tall and will be visible from many points along the Augusta coast. One of the advantages of the area are the incredible natural views looking east and south from the township.

		The location of the project is in an ecologically fragile area which should not be disturbed. There is now an abundance of information to suggest that wind turbines have a significant impact on the health and well being of humans and animals. They also create transport and disposal issues at the end of their life span. As the first leader of the Greens said recently- not all renewable projects are good projects. This is a prime example of a bad one.
293	Indifferent	While I strongly support renewable energy initiatives, this particular proposal raises serious environmental, community, and transparency concerns that make the site wholly inappropriate for such a project. 1. Threat to Native Birds and Wildlife The Scott River area is rich in biodiversity, providing essential habitat for numerous native and migratory birds and bat species. Large-scale wind turbines pose a well-documented risk to birds and bats through collision and displacement from key feeding and breeding grounds. These impacts would be especially harmful in this region, where many species already face mounting environmental pressures. The cumulative effect on the local ecosystem could be irreversible. 2. Damage to Sensitive Habitat and Acidic Soil The proposed site is known for its highly acidic soil composition, which is both environmentally fragile and difficult to rehabilitate once disturbed. Construction activities such as road building, excavation, and heavy machinery movement would permanently disrupt the soil structure and surrounding wetlands. The loss of native vegetation and changes to soil chemistry could severely impact the delicate ecological balance that defines the Scott River landscape. The Scott River Ironstone Association is one such fragile system. Two Landholders adjoining the proposed Wind Farm have sold their properties to Plantation Farmer Growers putting the Scott River in danger of monoculture and plantation fires thus putting the Scott National Park, Molloy Island and East Augusta at risk. 3. Fire Threat in a High-Risk Area Scott River is already classified as a high fire-risk zone. Introducing turbines and extensive electrical infrastructure into this environment significantly increases ignition risk, particularly through electrical faults or maintenance-related incidents in isolated areas. This represents a serious and ongoing hazard to local residents, wildlife, and emergency services — one that cannot be adequately mitigated given the terrain and distance from firefighting resources. 4. Impact on Augusta's Character and Tourism Appeal Augusta and the surrounding region thrive on their natural beauty and untouched landscapes — a cornerstone of the local tourism industry. The visual intrusion of large wind turbines would dramatically alter the skyline and diminish the area's sense of remoteness and tranquility, which visitors and residents alike deeply value. The long-term economic and cultural impact on Augusta as a tourism destination must not be underestimated. 5. Lack of Transparency and Conflicting Information from Synergy Perhaps most concerning is the lack of consistent and transparent communication from Synergy representatives. At various community drop-in sessions, different Synergy personnel provided conflicting statements regarding turbine placement, environmental impacts, and community benefits. This inconsistency has created confusion and distrust among residents. When public confidence is undermined, it becomes impossible for the community to meaningfully engage in the decision-making process.

		Such inconsistencies raise serious questions about whether Synergy has adequately assessed and disclosed the full environmental and social implications of the project.
294	Object	I am opposed to wind turbines in the Scott River area. The visibility of these turbines will be a blight on the area. The idea that wind turbines are a clean energy is incorrect and the disturbance to the natural world to erect them will impact the area negatively. Loss of habitats, noise pollution and the danger to migratory bird life are all concerns. Money is to be made by a few but locally the rural landscape will be forever altered.
295	Object	We are totally opposed to this hi risk "renewable energy" proposal. My husband and I brought a block of land in Kurdardup a couple of years ago with the intention of retiring down that way. We are absolutely disappointed with the AMR Shire with their slow response to community consultation on this proposal. My main concern is the environmental impact it will have on our pristine area. Why would you allow 250m turbines on a sensitive flood plain with acid sulfate soils and a shallow superficial aquifer? What of the risks to the surrounding farmland (cattle & crops) from dewatering and contamination of the dams, bores and drains. We are new to the area but like most of WA there is always bushfire risks particularly in the warmer months. There are no-fly zones around turbines which will affect aerial firefighting and in response to this, evacuation. My other concern is how will this affect our health. I do not want to be a guinea pig to this; seems Synergy RED has done little to ease my concerns on not just the audible noise but also infrasound. We may not be in close proximity to get the unfortunate shadow flicker effects, but it seems the Scott River community could quite possibly be. Unlike others that have already built in our lovely Kurdardup estate I have a choice to either stay or go. We are extremely disappointed with this proposal & the way Synergy RED has conducted the community consultations with very little information to ease our concerns. We are considering selling our piece of paradise as it will no longer be so if this project goes ahead.
296	Object	The impacts from the State and Federal government renewable energy projects threaten agriculture and nature in many of the same extractive ways of the industrial revolution. A Margaret River-urban based environmental movement supported by commercial energy developers have proposed the Scott River Windfarm project. They have turned a "Blind Eye" to this biodiversity-destroying project to meet renewable-energy and emissions-reduction targets. This has created tensions within our local community as affected ratepayers seek to defend their landscapes, property rights and rural lifestyles. Our family's appreciation of us and with over 50 years of living and farming on our rural property has been classified by the proponents of the Scott River Windfarm project in the Referral Document (RSD-Appendix S-Noise Input Assessment) as being R13. Our family are not only R13 but are the "Wrens", a family who with other like- minded families form part of the local community of "Alexandra Bridge". The site for proposed the Scott River Windfarm project sits adjacent to failed BHP mineral sand mine which closed in 1999. That BHP project was controversial when first raised to me, my family and the community in 1989 due to its size and location in an area highly valued for its natural assets. BHP couldn't contain the toxic reaction in the soil when they disturbed the soil below a certain depth. This environmental disaster cost the mining company $800 million dollars to clean up and is still under ongoing rehabilitation and monitoring to ensure the toxic sulphuric acid and heavy metals and arsenic do not leach into the nearby Scott River. "The legacy of the BHP Beenup Titanium Mineral Sands mine is evident… In some ways, it appears to have raised understanding of the natural values in the region. However, the short-lived mine has also created some skepticism that significant developments could have a greater impact than initially anticipated or shared by the developer," the attitudes survey by ID Consultants says There is a very high risk of Acid Sulphate Soils being created during and after the construction of the enormous wind turbines and what this will present to the sensitive waterways of the Scott and Blackwood River and farmland. The Scott River district is known for its high ecological value and is protected under the ENVIRONMENT PROTECTION AND BIODIVERSITY CONSERVATION ACT 1999 (Scott River Ironstone Association – Endangered Category) there is a high risk to endangered flora and fauna from wind turbine construction and operation. There are 26 fauna species listed as threatened, priority or

		under protection that occur within the Scott River catchment. The northern part of the Catchment provides more habitat for roosting and main channel for foraging. As a farmer and landowner living near the proposed wind farm, I have valid health concerns living near the 250m high wind turbines and my family could be exposed to noise, disturbance and the changes made by the industrialized development forever to our rural landscape. I request that you consider the rare and endangered wildlife, the rural landscape, nearby residents and the unique and sensitive environment when assessing the proposed Scott River Windfarm project.
297	Indifferent	Wind turbines are becoming common in nearly every westernised country around the world including Antarctica. I will be impaced visually by these from my house, but understand the need to improve electricity supply for the future. However, my concerns also relate to reliability as Augusta is already being impacted on a regular basis with outages and no details have been provided about whether having these in place, will minimise this for our town. Synergy have advised the residents that if this is approved they will be setting up a Community Fund of $100,000 annually. We have had promises like this in the past, but often it never actually occurs. How can Synergy be forced to proceed with that promise when I do not think it has been included in their submission. Overall, the consultation has answered a lot of my questions, but have concerns of 'end of life' planning when I have just read that the Albany wind farm is now at 'end of life' and discussions on its future are only just beginning. Just like in mining, Synergy should already have an 'end of life' plan in place which is adapted regularly to ensure it is still relevant.
298	Object	As a resident of Augusta, the proposal to construct a large-scale wind farm on the Scott River raises profound concerns about environmental stewardship, community wellbeing, and the long-term character of the region. While renewable energy development is a critical national priority, not every site is appropriate—and the Scott River and nearby Flinders Bay illustrate exactly where the balance tips sharply against industrialisation. The most immediate and unavoidable issue is the visual impact of turbines that would rise to approximately 250 metres! Structures of that magnitude would dominate the landscape, transforming what is currently a largely untouched natural environment into an industrial skyline. The Scott River region is prized for its tranquillity, forested horizons, and the sense of isolation that makes it special. Turbines of this scale would be visible from great distances, altering sightlines not only along the river but also from surrounding rural properties, tourism viewpoints, and public conservation areas. The argument that people “get used to” turbines dramatically underestimates the significance of a visual intrusion of this magnitude. Once erected, the character of the region is changed permanently—and not for the better. This inevitably leads to another serious concern: devaluation of local property values. Numerous studies, both in Australia and abroad, indicate that proximity to tall turbines can reduce property desirability and long-term market value. Buyers seeking rural or semi-wild settings do not expect to live next to moving industrial towers with flashing lights, shadow flicker, and constant low-frequency sound. For many landowners, their property is their major lifetime investment. Asking them to absorb an economic loss raises fundamental questions of fairness. Even more troubling is the potential impact on the abundant local birdlife and especially the whales that have for countless generations relied on Flinders Bay as a migration rest point and calving area. Although the proposed turbines would be land-based, their proximity to the bay and the documented ability of low-frequency emissions to travel over long distances raise legitimate concerns. Whales are highly sensitive to low-frequency noise, using similar ranges for navigation, communication, and mother-calf bonding. Disturbance in this

		frequency band can cause stress, behavioural changes, and displacement from critical habitat. It is difficult to reconcile the precautionary principle with a development that introduces large-scale, persistent low-frequency noise so close to an established whale hotspot. Finally, there is the question of community benefit—or the lack thereof. Too often, regional communities are asked to shoulder the environmental, visual, and economic burdens of large energy projects while receiving only token contributions in return. If developers insist this project is in the public interest, they must articulate clearly how the local public is to be directly compensated. Will there be significant reductions in electricity costs for residents? Will there be revenue-sharing arrangements principally for the Augusta community as the district most directly affected? Without robust, transparent, and enforceable mechanisms for community benefit, support for the project is not just unlikely but unreasonable. What's more, Synergy has given no reassurance that this is a finite number of turbines, nor has the WA government guaranteed that the project will not be transformed into a joint-venture or wholly on sold to a private investor fund, specifically Bright Energy Investments (BEI) with whom it has historically passed over many of its existing wind farm projects. As of now, there is to be no public record of a finalised ownership or investment structure (e.g., joint-venture, private investor fund, community-owned model, etc.) for Scott River and because many details remain 'commercial-in-confidence', it's not yet possible to definitively say exactly how profits will be split. Ultimately it appears to me that the Scott River wind farm proposal risks sacrificing the region's natural identity, property values, and marine ecology for benefits that may never flow directly to the very community asked to bear the cost. Environmental responsibility requires more than building turbines—it requires placing them where they truly belong, in close proximity to areas already zoned for the purpose of industrial development. Thank you for your consideration in this matter.
299	Object	No to wind farms
300	Indifferent	I object to the view of the proposed wind farm creating an industrial look amongst the beautiful natural scenery. I object to the proposed wind farm in relation to environmental factors that may relate or be impacted by the equipment should it deteriorate over time. I object to the proposed wind farm should it cause health issues or noise that may affect humans or animals. I do not know enough positive and realistic information and evidence about wind farms. I do support renewable energy that fits the above mentioned points and perhaps wind farms in areas that are not impacted by the above mentioned factors.
301	Object	Great risks of fire. And fighting fires as water bombers cannot operate. Health of wildlife, stock and humans from blades, infrasound and noise. This beautiful, quite, hugly productive Scott River area will be turned in to ugly industrial zone. Disturbance the acid soils will ruin the Scott River area and beyond.
302	Object	It will be an eye sore. Fire risk Long term lease, no flexibility if circumstances change

		The benefit will only benefit a few people, will making a lot peoples life unpleasant Little or no jobs for local people
303	Object	I have concerns about the visual, noise and environmental pollution of this project. It's one of our most beautiful tourist locations in the state, where people come to see the stunning views and the natural beauty of this area. We have primary producers, wineries and people just wanting a quieter way of life. What is also concerning is the reports of asbestos being found in wind farms already established, I'm wondering what guarantees will be given to prevent this from happening in the future, spreading into our beautiful waterways and land. Might be better suited to Cottesloe Beach, or Mr Cooks backyard.
304	Object	I object most strongly to the proposed wind farm development. The proposed wind farm is only 5km from Molloy Island. The population of the island will be subject to the audible pulsating disturbance of the turbines from the turbulence they cause to the normally laminar airflow. This pulsation is a known cause of detrimental health effects on humans. It is the unchanging regularity of the pulsations, not the level of their audibility, which causes health problems. The pulsations are actually surges in air pressure which upset the balance mechanism in the inner ear. In the case of both Molloy Island and Augusta, the location of the turbines directly to the east is an exacerbating factor. The direction of prevailing winds for a major part of the year, and particularly overnight, is directly from the east. Night time is the time when the environment is normally the quietest and the time for sleeping. Sleep is essential for good health. The pulsing of the wind turbines will be most pronounced overnight at exactly the time when peace and quiet is most needed for healthy sleep. Furthermore, the area where the wind farm development is proposed includes both widespread and concentrated areas of Acid Sulphate Soils. When left undisturbed in their natural state, these soils are effectively benign and do not cause any problems to the environment. However once disturbed and exposed to normal atmospheric oxygen, they produce sulphuric acid which is highly toxic not only to local flora and fauna, but can cause much wider uncontrollable and permanent damage once it enters waterways such as the nearby Scott and Blackwood Rivers. The Scott River flows through the Scott National Park and confluences with the Blackwood River at Molloy Island. The former BHP Beenup Mineral Sands Mine project, which is nearby to the proposed wind farm, failed in its development stage as a direct result of sulphuric acid contamination caused by the disturbance of acid sulphate soils. Despite millions of dollars and many years spent by BHP trying to contain the problem sufficiently to make the mine viable, the project was eventually and unavoidably discontinued. BHP then spent many more tens of millions of dollars and more than 20 years to rehabilitate the affected area. A major part of the expense was on preventing an acid sulphate plume from spreading to the Scott and Blackwood Rivers. The experience of BHP so close by in the same type of soil cannot be dismissed as irrelevant. Although this current period for public submissions might be seen as an attempt at consultation, it is in reality little more than a poorly implemented public opinion poll. Instead, a thorough and exhaustive Public Environmental Assessment, at the very least, is warranted. Rushing this proposal past the eyes of the public with an obscenely short consultation period is not the way a responsible community would mistreat and disrespect its precious environment and certainly not the rights of people to a healthy, peaceful existence. I object strongly to the proposed wind farm development.

305	Object	I object very strongly to the proposed development. The level of objection to this proposal must not be assessed simply on the number of objections. That would be totally misleading given the low number of properties within the area affected by the proposed development. The true degree of public objection must be based on the proportion of the submissions which are in objection. I am a retired professional Civil Engineer with over 45 years' experience in planning, designing and construction of major infrastructure with the Water Corporation of WA, including earth fill dams, water supply and wastewater tunnels and pipelines, as well as service reservoirs, high level water towers and similar water services infrastructure. I bring that experience to my objections to the proposed development. My objection is based on three main points DAMAGE TO THE NATURAL ENVIRONMENT HEALTH DETRIMENTS TO NEARBY RESIDENTS, and NEED FOR COMPLETE PUBLIC ENVIRONMENTAL ASSESSMENT 1. DAMAGE TO THE NATURAL ENVIRONMENT The area where the wind farm development is proposed includes both widespread and concentrated areas of Acid Sulphate Soils. When left undisturbed in their natural state, these soils are effectively benign and do not cause any problems to the environment. However once disturbed and exposed to normal atmospheric oxygen, they produce sulphuric acid which is highly toxic not only to local flora and fauna, but can cause much wider uncontrollable and permanent damage once it enters waterways such as the nearby Scott and Blackwood Rivers. The Scott River flows through the Scott National Park and confluences with the Blackwood River at Molloy Island. The former BHP Beenup Mineral Sands Mine project, which is nearby to the proposed wind farm, failed in its development stage as a direct result of sulphuric acid contamination caused by the disturbance of acid sulphate soils. Despite millions of dollars and many years spent by BHP trying to contain the problem sufficiently to make the mine viable, the project was eventually and unavoidably discontinued. BHP then spent many more tens of millions of dollars and more than 20 years to rehabilitate the affected area. A major part of the expense was on preventing an acid sulphate plume from spreading to the Scott and Blackwood Rivers. In my experience as a 45-year career Civil/Structural and Hydraulic Engineer with the Water Corporation of WA, acid sulphate soils are an absolute red flag to disturbance by development. If detected on a planned infrastructure development site where excavation is unavoidable, the solution often is to construct a barrier to depth around the area to be disturbed before removing the acid sulphate soil from within the barrier and from site, backfilling with clean sand, compacting and then proceeding. Acid sulphate soils are by no means a minor risk at the proposed wind farm. The experience of BHP so close by in the same type of soil cannot be dismissed as irrelevant. 2. HEALTH DETRIMENTS TO NEARBY RESIDENTS The proposed wind farm is only 5km from Molloy Island. The population of the island will be subject to the audible pulsating disturbance of the turbines from the turbulence they cause to the normally laminar airflow. This pulsation is a known cause of detrimental health effects on humans. It is the unchanging regularity of the pulsations, not the level of their audibility, which causes health problems. The pulsations are actually surges in air pressure which upset the balance mechanism in the inner ear. In the case of both Molloy Island and Augusta, the location of the turbines directly to the east is an exacerbating factor. The direction of prevailing winds for a major part of the year, and particularly overnight, is directly from the east. Night time is the time when the environment is normally the quietest and the time for sleeping. Sleep is essential for good health. The pulsing of the wind turbines will be

		most pronounced overnight at exactly the time when peace and quiet is most needed for healthy sleep. 3. NEED FOR COMPLETE PUBLIC ENVIRONMENTAL ASSESSMENT Although this period for public submissions might be seen as an attempt at consultation, it is in reality little more than a poorly implemented public opinion poll. Instead, a thorough and exhaustive Public Environmental Assessmentm, at the very least, is warranted. Rushing this proposal past the eyes of the public with an obscenely short consultation period is not the way a responsible community would mistreat and disrespect its precious environment and certainly not the rights of people to a healthy, peaceful existence. The approach being used appears to have a mercenary intent. There may be some few merits in increased use of wind energy but it most certainly must not be at any cost and even less so at an unknown cost and risk. IN CONCLUSION I object in the strongest terms to the proposed wind farm development. At the very least, a Public Environmental Assessment is essential in this case, even if other objections are overlooked.
306	Support	The dreaful overpopulation of Australia and the Shire requires additional power. The alternative to renewables is to burn fossil fuel or gererate nuclear power, none of which will be palatable in the Shire. Objecting to the wind farm equates to being a NIMBY (Not In My Back Yard). The current hysteria over the proposal verges on insane, focussing on just one aspect of overpopulation. Examples of objections being voiced on Molloy Island include: • Noise from the wind turbines: if you can hear them over the chain saws and leaf blowers • Birds will be killed: how many dead birds are seen on our roads, yet we don't stop driving • The turbine blades will be visible: houses on Molooy Island are visible, but we don't object to houses being built. The proposed development has merit, as long as proper environmental controls are implemented during construction: especially prevention of acid sulphate soils contamination to the river systems.
307	Object	
308	Support	As an owner of properties in Augusta and Kudardup, I am strongly in favour of the proposed development. WA needs at least ten projects on this scale to make a dent in its night-time burning of coal and gas; most of those can be further north, but those can only be built as fast as the transmission network can be extended northward to reach them. In the meantime, we need to make a start where we can.
309	Object	The Hutton family purchased lot 4157 Governor Broome Rd Scott River in 1972. We then purchased the neighbouring property, Lot 2, in 2019. And have farmed the land from this date. At no time did the AMR shire approach land owners, other than those land owners who had signed land access agreements in 2017/2018, and disclosed the intent of the AMR Shire which was to endorse the AMRCCE to lead the development of a large scale renewable energy facility in the region. The publicly available evidence shows the intent of the AMR Shire Council. A number of Councillors, vice & presidents held positions on the AMR shire and the AMRCCE concurrently including Chair and vice chair. 2017 to 2025 Local Energy Action Plan 2018: OCM 28th June: Shire Council fund, support and explicitly endorse AMRCCE as a strategic delivery partner (“vehicle for achieving Council’s LEAP”) - only 42 days after AMRCCE incorporated [OM2017/150]. AMRCCE Affiliates in Shire: 3-out-of-7 Councillors are AMRCCE members..

		We were first made aware of the proposed Scott River wind farm when we were approached to be a project host by Synergy representative Rowan Gallagher in November 2022. As stated in a 2017 report penned by then Chairperson of AMR community energy project working group created by Shire in 2016 : The extent of AMR Clean Community Energy's shareholding in the ultimate entity will depend upon the negotiated value placed upon the assets created by AMR Clean community energy and offered to the entity that will ultimately own and operate the Renewable Energy facility. The aim is that AMR Clean community energy will become one of the 20,000 social enterprises in Australia, most of which are owned by not-for-profits, that are self sustainable and use their income generating activities to benefit their communities.... How did AMRCCE generate income? (other than Council funding & donations)? By oppertunistically selling assets obtained by AMRCCE including wind data obtained from other potential developers and land access relationships. In doing so, subjecting the local community and neighbouring land owners to years of uncertainty, conflict and high risk. ie throwing the local people under the bus. The AMR shire and the AMRCCE have sold us out. After seeking legal advice we refused to host turbines or sign a neighbour agreement. The uncertainty & concern we voiced on a number of occasions to the Synergy reps regarding not only the detrimental impacts on our business, but the potential impacts on our land and environment caused by industrial scale wind turbines. These concerns are reflected in the opaque nature of the Synergy DA to EPA. Acid sulphate soil contamination not only in the waterways of the wetland environment, but lateral movement of the acid pyrites through the soil profile. Our property is/was directly downstream of the project site. Damage to pressurised surface aquifers effecting water tables and the ironstone community. Noise, vibration, infrasound and EMF. Survival birds and bats, including but not limited to thousands of migratory black swans which have inhabited both host and neighbouring properties... The use of our land as project buffer - regardless of signing a neighbour agreement. Dictating to us where we could build our family homes on the property. Risk created by blades shedding carbon fibre, turbine fires and health risks to animals..... All responses to our concerns were either denied or we were given "settled science" to read.....This then makes one question the authenticity of the intent behind this proposal... dismissing genuine health concerns eg Infrasound as 'Nocebo' enables these projects to proceed. If renewable industry proponents were forced to acknowledge the human, animal and environmental damage & death caused large scale renewable projects, they would simply not get Approval. We were forced to sell our farm due to the financial uncertainty that has accompanied the Scott River turbine project.
310	Object	This proposed wind factory for the Scott River is extremely unsuitable. What it has done is divide the community. It appears that the majority of those that support this dont live anywhere near the site and live in a suburban setting with no regard for environmental impact. And yet those opposing this know full well what detrimental effects the wind turbines will present. There will be a huge impact on the fragile Scott River ecosystem. The laying of huge concrete support for each of these turbines will impact on the acidic sulphate soils sending further to the destruction of the diverse flora and fauna that exists in this pristine area. There is very little trust in the company, that it will return the site to it's original state if decommissioned, which it will be because all over Australia and world wide, people are waking up to the inefficiency of wind turbines. They only produce intermittent and variable energy and definitely not on demand. Battery storage is not solved for a growing demand. Vesta-Synergy RED's preferred supplier for the Scott River wind factory has been named in the national asbestos scandal. Synergy RED and Vesta need to be open and put their full supply chain on the table, every component, every supplier, every safety check. Prove that it complies with Australian law. If this proposed goes ahead, on completion, those that inhabit the surrounds will be subjected to excessive noise, infra sound, EMF, BPA,

		PFAS, Cadium and Asbestos. The cost of a wind farm is never reported in the promotion but hidden away in the contract. It threatens bio diversity, selling a vision in which all the faults are hidden, more marketing then science. The value of properties in this area will go down. Coal produced energy is far more efficient and reliable. Stop making this a political issue and return us to a productive industrial and farming community.
311	Object	Subject: Submission Regarding Proposed Wind Farm Development I appreciate the opportunity to provide feedback on the proposed wind farm development in Scott River. While we acknowledge the importance of renewable energy initiatives, we have significant concerns regarding the adequacy of the submission and the potential impacts on the local environment, community, and our property. 1. Overall Concerns The submission does not sufficiently address key issues, and several reports rely heavily on desktop studies rather than comprehensive field investigations. This approach raises serious questions about the accuracy and reliability of the findings, particularly in areas such as geotechnical assessments, which are based on a limited number of test sites. 2. Social and Economic Impact The proposal offers minimal economic or social benefit to the Scott River community, aside from a few landowners hosting turbines. The consultation process has not adequately engaged affected residents, resulting in a polarized community. The referenced 'Way of Life' study does not reflect the views of many landholders within the area. 3. Environmental Impact • Flora and Fauna: The assessment lacks sufficient detail due to limited fieldwork. Birdlife is likely to be significantly impacted by turbine strikes. Surveys were conducted within the development envelope over a short timeframe, which does not provide a representative view of biodiversity. • Fire Risk: Wind turbines pose a fire hazard. The submission lacks clear mitigation strategies and compensation measures for potential fire damage to adjacent properties. • Greenhouse Gas Assessment: The estimates for supply and construction phases appear understated and rely on theoretical assumptions rather than confirmed turbine specifications. 4. Visual and Acoustic Impact • Visual Impact: The windfarm does not enhance the visual landscape in any way and will be prominent from many locations in the district. The wind turbines proposed are of an industrial scale and not suited for this sensitive environment The proposed turbine height of 250m is disproportionate and incompatible with the sensitive landscape. The turbines should not be higher than 140m, consistent with most other Australian wind farms. 5. Acoustic impact • Significant concerns over Noise, vibration, infrasound, and flicker impacts on health and well being of people in the vicinity of the wind turbines 6. Groundwater and Acid Sulphate Soils Everyone is aware that Scott River area is highly sensitive to acid sulphate soils and groundwater management. The geotechnical report

		indicates significant dewatering at turbine sites, posing risks to the environment and our property. Independent evaluation of these issues is essential. This is a significant risk in this region and needs to be further evaluated by parties independent of this approval. We note from the geotechnical report that borehole WM02 on the block adjacent has an extreme reaction when checking for acid sulphates at a depth of 3.5m. which is extremely close to our boundary and is a major concern. 7. Construction Phase The project will require substantial raw materials, likely sourced from the adjacent gravel pit, which has previously breached operational conditions. We have serious concerns about compliance and enforcement during construction. 8. Fire Risk The project does pose a degree of fire risk to the area and given that the operation of the turbines will be undertaken remotely we are concerned that fires will be identified too late and become uncontrollable with consequences to properties and residents in the area 9. Impact on Our Property We hold a Development Approval for three chalets near Coostien Road and plan to commence construction in early 2026. Four turbines are proposed within 1.5 km of this development, yet the submission does not consider the impact on our tourism venture. We seek assurances that: • Noise: The noise impact assessment does not include our planned chalets. The area is currently very quiet (we are able to hear the ocean which is 5km from our property in the evening), and continuous turbine operation will significantly alter this environment. We request assurances that noise levels will comply with WA EPA Noise Regulations 1997. The windfarm DA Submission states that the internal noise levels of a property will not exceed 30dba in the evenings and 45dba externally. If this development proceeds we would expect that a noise-sensitive receptor be installed near our chalets to trigger turbine shutdown if limits are exceeded. • Infrasound has not been assessed and must be evaluated to ensure no detrimental effects to humans. • No vibration impacts from the wind turbines have been included in the DA Submission and that these will be addressed • Shadow Flicker: Compliance with national guidelines must be confirmed, and our chalets should be included in the analysis. • Any future expansion of chalets or additional uses we may wish to proceed with on our land will not be restricted by wind farm operations. 8. Other Considerations The wind farm will likely reduce the value of our property and the viability of our tourism business. Despite this, we intend to proceed with development and subject to the final outcome use the chalets as a case study of tourism coexisting (or not) with large-scale wind farms in an ecologically sensitive area. 9. What we would like to see • Comprehensive environmental and social studies with meaningful community engagement. • Independent assessment of groundwater and acid sulphate soil risks. • Inclusion of chalets on our property in all impact assessments. • Conditions to ensure compliance with noise, flicker, and vibration standards. • A maximum blade height of 140m. • The Shire to ensure compliance with all relevant codes/legislation and standards and accept that the Synergy submission requires to be further detailed and challenged for accuracy and completeness. This was certainly not the case with the gravel pit on Gov Broome Road as the detail in the Gravel pit submission was never adequately checked for accuracy. Also the commitments made by the operator in

		their submission/ approved BL are not being adhered to. Thank you for considering our submission. We look forward to your response and to working collaboratively to ensure that if any development proceeds it is undertaken responsibly and with due regard for the Scott River community and environment.
312	Object	This proposed wind farm situation is forcing a clash between renewables and tourism! It should never be sited near an incredibly popular laid back tourist town of Augusta. It has and will divide the community! It should never be located on top of poor farmers in one of the states most productive agricultural regions. The WA coastline is massive and a better site should have been chosen. I personally will avoid looking at them when in Augusta as they are ugly and annoying. Frankly placing them there is criminal arrogance. Property prices will plunge and someone is going to be sued! I feel extremely sorry for all those residents who have to live next to these monsters and have to look at them daily. In most other states they have been located far away from populated areas in remote locations. It seems like in WA it doesn't matter who suffers as the$ rules under the disguise of renewables!!!
313	Support	
314	Object	I am apposed to the wind farm in Scott river , near crown land .. because the 250 m turbines need to be processed , and the energy to :dispose of the wastes may exceed the benefits!! I am concerned about asbestos and problems with environmental impact .please don't rush ,- this is a huge project with huge impacts and honestly need to be carefully investigated.. This will impact the reputation of the Augusta -Margaret river region as a premier international destination for tourism , farming cropping and it needs to seriously be considered, as once taken away or contaminated- it will : not be "energy -efficient "to recover. I am considered the risks of decontamination and dewatering of dams , bores and drains .. The 250 m turbines upon a sensitive floodplain with acid sulfate soils with a shallow aquifer. The firefighting difficulties , evacuation and no fly zones above the turbines . Concerned about noise, infrasound and shadow flicker from turbines that may be too close to homes and boundaries. I have moved to Augusta for the serenity and natural landscape , tranquility and am concerned about the wind turbines effect (as may be visible / noticeable from multiple points in around town) on my and many others' mental health .Artists will not choose the area and the impact may be felt in the Margaret river open studios art trails which has generated income , work for both cultural and entertainment venues, culinary and organic food.. (impact of , beef and greenery) Scott river being changed from a food bowl to an industrial power zone ; having irrevocable consequences on the surrounding region… the proximity to the natural resources is what concerns me.. is there not a location somewhat further from the natural resources . and less populated area .. ? I am concerned about the transparency of the application process for these turbines.- .. please can we have more open discussion forums . What about the wildlife impact? Bats , birdlife native..)
315	Object	Will destroy the character of the town and all properties on Turner street. Severely impacting property values as the negative effects on the environment, bird life, eyesore. Will impact tourism and the towns economy as the majority of the town will look over this eyesore. People leave concrete jungles to embrace nature - just to face unsightly structures build in / on environmental sensitivity area with some of the last natural areas and views left in WA. This process and approvals is a disgrace! I strongly object against approval of this project!

316	Object	environmental concerns negative visual impact from our property reduced property issues for nearby land owners
317	Object	negative visual impact on our coastal town negative impact on our property value environmental concerns
318	Object	I am strongly opposed to the Scott River Wind Farm project for the following reasons. - The site is on sensitive flood plains in a biodiversity hotspot which will no doubt have a detrimental effect on the plants and animals. - The bushfire risk and no fly zones is so dangerous in an area that is neighbouring essential primary producers and close to increasingly populated areas including the new Karridale and Kudardup residential subdivisions. - The wind farms will take away from the natural/ untouched views which bring so many tourists to the area each year. The untouched beauty of Augusta is what makes it so special. Seeing 250m high wind turbines from Flinders Bay and the Augusta hotel will be such an eyesore and a terrible shame.
319	Object	Although generally in favour of renewable energy projects, I have some objections and concerns regarding the Scott River proposal. 1. The height of the towers at 250 metres is out of place with the general skyline of the local environment. At about 5 times the height of the Cape Leeuwin lighthouse, the wind turbines would reduce the amenity of views for local residents and visitors to the area. 2. The area in question has an important aquifer and the deep foundations required for the turbine towers may impact the water supply as experienced with the BHP mineral sands mine (now closed). 3. Will the existing powerline network have the capacity to carry the electricity generated? If additions to the network are required in the future, then, there is likely to be significant clearing. 4. Currently, the area concerned is, generally, productive rural land. Will the location of the turbines reduce the area for primary production activities?
320	Support	I support a move away from fossil fuels and this part of the country has an abundance of wind . This makes sense to capture this for the future move to away from coal fire power stations. I do not consider them to be an eyesore as they have been used all over the country without any detrimental effect
321	Support	
322	Object	i am in opposition to this developement. destroying nature to save the environment is non-sensical wind farms have a massive environmental 'footprint' the vested interests in this are obvious, including the bias on the local councils behalf once again we will see big business move in on local community and do as they please psm.
323	Object	I’m concerned my health quill be effected

324	Object	There is enough peer reviewed papers suggesting health risks are associated with industrial wind turbines.
325	Object	I do not support the proposed wind farm in our shire. It is not wanted by the community, and proceeding with it would be a waste of time, resources, and ratepayers' money. The community has already indicated clearly that there is no support for wind farm development in this area. Projects like this are being pushed despite consistent local feedback. The proposal does not reflect our community's priorities, and it risks creating unnecessary division and expense for no genuine benefit to residents. Council resources should be directed toward projects that have real support and clear value for the people who live here.
326	Object	Wrong project for the wrong reasons: Disadvantages: 1) no jobs beyond unskilled for land clearance/concrete foundation pouring; materials/equipment imported and transported by 'oversize road trains' to site. Construction and infrequent maintenance will be undertaken by itinerant labour; operations will be remote. 2) Unpredictable intermittent power generation supply: hence, cannot displace baseload power generation. It is an ineffective project if Synergy are trying to displace power generated by fossil fuels. 3) Reliant on this type of project will create an increase in the frequency of spikes in demand above supply, which firstly increases power generation unit costs as a result of inequality of supply vs demand and secondly will lead to load shedding, brown-outs and black-outs particularly at edge of grid : i.e. AMR shire (similar to any regional/centralised edge of grid areas, for example within countries such as northern Norway and Canada). 4) Significant positive carbon footprint (not a good outcome): planting trees elsewhere is unfortunately greenwashing. No ability for recycling materials; for example, used turbine blades are shredded and end up in landfill. The project proponents cannot take credit for displacing any existing baseload power generated by fossil fuels. 5) Low plant availability: infrequent availability of power generated when required by the grid: majority of times either power generation is available, but demand is not required, or when demand is required, generation is not feasible due to lack of wind. 6) Major negative impact from loss of farmland and local biodiversity. 7) Project economics will always need to rely upon an assured revenue stream to calculate the NPV and reach financial closure. Upside from any unknown quantity of intermittent power supply cannot be credibly taken up in the economic viability assessment. This is being particularly so, if the project proponents are looking to farm down their investment at some point in the future. Hence economics will rely upon an artificially high annual installation tariff. The taxpayer will be paying for the wind farm through increased electricity bills, to compensate for the frequent periods when the facility is idle/off load. 8)AMR Shire should be across the ranking of this project against all other options to meet the regional forecast power generation demand curve, whilst phasing in a manageable way, the reduced reliance upon baseload power generated by fossil fuels. For example three alternatives provide greater long term economic and environmental benefits to our community: A) Questions remain as to why are Synergy not promoting further the greatest impact to increasing power generation though their 'Project Symphony' program: why is this roof top integrated solar power project, potentially from Mandurah to Joondalup not being implemented as a priority when the benefits clearly outweigh any land base wind farm. B) Greater long-term planning and implementation of multiple interconnected decentralised power generation, transmission and distribution networks will afford greater alignment to the community needs. C) Thirdly offshore wind farms also better address the power generation unpredictability factor, through access to less turbulent/ more laminar wind flow. Short-term increased capex considerations associated with shallow water installation (as opposed to land installation), should not override the

		permanency of land damage through unnecessary land clearing for onshore operations, simply because BHP previously laid a power cable nearby. 9) In summary AMR should push back on accepting a project in the Shire that has no discernible benefits and major disadvantages and seek to work with Synergy to implement only those projects that generate long term real benefit for our community. Simply labelling this project as a renewable project is disheartening when it clearly has a major carbon footprint and does not discernibly address the ability to withdraw the reliance upon fossil fuel generated power.
327	Object	It costs more to the enviroment to make wind turbines than they use
328	Object	I strongly disagree to this absolute scam/hoax and believe it will have such a negative impact on our community, water ways, farm land, nearby farm animals.
329	Support	I support renewable energy generation over burning coal or nuclear power generation. Most important we get on target before all the obvious signs of extreme bush fires, destructive winds, rain and rising sea state engulf our world. I and many in the community would like to see an impact study on mostly how the environment will be affected, both fauna and flora. How it will affect local businesses and communities during construction and period of operation.
330	Object	The Scott River is not a suitable or sustainable location for a wind farm. The acid sulphate soils, if disturbed, have potential to dramatically damage the Scott and Blackwood rivers. Should hydrological changes be put in place to prevent leaching of acid sulphate soils there is a significant risk of damaging threatened flora such as Darwinia ferricola (endangered), Grevillea manglesioides subsp. ferricola (priority 3), Lambertia subsp. Scott River Plains (endangered) and Melaleuca subsp. Gingilup (priority 2). The increased traffic that would accompany this project would also greatly increase the risk of Dieback (Phytophthora) introduction and weed introduction. The Scott River area is currently subject to Environmental Protection and Biodiversity Conservation Act which in itself should prove this area is not suitable. Many unique Ecological Communities are at significant risk of damage from this proposal. The visual pollution from this proposal is also significant. The visual landscape will be changed forever with the introduction of the wind farm and its effects will be greatly felt by the residents of Augusta. Our beautiful natural environment and landscape should not be destroyed by the permanent, man made, visual and auditory pollution these structures would bring. How will fire within this site be managed? Wind turbines are a structure, this and the Hazmat they present would mean local Bushfire Brigades are unable to assist directly with fires involving the turbines. The closest VOLUNTEER Fire and Rescue Brigade is over 35 minutes drive away plus mobilisation time. At every angle the risks of this proposal are not worth any possible minuscule gain. I implore the Augusta Margaret River Shire to oppose the Scott River wind farm proposal. Please keep my name confidential as this is a very emotive subject within our community

331	Support	I support the proposal as I would like to be using wind power generated electricity in my home, rather than that produced by fossil fuels that climate change worse. However I only give my support for a facility that minimises any clearing of native vegetation, and doesn't adversely impact local native endangered flora and fauna.
332	Object	Acid sulphate soil disturbed during construction leaching into Scott River,, Blackwood. I use both.
333	Support	Like the idea, should have provision for battery storage
334	Object	I will be able to see the turbines from my house. presently all I see is green bushland and that is the way it should stay. Wind farms should be placed in already visually polluted areas such as existing industrial areas. I'm also not convinced of the long term viability of wind farms given there relatively short life spans.
335	Object	What a blight to this beautiful area. We should enhance our beauty and protect our wildlife with every ounce of our being. I do not want to live in the line of this ugliness & believe it will not only affect the residents but could also impact the value of my property and all surrounding properties into the future. Clearing of 1 ha of native bush - how many animals will be displaced & eco systems destroyed. No more clearing of any land should be allowed no matter the reason. We need to stand up for those who can not speak for themselves, the small creatures, the birds, the insects - they all matter. I SAY NO TO THE WINFARM lets keep Augusta Margaret River pristine for the future.
336	Support	I don't live in Scott River and the proposed wind farm doesn't affect me directly, but I support renewable energy generally. I am concerned that climate change will have devastating impacts on everyone, so everything possible should be done to reduce the impacts of fossil fuels. If I lived in Scott River, and the wind farm proposal was next door, I would still support it.
337	Support	I hear y support the installation of up to 20 WTG's in the proposed location
338	Object	Policy must be relevant to modern sizes of turbines and projects. Buffer zones shouldn't be absorbed by neighbouring properties and host properties should br large enough to absorb appropriate setbacks to dwellings and boundaries. Independent environment impact studies should be at the forefront to accurately assess risk VS benefit and identify high risk floodways and water catchments. Decommissioning liability needs to be clearly established and cumulative impact disclosed.
339	Object	Sensitive ecosystem with high risk acid sulphate soils. High potential to contaminated water ways and aquifer affecting diverse flora and fauna in and around river catchment. Lot Holdings are too small for such a large scale industrial project. I am highly concerned about the vibration, infrasound and noise pollution. Increased fire risk with limited defence capacity due to no-fly zone.
340	Support	Very much in favour of a renewable energy transition away from fossil fuels and therefore very supportive of this proposal. I strongly support this being done with the least impact on the local environment, in particular any impact resulting in loss of habitat for local fauna and flora as well as any adverse impact on areas of cultural significance.
341	Object	
342	Object	Reasons for Objection below Community: If the shire supports this DAP application it would present as a classic case of the AMSRC favouring one cohort of rate payers over another. The proposed wind farm will be an absolute eye sore degrading the natural beauty of the Augusta region and town vista, and will erode or supress real estate values. The Augusta rate payers would wear this decision and vandalism solely and in full (in disproportion to

		the wider shire rate payer base) and in doing so would rightly have a case to pursue damages. Should this DAP application be approved our household will be one of what is a growing number of rate payers in the Augusta region that are now committed to contributing to funding to take every legal avenue available to us to overturn, delay and/or frustrate the development process for as long as possible. Environment: There is a very probable risk of Acid Sulphate Soils being created during and after the construction of the enormous wind turbines and what this will present to the sensitive waterways of the Scott and Blackwood River, neighbouring farmland and Flinders Bay. It's been proven 20+ years ago with the failed Beenup mineral sand mine that sits adjacent to the site. BHP couldn't contain the toxic reaction in the soil when they disturbed the soil below a certain depth. This environmental disaster cost the mining company $800 million dollars to clean up and is still under ongoing rehabilitation and monitoring to ensure the toxic sulphuric acid and heavy metals and arsenic do not leach into the nearby Scott River. The modern wind turbine requires substantial footings of 10m plus and extensive underground cabling to connect to the grid... The proposed location of the wind farm, will also risk the superficial aquifer system and the native vegetation that has specifically adapted to the ironstone profile of esturine environment. Wind turbine foundations on this known, high risk Acid Sulphate Soil site at the Scott River is a disaster waiting to happen! The Scott River district is known for its high ecological value. The entire wind farm project is located inside the sensitive 'Scott River Ecological Community protected federally under the EPBC act. There are 26 fauna species listed as threatened, priority our under protection that occur within the Scott River catchment. Flinders Bay is an internationally recognised birthing ground for the endangered Southern Right Whale and and a successful and sustainable aquaculture industry, an Acid Sulphate Soil breach at the Scott River will have serious effects on our environment and wildlife. Setbacks: The block sizes are too small at the Scott River to safely host an industrial energy project of this size and scale. The wind turbines proposed will be unprecedented at 250m high and the largest land-based turbines in the country, equal height to the largest skyscrapers in the Perth city skyline! The amenity and rural landscape will be changed forever with multiple industrial skyscrapers towering over residents 365 days of the year, creating noise, shadow flicker and other disturbances like flashing lights at night. Fire: Industrial wind turbines will increase fire risk to Augusta, Scott River, Molloy Island, East Augusta, Karridale Alexandra Bridge, Warner Glen and Kudarup communities. With no aerial and limited ground support around the industrial site. This is due to the no-fly zone above a wind turbine facility. Firefighters are already restricted at ground level due to the high value ecological communities that are protected federally under the EPBC act (Scott River Ironstone Association) that exist in the neighbourhood. Ground crews and fire trucks are restricted on sensitive sites surrounding the wind farm proposal. This puts our community and assets at a heightened risk from bushfires.with no aerial support and limited ground support around the proposed wind farm. Industrial wind turbines disperse highly toxic compounds onto the ground and into the air during catastrophic failures.

		Health Effects: Synergy is claiming that it's safe to live near and run livestock under the turbines. However, many international studies have shown there are serious health effects for humans and livestock. A German study found the pulsing acoustic vibration from wind farm infrasound 20 kilometres out from turbines. Something to consider for residents living in Augusta, East Augusta, Karridale and Kudarup, just over 10km from the Scott River proposal. Molloy Island, Nillup, Warner Glen and Alexandra Bridge residents are in the firing line at just under 6km. Wind turbines create a noise that humans can hear measured in decibels. However, they also produce a sound ultrasonically by the blades, called infrasound. Humans don't hear it as such, it's more like a frequency and a vibration and it's measured below 20 hertz. Infrasound easily travels through the walls of your home and into the human body. This creates serious discomfort in people. Causing sleep disturbance, balance problems, nausea and headaches. One common link amongst sufferers of infrasound exposure is heart disease. It's been shown that in some cases livestock actually die from the stress and lack of sleep, as they simply can not rest with the noise, ultrasonic vibration and disturbance from the wind turbines, around the clock. Developers of industrial wind facilities are currently only regulated by audible noise measured in decibels, not low frequency emissions measured in hertz. This policy needs to change. Contamination: Contamination of farm land and waterways is a serious concern for residents. The 100m long blades of a wind turbine erode during operation. This leading edge erosion spreads micro-plastics over great distances.
343	Support	I believe this to be an excellent project, contributing to our collective responsibility to reduce our carbon foot print. Hopefully it might also contribute to the provision of a more stable supply of power to Augusta. I am vehemently opposed to the stance taken by those who oppose these type of projects on the basis of aesthetics and/or impact on agricultural operation or loss of production. Any fair minded analysis of these arguments show that the benefits out weigh any negative impacts. The NIMBY attitude of such people is slowing down, and increasing the cost, of meeting our obligations to future generations!
344	Object	I strongly oppose the Scott-River Wind Farm on the basis of considerable public objection, inadequate assessments, and the severe short and long term impacts and risk to habitat, wetlands and health extending into a huge area of a unique and fragile ecosystem globally recognised as a unique biodiversity hotspot. That the project is being 'sold' as a green, environmentally positive solution to the public and decision makers is simply ridiculous. The sheer scale of the proposal of 20 turbines to a height larger than the tallest current building in Western Australia, visible for approximately 68km and only 6km away from the residential area of Molloy Island and close to Augusta should have triggered rejection well before now. The prominent visual feature of the nearby tourist town of Augusta and tallest lighthouse on the Australian mainland at just 39m will be dwarfed by the eyesore of 20 x 250m turbines in the distance. Augusta has been recently chosen as the filming location of several high profile film productions with major economic benefit to the area and that choice was due to the area's untouched beauty, 'that view' from the Augusta Hotel will lose its appeal and the beautiful reputation will be destroyed for an outdated energy solution. In additon to the visual intrusion, auditory impacts from infrasound are expected to be detected up to 90km away - 6km is unacceptable and poses significant human and wildlife health risks. Sleep disturbance from wind turbines are known to be responsible for mental health decline, cardiovascular problems, immune system and metabolic issues and safety concerns from drowsiness. Habitat clearing and the impacts of infrastructure are also unacceptable from a government that promised protection of environmental assets. I am quite honestly shocked that this proposal has continued in any form for this pristine area of the state. It's continuation would only occur for the benefit of a few and to the detriment of many (especially the fragile environment). I urge the authority to consider the long-term legacy of this decision. Approving this project in this sensitive location would represent a significant and lasting misstep in regional planning and would result in a permanent and irreversible degradation of the unique landscape and amenity of the area for future generations.

345	Support	Strongly support the proposal. The windfarm will have a strong positive environmental impact and very little permanent adverse environmental or social impact. It is essential to the preservation of the region.
346	Object	This is an ugly industrialisation of a beautiful natural environment. The risks for environmental damage to the Blackwood river and estuary are too high for the convenience of location alone. There is no direct benefit to the Augusta community especially when it comes to the continuity of electricity supply. Just massive risk with no reward. Why on earth isn't Augusta at the very least getting a community battery out of this that can power the town for days while flakey transmission lines are fixed after a storm? Or better still, use some of the massive millions being offered to overseas companies to build these hideous windmills to provide batteries on every solar home in Augusta to create a Virtual Power Plant for Augusta together with the community battery that could make Augusta self sufficient?
347	Object	This is an ugly industrialisation of a beautiful natural environment. The risks for environmental damage to the Blackwood river and estuary are too high for the convenience of location alone. There is no direct benefit to the Augusta community especially when it comes to the continuity of electricity supply. Just massive risk with no reward. Why on earth isn't Augusta at the very least getting a community battery out of this that can power the town for days while flakey transmission lines are fixed after a storm? Or better still, use some of the massive money being offered to overseas companies to build these hideous windmills to provide batteries on every solar home in Augusta so that the community battery could make Augusta self sufficient? We have had dozens of power outages this year.
348	Support	I strongly support this proposal. Windfarms are an essential part of the energy transition and a great way to supplement solar. They are safe and have minimal impact on wildlife.
349	Object	The proposed Scott River wind farm/factory will be a significant industrialisation of a picturesque, pristine, rural landscape of quiet farmland and native bush well known for its diversity of flora and fauna. From our property the visual pollution will be significant and not inconsequential hence it is our considered opinion that resale property prices of our property and 90% of Augusta will be adversely affected. Another aspect to this development is the guaranteed high risk of environmental damage from acid sulphate soils proven to be present in the development envelope. To hope to control this with lime application as the Synergy proposal states is nothing short of naive when it comes to the cavalier approach of most construction contractors, hence environmental damage to the Blackwood River estuary is almost certain with result death of the estuary, an important breeding ground for marine and aquatic life. The aspect of noise pollution is also of concern given we will be at 10 km direct line of sight from the development and that current proven scientific data about the adverse affects of this pollution at this distance, is uncertain/unknown. There is no doubt that the wind resource for this wind farm/factory is very good and that the location adjacent to a HV transmission line is also very good, however to use these as sole justification for the project over other far less risky and remote locations is short sighted at best when the environmental risks are so high.
350	Object	Absolutely reject the proposal of those wind turbines anywere in the south west. They destroy more than they save, please wake up.
351	Object	I object to this proposal because of the potential adverse environmental impact the towers will have on the Scott Plain, Yarragardie Water System and the Flinders Bay marine and coastal environments. This is due the severe acid sulphate soil and underground environment that exists. Eg: BHP minesite and agricultural operations impact. I also object to the significant potential the towers could have on industrial sound and their visibility over the Augusta, Flinders Bay, Molloy Island, Karridale and farming communities. as well as the impact on the national parks in the locality. Surely we can locate a location that does not have the risks and potential damage that this proposal would create. The changes to the environment and community could be adversely life changing. As a community we do not want this to occur.

		.
352	Support	I support the DAP Application by SynergyRED for a proposed wind farm in Scott River (P225771 - DAP Application DAP/25/02933 - Wind Farm), including the approval sought for the 'maximum case scenario' in terms of level of impact. My reasons for supporting the application are: (1) I understand that emission of CO2 through the burning of fossil fuel by humans is leading to warming of the planet. This conclusion is supported by science, see References 1 and 2 below. In summary, References 1 and 2 show that the way in which the return to space of the energy reaching the Earth from the Sun is being affected by an increasing concentration of the CO2 in the atmosphere. The overall effect is to increase the surface temperature of the Earth, leading to rapid human induced climate change with seriously detrimental effects, being: - Increase in frequency and severity of agricultural & ecological drought - Increase in frequency of fire weather with consequent more frequent wildfires - Increase in frequency of flash flooding - Increase in frequency of storms, heavy rain, and hail - Glacier retreat - Global sea level rise with coastal inundation and heightened storm surges - Upper ocean acidification with consequent adverse effects on marine ecosystems - Increase in frequency and severity of land and marine heatwaves The use of renewable forms of energy, such as the SynergyRED wind farm at Scott River will reduce CO2 emissions from energy production in the SWIS, and hence help globally to reduce the abovementioned detrimental effects of human induced climate change. (2) I believe the benefits of the SynergyRED wind farm outweigh the detrimental effects of it. The benefits include: - Wind is a renewable source of energy and use of it to generate electricity produces less CO2e/kWh over the lifetime of energy production than equivalent coal and gas generation as shown in the following comparisons (Reference 3): - Wind: 0.01 kg/kWh - Coal: 0.82 kg/kWh - Gas: 0.49 kg/kWh - Wind is a low-cost source of energy and the use of it to generate electricity costs less over the lifetime of energy production than equivalent coal and gas generation as shown in the following comparisons (Reference 4): - Wind: $27-$73 per MWh - Coal: $69-$168 per MWh

		- Gas: $45-$108 per MWh - Energy Independence: Wind turbines can generate electricity locally, reducing reliance on imported fuels. - Sustainability: Wind turbines can be built on agricultural land, allowing for dual use. References: (1) "Principles of Planetary Climate" by Raymond T. Pierrehumbert - This text book gives the reader an understanding of the present and past climate of Earth in terms of thermodynamics, infrared radiative transfer, scattering, surface heat transfer, and various processes governing the evolution of atmospheric composition. (3) "Australian Energy Update 2025 report from the Department of Climate Change, Energy, the Environment and Water". (4) "CSIRO 2024-25 GenCost Report".
353	Object	This proposed wind farm will destroy the habitat of many wildlife animals and birds and destroy the natural environment it will stand on.
354	Object	Our 'Unique town of Augusta's' claim to be 'an area of outstanding natural beauty' demands to be nurtured and respected now and for future generations to enjoy. The majority of residents are saddened by this extraneous and shocking proposal our community now has to address. Our protection now is essential, or this will be destroyed and irreplaceable in the future! Many of our small towns in Western Australia have already seen this happen by stealth, please do not allow Augusta to follow!
355	Support	I support renewables in general, and this proposed location has the advantage of strong winds and existing transmission lines. It's a another step on the long journey to net zero in 2050. Good to see only 1 hectare of native vegetation will be cleared - far less than the clearing done on the farms in the site area. Visually, it's a long way from Augusta, so most people will hardly notice it. Those opposed to it there will get used to the sight of it, as has been the case for the Denmark wind turbines.
356	Support	although in support of the windfarm, I am concerned that the foundations for the towers may have a yet to be established (to my knowledge) impact on both surficial and deeper ground water aquifers.
357	Object	The proposed wind farm threatens native wildlife and fauna, disrupts scenic real views and introduces industrial noise into a peaceful area. We must say no to this project and push for alternatives that truly protect our region.
358	Object	This proposal is a ridiculous size which impacts socially on the surrounding and nearby settlements and will affect the livelihoods of those residents. The noise, visual intrusion and potential health impacts are real. In addition it will impact on the pristine Scott River

		environment, valued by most local people. It will destroy the quiet, clean and beautiful environment of this area. These projects should be located on more remote farms and pastoral leases where there is less of a social impact and environmental damage - keep these wind farms away from river systems and place of precious environmental value.
359	Object	They will be an eye sore & noisy & unknown health affects
360	Support	I am looking forward to having a wind farm in the area and hope it will supply the Augusta community with much needed renewable energy.
361	Support	I'm very much in favour of this project going ahead. The location is ideal for generation of wind power and close to transmission lines. The only thing missing is a 'community' battery to store the power for local residents who cannot afford their own. For the last few months , there has been a huge amount of negative campaigning about this project in the Augusta area. Much of this has used emotional language to frighten people , without giving any scientific basis to the claims.
362	Object	I object to the proposed windfarm in Scott River. Unlike other parts of the Shire, the Scott River National Park is unique and pristine in nature where a development with turbine structures as high as 250m do not belong in this National Park. There is a reason for the name 'National Park'' not to be abused. Leave our area alone as it has been for decades before us.
363	Support	We need to urgently address global warming and that means everyone playing their part. I also support action to ensure a safe and reliable energy supply that can support the local economy into the future. I do not support an “at any cost approach” but believe that reasoned debate should not be hijacked by a small group of vocal objectors who do not seem to offer other options. This proposal seems to have few contentions and we need to just get on with it, especially in the light of recent announcements about 2030 and 2035 targets not being met. -The project will be owned by Synergy thus ensuring government and constituent oversight, -The synchronicity with solar energy is advantageous given the potential to generate power at night and at other times when solar is not optimum. - WA taxpayers need to stop propping up an inefficient coal mine owned by overseas interests just to keep an aging power station running. This is economic madness. - There is minimal impact on uncleared land with existing farm land being utilised - There is minimal need to build transmission lines with the potential for the State to recoup previous losses incurred in installing the transmission line for the failed Beenup mine. - It seems ludicrous that a sand mine could be approved but not a wind farm. - Whilst there will be some aesthetic impact on the Augusta township, the proposal is unlikely to impact other possible developments in the Scott River area. It is a relatively isolated, windy place. - There is the potential for farmers that hosting alternative energy projects helps keeps agricultural industries viable especially in unpredictable climatic conditions. Food and fibre security is an issue the whole community will need to address. - Reliable energy supply will act as an impetus for more industries- food processing, aquaculture etc helping to broaden the economic base of the Shire, plus enable development of local expertise and employment in the renewable energy field. Surely this proposal represents the “lowest hanging fruit” in terms of renewable energy projects given the lack of impact in terms of clearing of native vegetation and non requirement to build transmission lines. Being operated by a Government Authority constantly under scrutiny by Parliament, media, taxpayers etc gives a level of oversight that would not happen with private enterprise.

		People seem to resist change but the uptake of solar by Australian households, the recent elections of the Federal, State and our Local government of people and parties with renewable energy policies indicates that the majority of the community supports renewable energy even if they do not express their views by active community debate. Unfortunately the aggressive and often personalised expression of views by opponents actively discourages public debate. I applaud the council for offering this opportunity for input on this proposal. -
364	Object	Augusta is a small town known for its stunning natural beauty. We don't want a massive industrial infrastructure in this location. It will affect unique and often endemic species of fauna, also affect the identity of a small country tourist town that would like to see its natural beauty preserved, kept away from big scale Industrialisation. Please find another place for these gigantic turbines. Not in our town.
365	Support	We urgently need renewable energy!
366	Object	Unsightly. Unsustainable and impossible to dispose of in an environmentally friendly way. A hazard to light planes. An ugly blot on a beautiful landscape.
367	Object	Subject: Objection to Proposed Scott River Wind Farm To whom it may concern, I am writing to formally object to the proposed wind-farm development at Scott River. While I support responsible and effective renewable-energy policy, this project represents an approach where the perceived environmental benefits are enjoyed mostly in distant urban areas, while the significant environmental and social impacts fall squarely on the local community that actually lives here. 1. Disproportionate Burden on Local Residents Residents of Scott River bear the direct consequences of noise, visual impacts, heavy-vehicle movements, and land-use change. These are permanent, daily effects that cannot be shifted elsewhere.

		2. Minimal Local Benefit The project delivers limited long-term employment, limited local energy supply, and no meaningful community uplift despite imposing substantial disruption. 3. “Symbolic” Rather Than Practical Environmentalism Many supporters of projects like this live far from the affected area and experience none of the consequences. Policy should not prioritise symbolic gestures over well-designed, community-centred renewable outcomes. 4. Environmental Concerns Specific to Scott River Scott River is a sensitive landscape with ecological features that must be protected. The development risks: wildlife habitat disturbance bird and bat strike clearing of vegetation in a region that depends on ecological balance disruption to hydrology and water-quality flows 5. Major Risk: Exposure of Acid Sulphate Soils and Release of Sulphides Large-scale excavation, pylon footings, road widening, and cabling trenches threaten to disturb acid sulphate soils known to occur in parts of the Scott River coastal plain. When these soils are exposed to oxygen, they can oxidise and release acidic runoff, sulphuric compounds, and heavy metals. If not perfectly contained, this process could:

		contaminate nearby river systems, wetlands, and groundwater mobilise acidic leachate into the Scott River and its tributaries flow downstream into coastal marine environments, damaging seagrass, fisheries, and the wider ocean ecosystem cause long-term, possibly irreversible ecological damage Given the region's high water table, interconnected drainage, and porous soils, the ability to contain such contamination is uncertain at best — and catastrophic at worst. Once triggered, acid sulphate soil reactions can continue for decades. This is an unacceptable risk in a region that relies on clean waterways, healthy soils, and intact ecosystems. 6. Inadequate Community Consultation Local residents report that concerns about soil disturbance, hydrology, fire risk, and long-term environmental safety have not been adequately addressed. Proper consultation must be thorough, transparent, and not treated as a procedural formality. 7. Preferable Alternatives Renewable-energy planning should prioritise generation closer to urban demand centres, integrate rooftop and distributed solutions, and use lower-impact technologies before resorting to large industrial-scale installations in sensitive rural areas. Conclusion The Scott River community should not be asked to shoulder the environmental, ecological, and social risks of a project that delivers little local benefit and carries significant potential for long-term damage — including the catastrophic consequences of disturbing acid sulphate soils.

		I respectfully urge the decision-makers to reject the proposed Scott River wind-farm development in its current form.
368	Support	Very pro wind farms Angry and discusted at anti campaign claiming affecting biodiversity of beef farms and crazy notions acid soil and bio magneitic nonsence Wa needs to do start doing its part to reverse climate change and this is a great start for our children and planet Please please go ahead w wind farms!
369	Object	
370	Support	This wind farm is a wonderful idea that has been a decade or more in the making. Many properties are unable to generate electricity from rooftop solar as there is too much shade from trees around. The project has my full support from an environmental and employment perspective.
371	Object	Approval of this wind farm will only provide a win for the local landowners who directly benefit from infrastructure on their properties and the overseas owners (Energy providers) of the wind farm, plus the petty annual amount given to the shire. The installation of this wind farm will also prove that no matter what the levels of impact are environmentally those people already brainwashed into thinking that we must save the world by committing to net zero by whenever (ASAP) and will stop at nothing to convince us all that sea levels are rising and its our fault. Wind farms are nothing short of disgusting visual pollution and any noise emanating from these structures must be considered unnecessary noise pollution. I definitely object to this proposal.
372	Object	Seriously why even risk the chance of polluting the aquifers at Scott River. If pollution occurs in to the aquifers it will seep into all river systems. History should be enough information to not even risk this.
373	Support	Supportive: have already installed solar and batteries here to reduce reliance on a largely coal powered grid. The look of turbines is quite calming to me while noise issues at Augusta and nearby hamlets will be non-existent. Modest environmental impact much of which can be mitigated (far more modest than farming's impacts on the Scott River and Hardy). This proposal is not of industrial, wide landscape scale that would be visually jarring. The opposition group have been misleading, aggressive, intimidating and causing great visual pollution for more than a year; difficult people to live with.
374	Object	Due to the sensitive enviromental nature of the Scott River there is no doubt that it will have a negative impact on wildlife native and active in this area .Also the Scott River has a fragile water system that absolutely needs to be protected. Another important consideration is the representation of the community by Julia Meldrum who invested,worked and campaigned with the AMRCCE to get the wind farm up and running . Greg Boland who will also be representing the community is an ex Greens leader so there is a conflict of interest and they SHOULD NOT be allowed to represent our community on this issue .
375	Object	Why use stupid big expensive wind turbines that only last 10 years, Other countries are creating more greener energy for less money and less impact of the environment! Leave this beautiful part of the world alone and go ruin other Barron areas of Australia that don’t have as big of an ecosystem.

		Would love to show my children what being out bush and in the scrub means down here but with what yous are doing I don't think anyone will want to be down here, you's are ruining our lives and life for our future generations.
376	Object	My property is located 4 km from the proposed wind farm. I've owned it 18 years. My property includes a residence that is 4km from the wind farm. Synergy have not contacted or engaged with me in any way as an immediate land owner. I'm also a Synergy customer at the property and there is power infrastructure that traverses my property. I'm deeply troubled by this failure to engage. There has been no engagement on what wind farm noise we will hear from our property, what mitigations are available to us, risks on human health, risks to the aquifer which I am licenced to draw water for agriculture purposes, and the reduction in value of my property due to the wind farm and its impacts. It beggars belief that a land owner in the immediate surrounds has had no engagement. From my perspective this has been a flawed process. Separately, I am also troubled with locating this within productive farmland in Augusta Margaret River when there is extensive coastline land nearby for locating the turbines. The Albany wind farm is a model example, does not impact farmland or those who reside on farms. Please reconsider where such a long term project is located.
377	Support	I support the proposed windfarm because of the climate mitigation aspect but also because of the benefits to the local economy from it. I have some concerns that I think Synergy could address: 1) More equitable distribution of benefits to near neighbours of the windfarm. At present the hosts would get paid handsomely and the adjacent neighbours get nothing but may have visual and noise impacts. 2) The Community Benefit Fund should be earmarked for East Augusta community development and not allocated to AMR Shire general revenue.
378	Object	* Environmentally protected area already. Ignored in this proposal. Change the rules to suit the circumstance. * Failed mine due to acid soil and environmental damage leakage in adjacent area -more disturbance (footings/underground cables / access) - major risk to wetlands/ river systems - reparation is STILL ongoing. * Foreign ownership / no genuine care factor of implications or mitigation of issues (current research shows blade colour a bird deterrent) (profit driven). Will there be asbestos in the material blades are made from? Long term vision for disposal? * Largest turbines in Australia - what lessons have been learnt from overseas relating to size /lifespan/ environmental impact/ these may be causing and are any strategies being implemented? Not mentioned. *Impact on wildlife (birds / bats) - survey / not comprehensive (in adequate monitoring/ duration / times / species) and dismissive of the number death caused - due to perceived numbers of existing. NO serious monitoring or management plan for care of injured wildlife. Impact of sub sonic noise on wildlife / animals not even considered. Adjacent to large area of natural bush and wetlands hence likelihood of injury / death increased. Wildlife do not go around windfarms. * Augusta is major holiday destination - due to NATURAL BEAUTY - and isolation away from city living. One of the last non spoilt / populated places in WA South West. It should not have INDUSTRIAL infrastructure on the doorstep, that impacts on the tranquility and sense of well being, mental health that goes with being in nature. Place closer to source of need in the city (precedence has been set - Chicago) * Government has no viable energy policy related to increasing use of Solar and making affordable for ALL people and viable policy to DECREASE energy demand. The need for this type of infrastructure in this proposed location would be mitigated if every new build in WA had solar mandated, producing enough / most energy for use by that facility. Either housing / industrial. * 2 MR Shire representatives on committee that are representing the public/council are bias. Both have previously expressed their advocacy for the wind turbine project and so neutrality in representing the people is questionable. Neutral parties expressing all concerns / aspects of public should be in place.

		* We are not the only community that has concerns for the "mad dash" to net zero. Where is the states / Australian publicised "vision" - of areas to be affected and by what projects? Undertaking and dividing regional / rural areas with these proposals - that affect many "small Australians " and the environment while people in suburban areas largely have a no care factor as they are not immediately affected.
379	Support	It is critically important that our society moves to renewable energy sources for the future. These are the cheapest and cleanest energy sources available. This project provides a fantastic opportunity for the Shire to contribute to this aim. The background and consultation work has been extensive and we are ready to go. The potential downside of the project is that the wind turbines will be visible in the middle distance from parts of Augusta. However, some may argue this a benefit, and it is certainly better than a view of a coal-fired power station or a nuclear reactor. It would be great to be able to quarantine the wind power for use within the Shire.
380	Object	Strongly object to the proposed wind farm as it will be a complete blight on the horizon looking from a view to east Augusta im certain this wont be a good look for either locals or tourists not to mention the impact on the local wildlife etc This area has been beautiful pristine piece of the South West for as long as i can remember and i cant see why we should ever consider a wind farm of this magnitude
381	Support	I support this proposal with the following conditions: 1. It is clearly demonstrated that there is no risk of acid sulfate soil contamination and/or problems to the district's waterways. 2. Absolutely no more than the clearing of 1 hectare of native bushland as proposed. 3. Turbines are located no closer than 400 metres to neighbouring property boundaries. 4. Extensive use and application of planning tools such as Avistep are used to minimise danger and harm to native fauna
382	Object	Thank you for the opportunity to comment on the Scott River Wind Farm development application. I wish to lodge my objection to the proposal in its current form. While I am supportive of renewable energy projects and the long-term transition to cleaner power generation, this development places significant industrial infrastructure far too close to established communities when there are ample opportunities to locate these components in less populated areas. The South West region has extensive open land where turbines, associated facilities, and transmission infrastructure could be sited with minimal impact on residents, local amenity, and the natural environment. The developer has not adequately justified why the proposed infrastructure needs to be positioned so close to dwellings and community areas when viable alternatives clearly exist. My concerns include: • Proximity to homes and community spaces when non-residential areas are available • Avoidable impacts on landscape, noise, and environmental values • Insufficient exploration of alternative siting options that would reduce these impacts • Unnecessary encroachment on a built-up or semi-built-up locality despite the region’s capacity to accommodate infrastructure elsewhere I urge the decision-makers to require the proponent to reconsider the layout and relocate turbines and infrastructure to areas that do not impose these avoidable impacts on residents. I appreciate the chance to provide feedback and ask that these concerns be taken into full consideration when assessing the proposal.

383	Support	As a farmer on really prime agricultural land, we are seeing the effects of a change in our environment and on our production. All effort must be given, no matter how small to reduce the use of fossil fuels for electricity generation an transport. This wind farm will have minimal impact, will grow local jobs, will come with a community fund, uses already existing transmission infrastructure and will improve power reliability in the SWIC south of Forest Grove. The objectors, namely Scott Baxter lives in Busselton Shire, has property in Scott River, but leased for 30 years by another real farmer.
384	Object	The visual impact is astonishingly bad. Who knows what the sound impact will be. The impact on surrounding farm life and wildlife is also intuitively going to be very significant. Surely there are other locations which do not have these impacts. If not, then the whole venture should be abandoned In the final analysis 100 MW is not a significant contribution to the power grid so it is not justified on Power contribution either.
385	Support	This wind farm has everything going for it (wind speeds, connection to SW grid and suitable site. We are living in a time when climate change in the SW is very clear. The need to reduce fossil fuel emissions and to move to more renewable energy is evident. The SW requires more wind power (there are plentiful solar panels on houses). Synergy have carried out an exemplary series of communications to engage the community. And, there will always be folk who object to wind farms and many will find them visually unappealing. Despite this, I strongly support the development of the Scott River Wind Farm.
386	Object	Bird strikes are not acceptable. Requires govt funding/offtake guarantees that cost taxpayers more than other power sources Remediation and closure has no solution for turbine blades other than land fill Balsawood in turbine blades sourced from Amazon rainforest etc is totally unacceptable
387	Object	
388	Support	Strong support for renewable energy sources and this site has consistent winds which is ideal. Local environmental concerns such as rare flora and fauna and acid sulfate soils have been addressed well. Visual impact is negligible including from Augusta townsite and surrounds.
389	Support	I am a resident of Margaret River, and I am writing to express my support for the proposed Scott River Wind Farm. I believe this project is both responsible and necessary for our community, the environment, and the long-term sustainability of our region. The proposed site is highly suitable. There is an existing substation nearby, the land is already cleared, and extensive environmental and feasibility studies have been conducted. I have read the reports, the EPA documentation and applications. I'm confident that the actions taken to protect bird and bats are enough and that the cost of inaction by way of climate action is a far greater threat. There is also support from a substantial number of local landholders, showing that the project has backing from those directly impacted. I am aware of claims that all farmers oppose the project. They are being promoted by a group led by an individual who does not reside in the Augusta-Margaret River Shire and who appears to have a political agenda unrelated to the interests of our broader local community. Most importantly, this is a matter of climate action. Too often, discussions focus on opposition rather than the consequences of inaction.

		Continuing to rely on fossil fuels threatens our wildlife, environment, and contributes to rising energy costs. Transitioning to renewable energy is not only environmentally responsible, it also makes complete economic sense. The Scott River site, located on cleared land with suitable infrastructure, represents an ideal location to contribute to a sustainable energy future. In conclusion, as a local resident, I strongly support the Scott River Wind Farm. It is a practical, responsible, and forward-looking project that will benefit the community, the environment, and our economy. I urge the Shire to approve this development in recognition of its many advantages.
390	Object	Disagree with the benefits and believe no good will comes of this project to the area. Totally miss lead by government about how harmful this will be for animals and humans. Have no faith in our local, state or Federal governments to make correct decisions for the right reasons for the people. Only money benefiting them. Speaking with large amount of locals in area not one has said this will be good. Researching other projects in Australia and around the world it does seem scary at this point we are discussing the removal of native bush to install concrete
391	Support	Land is mostly cleared already Visual impact is negligible Renewable energy is great Area gets a lot of wind
392	Object	Wind turbines destroy the liveability and visual amenity of any area. They produce noise and visual pollution. They have a limited life span and then the cost of deconstruction is prohibitive leaving behind deteriorating land junk. This is not good planning or land management for the future. Technology will certainly provide simpler and more efficient energy. alternatives in the near future. Let's wait and plan for these.
393	Object	
394	Object	No way
395	Object	I want to begin by saying that I support renewable energy — we all know how important it is to move toward a cleaner, greener future. But we must also be smart about where and how we place renewable projects. The Scott River region is simply not the right place for wind turbines. Scott River is one of the most beautiful and ecologically significant areas in our part of the world. It's a landscape rich in native bushland, pristine waterways, and valuable farmland. It's home to unique wildlife and migratory birds that rely on these open spaces. Installing industrial-scale wind turbines here would change the character of the region forever. The first major concern is environmental impact. Large turbines require extensive clearing for roads, foundations, and power lines. This disrupts natural habitats and risks polluting waterways that feed into the river. The noise, shadow flicker, and vibration also disturb local fauna — especially bird species and bats that play an essential role in maintaining the balance of the local ecosystem. Secondly, there's the impact on local residents and farmers. The Scott River area supports agriculture, tourism, and small communities that depend on peace, open skies, and the natural beauty that brings visitors to the region. The presence of 150-metre-high turbines and red aviation lights would permanently alter that sense of place. Once that's lost, we can't get it back. We also need to think about economic practicality. Wind energy only works efficiently where consistent wind resources exist, and studies

		show that Scott River's wind profile isn't as strong or reliable as other coastal and offshore areas. That means we'd be sacrificing our local environment for relatively little return in power generation. There are better alternatives. Offshore wind farms, solar developments in already cleared or degraded land, and community-scale renewable projects can all deliver clean energy without sacrificing an area as unique and sensitive as Scott River. So today, I'm not arguing against renewable energy — I'm arguing for responsible renewable energy. For smart planning, genuine consultation with the community, and protecting the land and waterways that make our region what it is. Let's stand for a future that is sustainable in every sense — not just in power, but in people, nature, and place. Thank you.
396	Support	Wind turbines are beautiful. I'm confident the supplier will provide mechanisms to alert passing birds .
397	Support	I couldn't be more in support of this green energy solution. I would be happy for there to be wind farms in Margaret River also. Bring on the transition!
398	Object	This proposal is based on the belief that CO2 is the problem. Dr Mototaka Nakamura "Says CO2 is not the CONTROL KNOB" (He is not the only one.) CO2 lags temperature. CO2 is NOT a pollutant! CO2 is currently 0.04% of our atmosphere, its has increased from 0.03%. If it drop below 0.02% plant life start to die. Forget Net-zero that's fantasy land. Forget DC & inverters (wind, solar & batteries)to power our country. We need reliable and constant power (coal, gas & nuclear). NO inertia in wind, solar & batteries! If it's not economically sustainable, "it's NOT SUSTAINABLE". Also CO2 is logarithmic not linear in the way that it acts in the atmosphere. Do your own personal research. https://heartland.org/ https://friendsofscience.org/about/about-us.html

		https://www.climatedepot.com/2019/08/24/climatologist-dr-tim-ball-defeats-michael-manns-climate-lawsuit/ https://www.youtube.com/watch?v=vcAHdmYs0j0
399	Object	Visually destroying the forested view
400	Object	Negative impact on endangered birds in the area. Visual pollution. Noise pollution.
401	Support	This project is a major opportunity for the SWIS and for the Shire. Unlike a lot of the Wheatbelt wind, which peaks during the day while solar is already doing the heavy lifting, Scott River has strong overnight wind profiles. That's exactly what WA needs right now, clean generation that keeps batteries charged overnight and actually relieves pressure on the grid instead of adding to daytime oversupply. From what I've seen, the location is well chosen with minimal native clearing, minimal visual impact, and a layout that has clearly been designed with the local environment in mind. It also brings direct benefits to the community through the Community Benefit Fund, plus long-term regional jobs and local contracting opportunities, which is huge for the South West. Overall, this is the kind of well-planned, well-sited renewable project WA needs if we're serious about hitting our carbon targets and supporting a stable SWIS. I think the project is responsible, considered, and absolutely something the Shire should back.
402	Object	In response to proposed wind farm at Scott River, I strongly object to the project. The scale of the turbines will dominate Augusta's almost untouched vistas of the south coast, with negative effects on tourism, housing prices, and the mental wellbeing of local residents. There would be fewer residents of Augusta and surrounding areas objecting to this proposal if the turbines weren't roughly the same height as the tallest building in Perth. The turbines at Albany windfarm are 100m high. There should be shire restrictions limiting the scale of these industrial power generators. Much the same as building codes have height limitations for residential and industrial areas. There are countless reasons why this development should not go ahead, however, I would like the negative visual impact on the town of Augusta to be documented as a strike against the project in this shire. An industrial wind farm using the tallest turbines in Australia is not cohesive with a small coastal country town that relies on tourism.
403	Object	
404	Object	I object to the proposal by SynergyRED on the grounds that the proposed turbines would lead to significant visual harm to the Augusta community, and impact an already fragile ecosystem. I firmly believe that there also needs to be further work undertaken into developing reliable and effective energy storage systems so that the power generated by renewables is able to be stored. This includes the power generated by solar and alternate renewable sources. The fact that domestic solar has been implemented by households to such an extent that the power providers are having to turn off or reduce the capacity of their generation systems at times of peak solar power production needs to be addressed and storage systems need to be investigated and developed. This should be done before any further investment in wind generation is undertaken so that we do not have the often experienced situation where you see wind turbines idled.
405	Support	

406	Support	In my opinion this proposal is not only necessary, but a major bonus for the shire. It's a step in the right direction for a sustainable future. A future powered by clean, emissions free energy. I believe that the proposed Scott river wind farm should have the full support of our council.
407	Object	Infrastructure with a limited lifetime needs to be managed sustainably with long-term goals beneficial for all concerns.
408	Object	The environmental impact of wind turbines is so bad with the production of turbine components, like the metals and concrete used, has its own environmental footprint, including the use of fossil fuels during manufacturing. Currently, it is difficult to recycle turbine blades, which are a composite material. Wind turbines can kill birds and bats that collide with the blades. They can also disrupt habitats and navigation, particularly for bats that use sonar.
409	Object	No no no. Wind farms are terrible.
410	Support	I support the investment in renewable energy sources, including wind farms. The proposed development is an important addition to society's move away from fossil fuels. I have been appalled by the conspiracy theories and misinformation campaigns that have propagated within the community.
411	Object	The major tourist selling point for Augusta is its feeling of expanse of nature when you look to the east. The sunrises are something special and Augusta doesn't really have a sunset west view so the wind towers will take away the natural attraction that it has.
412	Object	
413	Support	I fully support wind farms in our Region.
414	Object	Net Zero is killing rural communities!! For the better of peoples ethics and values surely this project has to be further examined. I believe the environmental studies are flawed and have not been fully assessed in relation to to the location nor been honestly reported by multiple independent experts.
415	Object	They dominate the landscape in their size . They ruin the pathetic look f the horizon Visually Stunning don't feel they suit the raw rugged and beautiful landscape of Scott river I think the level of energy and carbon caused is n the manufacturing and removal is excessive for the returns If alternate energy is what they are after they need to find much more non intrusive ways for the environment to be sustainable They give of a hum or sound which maybe low but can be oppressive and iratatating for humans animals and birds. Especially over a long duration of time once they are there. We are going to have them for a long time . The landscape with its lakes unique flora and habitats is protected in its isolation and natural ruggedness . Die back is a bad g problem n theses landscapes the digging and removal of dirt and increased traffic will spread this disease fungus through out the landscape putting many vulnerable species at risk like banksias jarrah and a multitude of different ther rare species . Black point is highly me to one of these banksias species that once infected and spreading there is no reversing the damage . Where you could loose specific endemic species like banksia occidentalis I don't support thus project
416	Object	Western Australia has many places of wind and solar gathering regions. Augusta has one of the most precious environments in the country. With only 5 full time jobs at the end of it, I struggle to see the benefits. I'm for change but there are better options at a lower risk.
417	Object	Makes no sense to be putting them in such a prominent position…. impacting the landscape of one of australia's best coastlines.

418	Object	The visual, environmental impact by far outweighs the benefits that the wind farm will provide to the community
419	Support	I fully support this initiative
420	Support	Understand people on property nearby may find this change difficult. I think the arguments have been had and the choice is clear towards renewables. Cheaper and better for the majority going forward. But let's help out those most directly impacted. maybe property buy backs by state or federal can be offered?
421	Support	i support the idea as I know that during summer farmers have days where they use genoraters so augusta can have essentual power needed
422	Object	I think putting this development into the area will display a lack of knowledge of the river and ocean systems, the extra construction of the development of the wind farm will take the animals in the area away and works will bring extra transport into the area and roads
423	Object	I object to the proposed wind farm on the following basis 1. Environmental Impacts Scott River is an ecologically sensitive landscape containing diverse flora, fauna, wetlands, and important habitat corridors. The proposed turbine locations appear to be sited in or near areas that support bird and bat populations known to be vulnerable to turbine strike. Noise, vibration, and increased human and machinery activity also risk disturbing native wildlife and disrupting established ecological patterns. Construction works, including access tracks, turbine foundations, earthworks, and heavy-vehicle movement, pose a clear risk of soil disturbance, erosion, sediment runoff, and impacts on waterways that drain into the Scott River system. This catchment is already under cumulative pressure from agricultural activity and must be protected from further degradation. 2. Impacts on Landscape and Local Amenity The visual impact of industrial-scale wind turbines in a rural, natural landscape will be significant and irreversible. Scott River and is valued for its open spaces, natural scenery, and low-impact rural atmosphere. The introduction of large turbine structures, aviation lighting, and associated infrastructure will fundamentally alter the character of the area. Noise pollution, low-frequency sound, and shadow flicker have the potential to impact residents' wellbeing, daily activities, and property use. These impacts can extend far beyond immediate turbine locations, particularly in open and quiet rural landscapes where ambient noise levels are low. From Augusta, a place cherished for its breathtaking coastal vistas and pristine natural horizons, the sight of towering industrial turbines would be a jarring and unwelcome intrusion. The sweeping, uninterrupted views that define Augusta's character—and draw people to its lookouts, beaches, and headlands—would instead be marked by the constant presence of moving blades and stark vertical structures. This dramatic change would erode the town's sense of tranquillity, diminish its natural beauty, and replace a cherished, timeless landscape with an industrial skyline that does not belong in this iconic coastal setting. 3. Inadequate Assessment of Cumulative Impacts It is unclear whether the application adequately considers cumulative impacts from other existing or proposed renewable energy and transmission projects in the wider region. Cumulative effects can amplify environmental pressures, noise levels, habitat fragmentation,

		and overall visual intrusion. A thorough, region-wide cumulative impact assessment is essential for responsible planning and decision-making, yet the current proposal appears to lack meaningful analysis of this kind. 4. Bushfire Risk Scott River is located within a known high-risk bushfire zone. Turbines, transformers, cabling, and electrical infrastructure introduce potential ignition sources, especially during high-temperature and high-wind conditions typical of the region. The proposal does not appear to include a detailed, independently verified bushfire management plan outlining: ignition-prevention measures emergency response protocols access arrangements for emergency services maintenance requirements to minimise fire risk Given the region's fire history, this gap is a serious concern. 5. Insufficient Community Consultation A project of this scale, longevity, and regional impact requires genuine, transparent, and ongoing community consultation. Many landholders and residents appear unaware of key project details or feel that their concerns have not been appropriately acknowledged or addressed. Meaningful consultation must occur early, openly, and continuously—not as a procedural formality or after decisions have already been made. 6. End-of-Life Impacts, Waste Management, and Decommissioning Wind farm end-of-life and decommissioning obligations are often overlooked at the planning stage, yet they represent a major long-term challenge. Wind turbine blades, typically constructed from composite materials, are extremely difficult to recycle and often end up in landfill. Nacelles, generators, tower sections, and large concrete foundations can also pose disposal, removal, and contamination challenges. Without detailed commitments, communities can be left with industrial waste, degraded land, or incomplete rehabilitation.

		The current application lacks clarity on: Who is financially responsible for full decommissioning, removal of all above- and below-ground infrastructure, and site rehabilitation How composite materials, particularly blades, will be responsibly disposed of or recycled Whether adequate financial guarantees or bonds will be in place to ensure decommissioning even if the operator ceases to exist Expected environmental risks associated with long-term material breakdown Given the project's 20–30+ year lifespan, end-of-life impacts must be addressed at the outset, not deferred to future landholders or the broader community. Conclusion For the reasons outlined above—including environmental concerns, amenity impacts, inadequate cumulative impact assessment, bushfire risk, insufficient community engagement, and unresolved end-of-life waste management issues—I respectfully request that the proposed wind farm development in Scott River be refused.
424	Support	Fully support. Ignore the vocal minority. Most people in town support this but are intimidated by the vocal anti group.
425	Object	Wind farms are costly, ugly and inefficient. This one will be no different. Who pays for their upkeep and eventual replacements as they age, and what becomes of the waste products, will they be recycled effectively? How much of the money they generate stays in Australia and how much goes offshore? Who compensates the residents who must endure the construction process, the impact on services, the blight on their land and the health issues that may afflict them as a result of close proximity to their homes? What of the wildlife that is displaced, injured, killed by these massive, insidious turbines? Please listen to the residents of Scott River and have a care.
426	Support	I believe Scott river provides a perfect location for this great renewable energy, proven technology project.
427	Object	I don't support wind turbine as a power provider solution, especially in Scott River or anywhere else in the South West. Information available about turbine uses point in the direction that it isn't a good sustainable, eco friendly or 'green energy ' solution to offering extra power to the grid. The environmental impact on the land they would be set on is irreversible not to mention the cost and energy needed to then dispose of each turbine after its used by date, it just doesn't make sense to ruin such a beautiful area for the short term future gains!
428	Object	I object to this development on the grounds that it will harm the ecology and aesthetics of the delicate environment in the area. There is ample evidence now that wind turbines are a major hazard to birds and bats. The Blades shed toxic particles into the surrounding environment that could have devestating impacts on farmland and it's produce, humans and native wildlife. Harmonic pollution from the spinning blades can cause detrimental effects to humans over a large area within hearing distance from the turbines. Wind turbines are a diffuse, low output, intermittent generation method that on average output around 25% of claimed capacity.

		It is resource intensive for construction and implementation materials and is unlikely to repay its debt of emissions in its lifetime, which by the way is 20-25 years not the claimed 60 in the proposal.
429	Support	Great project, no real need to be 250m high The objections to it are baseless scare campaign. I would like to see a similar project along the Leeween Ridge West of Golf club.
430	Object	I refer to the Planning Application to install wind turbines across the riverine land of Scott and Blackwood Rivers, Augusta. We like seeing wind turbines in the landscape such as near Geraldton, across South Australia and further inland; we are not anti-turbine. We explored the Scott River area in the seventies and compared that to another visit three weeks ago. In the seventies, we found the area had risks – deep white sand to dark water covered with scrub and swamp in all directions. All around appeared fragile, roadside drains contained marron. We now see that roads have been raised and widened a bit and there are lush, green paddocks. As previously, we noted clearly visible, extensive sheets of water. The area appears very unsuited to heavy, moving structures sitting on sand and swamp currently stabilized with scrub, trees, or vigorous pasture across paddocks. Once installed - if it all goes wrong (and it certainly could) the task of removal and restoration would be messy, massive if not impossible. A turbine disaster in this area plays into the hands of fossil fuel supporters. There is legitimate concern over acid sulphate soils that cancelled two mining enterprises in this area. Using the left-over power infrastructure sounds logical, expedient but the necessary upgrade (including underground cabling according to a local) wipes out the financial gain sought and further increases the risks. Two wrongs do not equal a right. We have huge concerns that massive, heavy turbines will sink or tilt into riverine soil (like our vehicles could have). Blade movement at the top of such massive structures may coax the release of acid sulphate into fragile waterways seriously damaging seafood and tourism that are critical to the well-being of local people and visitors. Steady ocean level rise is already being documented. Higher ocean levels mean higher rivers, larger swamp areas, higher ground water putting top-active turbines on even riskier ground forcing farmers to watch an endowment delivering increasing threats to livelihood and life. The nation needs clean/green energy. In this case, there is unacceptable risk. While initially supportive of wind turbines near Augusta, after investigating we had no hesitation in changing our views. The idea is extremely risky in such a fragile area. Solar panels are light and stationary - yet not an option if something must go into this area? Huge aesthetic, environmental and livelihood impact before all roofs and car parks are put to use (something which would truly offer dual benefit).
431	Support	How can we ever get to net zero if we don't move ahead with renewable energy?

432	Object	I think they are a complete waste of our taxpayer dollars !! Building them alone will do more damage to the land and environment before it actually does any good! It pose risks to any potential wildlife living in the area! They give off a terrible noise! They only have a 20 year lifespan and then they are just left to rust away and be a complete eye saw. The cost to have them removed/recycled will cost more to have the built! Please don't do it!
433	Support	Wind and solar seem appropriate ways to manage our current and future electricity needs especially when used in current or former tree plantations.
434	Object	
435	Object	I strongly object to the industrialisation of this incredibly beautiful and biodiverse coastline. A project of this caliber does not belong on a flood plain/wetland with such a fragile constitution. (Where is the disaster mitigation plan should the highly probable acid sulphate soil contamination reach the water table that connects to our wetlands and river system?) This area plays host to a gamut of critically endangered flora and fauna, further more there has been no transparency regarding the fortified protection of wildlife within the industrial park's boundary's. Species of great concern due to their CR, EN, CD and VU ratings are Carnabys cockatoo, red-tailed black cockatoo, baudins cockatoo, blue billed duck, hooded plover, pouched lamprey, pigmy dugite, south western brown bandicoot, rakhi, western brush wallaby, western false pipistrelle and south western brush tailed phascogale, bar-tailed godwit, black tailed godwit, bridled turn, broad-billed sandpiper, Caspian turn, common green shank, common sandpiper, crested turn, double-banded plover, glossy ibis, grey plover, osprey, pacific golden plover, red-necked stint, ruddy turnstone, sanderling, sharp-tailed sand piper, whimbrel, wood sandpiper, grey-tailed tattler, peregrine flacon, curlew sandpiper, eastern curlew, great knot, western ringtail possum, western swamp tortoise, white bellied frog, woylie, Australasian bitten, blackbrowed albatross, black strip minor, dunsbough burrowing crayfish, lesser sand plover, red knot, salamanderfish, white-tailed black cockatoo, Atlantic yellow nosed Albatros, balstons pygmy perch, crates freashwater mussel, western quoll, greater sand plover, malleefowl, mud minnow, orange bellied frog, quakka and the wandering albatross.... to name a few... The whole township of Augusta faces the proposed site, a town whose income predominantly rests on the shoulders of tourism. The scale and visual aspect of this project will undoubtedly have an extremely negative effect on businesses and property value as there will be no escaping their spectre. This town boasts a world class unique and uninterrupted long view which our community generously offers to the state as a global tourism destination... something local businesses have worked tirelessly for years to build and our community is very proud of. Our soft lifestyle and tight knit community has been ripped apart with the presence of this proposal which is a real shame and I feel is reflective of the shire and synergy's lack of respect regarding transparency and honest consultaion. There also appears to be little regard for the property owners of this community and their investments regarding land value decline, many of whom have only recently been informed of the caliber and impact that this colossal project will impose, which is nefariously deceptive considering the shires long time involvement in the project. The two RDAP members tasked with "representing our community views" have a perceived conflict of interest and there is a very strong probability of risk of bias. A proposal of this scale should require independent and undecided representatives and not members that have provided long standing support of this project from conception.

		The SynergyRed group have intentionally withheld information regarding the project to the local community that will directly be affected by the project. It seems they have also intentionally left out important submission requirements to the EPA regarding bird and bat strike mitigation from their proposal which they have now been asked to rectify. And finally I would like you to consider from the ordinary council meeting agenda 26 November 2025 the community vision " one community, standing together" , managing our built environment ,"We're placing a strong focus on ensuring our built environment is functional , sustainable, accessible, safe and sympathetic to the surrounds, and promotes active lifestyles and community connection". Our Strategic goals "Environment-We will protect and enhance the unique natural environment and biodiversity of the region through climate action and informed decision making"
436	Support	
437	Support	
438	Object	This wind farm can be built well away from Augusta township and still collect enough wind.
439	Object	Margaret River shire seems like they've already lined there pockets with this one. Another project that no local wants just like Gnarabup terrible shire never listens to wants actual locals want.
440	Support	I would like to express my full hearted approval of the proposed Wind Farm at Scott River. As local resident I am thoroughly satisfied with the consultation process that has been undertaken by the developer SynergyRED. I note that the proponents have all the mitigations in place and are following the correct procedures. As a nation we are running out of time to replace our energy sources, if we are to leave a better environment for our children and grandchildren. All of us must be prepared to make the hard decisions. I have sensed some division in the community regarding the proposal but I would like to note that the quiet majority have been drowned out by a very organised and loud minority. Thank You for the opportunity to Have my Say on behalf of myself and my family.
441	Support	I strongly support the proposal
442	Object	I am very pro green energy, however I feel this solution isn't the best for this area. I fully support moving away from coal and feel there are fantastic solutions available to us such as hydroelectric, osmotic, or solar. Each have their benefits and drawbacks, but I have been following the windfarm development for a long time and have never seen alternative options presented or discussed. There is such strong community resistance to the windfarm – I feel installing it would be a real setback and would sour a lot of people towards the necessary green energy revolution. The windfarm proposal feels dated and lazy.
443	Object	This is a very sensitive area. The planning states “remnant native vegetation will be affected”. I feel that we have cleared too much native vegetation in the area and this is an unnecessary environmental risk that we should not take. What is proposed is irreversible. I strongly object this proposal.
444	Support	Whilst the views are important. There is evidence that agriculture and windfarms can exist alongside each other in a productive way. We do need to move to more sustainable energy generation and this is a positive and reasonable proposal. I totally support this application.
445	Object	
446	Object	I would like to state that I completely disagree with this development. There is evidence from European studies that have outlined the negative health effects of these type of wind generators on both humans and live stock through subsonic noise generation. This noise issue doesn't seem to have been mentioned. Along with other issues affecting the surrounding area this project is the wrong choice for the

		Augusta and the local community. In addition, I feel that is this project goes ahead it will also have an negative effect on local property values.
447	Object	I'm not for this project in a protected area. It will be a noisy and visually not good looking on the shire. Destruction of wildlife. Thanks
448	Object	I am against this proposal as for visual impact as from our nature's landscape view from our property.No one has come to our house and discussed the views and may degrease our property value. I read in forums from other wind farms about noise pollution blades falling off.asbestos in wind blades and in the braking pads.also motors catching fie and causing bush fires. These wind turbines are not a long term solution as they a short life spa . As per the height of the windmills will they need lights at night for aircraft such as rfds . Eviromentaly this is not good for all wildlife ,people and rivers and land.Why don't you put them in front of Scarborough Beach and see how city people would react.looking at the rest of the world These wind turbines are not sustainable to replace fossil fuel.I am happy for someone to take photos from my balcony and see the beautiful landscape you what to destroy
449	Support	I fully support the proposed wind farm. We need to move towards a sustainable power solution and stop mining new coal and gas. As soon as the wind farm is installed-it will start producing energy without using coal and gas which will benefit our community, country and world. More education on facts (instead of social media false claims) need to be spread from reliable sources such as shire/state and federal government (such as the findings of the latest Australian Government Climate Risk Assessment).
450	Support	bring it on!
451	Object	
452	Object	Natural Gas into existing coal fired powered stations is the only thing that makes sense.
453	Support	This is an important project to help transition from fossil fuels to renewable energy. Renewable energy is essential to address the looming climate emergency and reduce the cost of energy to consumers. This project feasibility study is particularly rigorous and puts to rest all potential issues. The location of the project is perfect! What a stroke of luck to find a location with lots of wind in close proximity to existing high voltage powerlines! It will be great to see these powerlines utilised which were built for Beenup, but hardly used. I particularly like the community payback aspect of the proposal (which is in contrast to fossil fuel projects that only benefit private, usually foreign companies.) Furthermore i think that the windmills are particularly beautiful and will be a wonderful addition to the landscape. I look forward to seeing more projects of this type in the region.
454	Support	I support this project for sustainable energy for the area into the future.
455	Support	Community energy resilience starts with integrating solar, wind and agricultural biomass alongside storage and flexible consumers. This is especially important for regions at the end of the grid such as Augusta. Solar and wind deliver the lowest-cost generation, while agricultural biomass provides firm, dispatchable power and carbon-negative value from manure, effluent and residues. Combined with batteries, micro-grids and demand flexibility, this approach reduces network stress, stabilises weak end-of-line infrastructure, and ensures reliable (non fossil fuel) power for rural communities. Europe has already shown how high renewables paired with biogas, flexible industry and local storage can strengthen the grid while cutting emissions. Supporting this direction enables agriculture to become a clean-energy

		producer and secures affordable, dependable power for regional Australia communities. Iam proud to witness a wind farm of such a scale in our shire.
456	Object	Why are we willing to push for a wind farm in a pristine area within our community without fact backing up the health/ environmental impact / surrounding property valuation impacts . . Farmer impacts that put food on our tables within our community. If we are looking at studies coming through now of windfarms that have asbestos in them how are we regulating the product that is even being brought in? It's a hard NO from me until the studies are conducted factually and the careful consideration of the impact it has on those surrounding. That means independent studies from varying areas not ones that feed into the project getting across the line.
457	Object	Having observed windfalls in other areas, the noise alone is enough to put you off, amongst also the eyesore it is going to create along our beautiful Scott River. The environmental effects it will have will be devastating to our community. With the annual whale migration and the bird population around the area, it has to have an impact! I have no idea how this even got through the environmental perspective. I'm in strong opposition to this project going through.
458	Object	This is not the location to be putting these and we should be using wind power in the first place
459	Object	A horrible eyesore on a pristine stretch of coastline. The materials and cost to build these, along with the maintenance, seems absurd. This is not real 'clean energy' at all!
460	Object	Strongly Object. One of the last remaining Great Southern Wilderness' Western Ringtail Possom Endangerment amongst others. We must question the (real) economic viability and supposed benefit of this project amongst significant landolder conflict.
461	Object	My family and community oppose the wind farm they are too big and too many and the area has significant wildlife including endangered turtles and possums. Please do not let this happen.
462	Object	These wind farms are an eye sore, we are choosing to live in Augusta to embrace the natural beauty of this place without looking at a monstrosity of a windfarm. Extend the gas pipeline down from Bunbury and build a gas fired power station. We have so much gas in WA we should be able to use for free. Cheers
463	Object	This installation of incredibly tall wind turbines will be an eyesore in contrast to the natural landscapes surrounding the area
464	Support	I have a very strong view that reducing our carbon footprint is imperative and fully support the development of a wind farm at Scott River. I understand that every project is determined by a consequence vs benefit analysis and I strongly feel that the benefits of developing a wind farm at Scott River overwhelmingly outweighs any negative consequences. I understand that the environmental impacts will be minimal as this is already mostly cleared farmland and that any disturbance to acid soils will be ameliorated. Research has indicated that detrimental effects on humans and stock are negligible. I have no negative feelings about their visual impact and believe there is the possibility, that

		like the wind farm near Albany, that this will be a point of interest for the many tourists who visit the area. I think renewable energy development, in appropriate locations, is a positive progressive step for the Augusta Margaret River Shire and aligns with the clean, green image of our region.
465	Support	
466	Support	Supportive of this proposal as we move to more renewables. It's aligned with our strategic direction as a country and will have great environmental and energy security benefits. I understand there are more studies to address any negative impacts and I look forward to seeing the results of these.
467	Support	This is fabulous. Very excited to see green energy solutions happening in the SW. As a private business who operates off grid, this is well overdue to provide green energy to households and businesses who can't achieve off grid solutions. Please let's get this across the line! Our planet needs it 🙏
468	Object	Preserve the landscape views. Many negative impacts of wind turbines. Encourage and incentivise solar for premises. Already excess on the grid, support BESS system.
469	Object	I was born in Augusta and spent my whole life here. This is our home. We do not support this and do not want to look at this eyesore for the rest of our lives. Yet another corrupt and closed door deal by the Augusta Margaret River shire. The scam of net zero is crippling the Australian economy and our way of life this is becoming extremely apparent and will no longer be able to hide. This is not about saving the planet it's about labour aligned investment funds getting rich off tax payer dollars. Put your wind farm somewhere else do not bring it here we will not stand for it
470	Object	Object on the basis 1. Effect on wildlife 2. Permanent harm to the local environment 3. Acid soils 4 impact on visual environment 5 the area in question is a pristine local environment…..leave it alone! Learn from the Alcoa experience!
471	Indifferent	Hello - I am all for improvement, regardless of aesthetics, and as long as the wildlife isn't adversely affected, I'm okay with the wind turbines. If they are though, then I would struggle to support - cheers
472	Support	I have been following the debate on the pros and cons of bringing sustainable energy to the Margaret River region. I consider this wind farm project to be hugely beneficial for all of the community. Those residents opposing the project will also reap the financial and environmental benefits. Our landscapes are always changing due to man's interference. Pollution to air land and water has reduced our quality of life rapidly over the last few hundred years. Some of the changes are irreversible and nevertheless we are still plodding along doing the same old thing but expecting better results.

		Here is a chance to join with other communities and countries to wind back the use of carbon in an effort to save our planet. This project has an urgency we need to respond to. Please approve of this project for the sake of our community, good governance and as a model for other less motivated communities.
473	Support	We need to transition our energy supply to be renewable. This proposal at Scott River is eminently sensible and will make the world a more sustainable place with little impact on the local environment.
474	Object	There is no way these windturbines are not going to do damage to enviroment, they only last a short time then they are rubbish. Just no way.
475	Support	A brilliant opportunity to generate clean energy, and a start to more reliable, locally generated energy. We already have more CO2ppm in the atmosphere than we can have for a safe future, and we are already feeling the impacts of climate change, which is only going to get worse and rapidly. It is imperative we do as much as we can do to shift from ALL fossil fuels immediately, and generate renewable energy instead. This project has taken years of considered feasibility studies and I support it going ahead.
476	Object	I do not consent to the proposed wind towers being constructed on the Scott River. The risk to Molloy Island to bush fire potential is too great and it is difficult enough presently in getting home insurance cover on Molloy. The threat to the Scott River, hence to the iconic Blackwood River, as the Scott spills into the Blackwood, would be an ecological disaster. The Real estate value to properties on Molloy could also be de-valued as very few people wish to live near a wind tower. I strongly advise the Augusta/Margaret River shire to reject SYNERGY`s proposal.
477	Support	The Wind Farm is sensibly located and will have minimal impact on the majority of the residents of the AMR shire. Renewable energy is vital to the world's future and we have a collective responsibility to do our share. As owners of 2 Brindley Street, Augusta my wife Susan and I strongly believe it is the AMR Shires responsibility to support this proposal.
478	Support	Excellent proposal. The AMR shire should support this proposal as part of its collective responsibility towards ensuring greenhouse emissions are lowered asap.
479	Support	The world's future climate needs action NOW. The bulk of the transmission lines (thanks to BHP's prior work) are in place thus saving a NIMBY reaction on that score & easy accessibility! The vast majority of the site has already been "spoiled" by humans; so saves some other undisturbed site from having to be selected as we try to get to net zero. Whilst a few number of people are affected by being relatively close to the turbines (& get some monetary compensation), the majority are kms away &, in my view, they are not unattractive looking at them (your Augusta picture at the start of this screed). One is NEVER going to satisfy everyone, but in this case by far the MAJORITY will benefit hugely from its power production, so a WIN WIN for the vast bulk of the community & the CLIMATE.
480	Object	I object to this application entirely on Amenity grounds and submit that the site should be moved 20 km further east. Or to Gage Roads (see below), If the development is built on the current site the turbine blades will be visible from Augusta township and many contiguous areas. That will scarify very high value historic, natural and visual Amenity of the Augusta area. Ie, people's understanding, enjoyment of and expectations of Place.

		I respectfully submit that in some cases (and this is one of them) Amenity must outweigh the pragmatic. I suggest that the days are gone when wind power could be flagged through and almost admired as industrial curiosities. Weight must be given to whether these things can actually be treated as a necessary evil and hidden from view. This is most decidedly the case with the Scott River (sic: East Augusta) proposal. If I am wrong, build this development on or near Rottnest Island to be admired and celebrated by Perth-dwellers. In closing I would like to refer to the concept of Social Capital. The existing visual, natural and historic Amenity of Augusta has enormous value. The residents and other friends of the district are being asked to donate a substantial amount for the pragmatic advantage of others who make no contribution or sacrifice. In that regard, I recently became aware of data that shows approximately 75% of carbon emission reductions and offsets (sacrifices) have been made in rural Australia compared to 25% by urban Australia. The cessation of native logging has been a major component of the rural contribution. So substantial social sacrifices can be seen to have been overwhelmingly made by the minority for the benefit of the majority. It is time for the latter to start making sacrifices; who knows, perhaps their Amenity can be sacrificed for once? There is plenty of room in the ocean off the Metropoltan beaches. Draw a line in the sand here. Protect valuable Amenity. It is worth it.
481	Object	Eyesore, health reasons
482	Object	I vote no to the proposal I don't like how it will look it will be an eyesore to the landscape
483	Indifferent	As a farmer out Nillup I most likely won't be directly effected by the wind turbines. However as a local volunteer Bush Fireman I'm great concerned as to the potential risks of this project causing fires to the South East of our communities. Mostly what does concern me is the speech that Senator Tyron Whitten gave in Parliament that highlighted the seeming cosy relationship between Shire Council, AMRCCE and Synergy. What started as a small scale Clean Energy Project or at least that how it was sold to the public, however it was show by Sen Whitten that it was always been designed to be this huge scale project. This kind of deceitfulness concerns me greatly Whilst the location for such a project is probably ok, the scale is in my opinion just too large for the greater communities to accept. Possibly a project half the scale would be acceptable. I guess that is why I'm indifferent to the project at this current stage however I shall start to follow this Proposal a lot more closely.
484	Object	

485	Object	
486	Support	I support the proposal. However I understand why some may object. My concern is that there is apparently very little in this for the local community. The financial Community contribution is minuscule. This is especially so when considered in light of the ongoing and serious reliability issues in Augusta. I can't count the number of outrages we continue to suffer. As an end of the line community this is serious. There are many end of the line solutions, like virtual power plants, community battery's etc which could be adopted by Westen Power but there has been little action. If Synergy and WP could work together to resolve this issue as part of this proposal I am sure the proposal would garner much stronger community support.
487	Support	Necessary renewable power project despite a minor change to the skyline
488	Support	generating from wind effectively replaces the burning of coal. voting against wind power is effectively voting for coal fired power generation, the most effective greenhouse gas emitter and environmental polluter of all our industries.
489	Indifferent	My concerns are Acid sulphate soils: will the site locations be altered to avoid the acid soils and at what point in the process will this be conducted. Shadow flicker: Feasibility assessment findings – part 2 states that the shadow flicker is expected to be less than 30 hours per year. Is this per turbine? Near buildings? Or in general farm areas. What is the recommended distance that houses be built to turbines, is this distance considered when putting turbines near boundary fences. Noise from turbines, the feasibility study doesn't mention the noise from the turbines and hence distance from houses.
490	Support	I fully support the wind farm proposal. I'm not offended by the view of the turbines, quite the opposite. I don't believe there will be any side effects from the turbines. WA needs more power supply and this is a good addition to existing supply stations. WA is a windy state and perfect for wind power. I say yes to wind turbines in WA, in Scott River and in Geograph Bay. We all need electricity.
491	Object	This proposed Scott River wind farm/factory will be a significant industrialisation of a picturesque, pristine, rural environment of quiet farmland and native bush well known for its diversity of flora and fauna. From our property the visual pollution will be significant and not inconsequential hence it is our considered opinion that resale property prices of our property and 90% of Augusta will be adversely affected. Another aspect to this development is the guaranteed high risk of environmental damage from acid sulphate soils proven to be present in the development envelope. To hope to control this with lime application as the Synergy proposal states is nothing short of naive when it comes to the cavalier approach of most construction contractors, hence environmental damage to the Blackwood River estuary is almost certain with result death of the estuary, an important breeding ground for fish, birds etc. The aspect of noise pollution is also of concern given we will be at 10 km direct line of sight from the development and that current proven scientific data about the adverse affects of this pollution is uncertain. There is no doubt that the wind resource for this wind farm/factory is very good and that the location adjacent to a HV transmission line is also very good, however to use these as sole justification for the project over other far less risky and remote locations is short sighted at best when the environmental risks are so high.
492	Object	
493	Support	I am delighted regarding wind farm Wa needs to pull its weight in investing in renewable energy I am incredulous about current anti windfarm movement spouting about biodiversity

		It is farm cattle land owner by wealthy white baby boomers who climate change will no affect I am very pro the wind farm!
494	Support	I am strongly in favour of ANYTHING that can be done to mitigate greenhouse gas emissions.
495	Support	The perfect place to have a Windfarm. So much less environmental impact than the windfarm proposed on the coastal dunes. High power line already there. We have had a 2.5kw WTG on our property for 30 years which was a wonderful asset. Only killed one bird, a Kookaburra in that time.
496	Support	Overall: Supported. • Renewable energy sources are essential for moving us forward to a net zero future, and reduce the significant impacts of climate change exacerbated by fossil fuel electricity production. • The Beenup site is largely pre-disturbed / already cleared and minimal additional clearing is required. • The Shire of AMR needs to add renewable energy into the mix, population is increasing and renewble energy sources are currently minimal. • The site has a favourable and regular wind supply, making it suitable for wind turbines. • This development should go hand in hand with education / awareness / advocacy from the Shire / Synergy around tips and techniques to REDUCE ELECTRICITY CONSUMPTION and PROMOTE ENEGY EFFICIENCY (i.e. demand side management).
497	Support	Any renewable electricity will be welcomed and of benefit to our community. As it is to be constructed in cleared farmland with minimum tree removal it is a bonus. Bring it on.
498	Support	The benefits of the proposed renewable energy would significantly outweigh economic, social and environmental impacts in this case.
499	Support	Renewables are the only way forward. We have to replace fossil fuels because we have reached so many tipping points with climate change. I attended the synergy presentation and I feel secure in the knowledge that this wind farm has been adequately researched and assessed in order to mitigate the factors that concern the public such as noise, acid sulphate soils, risk to biodiversity etc.
500	Object	I recently purchased this property in Kudardup and have a direct and material interest in the amenity, landscape, and environmental values of the surrounding area. My grounds for objection are as follows: 1. Visual amenity and landscape impact The proposed turbines will be highly visible from my property and will dominate views from my residence and land. This represents an unacceptable loss of rural/residential amenity and will significantly detract from the scenic values that were a key factor in my decision to purchase the property. 2. Property value impacts There is substantial evidence from both Australian and international studies that large-scale wind farms located in close proximity to residential properties can negatively affect property values. Given the recency of my purchase, this represents a material financial detriment. 3. Noise impacts I am concerned that operational noise (including low-frequency noise and amplitude modulation) from the turbines may exceed acceptable limits at my residence, particularly given prevailing wind directions and the proximity of proposed turbine locations. 4. This development contributes to an unacceptable concentration of industrial-scale infrastructure in what is currently a rural/residential landscape. 5. Lack of social licence / community division The proposal has generated significant concern among local residents and appears to lack broad community acceptance. For the reasons outlined above, I respectfully request that the application be refused

501	Object	I strongly disagree with the installment of these wind farms. Both for environmental and community reasons. This is another land grab and money making scheme under the desquise of "green" energy.
502	Object	Lack of transparency has made it hard to inform an acurate decission.
503	Object	This proposal is an environmental disaster if it is allowed to happen. I do not understand the thinking of the proponent. Why destroy a pristine location by the construction of 20 wind turbines to a height of 250 metres plus the associated infrastructure and transmission lines (overhead or underground) in the name of saving the planet? Not to mention the environmental damage done by the construction of the turbines and infrastructure on hand off the site. To my mind this is extraordinarily short term thinking. Inevitably these turbines will deteriorate in time and with use and will need to be disposed of and replaced with new turbines. They are not sustainable. I think that Synergy would be better using their resources to investigate alternative sources of energy if they really need them. Already Synergy receives more energy from roof top solar panels than it needs or can handle hence the low feed back tariff of a token 2 cents per KW.
504	Support	Important project. Strongly support
505	Object	I don't want the wind farm in Scott River mostly due to the environmental impact. Also, it will be a blight on the pristine sky line. I also have concerns with the infrasound.
506	Support	All in favour. I just hope substantial bird studies are done.
507	Object	Why would you want decimate native forest and bushland for these ineffective/non degradable ugly turbines. The majority of local Augusta residents clearly object to this
508	Object	I write not as a permanent resident of Augusta, but as a regular visitor. I object strongly to the proposed wind farm at Scott River. It is a blight and eyesore, and I wish to oppose it any way i can. Given such strong community opposition to the proposed wind farm, it is unconscionable to go ahead with the tallest wind farm in Australia, at 250m. This will affect my future in Augusta. I will not holiday there anymore, nor will my extended family. We do not wish to suffer the effects of low-frequency noise. Wind turbines are not 'green', nor do they have low environmental impact. To quote William Blake in his 1804 poem 'Jerusalem', they are "dark satanic mills".
509	Support	
510	Object	This will have disastrous effects on our local community. I strongly disagree with it going ahead. I have a 6yro, pay rates within the shire and have grown up here. I really hope the Shire will actually take into the consideration the community and how this will effect everyone in the future. It is not the right choice to build any wind farms in this Shire.
511	Object	Augusta is a tourism eco hotspot! My business of selling this ECO Vista across my holidays homes and is vital to my family run business. Experience Augusta hosts more than 50 Holidays homes in Augusta alone, with many that take in the view across the river. Whilst I am not opposed entirely to wind sourced power I feel like this project is going to destroy the pristine nature and beauty of our region. I would like to see it shifted to further back so that our town can remain with the beautiful outcrop which tourists flock here for, so that it can not

		been seen or heard. Further more I would add that the project be scrapped altogether, encourage more people to sustain their own properties and go off grid! Why should we the country folk bear the brunt of the city folks needs. It would be farer to place these in state forest which then is for All West Australians.
512	Support	
513	Support	I completely support the proposed wind farm at Scott River, to help with climate change
514	Support	We are not directly affected by the proposal (just added our residential address because an address is required). We fully support the proposal.
515	Object	Visual. disturbing ocean & farm land & ground water supplies which will affect Blackwood River We have Coal & Oil & lithium available which could be used more efficiently
516	Object	The visual impact is disturbing And the manufacturing carbon foot print is wreckless
517	Support	The proposal makes sense from both a location (transmission lines, sparsely populated, windy) and environmental point of view. It should be fast tracked.
518	Support	Huge emotion based misinformation campaign running in local social media. Only accurate negative is that it will be visible. I can live with that. Very little land clearing for turbines.not requiring significant clearing for power lines/ poles to feed the grid. Hard to imagine a site with less environmental damage.
519	Object	I am totally opposed to this proposal. Firstly it has been carefully pushed by Shire officers giving large sum of money and then same Shire officers masquerading as AMRCCE. There will be eagles and other birds killed, despite what the Synergy says, bitd kill is unavoidable. The beautiful view across thousands of acres of pasture and bush will be destroyed by these monstrosities. The noise, subsonic noise and throbbing can be heard kilometres away and is upsetting to human and animals. The disturbance to local infrastructure of building these massive towers will be huge. The blades are only going to last a few years, maybe 20, then they will be replaced, or the project abandoned, and there is no recycling of blades, they will be huge landfill. It will make our electricity more expensive, despite what we are told by politicians, we clearly see that the incresed penetration of so called "renewable energy" has done nothing but increase our bills. It is not continuous energy and will need full backup for calm nights, which will be more expensive again. It is foreign made and owned. It is great for the Margaret River greens, NIMBY, but horrible for us Augusta residents. But sadly I have learned that this is just a box ticking excercise, to show community engagement, and will go ahead despite all our local objections. And just like the Beenup mine, which was totally opposed by all Augusta residents, and went ahead anyway, and created a huge environmental disaster, and had to be shut down because it was not economic. I firmly believe that this proposal will be just the same, with no government handouts to make it financially viable, it will do nothing but destroy our beautiful unspoiled environment.
520	Support	Carbon emissions must be reduced urgently. Wind and solar power are the best way to achieve this. The need to act now means that NIMBY ism is inappropriate and harmful. I have read the information available and I unequivocally support the Scott River proposal

521	Support	Anthropogenic climate change is a far bigger threat to the planet, our local environment, and humanity in general than any RE development. Political timidity is allowing the denialists' misinformation campaigns to undermine sensible processes for positive action on development of renewable energy. We do not have time to waste. There is a cost and there are risks with any project. Manag them and get on with it.
522	Support	I would like to see Augusta Margaret River powered by %100 renewable energy, as we are blessed with the wind and sun for this to be possible. As an ecologist myself, having read the feasability assessments, I believe the design is very environmentally conscientious, with impacts minimised, particularly with regards to threatened species and ecological communities. I think wind farms aesthetically beautiful, so no affect tourist and are something we should be proud of as a community. I hope this project can pave the way for more wind farms and renewable energy projects in our community.
523	Object	The proposal is considered not to have any regard to an inability to appropriately control the Acid Sulphate Soils and particularly noting both the failed BHP Beenup Mine and Cable Sands Jangarup Mine. The proposed site exhibits the same soil profiles that both BHP and Cable Sand could not control. Hydrology and the affect on the Blackwood River is a serious issue. The site is located within an area of endangered fauna and flora. The site is located within close proximity to residents of both Molloy Island and Scott River. The noise from turbines has an adverse effect on health and the quality of life. The visual affect from the Augusta township is totally unacceptable. and is proven to cause annoyance, stress or sleep disturbance. The affect of wind turbines is not just direct but also indirect What are the future plans of Synergy to further extend the wind turbines The "drop in sessions" by Synergy were arranged mid week when most people are working. Why was there not a representative present during the weekends to ensure all residents of Augusta had the opportunity to express their concerns. This proposal is poorly conceived and executed and should not proceed. It will be a burden for both current and future generations. Who will remediate the site when it becomes contaminated. Who will remove the turbines when they are obsolete. They are not warranted in such a pristine environment.
524	Object	Totally object to this proposal - there is nothing green about wind farms whilst they might sound like a good idea. These are an eye sore to the environment not the mention environmental destruction required to facilitate these structures + they are for the most part not recyclable, their ultrasonic noise interferes with wildlife - birds / marine & no doubt mammals. For the power they generate vs cost & longevity there's no justification. If we want clean energy in the 21 century for our future generations we should be focusing on the safe nuclear energy that has a far greater energy production capability/longevity & negative impact on our environment.
525	Support	While WTG might not provide the best vista there is no question that we need to create electricity generation. We don't want coal or gas. Solar has the same arguments against as WTG + effects of extraction of rare earth used in construction of panels. WTG seems like the most feasible option.
526	Object	This project has the potential to be an environmental disaster. We know you are aware of the acid sulphate soils in the area and the 25 years it has taken to rehabilitate the Beenup mine area. And now you want to destroy the countryside, the land, the rivers, for an unreliable, expensive, intermittent power supply that is anything but green and renewable. This net zero, so called renewable energy,

		journey that our government is on will be a blight on the landscapes of Australia for generations to come. Failing wind turbines, smashed solar panels, tonnes of concrete and steel buried in the ground, leaching chemicals and minerals into the ground, destroying arable land, not just in Scott River, but all over Australia. It is lunacy of the highest order. And I object, object and object to the whole concept. I live on Molloy Island, a peaceful, quiet, pleasant way of life and a caring community. You say the sound won't affect us, well maybe not, I would hope not. But the fear is for the waters surrounding us, the Scott River, the Blackwood River, which could easily be contaminated and cause irreparable damage to the ecology of the district. I'm no expert, I'm not a scientist. But I have seen a man who has spent 25 years involved in the rehabilitation of the Beenup mine, end in tears because of his fears for the damage this project could cause.
527	Object	As an Augusta resident, I have attended the community briefings provided by Synergy and have found that the information provided to this point has been vague on detail, and short on supporting data. I understand the proposal is in early design phase, but dsespite numerous requests the Synergy team have been unable or unwilling to provide any information on pile design and potential impacts to Acid Sulphate Soils, other than a couple of simple sketches. Whilst I understand the attraction of the site in terms of utilization of the old transmission line and associated transport infrastructure, Synergy have not provided any information on the process for engagement of a commercial operator for the wind farm if approved, and they have refused to provide information on how they will ensure the operator holds liability for the decommissioning and site remediation at end of commercial viability, to ensure that the Shire residents, particularly us in the areas affected by this development, are not left with a huge decommissioning bill or eyesore on our un-spoilt southern coastline. I believe that the size and number of turbines present a visual pollutant for Augusta residents, and will detrimentally affect tourism in our town. This proposal is vastly different from the original concept discussed when the Shire was developing concepts for a community-supported wind farm. I strongly hope the Shire supports a much smaller development, with turbine heights and blade sizing reduced to minimize impact on wildlife and visual amenity. Whilst I am supportive of a staged transition to renewable energy supply within the Shire, I would ask that the Shire reject the current DA proposal, in favor a smaller development more in line with community requests and sentiment.
528	Support	It is a good use of a piece of land that is unsuitable even for a mine. The level of scare mongering and misinformation by the naysayers is absurd. The community should embrace the chance to help in providing green energy with a resource that seems plentiful, namely wind. I am embarrassed by the level of "NIMBYISM" in a supposedly green area.
529	Object	I write to lodge a formal submission on Synergy Renewable Energy Developments Pty Ltd's (SynergyRED) Development Application (DAP pathway) for the proposed Scott River Wind Farm. My wife and I are currently considering both commercial and residential developments in the town centre and on Turner Street and this major windfarm development would have a significant impact on the amenity and value of these developments to the point where we are re-considering our significant investments given the substantial costs involved in completing our projects. In particular, we are looking to invest in creating an arts studio and cultural centre which we believe will become an important cultural hub and drawcard to the town which is currently lacking in this regard.

		Our objection is based on the scale and nature of the proposal, the lack of sufficient detail in the Development Application to allow proper assessment, and the significant long-term impacts the development would have on the environment, including groundwater and impact of acid sulfate soils, visual amenity, rural character, community wellbeing and future land use in the Scott River and Augusta region. The Development Application seeks approval of a largely conceptual proposal. Key elements—including the number, location, height and specification of turbines, construction methodology, foundation design, dewatering volumes and environmental management measures—have not been finalised. As a result, the application does not provide a reliable basis for assessing worst-case impacts or for imposing effective and enforceable conditions on a development that would operate for several decades. The proposal poses serious environmental risks. Large-scale excavation, trenching and turbine foundations will require piling and dewatering, with the potential to alter groundwater flow paths and water table levels. The Scott River area is known to be sensitive, with shallow groundwater and acid sulfate soils. Disturbance of these soils through excavation or groundwater drawdown can generate sulfuric acid and mobilise heavy metals, causing long-term damage to soils, waterways, vegetation and agricultural water supplies. The application lacks a site-specific acid sulfate soil investigation, a detailed hydrogeological assessment, and a robust dewatering and management plan with monitoring, trigger levels and emergency responses. The scale of earthworks is substantial, including approximately 30 km of onsite roads, 30 km of cable trenching, and turbine foundations involving thousands of tonnes of excavation per turbine, potentially exceeding 7 metres in depth. Despite this, no clear method is identified for managing dewatering volumes or mitigating cumulative impacts across the site. Visual impact is a major concern. The proposed turbines would exceed the height of Perth's tallest buildings and introduce multiple skyscraper-scale structures into a rural landscape. This would fundamentally alter the character of the area, dominate views from surrounding properties and roads, and cause long-term loss of amenity. Structures of this magnitude do not "blend in" to a natural rural landscape. They fundamentally industrialise it. The photomontages provided are limited and do not adequately convey the true scale, worst-case or cumulative visual impacts. Approval of this development would also effectively sterilise surrounding land, constraining future rural, residential and tourism uses for decades. The proposal does not demonstrate compliance with the intent of the Shire's Town Planning Scheme, which requires wind turbines to be designed and sited so as not to detract from visual amenity. Even the developer acknowledges that the turbines will have significant visual impacts. Noise, shadow flicker and general disturbance have not been adequately assessed, particularly given the absence of final turbine specifications. The application does not provide confidence that impacts on nearby residents will be acceptable or enforceably managed. Community consultation has been inadequate. Many affected landowners report no direct engagement, and the application does not clearly document community feedback or demonstrate how concerns have been addressed. The first direct correspondence I received from the Shire about the proposal in its current form was a one-page letter sent less than a month ago. Why has the community consultation period for such a major infrastructure proposal in such an environmentally sensitive area been so short?? Finally, the application fails to demonstrate clear economic or environmental benefit to offset these impacts. Claims of up to 200,000

		tonnes per annum of CO_2 savings are unsubstantiated, with no explanation of how or where such reductions would occur. The proposal is silent on impacts to tourism and land values as well as any planning or response plans for potential flow of acidic water into the Scott River and ultimately into the Blackwood river mouth at Augusta. What significant benefits and assurances will Augusta get for the environmental risks and loss of amenity. Will this windfarm grow in the future and what other alternative sites in the Shire have been seriously considered? Will the development alleviate the constant power outages in the Augusta? For these reasons and queries, I respectfully request that the Shire of Augusta Margaret River recommend that RDAP refuse the application, or at minimum return it for major further information and re-advertising before any Responsible Authority Report (RAR) is finalised. Please confirm receipt of this objection and please feel free to contact me to further discuss.
530	Support	Thank you for inviting us to comment on this planning application. Based on the information provided, we fully support the creation of a wind farm.
531	Object	Fire danger, surface water flow, loss of black cockatoos, noise, loss of property value
532	Support	All for this develoment, what a wonderful way to generate clean energy. Sad to see so much misinformation out there. Sweden's windfarms account for over 20% or the overall energy quota. And they are really quite magestic things.
533	Object	Have your say: My objection to the proposed wind farm is based upon the visual impact industrialising the image of Augusta and destroying the pristine wilderness and natural beauty outlook that makes the town so appealing. I was born in Augusta and raised on a family farming property on the Blackwood River fronting the Hardy Inlet only a few kms from the town. The Blackwood and Scott Rivers are a huge part of what makes this area so special and the proposed wind farm with massive towers some 250 metres tall in a locality with proven high acid sulphate soils provides an unacceptable risk to the environment in so many ways. This is in addition to being so highly visible from most of Augusta and surrounding areas along the Blackwood and Scott River. I am willing to be involved in further discussions and public forums which I consider most necessary on an issue so important.
534	Object	I write on behalf of Grevillea Blackwood Pty Ltd t/as the Augusta Hotel whose new owner has been engaged in developing a strategic vision for the property in order to create a high-quality tourism establishment that leverages Augusta's unique natural beauty and coastal appeal.

		It has come to our attention that a large-scale wind farm is proposed for the Scott River/ East Augusta area, involving turbines up to 250 metres in height. While we recognise the importance of renewable energy and support Western Australia's sustainability goals, we have serious concerns regarding the potential impact of this project on the area's tourism economy and community character. Our key objections and concerns are as follows: Visual and Landscape Impact The proposed turbines, among the tallest globally, will significantly alter the iconic coastal vistas that attract visitors to Augusta. This visual intrusion is incompatible with the premium tourism experience we and other stakeholders aim to deliver. Tourism and Economic Consequences Augusta's economy relies heavily on tourism. Any development that diminishes the area's natural appeal risks undermining local businesses, employment, and long-term economic growth. Community and Investor Confidence This project is causing significant concern for the local community and for us as an investor in the region given the many millions of dollars envisaged for the Augusta Hotel development and construction. We respectfully request that the decision-making process fully considers these concerns and that the adverse visual, economic, and environmental impacts determine that the Wind Farm project is in fact proposed in the wrong location. At present our commitment to Augusta remains strong, and we hope to continue developing projects that enhance the region's appeal. To achieve this, it is important that future developments complement Augusta's unique character and support its long-term tourism potential. We would welcome the opportunity to participate in further consultations and provide detailed input on this matter.
535	Object	
536	Object	Submitted on behalf of thirty-six (36) directly impacted landowners within 5 km of the proposed turbine array (all landowners copied into the email submitting this submission) 18 December 2025 1. Introduction and Position We, the thirty-six (36) undersigned landowners (set out the foot of this submission), write to formally object to the Scott River Wind Farm development application in its current form. Our properties lie within the immediate impact zone of the proposed 20 turbine, 250 metre high industrial facility, and we would bear the greatest cumulative impacts across noise, amplitude modulation (AM) including excess amplitude modulation (EAM), visual intrusion, environmental risk, agricultural disruption, and long-term amenity loss. Our objection is based on the individual impacts and risks we as adjacent landowners will be exposed to; and further, the absence of cumulative spatial conflict modelling, procedural

		fairness, and baseline technical assessments that are essential for determining whether the Scott River landscape is capable of absorbing a development of this scale. The application, as submitted, does not meet the standards of due diligence, transparency, community engagement, environmental protection, social licence, or evidence-based assessment that the Shire should require before considering approval. 2. Key Grounds for Objection 2.1 Inadequate Engagement and Procedural Fairness Despite the scale of the proposal, and the proximity and severity of impacts to our properties, Synergy has not engaged with us directly. No site-specific assessments have been provided to us, and no individual consultation has occurred. This is not a minor oversight. It represents a procedural-fairness failure: · directly impacted residents were not given the opportunity to understand or respond to site-specific risks · no individual noise, AM, visual, hydrological, or agricultural impact assessments were provided · the proponent relied on generalized information sessions rather than meaningful engagement This approach is inconsistent with the principle of informed consent, falls below contemporary expectations for large-scale renewable-energy development, and undermines community trust.2 Engagement must be consistent across all potentially aU'ected landowners; selective or confidential approaches undermine procedural fairness and community trust. Given the Shire's own Engagement Report shows strong concern about transparency and consultation quality, the absence of direct engagement with the most aU'ected landowners is a critical deficiency. 2.2 Absence of Cumulative Spatial Conflict Modelling The application does not include the modelling required to determine whether the Scott River landscape can absorb the combined impacts of: · noise and AM and EAM propagation · visual dominance from 250-metre turbines (physical and lighting) · hydrological and groundwater disturbance · biodiversity fragmentation · fire-risk constraints and aerial-firefighting limitations · agricultural operational impacts

		· construction traU̓ic and heavy-haul logistics These impacts do not occur in isolation. They overlap spatially and interact in ways that can only be understood through cumulative spatial conflict modelling — a standard requirement in many jurisdictions for developments of this scale. Without this modelling, neither the Shire nor the community can meaningfully assess: · landscape suitability · cumulative risk · compatibility with agricultural land use · environmental resilience · long-term community impact The absence of this modelling is a fundamental flaw in the application. 2.3 Incomplete and Inadequate Noise and AM and EAM Assessment The application relies on standard acoustic modelling that does not address: · amplitude modulation (AM) including excess amplitude modulation (EAM) · low-frequency noise · infrasound · downwind propagation under prevailing SE winds3 · stable night-time atmospheric conditions · cumulative eU̓ects of 20 turbines operating simultaneously AM and EAM are internationally recognized as the most intrusive and complaint-generating characteristic of wind farms. Given the turbine size and downwind orientation of our properties, AM risk is inherently elevated. The application provides: · no independent AM or EAM analysis · no mitigation plan · no curtailment triggers · no commitment to independent monitoring This is not adequate for a development of this scale. 2.4 Landscape, Visual, and Environmental Impacts Visual The proposed turbine height (the highest in Australian and one metre higher than the tallest skyscraper in Perth) and density would fundamentally alter the rural landscape character of Scott River, Courtenay, Nillup, Alexandra Bridge, Warner Glen and surrounding areas.

		Night time landscape The district also contains some of the darkest night-sky conditions in the South-West, an environmental and cultural asset that would be significantly degraded by aviation and operational lighting associated with the proposal. The application does not adequately address: • cumulative visual impacts (including physical and night-time lighting/skyglow) • sequential views along key roads and recreation areas • impacts on iconic landscapes and tourism values • impacts on the region's exceptional dark-sky environment, despite the WA Government's Position Statement: Dark Sky and Astrotourism requiring dark-sky considerations to be applied at all stages of the planning process. The attached "Lower Blackwood Dark Sky Assessment Report" authored by Dyna JeU'ery sets out the case for the Lower Blackwood to be internationally recognised as a world class Dark Sky Reserve, noting that the estimated Bortle Class 1–2 conditions place the Lower Blackwood in the same darkness category as some of the most celebrated Dark Sky reserves in the world. Environmental risks Environmental risks are insuU'iciently assessed in the application. The Scott River district forms part of a nationally recognized biodiversity hotspot, containing species and ecological4 communities that are already highly pressured and vulnerable to further disturbance. The proposal does not provide the level of technical evidence required for a development of this scale. Specifically: • the region contains extensive high-risk acid sulphate soils (ASS), including areas with historical failures and multiple precedent environmental incidents in the South-West arising from ASS disturbance. • it is as matter of public record that Australia's largest company, BHP with all its resources and expertise, was not able to manage acid sulphate risks at Scott River. After spending ~$300M to develop the Beenup Mineral Sands mine in Scott River, BHP had to permanently shut the mine after only 2 years of operation in 1999. The land hosting the mine remains, after more than 20 years, classified as "remediated for restricted use" under the Contaminated Sites Act 2003. We note that based on the Synergy's Proposed Wind Farm layout, as attached to the Shire's letter to landowners dated 19 November

		2025 for Planning Application P225771, that the proposed Wind Farm is immediately adjacent the failed mine site and two regulated contaminated sites, and that two of 250 metre high wind turbines are to be located 300 to 400 metres from the failed mine site and one of the contaminated sites while a third turbine is to be located ~800 metres from the second contaminated site. Attached for reference are: 1. “Acid Sulfate Soils and the Scott River Wind Farm Report” authored by Dyna JeU’ery providing a scientific literature review and assessment of Environmental Risk, Precedent, and Project Feasibility. 2. extracts of DWER’s Contaminated Sites Act 2003 for 886 Scott River Road, Scott River (site ID 25934) and for 4254 Scott River Rd, Scott River (site ID 25933), setting out the nature and extent of contamination, the restrictions on use and the reasons for classification. • groundwater systems are shallow, highly permeable, and hydraulically connected across the district • the site includes tributaries and drainage lines feeding into the Scott and Blackwood Rivers, and the risk of acid and sulphate concentrations entering these rivers as a result of construction activities of 20 turbines of more than 250 metres in height, noting the substantial foundations that will be required for these turbines • the area supports vulnerable flora, fauna, and ecological communities that are already under significant pressure from fragmentation, hydrological change, and cumulative land use impacts • biodiversity corridors including ground-based and aerial movement pathways would be further fragmented by turbine pads and structures, access roads, and cabling, with no avoidance or mitigation hierarchy demonstrated5 • no assessment is provided for lighting impacts, skyglow, dust-related sky degradation, or impacts on nocturnal fauna, despite these being required considerations under the State's Dark Sky policy Given the sensitivity of the Scott River and Blackwood River catchments, the vulnerability of local species, the region's exceptional dark-sky values, and the history of ASS-related failures in the district and broader South-West, independent hydrogeological, ecological, lighting/sky-quality, and ASS assessments should be mandatory prerequisites for any consideration of approval. These assessments are not included in the application.

		2.5 Agricultural Impacts and Land-Use Compatibility The Scott River, Courtenay, Nillup, Alexandra Bridge and Warner Glen districts are a productive agricultural region. The application does not demonstrate that the proposed development is compatible with: · livestock wellbeing and management · aerial spraying · organic certification · biosecurity requirements · current and future farm and business planning, family or retirement dwellings Industrial-scale turbines introduce permanent constraints on agricultural operations, and cause documented behavioural avoidance, stress responses, and disruption to grazing and movement patterns in livestock. These impacts are not adequately assessed or mitigated. Further, the proposal would impose new constraints on our ability to build dwellings, tourism ventures, agricultural infrastructure, or family and retirement homes on our own land. These reverse-amenity impacts arise solely from the introduction of an industrial-scale facility adjacent to long-established rural properties and would materially limit our future development potential despite our prior tenure. 2.6 Lack of Benefit-Sharing or Compensation for Non-Host Neighbours The application oU'ers no neighbour benefit-sharing scheme or compensation for non-host landowners, despite the fact that we would bear the majority of the impacts. In comparable jurisdictions, neighbour benefit-sharing is standard practice for large-scale wind developments, recognizing that non-host landowners experience significant amenity, landscape, and operational impacts. The absence of such a framework creates a clear inequity between host landowners, who receive financial compensation, and neighbouring residents, who receive none. Benefit-sharing is a recognized component of social licence and a key mechanism for reducing conflict and ensuring that the burdens and benefits of development are more evenly distributed. Any such framework must be transparent and must not include confidentiality clauses that restrict community understanding or participation.6 2.7 InsuU'icient Safeguards for Long-Term and Post-Operation Risks The application does not include: · a secured financial guarantee or bond or rehabilitation fund · independent auditing of decommissioning costs

		· full foundation removal requirements · commitments to restore agricultural productivity or any aUected environmental or ecological aspect · transparent operational monitoring or enforceable monitoring controls Given the long-term risks associated with industrial infrastructure, these omissions are significant. 3. Conclusion We do not oppose renewable energy. We oppose a major industrial-scale proposal that would fundamentally alter the rural, ecological, agricultural, and social character of Scott River, Courtenay, Nillup, Alexandra Bridge, Warner Glen and surrounds; that lacks the cumulative impact modelling, procedural fairness, and evidence-based safeguards required for transparent and defensible decision making; and that would impose significant, long-term, and irreversible burdens on a small group of private landowners without their meaningful and informed consent or any form of equitable compensation. The Scott River Wind Farm, as currently submitted, does not meet contemporary standards of due diligence, social license, environmental protection, agricultural compatibility, or community fairness. It fails to demonstrate that the landscape is capable of absorbing a development of this scale, risks that may emerge and it fails to protect the legitimate expectations and rights of existing landowners. It also fails to address the region's exceptional dark-sky values or meet the requirements of the WA Government's Dark Sky and Astrotourism Position Statement, and it provides no credible assessment of severe ASS risks despite well-documented precedent failures in the South-West arising from ASS disturbance. 4. Request for Decision: For all the reasons set out in this submission, we respectfully request that the Shire: Refuse the application Signed, the thirty-six aUected landowners located within 5 km of the proposed turbine array

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
Department of Planning, Lands and Heritage (DPLH)	The following comments and attached photos are provided on the visual impact of the proposed Scott River wind farm and the proponent's Landscape and Visual Impact Assessment (LVIA). The comments are made with reference to the WAPC *"Visual landscape Planning in Western Australia – a manual for evaluation, assessment, siting, and design"* and the Department of Planning, Lands and Heritage GIS "InQuiry", as well as knowledge of the area. The viewshed mapping indicates that the turbines may be extensively visible. However, it is likely that roadside trees would obscure views from two of the three major roads to Augusta (Bussell Highway and Caves Road), and views from narrow, treelined secondary roads oriented generally towards the site eg Challis Road, and Fisher Road, which is used to access the settlement on Molloy Island. Analysis using Google Streetview images indicates that the greatest visibility is likely to be from: • private residences in Augusta which have northeasterly views, comprising o elevated sites o sites along the shore of the Blackwood River, Hardy Inlet, or ocean; • public recreation sites on the western banks of the Blackwood River (eg the river end of Howe Road), Hardy Inlet (eg end of Ellis Road) or open ocean (eg Flinders Bay); • from western portions of Hardy Inlet; • from the open ocean. It also appears that there will also be significant visibility from Augusta's main intersection at Blackwood Avenue and Ellis Street, other locations along Blackwood Avenue, and from Scott River Road and Governor Broome Road, which are at the project site and are used to access East Augusta and more distant coastal areas eg for recreational purposes. **<u>Assessment report - method and conclusions</u>** The method used for the assessment is generally suitable, with two exceptions as below. • several important viewpoints have been overlooked in analysis: 1. Travelling east along Scott River Road leaving East Augusta, in locations where the vegetation is naturally low (see attached Photo 1); 2. Main street intersection, Ellis Street moving downhill into the intersection with Blackwood Avenue (Photo 2 – two examples); 3. Main town foreshore opposite East Augusta (Photo 3); 4. Albany Terrace, close to the opening between Hardy Inlet and the ocean (Photo 4).

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	• reference to the three primary visual management objectives as being 'protection', 'best practice', and 'engagement', but the third objective advised in the WAPC's manual is 'enhancement', not 'engagement'. It is beneficial to identify potential engagement opportunities, but this should occur elsewhere in the report and 'enhancement' should be addressed. This objective would justify introducing roadside tree planting to Scott River Road and Governor Broome Road, within the project site, as it would reduce turbine visibility from the closest viewpoints, and would enhance environmental values in the landscape. The conclusions reached in relation to the analysed viewpoints are supported. It is noted that, of the 12 viewpoints analysed, the significance of the visual impacts was determined to be 'high' for four points, 'moderate-high' for five points, 'moderate' for two points, and 'negligible' for one point (which mapping showed was not within the viewshed in any case). Overall, the impact on the key selected viewpoints within and around the town of Augusta could correctly be described as moderate at the very least, but frequently high. **Further analysis advised** The significance of the project's potential visual impacts on the tourist town of Augusta warrants further work by consultants: 1. Provision of photomontages for the additional viewpoints listed above, possibly using a simpler method to produce wireframe images but with vegetation overlaid; 2. Provision of a project site plan showing individually numbered turbines, with numbers also shown on the existing and new photomontages, to enable further assessment of the siting of individual turbines with a view to relocating some of the turbines elsewhere within the project site. **Mitigation measures** Two measures to mitigate visual impacts are recommended: 1. Relocate approximately three of the outlying turbines at each of the north and south ends of the layout, using numbered photomontages to identify the particular turbines which have the greatest impact; 2. Plant local trees to form a screen along the Scott River Road and Governor Broome Road boundaries of the project site (see Photos 5-7). **Conclusions**

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	The proponent concludes that a grid layout would be preferable to the proposed irregular layout, on the basis that this is more appropriate for the open, agricultural setting. This is consistent with Scottish wind farm guidance which recommends a regular layout for wide open and level landscapes with regular agricultural fields. It is noted that there is a significant proportion of woodland vegetation so the landscape is not fully 'open', and the overall landscape setting is gently undulating, not level, partly due to clumps of trees set amongst areas of lower dune and wetland vegetation. From distant viewpoints such as Augusta and the coastline south of town, the horizon-line is not level, but hillocky, with variations in colour and texture of remnant vegetation. Although the turbines are located in an agricultural setting, from the significant viewpoints the wind farm appears to be located within a broadly natural wider landscape. Therefore, the currently proposed irregular layout is considered to be the most suitable, and should therefore be retained. As mentioned above, it is recommended that some turbines are relocated, with the specific altered layout dependent on further analysis of the existing photomontages once turbine numbers are added to the images, and the consideration of further images of views from important locations that were not initially assessed. Examples derived from Google Streetview images and the photomontages in the LVIA are: • In Viewpoint 4, which is on the western shore of the Blackwood River just upstream from Molly Island, if the northern two or three turbines were relocated further south, it appears that no turbines would be visible, and potentially other viewpoints in the vicinity of Molloy Island, assuming that intervening vegetation remains. • In views from the western shore of Hardy Inlet, near the inlet mouth, several turbines are apparent at the focal point of easterly views, adjacent to the steep southerly face of the dune at the mouth of Swan Lake. Relocation of those turbines would retain the natural character of this important view. • In viewpoints along the ocean coastline, relocation of southern turbines would decrease the perception that turbines are very close to the coast. In views from town, the wind farm would be less prominent if turbines were in a more compact, clustered layout rather than locating them in an open, roughly linear pattern extending further north and south over a larger area. The **Social Values Assessment Report** provided by the proponent does not adequately address the community's perception of landscape character and views as required by the *WAPC Visual landscape Planning in Western Australia – a manual for evaluation, assessment, siting, and design*. For example, study participants were not asked about the importance of views of the landscape. The list of values that participants were asked about did not include "scenic views" or similar. The closest category was "preserving what is unique about this area'' and "being able to see the clouds, horizon and sky", neither of which adequately interrogates opinions about views of this landscape. Only a small proportion of participants (15%) were residents of Augusta and as such would be directly impacted by views of the wind farm. Overall, the social values report likely results in under-estimating the likely social impacts of the proposed wind

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	farm. Public submissions on the wind farm proposal could be reviewed to gain a more comprehensive overview of community perceptions. **Additional Viewpoints for Photomontages Saved in Separate Attachment.**
Department of Water and Environmental Regulation (DWER)	This proposal has been referred to the Environmental Protection Authority (EPA). On 8 December 2025, the EPA determined to not assess the proposal under Part IV of the *Environmental Protection Act 1986*. The EPA's public record and summary of reasons include public advice to other decision-making authorities to ensure that their statutory decision-making processes achieve and assure environmental outcomes consistent with the EPA's environmental factor objectives. Further information about the EPA process and what stage this application is at can be found at Wind Farm in Scott River | EPA Western Australia. The Department has identified that the proposal has the potential for impact on environment and/or water resource values and/or management. Key issues and recommendations are provided below, and these matters should be addressed: 1. Issue: Water licensing Advice: The following advice notes are recommended to be applied: Advice Note: The proposal is in the Lower Blackwood Surface Water Area proclaimed under the *Rights in Water and Irrigation Act 1914*, therefore a Bed and Bank permit will be required for any interference with the bed and bank of any watercourses. For more information, please contact the Department of Water and Environmental Regulation's Water Licensing staff on 08 9781 0188 or busselton.admin@dwer.wa.gov.au. Advice Note: The proposal is in the Lower Blackwood Surface Water Area and Beenup and Rosa Beenup Groundwater subareas proclaimed under the *Rights in Water and Irrigation Act 1914*, therefore any take of surface water from a watercourse or groundwater will require a licence to take water. For more information, please contact the Department of Water and Environmental Regulation's Water Licensing staff on 08 9781 0188 or busselton.admin@dwer.wa.gov.au. 2. Issue: Water supply Advice: The following condition is recommended to be applied: Condition: Prior to any ground disturbing activities, the proposal water balance and Water Sourcing Strategy is to be prepared to the satisfaction of the Local Government. 3. Issue: Surface water management Advice: The following condition is recommended to be applied:

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	Condition: Prior to any ground disturbing activities, a post-development flood model is to be prepared to the satisfaction of the Local Government, on advice from the Department of Water and Environmental Regulation. Condition: Prior to any ground disturbing activities, a Stormwater Management Plan shall be prepared to the satisfaction of the Local Government. 4. Issue: Industry Regulation Advice: The following advice notes are recommended to be applied: Advice Note: Insufficient information was provided to enable Department of Water and Environmental Regulation to determine whether the proposal will be categorised as Prescribed Premises as per Schedule 1 of the *Environmental Protection Regulations 1987*. Based on the information provided the proposed crushing and screening of material taken from borrow pits operations may cause the premises to become Prescribed Premises as per for the purposes of Part V Division 3 of the *Environmental Protection Act 1986*, if it has the capability to meet or exceed the specified production or design capacity of category 12 or 70 under Schedule 1 of the *Environmental Protection Regulations 1987*. The Applicant is therefore advised to refer to the information and Industry Regulation Guide to Licensing available at http://www.der.wa.gov.au/our-work/licences-and-works-approvals and / or if they have queries relating to works approvals and licences to contact DWER at info@dwer.wa.gov.au or 6364 7000. Advice Note: Insufficient information was provided to enable Department of Water and Environmental Regulation to determine whether the proposal will be categorised as Prescribed Premises as per Schedule 1 of the *Environmental Protection Regulations 1987*. Based on the information provided the proposed concrete batching plant operations may cause the premises to become Prescribed Premises as per for the purposes of Part V Division 3 of the *Environmental Protection Act 1986*, if the concrete produced is used at another premises or if the proposed concrete batching plant has the capability to meet or exceed the specified production or design capacity of category 77 under Schedule 1 of the *Environmental Protection Regulations 1987*. The Applicant is therefore advised to refer to the information and Industry Regulation Guide to Licensing available at http://www.der.wa.gov.au/our-work/licences-and-works-approvals and / or if they have queries relating to works approvals and licences to contact DWER at info@dwer.wa.gov.au or 6364 7000. Advice Note: The concrete batching plant will need to demonstrate compliance with the *Environmental Protection (Concrete Batching and Cement Product Manufacturing) Regulations 1998* irrespective of whether the premises meets the threshold to become a Prescribed Premises as per Schedule 1 of the *Environmental Protection Regulations 1987* or not.

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	5. Issue: Onsite domestic wastewater management Advice: The following condition is recommended to be applied: Condition: Prior to the installation of onsite domestic wastewater systems, a site and soil evaluation report is to be prepared that takes account of the principles of the *Government Sewerage Policy (WAPC 2019)*. 6. Issue: Construction Environmental Management Plan Advice: The following condition is recommended to be applied: Condition: Prior to any ground disturbing activities, a Construction Environmental Management Plan is to be prepared to the satisfaction of the Local Government. 7. Issue: Native Vegetation Advice: The following advice notes are recommended to be applied: Based on the information provided the proposed clearing may not be exempt and a clearing permit may need to be obtained under the Environmental Protection Act 1986. For more information, please contact the Department of Water and Environmental Regulation's Native Vegetation Regulation staff on 08 6364 7098 or admin.nvp@dwer.wa.gov.au. 8. Issue: Potential contamination and acid sulfate soils Advice: The following condition and advice note are recommended to be applied: Condition: Prior to any ground disturbing activities, an Acid Sulfate Soils and Dewatering Management Plan is to be prepared to the satisfaction of the Local Government, on advice from the Department of Water and Environmental Regulation. Advice Note: For condition [INSERT VALUE] the following document provides guidance on the assessment and management of contaminated sites in Western Australia (WA) within the legislative framework provided by: the *Contaminated Sites Act 2003* and the *Contaminated Sites Regulations 2006*; and the revised national site assessment framework provided in the *National Environment Protection (Assessment of Site Contamination) Measure 1999*: Guideline: Assessment and management of contaminated sites (www.wa.gov.au). Further information on Contaminated Sites can be obtained by email (contaminated.sites@dwer.wa.gov.au) or by telephone on 1300 762 982.

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS

9. Issue: Noise
   Advice: Please see the attached Technical Review Report prepared by the Department's Environmental Noise Branch.

10. Issue: Terrestrial fauna
    Advice: The following condition is recommended to be applied:

    Condition: Prior to operating any turbine, a Bird and Bat Adaptive Management Plan is to be prepared to the satisfaction of the Local Government, on advice from the Department of Water and Environmental Regulation and other relevant stakeholders.

More detail pertaining to the above issues are provided in the table below.

Item No.	Reviewer comment/advice
1	**Issue:** Water licensing **Advice:** The following advice notes are recommended to be applied: Advice Note: The proposal is in the Lower Blackwood Surface Water Area proclaimed under the *Rights in Water and Irrigation Act 1914*, therefore a Bed and Bank permit will be required for any interference with the bed and bank of any watercourses. For more information, please contact the Department of Water and Environmental Regulation's Water Licensing staff on 08 9781 0188 or busselton.admin@dwer.wa.gov.au. Advice Note: The proposal is in the Lower Blackwood Surface Water Area and Beenup and Rosa Beenup Groundwater subareas proclaimed under the *Rights in Water and Irrigation Act 1914*, therefore any take of surface water from a watercourse or groundwater will require a licence to take water. For more information, please contact the Department of Water and Environmental Regulation's Water Licensing staff on 08 9781 0188 or busselton.admin@dwer.wa.gov.au. **Discussion:**

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS

			The proposal includes the take for groundwater for dewatering and proposed works across creek lines for transmission lines and access roads. It has not yet been determined where the water supply will be sourced, which may be drawn from groundwater. The subject property is in the Lower Blackwood Surface Water Area as proclaimed under the *Rights in Water and Irrigation Act 1914*. Any taking or diversion of surface water in this proclaimed area (whether by direct pumping, construction of a dam, or excavation) can be subject to licensing. Any interference of the watercourse (such as the construction of a dam or crossing, or excavation of the watercourse) may require a *permit to interfere with the bed or banks* from the department. Exemptions from regulation can be sought from the department related to the presence of any springs at the head of a watercourse rising on the property. The proponent is advised to contact the department to determine licensing and permit requirements or whether any exemptions apply. As of Dec 2025 there was water available in the Lower Blackwood Estuarine Reach surface water sub area under the *Whicher surface water allocation plan (DoW 2009)* which relates to the subject land. The subject property is in the Beenup and Rosa Beenup Groundwater subareas as proclaimed under the *Rights in Water and Irrigation Act 1914*. Any groundwater abstraction in this proclaimed area is subject to licensing by the department, other than supply from the shallow watertable (superficial aquifer) for domestic and non-intensive stock watering purposes. Note: *Domestic use* generally refers to the take of water to service ordinary use associated with a household and for firefighting purposes*. Intensive stock watering* relates to the watering of stock that are generally confined to an area smaller than that required for grazing under normal conditions. Under these latter circumstances, stock is usually fed by hand or mechanical means. As of Dec 20205 there was: • water available in the Perth-Superficial Scott aquifer of the Beenup ground water sub area; • no water available in the Perth-Lesueur Sandstone South aquifer of the Rosa Beenup ground water sub area;	

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS			
			• water available in the Perth-Leederville aquifer of the Beenup ground water sub area; under the *South West groundwater areas allocation plan (DoW 2009)* which relates to the subject land. Available water is allocated on a first-in first-served basis and as such, there is no guarantee that water will be available at the time of development. The availability of water resources can be viewed at the department's public water register is available at https://maps.water.wa.gov.au/#/webmap/register.	
		2	**Issue:** Water supply **Advice:** The following condition is recommended to be applied: Condition: Prior to any ground disturbing activities, the proposal water balance and Water Sourcing Strategy is to be prepared to the satisfaction of the Local Government. **Discussion:** The water demand has not yet been determined, and Sect 3.4 of *Preliminary Construction Environmental Management Plan (synergyRED 2025)* states 'Permanent and temporary water tanks and/or storage dams will be installed to support construction and operational water requirements (Figure 3-1). Water will be sourced elsewhere, purchased and ported in. There is a possibility that any dewater collected during construction, if treated appropriately to a suitable quality, may also be able to be used during construction'. Furthermore, Sect 2.3.6 of *Development Application Report (Urbis 2025)* states that 'Once the water sourcing strategy has been finalised, engagement with Department of Water and Environmental Regulation (**DWER**), Water Corporation and the Shire AMR prior to the commencement of construction will be undertaken as required'. The Department supports the preparation of a water balance and Water Sourcing Strategy, and this should be conditioned.	
		3	**Issue:** Surface water management	

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS			
			Advice: The following condition is recommended to be applied: Condition: Prior to any ground disturbing activities, a post-development flood model is to be prepared to the satisfaction of the Local Government, on advice from the Department of Water and Environmental Regulation. Condition: Prior to any ground disturbing activities, a Stormwater Management Plan shall be prepared to the satisfaction of the Local Government. **Discussion:** Sect 3.12 of *Development Application Report (Urbis 2025)* states 'Surface water – flood characterisation assessment and modelling to identify inundation areas to inform the future placement of infrastructure and mitigate impacts on surface flow post-construction'. Preliminary pre-development flood modelling has been undertaken and presented in the *Hydrological & Hydrogeological Assessment (Stantec 2025)*, which has provided plans with the 1% AEP peak flood depths and peak flood velocity. Noting the scale of the subject site, Key Model Parameters presented in Section 5.4.1, and application of the 1% AEP climate change high emissions scenario Representative Concentration Pathway 8.5 the model is considered fit for purpose by the Department. It is recommended that this work is used to help inform the overall surface water plan for the development site. A post development flood model will assist in informing infrastructure locations, road crossing designs to comply with Shire requirements, road drainage designs mitigate erosion and sediment mobilisation, and all electrical installations are suitably located and insulated to increase resilience to major flooding. The post development flood model along with a Stormwater Management Plan is recommended to be conditioned.	
		4	**Issue:** Industry Regulation **Advice:** The following advice notes are recommended to be applied:	

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS			
			Advice Note: Insufficient information was provided to enable Department of Water and Environmental Regulation to determine whether the proposal will be categorised as Prescribed Premises as per Schedule 1 of the *Environmental Protection Regulations 1987*. Based on the information provided the proposed crushing and screening of material taken from borrow pits operations may cause the premises to become Prescribed Premises as per for the purposes of Part V Division 3 of the *Environmental Protection Act 1986*, if it has the capability to meet or exceed the specified production or design capacity of category 12 or 70 under Schedule 1 of the *Environmental Protection Regulations 1987*. The Applicant is therefore advised to refer to the information and Industry Regulation Guide to Licensing available at http://www.der.wa.gov.au/our-work/licences-and-works-approvals and / or if they have queries relating to works approvals and licences to contact DWER at info@dwer.wa.gov.au or 6364 7000. Advice Note: Insufficient information was provided to enable Department of Water and Environmental Regulation to determine whether the proposal will be categorised as Prescribed Premises as per Schedule 1 of the *Environmental Protection Regulations 1987*. Based on the information provided the proposed concrete batching plant operations may cause the premises to become Prescribed Premises as per for the purposes of Part V Division 3 of the *Environmental Protection Act 1986*, if the concrete produced is used at another premises or if the proposed concrete batching plant has the capability to meet or exceed the specified production or design capacity of category 77 under Schedule 1 of the *Environmental Protection Regulations 1987*. The Applicant is therefore advised to refer to the information and Industry Regulation Guide to Licensing available at http://www.der.wa.gov.au/our-work/licences-and-works-approvals and / or if they have queries relating to works approvals and licences to contact DWER at info@dwer.wa.gov.au or 6364 7000. Advice Note: The concrete batching plant will need to demonstrate compliance with the *Environmental Protection (Concrete Batching and Cement Product Manufacturing) Regulations 1998* irrespective of whether the premises meets the threshold to become a Prescribed Premises as per Schedule 1 of the *Environmental Protection Regulations 1987* or not. **Discussion:** Sect 2.3.1 of *Development Application Report (Urbis 2025)* refers to both the 'Installation and operation of concrete batching plants' and 'Extraction of borrow material (may include crushing and screening by mobile plant)'.	

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS

However, Table 3-1 of *Section 38 Referral Supporting Document (Ecologial 2025)* details that 'A Works Approval and Operating License/Registration for crushing and screening will be applied for', but there is no reference to any regulatory considerations for the concrete batching plant.

Insufficient information was provided to enable DWER to determine whether the proposal will be categorised as Prescribed Premises as per Schedule 1 of the *Environmental Protection Regulations 1987* (EP Regulations). Based on the information provided the proposed crushing and screening and concrete batching plant operations may cause these premises to become Prescribed Premises as per for the purposes of Part V Division 3 of the *Environmental Protection Act (*EP Act), if it has the capability to meet or exceed the specified production or design capacity* of the relevant category under Schedule 1 of the EP Regulations. e.g.

12	Screening, etc. of material: premises (other than premises within category 5 or 8) on which material extracted from the ground is screened, washed, crushed, ground, milled, sized or separated	50000 tonnes or more per year
70	Screening, etc. of material: premises on which material extracted from the ground is screened, washed, crushed, ground, milled, sized or separated	More than 5000 but less than 50000 tonnes per year
77	Concrete batching or cement products manufacturing: premises on which cement products or concrete are manufactured for use at places other than those premises.	100 tonnes or more per year

The EP Act makes it an offence to undertake any work which causes a premises to become, or become capable of being, a Prescribed Premises unless the work is undertaken in accordance with a works approval. It is also an offence under the EP Act to cause an emission or alter the nature or volume of waste, noise or odour from the Prescribed Premises, unless done so in accordance with a works approval or licence or a registration (for operation) is held for the premises.

The Applicant is therefore advised to refer to the information and Industry Regulation Guide to Licensing available at http://www.der.wa.gov.au/our-work/licences-and-works-approvals and / or if

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS			
			they have queries relating to works approvals and licences to contact DWER at info@dwer.wa.gov.au or 6364 7000. It is noted that category 77 Prescribed Premises are premises where cement products or concrete are manufactured for use at other premises. If cement products or concrete produced at a premises are used solely at that premises, it is not considered a category 77 Prescribed Premises under Schedule 1 of the *Environmental Protection Regulations 1987*. The application will need to demonstrate compliance with the *Environmental Protection (Concrete Batching and Cement Product Manufacturing) Regulations 1998* irrespective of whether the premises is Prescribed or not. * Production capacity and design capacity definitions: • The **production capacity** is the rate at which a product is produced as relevant to the description of the prescribed premises category; and • **design capacity** is the maximum capacity for which the facility or equipment is designed to receive, handle, process, contain or emit, as relevant to the description of the prescribed premises category. In view of the uncertainty regarding regulation under Part V of the EP Act advice has been provided on environmental risks and mitigation strategies, based on the available information. If the applicant determines that a works approval or licence application is required under Part V of the *Environmental Protection Act 1986* (EP Act), the advice provided in this communication does not prejudice and must not be considered to infer the outcome of the EP Act licence and works approval process.	
		5	**Issue:** Onsite domestic wastewater management **Advice:** The following condition is recommended to be applied: Condition: Prior to the installation of onsite domestic wastewater systems, a site and soil evaluation report is to be prepared that takes account of the principles of the *Government Sewerage Policy (WAPC 2019)*. **Discussion:**	

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS			
			It is noted that Sect 2.2.9 of *Development Application Report (Urbis 2025)* identifies that no construction camp or temporary onsite accommodation is anticipated to be required, with workers proposed to be accommodated in local accommodation in surrounding towns and localities. Onsite facilities are however proposed to be provided and for domestic wastewater Sect 2.2.11 of *Development Application Report (Urbis 2025)* suggest this may be in the form of mobile self-contained or inground septic systems. The site is in a sewerage sensitive area as defined in the *Government Sewerage Policy (WAPC 2019)* (GSP). Therefore, if inground systems are proposed, it is recommended that the principles of the GSP are applied in the development of a site and soil evaluation report to support the 'Application to Construct or Install an Apparatus for the Treatment of Sewage' required under the *Health (Treatment of Sewage and Disposal of Effluent and Liquid Waste) Regulations 1974*. This requirement is recommended to be conditioned.	
		6	**Issue:** Construction Environmental Management Plan **Advice:** The following condition is recommended to be applied: Condition: Prior to any ground disturbing activities, a Construction Environmental Management Plan is to be prepared to the satisfaction of the Local Government. **Discussion:** The *Preliminary Construction Environmental Management Plan (synergyRED 2025)* is noted, and the terrestrial environmental quality and inland waters objective-based management actions are supported. The document does not however provide details of any contingency measures. For example, in the event of a spill what action will occur and what actions will be taken if any significant erosion and/or sediment mobilisation occurs. It is recommended that the report be conditioned and should be updated to include emergency and contingency response actions.	
		7	**Issue:** Native Vegetation	

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS

Advice: The following advice notes are recommended to be applied:

Based on the information provided the proposed clearing may not be exempt and a clearing permit may need to be obtained under the *Environmental Protection Act 1986*. For more information, please contact the Department of Water and Environmental Regulation's Native Vegetation Regulation staff on 08 6364 7098 or admin.nvp@dwer.wa.gov.au.

Discussion:

It is noted that the clear of native vegetation has been reduced as much as practical. Some clearing will however be required and Table 3-1 of *Section 38 Referral Supporting Document (Ecologial 2025)*: states that 'A native vegetation clearing permit will be applied for'.

Under section 51C of the *Environmental Protection Act 1986* (EP Act), clearing of native vegetation is an offence unless:

- it is undertaken under the authority of a clearing permit
- it is done after the person has received notice under Section 51DA(5) that a clearing permit is not required
- the clearing is subject to an exemption

Exemptions for clearing that are a requirement of written law, or authorised under certain statutory processes, are contained in Schedule 6 of the EP Act. Exemptions for low impact routine land management practices outside of environmentally sensitive areas (ESAs) are contained in the *Environmental Protection (Clearing of Native Vegetation) Regulations 2004* (the Clearing Regulations).

Based on the information provided, should development approval be issued, clearing to construct a building or structure is likely to be exempt from the requirement for a clearing permit under Regulation 5, Item 1 of the Clearing Regulations, if the vegetation to be cleared is not riparian. Riparian vegetation is defined as the distinctive vegetation associated with a wetland or watercourse. If any riparian vegetation is required to be cleared for the proposed development, a clearing permit is required.

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS

			Clearing to construct vehicular tracks is likely to be exempt from the requirement for a clearing permit under Regulation 5, Item 12 of the Clearing Regulations. Noting that: • Construction of vehicle tracks within riparian vegetation is generally not allowed, but where there is no reasonable alternative route, and the track is necessary for the commercial activities of the property, it may pass through riparian vegetation. • There must be at least 100 metres between the track and any other cleared land that can be used for the purpose intended for that track. This may include other cleared areas. Note that these exemptions will not apply prior to development approval being issued. Please also note that that clearing for a building / structure and vehicular tracks, combined with other exempt clearing activities on the property, must not exceed five hectares in a financial year. If further clarification is required, please contact the Department's Native Vegetation Regulation section by email (admin.nvp@dwer.wa.gov.au) or by telephone (6364 7098).	
		8	**Issue:** Potential contamination and acid sulfate soils **Advice:** The following condition and advice note are recommended to be applied: Condition: Prior to any ground disturbing activities, an Acid Sulfate Soils and Dewatering Management Plan is to be prepared to the satisfaction of the Local Government, on advice from the Department of Water and Environmental Regulation. Advice Note: For condition [INSERT VALUE] the following document provides guidance on the assessment and management of contaminated sites in Western Australia (WA) within the legislative framework provided by: the *Contaminated Sites Act 2003* and the *Contaminated Sites Regulations 2006*; and the revised national site assessment framework provided in the *National Environment Protection (Assessment of Site Contamination) Measure 1999*: Guideline: Assessment and management of contaminated sites (www.wa.gov.au). Further information on Contaminated Sites can be obtained by email (contaminated.sites@dwer.wa.gov.au) or by telephone on 1300 762 982. **Discussion:** Contamination	

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS			
			• The location of the proposed windfarm is adjacent east and north-east of the site of the former Beenup Mineral Sands Mine. The former Beenup mine site (Lot 4254 on Plan 208478 and Lot 200 on Plan 36387) was classified under the Contaminated Sites Act 2003 (CS Act) on 26 June 2013 as remediated for restricted use, and a memorial (number M345894ML) was placed on the certificates of title. The site was classified because site investigations during mine closure confirmed that groundwater and surface water at the site contain elevated levels of metals and sulfate, some exceeding environmental and health guidelines. The observed impacts to surface water and groundwater have resulted from historical mining activities, including disturbance and poor management of ASS and deposition of mineral processing waste. • As the regional groundwater flow is south to south-west, generally towards the Scott River, legacy contamination at the former Beenup mine site is not expected to impact the location of the proposed wind farm. However, those historical impacts highlight the fact that soil and groundwater conditions in the area present a high risk of acidification, and potential ASS will require management during construction activities. • CS has reviewed the document "Proposed Wind Farm in Scott River, Preliminary Geotechnical and Baseline Contamination Report (Stantec, 1 July 2024)", and considers that it provides an appropriate assessment of baseline contamination conditions at the site. <u>Acid Sulfate Soils</u> • The proposed wind farm is located in an area that is mapped as having a high to moderate risk of ASS occurring within • CS has reviewed the document "*Proposed Wind Farm in Scott River, Preliminary Acid Sulfate Soils and Dewatering Management Plan* (PTG Consulting, 10 September 2025)", and considers that it provides an adequate preliminary assessment of ASS risks associated with construction of the proposed wind farm. CS considers that risks associated with disturbance of ASS are able to be appropriately managed should the proposed development of the wind farm proceed. • The report notes that dewatering drawdown has been modelled to a maximum depth of approximately 2 metres for turbine construction and 3 metres for construction of	

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS			
			meteorological towers. The report presents options for management of ASS risk during dewatering and excavation which appear appropriate and generally consistent with the guidance provided in DWER's ASS guidelines and national guidelines for the management of ASS. • As the ASS Dewatering Management Plan is preliminary only, CS expects that further, more detailed investigations will be required once all aspects of the proposal design are finalised, at which stage the proposed options for dewatering management can be reviewed and refined.	
		9	**Issue:** Noise **Advice:** Please see the attached Technical Review Report prepared by the Department's Environmental Noise Branch.	
		10	**Issue:** Terrestrial fauna **Advice:** The following condition is recommended to be applied: Condition: Prior to operating any turbine, a Bird and Bat Adaptive Management Plan is to be prepared to the satisfaction of the Local Government, on advice from the Department of Water and Environmental Regulation and other relevant stakeholders. **Discussion:** As detailed in the EPA Chairman's Determination it was considered that the impacts of the proposal, including on birds and bats, were not so significant that assessment by the EPA under Part IV of the *Environmental Protection Act 1986* (EP Act) was required and determined to not assess the proposal. While the EPA determined not to assess the proposal, it was identified that the construction and operation of the proposal has the potential to impact birds and bats from collision/strike and barotrauma. The EPA's decision was made on the basis of other decision-making processes being able to manage the potential impacts to birds and bats, and the proponent implementing the proposal in accordance with the Preliminary Bird and Bat Adaptive Management Plan (Eco Logical 2025, dated 24 November 2025).	

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	Other decision-making processes the EPA identified included: • authorisation under s40 of the *Biodiversity Conservation Act 2016* (BC Act) to take or disturb threatened fauna • Part V Division 2 of the EP Act to regulate impacts associated with loss of fauna habitat • referral under the Commonwealth *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) for assessment of potential impacts to species of Matters of National Significance (MNES) The EPA identified that these decision-making processes can consider threatened and migratory fauna species but cannot consider risks to fauna species that are not specially protected. Noting that one conservation significant bird (Priority 3) and one bat species (Priority 4) were recorded during site surveys. The EPA made specific reference to the ability to include a condition requiring preparation of a Bird and Bat Adaptive Management Plan provides assurance that impacts to birds and bats are monitored and managed appropriately, including species that are not considered under other decision-making processes. The EPA has committed that requests to review and provide advice on the adequacy of any Bird and Bat Adaptive Management Plan submitted to the Shire can be made to the Department's Green Energy team via greenenergy.exec@dwer.wa.gov.au. Where the Department has a statutory role, planning applications should be considered prior to the Department issuing any relevant permits, licenses, and/or approvals. If the applicant determines that a works approval or licence application is required under Part V of the *Environmental Protection Act 1986* (EP Act), the advice provided in this communication does not prejudice and must not be considered to infer the outcome of the EP Act licence and works approval process. In the event there are modifications to the proposal that may have implications on aspects of environment and/or water management, the Department should be notified to enable the implications to be assessed.
Water Corporation	We offer the following comments regarding this proposal.

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	Reticulated water and sewerage are not available to the subject land. The Water Corporation has no objection to the proposed wind farm development. It has been noted in the report water will be trucked to the site to service potable and non-potable water requirements. Onsite effluent disposal managed by a septic system and removed by a certified contractor, or an in-ground septic system will be installed. The information provided above is subject to review and may change. If the proposal has not proceeded within the next 12 months, please contact us to confirm that this information is still valid. Please provide the above comments to the landowner, developer and/or their representative.
Department of Primary Industries and Regional Development (DPIRD)	The Department of Primary Industries and Regional Development (DPIRD) and the South West Development Commission has reviewed the development application by Synergy Renewable Energy Developments Pty Ltd (SynergyRED), a wholly owned subsidiary of Synergy, to build a wind farm. The project will be located 15km north-east of Augusta on the Scott River plain, an agricultural district predominantly hosting beef grazing, dairy farming and blue gum plantations. The project includes the construction and operation of: • up to 20 wind turbines over 3,597 ha with a production capacity of up to 100MW • associated infrastructure, including a 4.3km 132kV transmission line, a new 132kV electrical sub-station, a permanent site office, up to 2 met masts, up to 2 communications towers and associated water tanks and roads. The development is not large by the standards of other wind farms being proposed in the state. The following comments relevant to regional development were received from DPIRD's Strategic Programs team and Local Content Adviser Network • DPIRD notes the wind farm proposal presents a positive economic development opportunity for the region, with the proponent making efforts to ensure the host communities share in project benefits. • Provided the environmental mitigations can be addressed, the project provides for some renewable energy to feed into the SWIS from the south of the state, which will help power supply locally as well as provide feed in via the nearby Beenup 132 KVA line that runs to Manjimup. The project may not significantly increase the range of jobs on offer to the local community in the longer term. • The proponent has not factored in an accommodation strategy and 'likely' accommodation model. Even as a staged project, occasions when up to 150 staff are employed at once are expected to strain the local housing

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	market. An accommodation strategy should be provided that includes all sources of housing demand generated by the project and addresses both the temporary and longer-term workforce accommodation requirements. • DPIRD's Local Content Adviser Network (LCAN) considers the Scott River project to present a strong opportunity for achievable local content outcomes. There is significant potential for local participation in the civil and enabling works, as well as onsite support services, including fabrication and electrical. • There are several capable businesses across Busselton, Margaret River, and the wider South West region that could contribute to the delivery of this project. • The LCAN sees this project as an excellent opportunity to both utilise and further build local capability in wind farm construction. The following recommendations to SynergyRED have been provided by DPIRD's Strategic Programs team and Local Content Adviser Network: • carefully analyse how its accommodation needs will be met given concerns about the availability of local housing. • note Recommendation 2 of the social impact report in addressing concerns in the Scott River locality and being flexible and open to suggestions for improved local benefits. • apply more focus on developing neighbour programs, local content and training opportunities for employees and businesses that are not adequately defined at this stage. • Contact DPIRD's Local Adviser Network (local.content@dpird.wa.gov.au) to find out how they might best engage local regional businesses to supply the project. The following comments relevant to regional development were received from the South West Development Commission (SWDC). • *LGA Draft Policy:* The Shire of Augusta Margaret River has released a Draft Local Planning Policy – Large-Scale Renewable Energy Facilities for comment. It is strongly recommended that SynergyRED review this draft policy and work with the Shire to see how they can respond and accommodate any necessary changes in the project proposal as the policy is progressed and formalised. It is noted that several of the provisions in the draft Local Planning Policy are already addressed in SynergyRED's proposal. • *Aviation impact assessment:* The conducted aviation impact assessment only considered certified aerodromes within 30 nautical miles and non-certified aerodromes within 5 nautical miles of the project site. However, there are two airstrips within the Shire of Augusta Margaret River, one located in Augusta and one in Margaret River, which have received Regional Airports Development Scheme funding from the State and which support the Royal Flying Doctor Service, small general aviation and charters and potential aerial support for Department of Fire and Emergency Services, WA Police and Department of Biodiversity, Conservation and Attractions. The aviation impact assessment did not receive responses from several key aviation stakeholders including the Royal

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	Flying Doctor Service. It is strongly recommended that further consultation occur with the aerodrome manager/s and key users of airstrips in the region to ensure that these smaller operations can continue safely during and following construction. • *Community contribution:* SynergyRED should be commended for proposing adoption of the *Draft Guideline on Community Benefits for Renewable Energy Projects in Western Australia* with respect to a community benefit fund. Further proposed structure of this fund is in the Shire's draft policy linked above. Opportunities to support local employment, training and accommodation should continue to be explored. Ancillary improvements to telecommunications or power for (at a minimum) landholders within the development envelope should also be considered. • *Local economic impact:* It is understood from the proposal that agricultural uses within the project envelope will be able to continue during and following construction. This is an excellent outcome for the landholders and for the broader regional economy. Every opportunity to mitigate impact to these operations should be taken. This includes engagement with landholders with regards to seasonal traffic variations (for example, around harvest) and peak construction, which may require traffic planning or traffic management on some internal roads. • *Stakeholder engagement:* There is clearly mixed sentiment towards the development of a wind farm in this location, particularly from residents in the immediate vicinity. Ongoing stakeholder engagement is required to continue to provide information to the community about the wind farm, the technology, the impact and the opportunities it provides. While the proposal details how to manage the water table, acid sulphate soils and construction to the level of detail it can at this stage, the assessments on noise and shadow flicker are not well articulated for community members. SynergyRED could consider development of additional fact sheets or infographics outlining what the practical impact is likely to be, and/or engage an independent assessment to counter existing misinformation. It is also unclear if the Shire of Nannup has been engaged, which – while not the directly responsible local government – does run very close to the project envelope. There will also be a requirement to continue to work with neighbours to mitigate or compensate for impacts to their plans for their properties. • *Viewing platform:* While little planning has been conducted at this stage with regards to the viewing platform, it is recommended that if there is the opportunity to do so, that SynergyRED engage with Karri Karrak Aboriginal Corporation in designing and developing the signage, to also articulate relevant Aboriginal culture and heritage in the project area/region. • *Construction workforce:* The proposal suggests that the construction workforce be accommodated in local accommodation in surrounding towns and localities. Adequate forward planning is required for this due to limited availability of accommodation in the South West, some of which is already utilised by other projects in the region. The following comments relevant to agricultural resource management were received from DPIRD's Agricultural Resource Management and Assessment (ARMA) branch.

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	• DPIRD has reviewed the Preliminary Construction and Environmental Management Plan (CEMP) and supports use of the CEMP to outline measures to manage biosecurity and water erosion risks during construction. DPIRD provides the following considerations for finalising the CEMP. o It is essential to outline biosecurity management measures to reduce the risk of introducing or disturbing pathogens and weed species within the vegetation across the development envelope. Managing biosecurity risks during construction, ongoing operations, and eventual decommissioning of the wind farm will help minimise impacts on landholders, adjoining farms, and transport routes. o DPIRD is aware of wind farms where soils/landscapes considered at low risk of water erosion under agricultural use, have suffered serious erosion under other uses. The movement of very large and heavy machinery, combined with access roads, pads for turbines and other features can concentrate water flow resulting in erosion. The management measures will need to address any potential surface water or groundwater impacts associated with the development. • DPIRD requests a copy of the final CEMP document, when it becomes available, and the opportunity to advise whether the biosecurity and soil degradation risks associated with this project are being managed. • The Soil and Land Conservation team have advised that within the project area there are several Agreements to Reserve native vegetation in perpetuity. Should SynergyRED and their contactors require to undertake activities within these areas, or to obtain more information on these agreements, they should contact the Commissioner of Soil and Land Conservation, by email at commsoil@dpird.wa.gov.au, prior to commencing any activities.
Department of Biodiversity, Conservation and Attractions (DBCA)	The following comments are provided pursuant to DBCA's responsibilities under the *Conservation and Land Management Act 1984* (CALM Act) and *Biodiversity Conservation Act 2016* (BC Act). **DBCA-managed lands** The proposal area surrounds and partially intersects with an unnamed Nature Reserve (R 42377 / Lot 4924) accessed from Dennis Road, as well as Crown freehold Lot 101, currently held by the Department of Planning, Lands and Heritage but actively managed since 2016 by DBCA and accessed via Scott River Road. It is intended that Lot 101 will ultimately be transferred to the conservation estate to be managed as a nature reserve by DBCA under the CALM Act. The project area also adjoins Crown freehold Lot 1 Governor Broome Road to the southeast, acquired by DBCA through an environmental offset process. To the northeast of the project area, adjoining Dennis Road/Pagett Road, is the Pagett and Chester Nature Reserves and South Blackwood State Forest. To the south and west of the project area, along the Blackwood and Scott Rivers, is the Scott National Park. The proposed development should not result in impositions being placed upon the management of the adjoining and nearby DBCA-managed lands. There should be no direct or indirect impacts, including vehicle, pedestrian and/or stock

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	access, fire management, dewatering/groundwater impacts, surface water run-off, erosion, pollution, pests, Phytophthora dieback or weed spread from the proposed development to the adjacent DBCA-managed land. The submitted Development Application Report (Urbis, October 2025) provides indicative locations for the 20 proposed Wind Turbine Generators (WTGs) and associated infrastructure such as wind monitoring and communication towers, electrical substation, site buildings, transmission line, dams, temporary concrete batching plant, storage and stockpile areas. The proposal states that the maximum tip height for the WTGs is 250m, with a hub height of 164m and a minimum tip height of 40m. For this proposal, the rotor swept area (RSA), -the physical area swept by the blades during operation - is between 23,000m2 and 26,000m2 and has the potential to impact on fauna movements across the landscape. *Advice* • Adequate boundary fencing and gates should be installed to restrict vehicle or stock access to the adjoining DBCA-managed reserves. • Recommend a minimum 100m setback from the boundary of the adjoining nature reserves to any of the proposed buildings, structures and earthworks, to mitigate potential impacts on DBCA-managed lands. A greater setback distance to WTGs or supporting development may be identified, based on finalisation of the development plans following a further design and procurement process, as noted in the Development Application Report (Urbis October 2025). • The proposed gravel-capped access road alignments cross the access ways to Lot 101 and R42377. Further discussions with DBCA will be required in relation to current and future access to the lands and appropriate roading materials to minimise Phytophthora disease spread. **Visual Amenity** The methodology, process and outcomes as presented in Attachment 4 - Referral Supporting Documents (RSD), Ecological Australia 2025 and the main assessment documented in Proposed Wind Farm - Scott River Landscape and Visual Impact Assessment by GHD 2025 are generally supported given: • The methodology aligns with industry standards using established methodologies and approved documents, including the WAPC *Visual Landscape Planning in Western Australia: a manual for evaluation, assessment, siting, and design*. • Suitable Landscape Character Units (LCU) were developed highlighting the variety of landscape types that surround the project. These were then extended to describe the public's acceptance of visual change to the landscape quality of those LCUs. • The Zones of Visual Influence (ZVI) capture where the wind farm infrastructure will be seen across the landscape. Views specific to DBCA managed lands are largely absent, including the Cape to Cape Track, recreation sites and activity on and along the Blackwood River / Scott River and Hardy Inlet, and the Cape Leeuwin Lighthouse (from the

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS

	ground and the top viewing deck). Assessing more receptors could help to identify small scale or local mitigation measures.
	
	The majority of the assessment focuses on the WTGs as these are the largest elements in the landscape - this includes the mapping of ZVIs. Other infrastructure worthy of the same detailed assessment as the WTGs include the access and maintenance roads, transmission line, meteorological masts and the substation, given they are of significant scale or length in the landscape and will be seen in a different context to the towers.
	
	Individual ZVIs for the other infrastructure will determine where these elements will be seen from the landscape and sensitive visual receptors. These ZVIs could inform mitigation measures that could reduce the individual visual impact of these items and therefore reduce the collective total visual impact for the project as a whole.
	
	The report notes that there will be an impact to the quality of the visual landscape from this proposal. Because of this acknowledgment, and the degree of the impact, the proposed mitigation measures appear limited. More advanced assessment of mitigation measures, based on a more detailed assessment of sensitive visual receptors, infrastructure assessment and associated ZVI may provide more protection of landscape quality and the viewer's sensitivity to the proposal.
	
	Advice
	• The viewing deck at the Cape Leeuwin Lighthouse sits ~40m above ground, and the base of the lighthouse is ~ 20m above sea level. As this is a significant tourism site it would warrant an assessment.
	• The Visual Impact Assessment identifies that this proposal will be highly visible in the surrounding landscape and that there is limited scope in most instances to reduce this visual impact.
	• The proposed mitigation measures are limited and reflect the high impact of the proposal from scattered receptor sites but do not consider local or small-scale mitigation measures or interventions to protect visual quality from the entire landscape.
	• Potential mitigation measures to address landscape-wide and locally identified impacts could include:
	  • Road edge vegetation screening along surrounding travel route corridors of all types managing and screening views along the length of these corridors.
	  • Localised screening surrounding the ancillary infrastructure.
	  • Broadscale landscape planting within the project area.
	
	Flora
	DBCA provides the following comments on Attachment 4 (RSD) - Appendix I Detailed Flora and Vegetation Survey undertaken by Phoenix Environmental Services in February 2025 (the Flora Survey).

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	Vegetation complex information has not been assessed correctly. For the southwest Regional Forest Agreement Area, the Mattiske and Havel (1998) mapping should be used. Threatened flora, *Conospermum quadripetalum* (CR), has been recorded in previous surveys from 2019, including in close proximity to proposed WTGs in the northwestern vegetation and in the road reserve as recently as 2022. The Flora Survey did not record this species, although it was noted that its habitat was not thoroughly searched. *C. quadripetalum* is wetland dependant and may be impacted by dewatering. 71 individual specimens of the threatened *Verticordia plumosa* var. *vassensis* (EN) have been recorded on Governor-Broome Road, some of which appear to be in proximity to the proposed track that crosses the road. *V. plumosa var. vassensis* is often found in seasonally inundated areas and may be impacted by alterations to hydrology / drawdown. Survey sites BEE030 and BEE061 have incorrectly identified a known population of threatened flora *Banksia nivea* subsp. *uliginosa* (EN) as the common subspecies *Banksia nivea* subsp. *nivea*. The common subspecies has not been recorded on the Scott Coastal Plain. Survey sites BEE114, BEE115R also recorded *Banksia nivea* subsp. *nivea*. The Flora Survey did not locate any plants of the threatened *Darwinia ferricola* (EN). DBCA records indicate there are nine populations within the area surveyed. Records of *Leucopogon alternifolius* (P3) have likely been confused with the Priority 3 species *Leucopogon wheelerae*, which is endemic to the Scott Coastal Plain and only known between Walpole to Albany. It is possible that some of these BC Act listed threatened species may no longer persist on site, however a soil stored seed bank is still likely to be present and plants may germinate at this location in future. At present, there are several tracks within the footprint that occur very close to known threatened plant occurrences (e.g. *Darwinea fericola*, *Verticordia plumosa* var. *vassensis)*. Attachment 1 provides a list of DBCA identified regionally significant species from the Flora Survey records. The flora survey does not provide a table of locations or precisely identify the spatial location of conservation listed or significant flora. Attachment 4 (RSD) – Appendix D Preliminary Oversize and/or Over Mass (OSOM) Route Study (Ares Group April 2025) indicates that some native vegetation clearing along the transport route from Bunbury Port to the site may be

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	required, and potentially around Site Entrance A. Vegetation to be cleared in association with the transport route was not assessed in the Flora Survey. *Advice* • It is recommended that the proponent obtain detailed flora survey records from DBCA via a data request. • Pre-clearance surveys of the northwestern vegetation for *Conospermum quadripetalum* should be conducted to determine whether it is present and in proximity to the clearing. • Pre-clearance surveys of the northwestern vegetation for *Verticordia plumosa* var. *vassensis* should be conducted to determine whether it is present and in proximity to the clearing. • Records of *Banksia nivea* subsp. *nivea* need to be reviewed to determine if it is the threatened sub species *B. nivea* subsp. *Uliginosa*. • Where possible, a 50 metre buffer be applied to all confirmed threatened plant records (even if the plant no longer persists on site). If this is not feasible, a BC Act section 40 authorisation will be required for the take of plants, soil stored seed and inadvertent take of threatened species of plants, which may be subject to conditions to mitigate and offset any potential impacts. • Given the project area is predominately cleared agricultural land (72.4%) it is recommended that any WTGs, associated development such as BESSs, concrete batching plant, extraction pits and supporting infrastructure such as access tracks, transmission lines target existing cleared areas. • It is noted that several of the proposed access tracks currently bisect drainage lines. Clearing of drainage lines should be avoided where possible. • Transmission line fire mitigation measures such as vegetation pruning and grass spraying should not result in any clearing or modification to the remnant vegetation in the DBCAmanaged nature reserve (R42377) to achieve transmission line fire protection objectives. • Planning access for construction traffic off Scott River Road and Governor Broome Road should consider presence and avoid any impacts on threatened and conservation significant flora within these road reserves. **Threatened Ecological Communities** The ironstone soils, which are the foundation of the Scott River Ironstone Threatened Ecological Community (TEC), are highly restricted in distribution on the Scott River Plain. The Scott River Ironstone TEC is listed as Critically Endangered under the BC Act and Endangered under the federal *Environmental Protection and Biodiversity Conservation Act 1999* (EPBC Act). Currently there are 24 occurrences from the Scott River area recorded on DBCA's TEC database. The occurrences total 377 hectares over an extent of occurrence of approximately 150 km2. The loss of any occurrence of this TEC is considered significant.

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	The Scott River Ironstone Association Interim Recovery Plan 2015–2020 (DPAW, 2015) (IRP) for the TEC refers to the underlying geology's physical properties as being important for local moisture retention and to sustain the TEC vegetation. The TEC relies on relatively shallow groundwater depth in summer and autumn (1-2 metres below ground). Ponding occurs in low-lying areas during the winter because vertical drainage of rainfall and runoff is prevented by the relatively impervious ironstone layer and shallow groundwater level. Inundation usually persists for a period of three months during winter, although some occurrences may have little surface water. The vegetation community is tolerant of periodic inundation (usually for several months during winter). The IRP also states that "any groundwater use that has the potential to lower the summer minimum groundwater levels at the water table by more than 0.3 metre should be considered a potential threat" (p16). If groundwater levels are impacted or dewatering occurs, this could result in vegetation deaths within the community. Areas currently mapped as Scott Ironstone TEC that were considered to be in degraded condition were not included as occurrences of the TEC, as they do not meet the criteria of good or better to be listed under the relevant acts. These occurrences are still considered to be important, as with intervention (eg fencing, weed control and grazing management) they have the ability to recover sufficiently to be considered part of the TEC. These areas of vegetation should also be considered for potential impacts from clearing and groundwater drawdown. Some of the proposed WTG locations are very close to known occurrences of Scott Ironstone TEC and vegetation within conservation reserves (Lot 101, Lot 1 and R42377). For example, the proposed WTG on the east side of Lot 101 is immediately adjacent to native vegetation within Lot 101 as well as vegetation mapped as Scott River Ironstone TEC in the Flora Survey. Groundwater drawdown here has a high potential to impact native vegetation, including the Scott River Ironstone TEC. The information provided does not include sufficient detail to demonstrate that modification of the TEC is unlikely to occur. The proposed site office, concrete batching plant and laydown areas are in close proximity to Lot 101 and DBCA's access gate into Lot 101. *Advice* • It is recommended that footings that require minimal dewatering are used for any of the WTGs near the Scott River Ironstone vegetation. • Further discussion is required with DBCA to ensure there is no impact to vegetation in Lot 101 and DBCA's operations/access. • The access track construction should consider appropriate culvert installation to ensure surface hydrology flows are not altered, which may impact the Scott River Ironstone TEC.

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	• A minimum 100m setback is recommended from proposed buildings, structures and earthworks and the Scott River Ironstone TEC occurrences, to mitigate potential impacts on the TEC. • It is recommended a site-specific hydrological study is undertaken. If this information identifies potential impacts to TEC vegetation from the proposal, authorisation under section 45 of the BC Act will be required. If further advice is required in relation to requirements under the BC Act including whether authorisation is required to modify a TEC, email speciesandcommunities@dbca.wa.gov.au. • It is recommended that the Preliminary Acid Sulfate Soils and Dewatering Management Plan **(**Attachment 4 (RSD) - Appendix B – PTG Consulting September 2025) be updated in consultation with DBCA to include appropriate monitoring and mitigation measures relating to the Scott River Ironstone TEC and be conditioned on any development approval. • The proponent may also need to address any referral requirements under the EBPC Act. **Wetlands** The majority of the development area is mapped as palusplain in the Geomorphic Wetlands Augusta to Walpole dataset, with a cluster of sumplands and damplands around the middle of the development area, particularly within Lots 4152, 4263 and 4265. Any alterations in hydrology may impact the palusplain. There may also be indirect impacts to the sumplands that are in close proximity to development. **Fauna** DBCA notes potential impacts of the development on conservation significant values including breeding, roosting and foraging habitat of the threatened Carnaby's cockatoo (*Zanda latirostris*), Baudin's Cockatoo (*Zanda baudinii*), Forest Red-tailed Black Cockatoo (*Calyptorhynchus banksia naso*), and the Priority species Western False Pipistrelle bat (*Falsistrellus mackenziei*), all of which were observed within the proposal area. Evidence from studies at other windfarms has shown that operational impacts affect particular species disproportionately, compared to habitat loss or stationary elevated structures (Willis et al. 2010). While research on Australian wind farms is limited, evidence to date suggests the species most affected by collision mortality fall into the following groups (MacMahon 2010): • Large sedentary raptors. • Fast high flying microchiropteran bats. • Fast high flying non-passerines. Representative species from all of these groups are known to occur within the locality of the Scott River proposal.

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	Studies reported in the literature reviewing the operational impacts at Australian wind farms using data from operational monitoring (i.e. carcass searches) at Australian wind farms found an average mortality of 0.71 birds and 0.55 bats per turbine per year, although these rates are imperfect given the limited datasets (Heinze et al, 2014). It is noted that some species such as the wedge-tailed eagle (*Aquila audax*) and white-striped freetailed bat (*Austronomus australis*) have an 'almost certain' risk of collision with the turbines and high mortality rates/carcass counts have been recorded at other wind farms in Australia. However, as these species are not conservation listed, the impact to these species has not been assessed. How black cockatoos use the landscape in the presence of wind turbines is not well known at present. It may change their foraging, roosting and breeding behaviour. Locating turbines and tracks away from trees and vegetation may minimise disruption to their normal behaviour patterns. Black cockatoos may fly a distance of around 20-30 km on average over open areas (e.g. agriculture areas). Black cockatoos utilise vegetation corridors, such as those formed by the adjacent remnant vegetation, to access known patches of foraging, roosting and breeding habitat. Often the birds will fly to the ground to drink on dusk before returning to their night roost in the forested areas. The RSA of the proposed WTGs is between 40-250m above the ground. The supporting Attachment 4 (RSD) - Appendix L Bird and Bat Risk Assessment – Level Two (Phoenix Environmental Sciences August 2025) indicates that certain conservation significant species such as Red-Tail and Carnaby's Black Cockatoos have been recorded flying to heights of 50m. Many of the WTGs appear to be placed close (or within) areas of remnant vegetation/Black Cockatoo habitat. There is evidence in other bird species that the impact of noise from the turbines may be detrimental to reproductive success. Studies also indicate that birds may exhibit avoidance behaviour near windfarms, with reports of displacement effects ranging from 75 to 800 metres from turbines (Strickland 2004, Winkelman 1994). Potential noise impacts to fauna are considered in Attachment 4 Referral Supporting Document (RSD) and is proposed to be managed through Attachment 4 (RSD) - Appendix N Preliminary Bird and Bat Adaptive Management Plan (both Ecological September 2025). The Preliminary Bird and Bat Adaptive Management Plan **(**Attachment 4 (RSD) - Appendix N – Ecological September 2025) (BBAMP) emphasises carcass monitoring but lacks detail on adaptive responses if collision triggers are exceeded. There are high-quality habitat areas and records for Western Ringtail Possum (*Pseudocheirus occidentalis*) (WRP) in the southeast corner of the development area, which is in proximity to two proposed WTGs.

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS

	Advice
	• Where possible, a minimum 100m buffer between remnant vegetation and individual WTGs is recommended, to reduce bird strike and any potential impacts from the turbine noise. In particular, recommend the following specific WTGs be considered for relocation to reduce impacts for black cockatoos and WRP:
	  • WTG in the northeast of the Development Area adjacent to red-tailed black cockatoo records
	  • WTG cluster north of Governor Broome Road
	  • northwest WTG in dense vegetation, and
	  • southwest WTG just to the north of Governor Broome Road.
	• Recommend the proponent identify any water sources such as fire water points/soaks/troughs/bores etc. in the agricultural land and consider not placing turbines between the existing water points and the vegetation to ensure no disruption to flight paths and reduce the potential for bird strike.
	• Recommend the BBAMP **(**Attachment 4 (RSD) -Appendix N – Ecological September 2025) be updated in consultation with DBCA and be conditioned on any development approval.
	• Recommend the BBAMP be updated to include specific operational adjustments such as blade feathering, appropriate RSA for the proposed WTGs, painted blades, acoustic deterrents, and radar/camera-based smart curtailment of the turbine speed during periods of high species activity, in response to carcass reporting.
	• WRP and Black Cockatoo species are listed as threatened under the BC Act and EPBC Act. The proponent should be aware of their obligations and approval requirements under section 40 of the BC Act, which requires Ministerial authorisation to take or disturb threatened species. If further advice is required in relation to requirements under the BC Act including whether an authorised fauna spotter is required for activities such as vegetation clearing, email speciesandcommunities@dbca.wa.gov.au.
	
	Construction Environmental Management
	The submitted Attachment 4 (RSD) - Appendix H Preliminary Construction Environmental Management Plan (CEMP) Fig 3.1 identifies a temporary concrete batching plant being located approximately 300 metres southwest from Lot 101, which contains Scott River Ironstone TEC vegetation. There is potential for dust impacts on DBCA-managed lands and TEC vegetation from the prevailing wind direction.
	
	The proposed construction laydown area and communications tower appear to be located in close proximity to the access gate/track for Lot 101.
	
	The entirety of the Development Area and surroundings are identified as a Dieback Vulnerable Zone. In terms of specific occurrences of dieback, the intersection of Brockman Highway and Sues Road and the northern side of Brockman Highway was assessed as infested in 2001 and 2008. The vegetation to the south and east of the intersection of

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	Brockman Highway and Dennis Road was assessed as dieback infested in 2008 and 2009, respectively, potentially including the road verge vegetation. In addition, Lot 101 and R42377, were assessed as dieback infested in 2009/2010. Priority Protection Areas (PPA) are the highest Phytophthora dieback disease priority management areas within the State. The focus of PPAs is to reduce the risk of Phytophthora dieback spread. In the development area, there are two Priority Protection Areas – an uninfested high value hotspot in the southeast corner of Lot 1 and eastern portion of Lot 4154 and an infested high value hotspot in the southwest corner of the site, extending over around a quarter of Lot 4260. The section within the infested high value hotspot PPA along Scott River Road / Governor Broome Road is actively managed to reduce impacts. PPA on-ground management measures include fencing, road improvements, drainage control and phosphite treatments. Attachment 4 (RSD) - Appendix H Preliminary Construction Environmental Management Plan (SynergyRED September 2025) indicates that a Dieback Management Plan will be developed and will be informed by a Phytophthora dieback survey completed prior to construction. The Dieback Management Plan will need to include appropriate prevention and mitigation measures such as ensuring that vehicles and machinery are cleaned when arriving and leaving the development area, with information provided on how and where vehicles machinery and equipment will be cleaned of soil (e.g. wash down bays). DBCA is aware that Governor Broome Road can be subject to seasonal saturation causing road deterioration and summer dust. The current proposal will increase existing truck movements, and the adjoining TEC vegetation and flora species may be subject to increased Phytophthora dieback spread impacts, vehicles straying off-road to avoid road damage, and dust coverage. Existing fencing along Governor Broome Road, installed to protect TEC vegetation and threatened flora from cattle movement between sites at this location, has an increased damage risk from stock and vehicles during the construction period. *Advice* • Recommend further modelling be undertaken to identify and address potential dust impacts from the proposed temporary concrete batching plant on DBCA-managed lands and TEC occurrences. • The proposed construction laydown area and communication tower be relocated further to the south so that DBCA access to Lot 101 is not restricted. • Recommend that the proposed Dieback Management Plan be produced in consultation with DBCA and be a condition of any development approval, to be completed prior to the commencement of works. • Recommend water sources used for dust mitigation measures be clean or treated to minimise the risk of moving/spreading pathogens and impacting upon native vegetation. • Recommend the proponent consider suitable traffic management measures during construction to ensure fencing along Governor Broome Road is not damaged.

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	• Recommend that any mulch or topsoil stockpiles, or hydrocarbon/hazardous material stores, are not located upslope and/or within 100m of DBCA-managed lands and TEC occurrences. • Recommend all cleared vegetation be mulched and disposed offsite every day to minimise fauna utilising/moving into the cleared vegetation. If spoil is stockpiled and not mulched or disposed offsite within this timeframe, stockpiles should be checked for fauna before they are mulched or removed from the site. • CEMP Table 6.7 Terrestrial Fauna Management refers to incidents where loss or injury of native fauna occurs. Regional Wildlife Officers at DBCA's Southwest Region should be notified within 24 hours of any incident occurring. **Attachment 1** – DBCA identified regional significant flora species based on the Flora Survey records (assuming correct ID) • *Actinodium cunninghamii* - western range end. Disjunct western populations. • *Calothamnus lehmannii* - disjunct and rare on Scott Coastal Plain. • *Cyathochaeta equitans* - no known previous record on Scott Coastal Plain. • *Daviesia flexuosa* - western populations are disjunct from the eastern south coastal populations. • *Goodenia micrantha* - first known record on Scott Coastal Plain. • *Grevillea diversifolia* subsp. *subtersericata* - no known previous record on Scott Coastal Plain. Disjunct from usual distribution. Nearest record near Northcliffe. • *Hakea tuberculata* - disjunct western populations are endemic to the Scott Ironstone TEC. • *Isolepis congrua* - no known previous record on Scott Coastal Plain. Nearest record near Denmark. • *Isolepis hookeriana* - no known previous record on the Scott Coastal Plain. Nearest record near Bridgetown. • *Lepidosperma leptostachyum* - no known previous record on the Scott Coastal Plain • *Melaleuca densa* - western range end. Uncommon on Scott Coastal Plain. • *Myriophyllum salsugineum* - Poorly recorded. First record on the Scott Coastal Plain landform. • *Persoonia graminea* - western populations are disjunct from eastern populations. Uncommon. • *Scaevola striata* var. *striata* - western range end at Scott River. • *Sphaerolobium grandiflorum* - First record on the Scott Coastal Plain landform. Disjunct. Not recorded west of Walpole • *Sphaerolobium racemulosum* - western populations highly disjunct from populations east of Albany. • *Stylidium megacarpum* - southern range end. Poorly recorded on the Scott Coastal Plain landform. • *Synaphea obtusata* - no known previous record on the Scott Coastal Plain. Not previously recorded west of Manjimup.
Department of Health (DoH)	DoH position: No objection – with comments and/or recommended conditions and advice notes provided below.

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	1. Site servicing The DoH advises that the treatment and disposal of wastewater generated on site, either temporarily or permanently, is required to comply with the *Health (Treatment of Sewage and Disposal of Effluent and Liquid Waste) Regulations 1974* and the Government Sewerage Policy 2019 requirements. A site-specific Site and Soil Evaluation (SSE) should be undertaken by a qualified consultant during the wettest seasonal time of the year (mid-July/August) as per AS/NZS 1547:2012, to ensure the land application area for each wastewater treatment system is appropriately sized and located. **2. Health and amenity** Mosquitoes The subject land is in a region that occasionally experiences problems with nuisance and disease carrying mosquitoes. These mosquitoes are known carriers of Ross River (RRV) and Barmah Forest (BFV) viruses. Human cases of RRV and BFV diseases have been reported in this region. Future development should avoid the creation of additional mosquito breeding habitats. The DoH recommends that the proponent ensures the proposed site works and infrastructure do not create additional mosquito breeding habitat as follows: • Changes to topography resulting from earthworks must prevent run-off from creating surface ponding as it may become mosquito breeding habitat. • Water tanks and other water-holding containers must be sealed or screened to prevent mosquito access and breeding. • On-site infrastructure and constructed water bodies must be located, designed and maintained so they do not create or contribute to mosquito breeding. Temporary concrete batching plant Concrete batching facilities may impact human health due to contaminant types such as lime, calcium hydroxide, alkalis, hydrocarbons, asbestos and metals (nickel, zinc). Concrete batching plants are also considered a potentially contaminating land use as described in the Department of Water and Environmental Regulation's *Assessment and management of contaminated sites* (DWER, Nov 2021). The DoH considers it appropriate that these matters are addressed through the development application, including considerations to protect public health and to avoid the creation of a new contaminated site. The DoH recommends that the applicant provide details of effective management of the proposed temporary concrete batching plant, including contingency measures and actions in the event of facility malfunctions or spills.

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	Noise The DoH is unable to provide noise-related comments as noise falls outside of the DoH's regulatory area. Please refer the request to the Department of Water and Environmental Regulation noise branch for advice concerning noise impacts and comment on the proposed wind farm application: Noise regulation | Western Australian Government. Contaminated sites There is a large area adjacent to the western boundary of the site comprising a series of linear ponds and wetlands known as the former Beenup Titanium Minerals Mine. The site was reported (DMO25933/25934) under the *Contaminated Sites Act 2003* based on the presence of groundwater contamination derived from deposits of mineral processing wastes and disturbance of acid sulfate soils, and elevated radiation derived from the titanium mineral processing waste deposited on site. The mine operations were rehabilitated to wetlands in 2004 and a radiation survey conducted at the time concluded that the site was suitable as a wetland reserve but not for any other sensitive land uses. The proponent may wish to discuss this with the Radiological Council of Western Australia. **Approvals** • An Application to Construct or Install an Apparatus for the Treatment of Sewage for each onsite wastewater treatment system, temporary or otherwise, will be required to be submitted to the Shire of Augusta Margaret River. • All drinking water provided on site must meet the health-related requirements of the *Australian Drinking Water Guidelines 2011*.
Department of Fire and Emergency Services (DFES)	I refer to your email dated 19 November 2025 regarding the submission of a Bushfire Management Plan (BMP) (Revision 1.0), prepared by Linfire and dated 27 March 2025, for the above proposed development. The BMP is accompanied by a Bushfire Risk Management Plan (BRMP) (Revision 0) from the proponent dated 27 March 2025 in relation to the proposal. This advice relates to the State Planning Policy 3.7 Bushfire (SPP 3.7) and supporting Planning for Bushfire Guidelines (Guidelines), as well as DFES' role and responsibilities as Hazard Management Agency (HMA) for Fire in Western Australia. **General Comment** • DFES acknowledges that the development site consists of multiple owners of land primarily used for agricultural purposes. The proposed development includes the installation of 20 wind turbines and associated infrastructure, including a substation and operations and maintenance building/office. • Specific requirements of SPP 3.7 and the Guidelines are to be further addressed in the BMP as outlined in the below assessment Tables 1 and 2.

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	• DFES notes that the current version of SPP 3.7 and the Guidelines no longer makes reference to 'high risk land use'. The decision maker has referred this proposal to DFES as a discretionary referral. DFES considers that SPP 3.7 and the Guidelines do not adequately address high risk land use such as renewable energy facilities. Given the temperature sensitive nature of the infrastructure, it is critical to ensure that the proposed design adequately responds to facility fire risks and bushfire risks in order to protect life, property and infrastructure. • Accordingly, DFES has also assessed the proposal against the CFA Design Guidelines and Model Requirements – Renewable Energy Facilities as amended (REF Guidelines) which is currently considered best practice for the development of renewable energy facilities. • Specific requirements of SPP 3.7 and the supporting Guidelines and the REF Guidelines are to be further addressed in the BMP and BRMP as outlined in the below assessment. The assessment comments relating to the REF Guidelines have been incorporated into the below overall assessment comments for the respective issue/element. **Recommendation: Compliance with acceptable solutions not demonstrated – modifications required** DFES advises that the BMP has not demonstrated that the proposed development complies with the Element 2: Siting and Design requirements of SPP 3.7 and the Guidelines. Further information should also be submitted to demonstrate compliance with the Victorian Country Fire Authority REF Guidelines, considered best practice for the development of renewable energy facilities. DFES recommends the BMP and BRMP be modified as per the Assessment advice provided in Tables 1-3 to ensure it is accurate and the bushfire risk management/mitigation measures are effective and can be implemented in perpetuity to manage/mitigate the bushfire risk to people, property and infrastructure to an acceptable level and appropriate to the land use and location. The required modifications are listed in the table(s) below. Should the modified BMP and BRMP affect the design of the proposal, the proposal should be amended to reflect these modifications. DFES recommends that due consideration be given to the below assessment of the extreme bushfire hazard level and unacceptable risk (see Tables 1 – 3).

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS

Table 1: Assessment – Policy Measure 7.1 ii. c. Compliant Preparation of a BAL Contour Map

Vegetation Classification or Exclusions	BMP Modification Required
Classified Plot 6 – not demonstrated Vegetation Plot 6 cannot be substantiated as Class B Woodland with the limited information and photographic evidence provided. Photograph IDs 6a-c do not represent Class B Woodland. The foliage cover appears to exceed 30% and most of the Plots are contiguous with Class A Forest. The BMP should detail specifically how the Class B Woodland classification was derived as opposed to Class A Forest. If unsubstantiated, the vegetation classification should be revised to consider the vegetation as per AS 3959, or the resultant BAL ratings may be inaccurate.	**BAL Rating cannot be validated.** Further evidence to support the vegetation classification of Plot 6 as Class B Woodland is required.

Table 2: Policy Measure 7.1 ii. e. Compliance with the Bushfire Protection Criteria 7: Development – Commercial and Industrial

Element	Assessment	Action
Siting and Design	**A2.1a – not demonstrated** The BAL ratings cannot be validated for the reason(s) outlined in Table 1. There are two turbines located in a high-risk environment within a timber plantation, the timeline for harvesting is unknown. Should the plantation land use continue it is suggested from a HMA perspective that these turbines be located to a lower risk environment on the site. Furthermore, although SPP 3.7 does not require commercial or industrial land uses achieve anything less than BAL-29 for habitable buildings, evidence is required that the proposal meets the separation distance requirements (whichever is greater) to ensure: a) that radiant heat from a nearby bushfire will not trigger a failure in the infrastructure (whatever the most susceptible component is); and b) that radiant heat emitted from a failure in infrastructure should be used to inform the minimum separation distance required (i.e. radiant heat level that the weakest component can withstand) and provided to demonstrate compliance. Sufficient evidence in the form of technical specifications and/or standards should be provided.	**BAL Rating cannot be validated.** Modification to the BMP is required to address the Assessment advice.

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS

Vehicular Access	**A3.1 – demonstrated** The BMP has demonstrated compliance with the driveway and turning circle requirements of the Guidelines. **REF Guidelines** The REF Guidelines requires a larger turning circle or T-head to allow for the turning of fire appliance. It is recommended that consideration is given to these Guidelines, in consultation with the local brigades and units, to determine the minimum driveway compliance requirements.	**Compliance with vehicular access requirements of the REF Guidelines not demonstrated.** Modification to the BRMP is required to address the Assessment advice.
Water Supply	**A4.1 - demonstrated** The BMP has demonstrated compliance with Element 4: Water Supply of the Guidelines. **REF Guidelines** The REF Guidelines require a 45,000L water tank at each site entrance and there are four site entrances listed in the vehicle access compliance statement. However, only three water tanks for firefighting purposes are shown on Figures 8 and 9 and they are located throughout the site at various driveway intersections.	**Compliance with firefighting Water Supply requirements of the REF Guidelines not demonstrated.** Modification to the BRMP is required to address the Assessment advice.

Table 3: Policy Measure 7.1 iv. and Section 9.4.2 of the Guidelines: DFES Role as Hazard Management Agency (HMA)

DFES wishes to provide the below additional advice in its role and responsibilities of HMA for Fire in Western Australia.

Emergency Management Plan (EMP)		Action
Emergency Management Plan (EMP)	Given the high-risk land use at this location, it is considered appropriate that an 'Emergency Management Plan' be prepared. Consideration should be given to the Bushfire Emergency Plan (BEP) Manual (as published by the Western Australian Planning Commission), Section 7 of the REF Guidelines and the comments from DFES Aviation Services below. These contain details of information that should be included in a EMP and will ensure the appropriate content is detailed when finalising the EMP to the satisfaction of the decision maker.	**Comment only.**

Attachment 7 – Schedule of Referral Responses

<table>
<tr><th>Agency</th><th>SUMMARY OF COMMENTS</th></tr>
<tr><td></td><td>
<table>
<tr><th>Renewable Energy Facilities</th><th></th><th>Action</th></tr>
<tr><td>Consultation</td><td>In the event that an approval is granted, the DFES District Officer responsible for this region and the local fire and emergency services should be consulted during the development, construction, and leading up to the commissioning of the facility.

It is considered critical for the local fire and emergency services to understand the hazards present in the facility and the measures required to ensure the safety of firefighting personnel when working in or around different parts of the facility.

This may impact on how crews respond to a fire within the facility, which may in turn have ramification regarding the optimal number and location of water supplies.</td><td>Comment only.</td></tr>
<tr><th>DFES Other Technical Advice</th><th></th><th>Action</th></tr>
<tr><td>DFES Regional and Special Operations</td><td>DFES Land Use Planning have referred the Scott River wind farm proposal to both the lower south west regional and special operations branches. Due to operational priorities no comment has been received to date. Should any comment be provided within the near future it will be provided to the Shire.</td><td>Comment only.</td></tr>
<tr><td>DFES Aviation Services</td><td>Aviation Services provide the following comments:
• No wind turbines to be located within 300 metres of one another.
• Wind turbines will be provided with automatic shut-down and the ability to be completely disconnected from the power supply in the event of fire.
• All weather monitoring stations to be notified to the Civil Aviation Safety Authority.
• All guy-wires to be clearly marked.</td><td>Turbine locations to be provided to DFES Aviation Services.</td></tr>
<tr><td>DFES Land Use Planning</td><td>It is the responsibility of the proponent to ensure the proposal complies with relevant planning and building requirements. This advice does not exempt the applicant/proponent from obtaining approvals that apply to the proposal including planning, building, environmental health or any other approvals required by a relevant authority under written laws.</td><td>Comment only.</td></tr>
</table>
</td></tr>
<tr><td>Department of Energy and Economic Diversification (DEED)</td><td>Officers from the Energy Policy WA and PoweringWA groups have previously met with representatives from Synergy to discuss SynergyRED’s (the Applicant) proposal. The Department notes SynergyRED has a successful track record of developing renewable projects in the South West Interconnected System (SWIS), including joint venture projects like the Mumbida Wind Farm and the Warradarge Wind Farm.

Electricity Demand
The State Government has committed to the retirement of state-owned coal fired power stations by 2030, with the Collie Power Station due to retire in 2027 and the remaining Muja Power Station units in 2029. The Australian Energy Market Operator’s (AEMO) 2025 Wholesale Electricity Market (WEM) Electricity Statement of Opportunities highlights a need</td></tr>
</table>

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	for new generation capacity in the SWIS from 2027 onwards. This is due to the planned retirement of these facilities, plus growth in peak demand and overall electricity consumption. The Clean Energy Link – North transmission project, due for completion at the end of 2027, will enable the connection of new generation and storage projects between Three Springs and the Perth metropolitan area. This transmission infrastructure will support a range of energy sources, including wind and solar projects, with connections enabled from 2028 onwards. In advance of completion of this transmission program of works, and noting growing demand, the Department is supportive of renewable energy projects connecting to the existing Western Power network and making use of any available capacity. Additionally, whole-of-system modelling indicates that wind generation assets should be developed across the SWIS to access diverse wind profiles over the day and year to maximise the availability of renewable generation at any one time. Excess renewable power also fills the growing fleet of Battery Energy Storage System facilities across the SWIS, providing a lower cost and lower emissions energy source to 'firm' intermittent renewable energy generation. **Connection to the SWIS** Connection to Western Power's transmission network and confirmation of project financing are essential to the viability of the proposed wind farm in Scott River. The Department notes the applicant; • proposes to connect up to 100 megawatts of wind generation capacity to the Beenup to Manjimup 132 kilovolt transmission line via a 4.3 kilometre connection asset, and • has been engaging with Western Power regarding the connection of their project to the SWIS via fortnightly meetings since February 2025. The Department notes the progress being made towards a connection agreement and that ongoing work is required to connect the project to the SWIS, including approvals, confirmation of project financing and available network capacity, and construction of the connection asset. **Stakeholder Engagement and Community Benefits** The State Government expects renewable energy proponents to follow best practice when engaging with landowners, stakeholders and the communities in which they intend to operate. The Department notes SynergyRED has undertaken the first steps in obtaining social licence for their project through: • engagement across the community since 2024, including community drop-in sessions, monthly updates in the local newsletter, letter drops and targeted advertising; • performing a Social Values Assessment to inform the development of their project; and

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	• committing to provide $100,000 per annum towards a Community Benefits Fund, the allocation of which will be informed by the development of a Community Benefit Fund Implementation Plan in consultation with the Shire of Augusta Margaret River (the Shire) and the community. The Department notes the Applicant's proposed community benefits contribution is in line with the recommended amount outlined in the PoweringWA *Draft Guideline on Community Benefits for Renewable Energy Projects*. The Draft Guideline is subject to finalisation. As such, SynergyRED should continue to work with the Shire and local community to ensure funds may be allocated in a way that meets the long-term needs of the community and is consistent with the final Guideline once published. The Department does not have a formal role in approvals required to deliver the Project, and encourages SynergyRED to continue to engage relevant agencies, including Western Power and AEMO, to understand its complete approval pathways from development through to energisation. The Department also encourages the applicant to continue to undertake on-going engagement regarding the development, prioritising transparency and collaboration with the Shire and local community.
Western Power	I refer to the Development Assessment Panel development application - Shire of August Margaret River for SynergyRED Scott River Wind Farm. The applicant's report states that the "Feasibility assessment Area" (subject area) and the "latest draft development boundary…is subject to change as the feasibility assessment progresses". Western Power recommend that a Detailed Design and Construction Phase plan as agreed with Western Power be provided by the proponent/applicant. Noting the existing and potential Western Power assets relevant to the proposal, Western Power's internal customer connection team in respect to the proposed development advise that the customer/proponent has been progressing the development with Western Power. However, prior to commencement of works, the proponent shall ensure that the connection and stages, location, design, access and ongoing maintenance and operations of assets is supported and agreed with Western Power. Western Power recommends the following standard Advice Notes prior to development or subdivision on the subject site, pursuant to Section 167 of the Planning and Development Act 2005: Advice Notes *(i) The development shall be designed and constructed to protect Western Power infrastructure and interests from potential land use conflict.*

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	(ii) No development (including drainage, fill, fencing, storage or parking) will be permitted within Western Power line and cable easements or restriction zones without the prior written approval of Western Power. *(iii) The applicant should formally progress the Western Power network connection and substation arrangements with Western Power.* *(iv) Arrangements being made to the specifications of Western Power for the provision of necessary electricity easements as and where required.*
Main Roads WA (MRWA)	I refer to your email of 19 November 2025 and advise that Main Roads has no objections in principle to the proposed development, subject to further engagement being undertaken with Main Roads regarding the intersection construction required to facilitate the movement of components from the Bunbury Port to site.
CASA	CASA has reviewed the Aviation Impact Assessment (AIA) prepared by Aviation Projects dated April 2025 for the Scott River (Beenup) Wind Farm project located in the Shire of Augusta Margaret River Local Government Area in Western Australia. CASA notes the following information contained in the AIA: • This wind farm development compromises 20 wind turbine generators (WTGs), which are up to 250 m Above Ground Level (AGL). • The wind farm is located outside of Busselton Airport's OLS. • The wind farm will affect the minimum sector altitude and GNSS arrival instrument procedures at Busselton aerodrome. Please consult with the aerodrome and aviation operators to ensure that they accept the proposed changes. We need confirmation from the aerodrome operator before we will make any changes (Airservices Australia - 25 February 2025). • There are 2 uncertified aerodromes identified within 3 nm: o Unknown Aerodrome 1. The proposed wind farm would be considered potentially hazardous obstacles. When the wind blows from the north, downstream wake turbulence from the closer WTGs will extend into the aerodrome's right side of the circuit area. Further consultation with the owner/operator of this aerodrome would be beneficial in understanding the potential extent of these impacts. o Boley Aerodrome. The proposed wind farm would be considered potentially hazardous obstacles. When the wind blows from east, downstream wake turbulence from the closer WTGs will extend into the aerodrome's right side of the circuit area. Further consultation with the owner/operator of this aerodrome would be beneficial to understand the potential extent of these impacts. CASA notes from the Airservices Australia response that it concluded that … The proposed activity will penetrate the current Airservices-designed airspace procedures and/or impact CNS facilities or ATC operations at Busselton aerodrome. Busselton aerodrome (YBLN) is a certified aerodrome which must operate in accordance with the

Attachment 7 – Schedule of Referral Responses

Agency	SUMMARY OF COMMENTS
	requirements of Part 139 (Aerodromes) - Manual of Standards 2020. Therefore, until such time that the impacts at Busselton Aerodrome are resolved and published, CASA advises that the proposed Scott River (Beenup) Wind Farm as presented, would have an unacceptable effect on the safety of existing and future air transport operations at Busselton Aerodrome. Further, CASA agrees with the AIA that communication with the 2 uncertified aerodromes owners/operators is required regarding the potential impacts associated with the planned 250 m high WTGs. CASA's assessment was conducted in accordance with the National Airports Safeguarding Framework (Guideline D) as developed by the Department of Infrastructure, Transport, Regional Development, Communications and the Arts, and as developed to provide planning advice to State and Local Planning Authorities to aid in safeguarding Australian airports from incompatible development. Post the above being resolved and published, with regards to Visual Flight Rules (VFR) operations, pilots are permitted to fly as low as 500 ft AGL. The WTGs will reach up to a height of approximately 820 ft (or 250 m) AGL, and therefore the turbine blades will infringe navigable airspace by 320 ft. Therefore, CASA would recommend the proponent install obstacle lighting on the WTGs due to the height of these structures. To limit any potential visual impact on the community, CASA would also recommend consideration of a radar-activated type system of steady red low intensity (200 cd) aviation hazard lighting or contacting obstacle lighting suppliers and discussing whether a cowling system, much like a typical "lampshade", could be incorporated into the lighting system that could result in little or no downward light spill without impacting aviation safety. Any wind monitoring masts associated with the development should be marked as per Section 8.110 of CASA's Part 139 (Aerodromes) - Manual of Standards (MOS139) with the inclusion of aviation hazard markers. The coordinates and estimated survey heights of each WTG and wind monitoring mast must be reported to the Airservices Australia Vertical Obstacle Database (VOD) email address, once Development Approval is granted to ensure that the location of the wind farm can be mapped for the information of pilots. Changes to maps can take in excess of six months, therefore one month prior to works commencing, Airservices should be contacted via the VOD email address so that a NOTAM (Notice to Airmen) can be published by Airservices advising pilots that the construction of tall structures in the area is imminent. On the completion of works, the VOD should be advised of the surveyed height and location of each WTG and wind monitoring mast so that the wind farm details can be accurately recorded in the database.

Attachment 8

On 19 September 2025, the Shire received a petition containing **1,377** signatures requesting the following:

Petition

Save Scott River from Wind Turbines

To the Planning Minister of Western Australia and the Shire President of Augusta Margaret River This petition is to show our objection to the proposed wind farm in Scott River, Western Australia for the following reasons:

(1) The Scott River district is known for its high ecological value and its protected under the Environment Protection and Biodiversity Conservation Act 1999 (Scott River Ironstone Association – Endangered Category) there is a high risk to endangered flora and fauna from wind turbine construction and operation. There are 26 fauna species listed as threatened, priority or under protection that occur with the Scott River catchment. (2) Industrial wind turbines will increase fire risk to the local community, with no aerial and limited ground support around the site. (3) There is a very high risk of Acid Sulphate Soils being created during and after the construction of the enormous wind turbines and what this will present to the sensitive waterways of the Scott and Blackwood River, neighbouring farmland and Flinders Bay. (4) Neighbouring landowners have valid health concerns living under 250m high wind turbines and will be exposed to the noise, disturbance and shadow flicker.

We ask you to consider the rare and endangered wildlife, nearby residents and our unique and sensitive environment when considering industrialised development at the Scott River and our strong objection to the proposed wind farm in such an unsuitable location.

1 SHIRE REQUEST FOR FURTHER INFORMATION (RFI) ISSUED ON 23/01/2026

No.	KEY THEME	RFI ITEM	RESPONSE
1.	Micro-siting	<u>Context</u> The Shire is aware that the applicant has provided a concept plan to have maximum flexibility in the next stage of the project, with other companies predicted to carry out construction and operation. However, the lack of certainty on the locations of the WTGs (Wind Turbine Generators) limits a full and thorough assessment of the proposal. The Shire first and foremost asks that the locations of the WTGs be presented with greater certainty at this stage to enable more detailed and specific evaluation of impacts and mitigation measures. In particular, visual impact, environmental disturbance and ASS risk all require a greater level of precision than that put forward by the application. The Shire recognizes the need for some flexibility in delivery and notes the industry based standard embodied within the State Draft Renewable Energy Code providing for micro-siting within a 100m radius of a particular location. <u>Request</u> Provision of site plan showing actual proposed locations of wind turbines with individually numbered turbines. The Shire is open to a development envelope with a radius of 100m.	The Scott River site presents a complex combination of environmental, technical and planning constraints that must be balanced when determining appropriate Wind Turbine Generator (**WTG**) placement. As a result, SynergyRED does not consider the application of a standard radial approach to micro-siting to be appropriate for this Proposal. The State Government Draft Renewable Energy Planning Code ('Draft Code') currently proposes a 100 m micro-siting radius, which is also reflected in the Shire of Augusta-Margaret River's ('the Shire') Draft LPP23: Renewable Energy Facilities ('**Draft LPP23**'). Draft LPP23 is yet to be adopted by the Shire of Augusta-Margaret River ('the Shire'). SynergyRED, however, understands that DPLH is considering increasing the micro-siting radius, based on industry feedback during the public consultation process for the Draft Code. To support both the Shire and community's need for certainty and transparency, and the Proposal's technical requirements, SynergyRED proposes a refined, site responsive and constraint informed micro-siting approach for the Shire and Development Assessment Panels' (**DAP**) consideration, as set out in **Appendix A**: Proposed Wind Turbine Envelope:. SynergyRED proposes a methodology that positions <u>all WTG within a defined 'constraint-free area' **and** within a 500 m radius of their currently proposed locations</u>, offering a technically robust alternative to the Draft Code and Draft LPP23. From a visual impact perspective, applying a 500 m micro-siting radius provides limited flexibility to relocate WTGs, given the constraint-free area on the plan in **Appendix A**. Using this approach, the 'horizontal spread' of the total wind farm will not be able to increase from most key viewpoints (the south west around Augusta). That is, the most northern turbine and southern turbine cannot move any further away from the centre of the site which therefore limits any increase to visual impact. Hence, any future turbine relocation is not expected to materially increase visual impacts from those identified in the updated visual assessment, completed to address DPLH's comments (see Section 2.1 - DPLH Agency Response). A condition of Development Approval reflecting the above rationale is proposed for Shire and DAP consideration and is set out **Appendix A**. The proposed condition is based on the State Development Assessment Unit's (**SDAU**) decision on the Narrogin Wind Farm (September 2025), adapted to accommodate the above approach for the Wind Farm in Scott River Proposal.

2.	Landscape/ Visual Impact	Outline how the proposal has responded to community concerns around landscape impacts.	See **Section 2.1** - Response to DPLH Agency Submission.
		Show numbers on the existing and new photomontages to enable further assessment of the siting of individual turbines with a view to relocating some of the turbines elsewhere within the project site.	See **Section 2.1** – Response to DPLH Agency Submission.
		Provision of photomontages for the additional viewpoints listed below possibly using a simpler method to produce wireframe images but with vegetation overlaid: i. Travelling east along Scott River Road leaving East Augusta, in locations where the vegetation is naturally low (see attached Photo 1). ii. Main street intersection, Ellis Street moving downhill into the intersection with Blackwood Avenue (Photo 2 – two examples). iii. Main town foreshore opposite East Augusta (Photo 3). iv. Albany Terrace, close to the opening between Hardy Inlet and the ocean (Photo 4). v. Key recreation sites of DBCA managed land.	See **Section 2.1** – Response to DPLH Agency Submission.
		Inclusion of other structures in the assessment including meteorological masts, transmission lines, substation and other associated structures and mitigation methods for these.	See **Section 2.1** – Response to DPLH Agency Submission.
		Mitigation measures to address landscape-wide and locally identified impacts could include. i. Road edge vegetation screening along surrounding travel route corridors of all types managing and screening views along the length of these corridors. ii. Localised screening surrounding the ancillary infrastructure. iii. Broadscale landscape planting within the Proposal area.	See **Section 2.1** – Response to DPLH Agency Submission.
		4. Inclusion in VIA of how structures other than wind turbines may have visual impact and how these will be mitigated (if necessary).	See **Section 2.1** – Response to DPLH Agency Submission.
		5. Outline of any mitigation measures for localised visual impact such as vegetation screening.	See **Section 2.1** – Response to DPLH Agency Submission.
3.	Social Impact (associated with Visual Impact)	The social values assessment provided with the application does not adequately measure community concerns around landscape impacts. The high level of submissions in the public consultation demonstrates the high social value attributed to the Augusta/Scott River landscape and provides some opportunity for the proponent to address community perspectives on this matter. Landscape impact, including the perception of impact, remains a substantive issue and the social values assessment provided with the proposal does not address this issue sufficiently. As noted in the DPLH response, submissions received detailing landscape impact concerns provide a sound basis for an updated social impact assessment and for refinement of the proposal to mitigate impacts.	See **Section 2.1** – Response to DPLH Agency Submission.

4.	Acid Sulfate Soils and groundwater management (including native vegetation and dewatering)	Details of what research is required to inform an ASS and groundwater management plan and what would trigger an alternative construction design to address presence of ASS and impacts of dewatering on GDEs. Confirmation of the actual location of the WTGs will enable the Shire to be able to assess impacts on native vegetation, TEC's and fauna. DBCA have provided detailed advice as to setbacks that would be required from groundwater dependent ecosystems (GDE's) and other native vegetation which should be reflected in the siting of the WTGs. While an ASS and groundwater management plan is predicted to be forthcoming were the application to be approved, there is a lack of certainty around what would trigger the alternative methods of construction and whether this would be achievable at the proposed locations. That is, how will risk be determined and the optional foundation responses and management measures be enacted?	As noted in Section 6.5 of Attachment 4 - RSD (Eco Logical Australia 2025), SynergyRED commits to undertake a detailed geotechnical and Acid Sulfate Soils (**ASS**) investigation prior to construction. This will include additional soil sampling and analysis to at least 1 m below the base of any proposed excavations to ascertain the extent of Potential Acid Sulfate Soils (**PASS**), in accordance with Department of Water and Environmental Regulation (**DWER**) Guideline on the Identification and investigation of acid sulfate soils and acidic landscapes (2015a). This will define the nature and extent of ASS and the amount of existing and potential acidity it contains in order to determine appropriate management measures. Additional baseline water monitoring will also be undertaken prior to construction to contribute to the baseline dataset for the site and inform the establishment of appropriate water quality targets and thresholds within the detailed Acid Sulfate Soils Dewatering Management Plan (**ASSDMP**). As detailed in Section 2.2.2 of the Development Application, two (2) primary WTG foundation options (above ground/partial above ground) will be utilised to minimise the depth of excavation limiting impacts to groundwater (and reducing the volume of ASS disturbed). A typical below ground foundation will only be used where it is confirmed, prior to construction, through detailed site investigation and revised modelling, that no dewatering will be required (i.e. where groundwater level is below depth of excavation ~5m). As detailed in Section 10.5.2 of Attachment 4 - RSD (Eco Logical Australia 2025) the specific foundation option chosen for each turbine/mast/tower location will be determined based on detailed site investigation and revised modelling to ensure that any proposed dewatering or excavation would not result in significant impact to soil, surface water or groundwater quality as a result of PASS exposure. An above ground foundation may be required where revised modelling indicates that a partial-above ground foundation proposed at a particular location would not comply with the defined dewatering limits (as defined in Section 7.6.1 of Attachment 4 - RSD (Eco Logical Australia 2025)). Micro-siting of WTGs is discussed in response to Shire RFI Key Theme 1 and consideration of DWER recommended buffers provided in Section 2.2. The micro-siting approach ensures WTGs are located 100 m from native vegetation, including Groundwater Dependent Ecosystems (**GDE**) (i.e. Threatened Ecological Communities (**TEC** and wetlands), as measured from their centre point. This buffer combined with the temporary and spatially constrained nature of the proposed dewatering, and implementation of the ASSDMP including application of the defined groundwater drawdown limits will ensure that drawdown of groundwater does not significantly impact GDE within or surrounding the Development Envelope. Impacts to GDE are discussed further in response to public submissions of objection – **Key Theme (3**Submissions raised concern for threatened and endangered species including the white-bellied frog, snake-neck turtle, short-neck tortoise, ringtail possum, black swans and Baudin's and Carnaby's black cockatoos.**).**Submissions raised concern for threatened and endangered species including the white-bellied frog, snake-neck turtle, short-neck tortoise, ringtail possum, black swans and Baudin's and Carnaby's black cockatoos.

5.		Please also provide details as to any dewatering that may be required for cables going to the substation and the location of these.	Cabling between the wind turbines and the substation that connects the Proposal with the 132 kV transmission line is expected to be underground and follow existing and proposed internal access roads where possible to minimise disturbance. High Voltage (**HV**) cables are typically buried at depths of about 900-1200 mm, with the trenches being typically 450 mm wide subject to design. Civil construction, specifically activities that require excavation, will be scheduled to occur during the dry season, where practicable, to reduce the likely requirement to dewater. The dewatering management for cables (if required) is included in the (ASSDMP). included as Appendix B in the Development Application.
6.	Noise Impact	Inclusion in Noise Impact Assessment for noise controls relating to the 'modulation' Characteristic. DWER's environmental noise branch considers the 'modulation' characteristic, as defined in regulation 9, is the most likely to be present in the noise received. Therefore, at this stage of the project the proponent should also investigate noise controls that can be put in place before (e.g. serrated edges) and/or during operation (e.g. curtailment strategies) to reduce noise levels to compliance should modulation be detected at receivers outside the Project development envelope once the wind farm is operational.	See **Section 2.2** – Response to DWER Agency Submission and updated Noise Impact Assessment in **Appendix D**: Updated Noise Impact Assessment
7.	Community Benefit Fund	Update on details of the proposed community benefit fund and any other details regarding local economic benefits such as local procurement, training etc, Please provide further information regarding the proposal for community benefits, including how it is proposed the funding will be governed and function.	SynergyRED has committed to establishing a $100,000 per annum Community Benefit Fund ('the Fund') for the proposed wind farm. The Fund will be adjusted in line with the Consumer Price Index (**CPI**) for future years. SynergyRED will align the implementation of the Fund with the Department of Energy and Economic Diversification (**DEED**)'s "*Community Benefits Guideline for Large-scale Renewable Energy Projects in the South West Interconnected System*" (**Community Benefits Guideline**), released on 4 March 2026. An Advice Note is proposed in relation to the Fund, consistent with the SDAU's Narrogin decision.
8.	Aviation Impact Assessment	Update the aviation impact assessment to include Augusta and Margaret River airstrips. Consideration of the Augusta and Margaret River Airstrips which are regularly used were not taken into account in the Aviation Impact Assessment. As per advice from DPIRD, consultation with relevant stakeholders should occur to investigate any impacts.	See Section 2.4 – Response to Department of Primary Industry and Regional Development (**DPIRD**) Agency Submission (Aviation Impact Assessment).
9.	Bushfire Management	Confirmation that the turbines within a plantation have adequate separation distance for bushfire. Advice from DFES noted the location of two turbines within a timber plantation. A query was raised as to whether proposal meets the separation distance requirements (whichever is greater) to ensure: a) that radiant heat from a nearby bushfire will not trigger a failure in the infrastructure (whatever the most susceptible component is); and	See Section 2.7 – Response to Department of Fire and Emergency Services (**DFES**) Agency Submission.

		b) that radiant heat emitted from a failure in infrastructure should be used to inform the minimum separation distance required (i.e. radiant heat level that the weakest component can withstand). Please confirm that the separation distance is adequate in regard to the above. Note, DFES have raised other issues that should be resolved through an updated BMP.	
10.	DCCEEW Referral	An update on the status of the referral to DCCEEW	The Proposal has received a 'not a controlled action if taken in a particular manner' (**NCA-PM**) referral decision from the Department of Climate Change, Energy, the Environment and Water (**DCCEEW**). This decision means that the Proposal is not likely to have a significant impact on Federally protected flora, fauna or ecological communities, and so does not require assessment by DCCEEW, provided that it is developed in accordance with the 'particular manner' specified in the decision. The 'particular manner' includes a new commitment to ensure the minimum blade ground clearance is 59 metres above ground level (increased from 40 metres above ground level at time of referral), to avoid significant impacts to black cockatoos and migratory birds. For more information on the decision and the required actions, refer to DCCEEW's website: EPBC Act Public Portal.
11.	Response to Submissions Raised	**1.** The conceptual nature of the design & lack of project certainty **2.** Impacts on biodiversity **3.** Impacts on hydrology, groundwater & dependent ecosystems **4.** Acid sulfate soils & irreversible environmental risk **5.** Impacts on visual impact & landscape character **6.** Noise, shadow flicker and EMI and associated health & residential amenity impacts **7.** Planning and other approval processes & community consultation **8.** Impacts on agricultural land & rural productivity **9.** Impacts on property values, investment & rural lifestyle **10.** Impacts on tourism & local economy **11.** How the project will contribute to community benefits & energy equity **12.** Traffic, roads & roadside vegetation **13.** Extreme weather, fire & safety **14.** Decommissioning & rehabilitation risks	**Refer to Public Submissions summary (in Section 3)** *Note: Responses to several additional matters raised in the submissions (as identified in SynergyRED's review) have also been included in the Section 3 response.*

2 AGENCY SUBMISSIONS

2.1 Department of Planning, Lands and Heritage (DPLH)

SUMMARY OF SUBMISSION	RESPONSE
The following comments and attached photos are provided on the visual impact of the proposed Scott River wind farm and the proponent's Landscape and Visual Impact Assessment (LVIA). The comments are made with reference to the WAPC "*Visual landscape Planning in Western Australia – a manual for evaluation, assessment, siting, and design" and the Department of Planning, Lands and Heritage GIS "InQuiry",* as well as knowledge of the area. The viewshed mapping indicates that the turbines may be extensively visible. However, it is likely that roadside trees would obscure views from two of the three major roads to Augusta (Bussell Highway and Caves Road), and views from narrow, treelined secondary roads oriented generally towards the site e.g. Challis Road, and Fisher Road, which is used to access the settlement on Molloy Island.	Noted and confirm the above comment. As outlined in the Proposal LVIA (2025) section 3 Methodology, the ZTV only considers the landform and does not include land cover factors such as the presence of buildings and trees. It therefore represents the maximum case scenario of potential visual impacts.
Analysis using Google Streetview images indicates that the greatest visibility is likely to be from: • private residences in Augusta which have northeasterly views, comprising ▪ elevated sites ▪ sites along the shore of the Blackwood River, Hardy Inlet, or ocean; • public recreation sites on the western banks of the Blackwood River (e.g. the river end of Howe Road), Hardy Inlet (e.g. end of Ellis Road) or open ocean (e.g. Flinders Bay); • from western portions of Hardy Inlet; • from the open ocean. It also appears that there will also be significant visibility from Augusta's main intersection at Blackwood Avenue and Ellis Street, other locations along Blackwood Avenue, and from Scott River Road and Governor Broome Road, which are at the project site and are used to access East Augusta and more distant coastal areas e.g. for recreational purposes.	Noted. See **Appendix B**: Addendum to the LVIA to address agency comments **Section 4.2** The locations identified by DPLH as having the greatest potential for visibility align with the landscape and visual impact assessment, which incorporates representative viewpoints from residential, coastal, inlet, recreational, and road-based receptors, ensuring the visual exposure and sensitivity from these areas are appropriately addressed.
Assessment report - method and conclusions The method used for the assessment is generally suitable, with two exceptions as below. • Several important viewpoints have been overlooked in analysis: **1.** Travelling east along Scott River Road leaving East Augusta, in locations where the vegetation is naturally low (see attached Photo 1); **2.** Main street intersection, Ellis Street moving downhill into the intersection with Blackwood Avenue (Photo 2 – two examples); **3.** Main town foreshore opposite East Augusta (Photo 3); **4.** Albany Terrace, close to the opening between Hardy Inlet and the ocean (Photo 4). • reference to the three primary visual management objectives as being 'protection', 'best practice', and 'engagement', but the third objective advised in the WAPC's manual is 'enhancement', not 'engagement'. It is beneficial to identify potential engagement opportunities, but this should occur elsewhere in the report and 'enhancement' should be addressed. This objective would justify introducing roadside tree planting to Scott River Road and Governor Broome Road, within the project site, as it would reduce turbine visibility from the closest viewpoints, and would enhance environmental values in the landscape. The conclusions reached in relation to the analysed viewpoints are supported. It is noted that, of the 12 viewpoints analysed, the significance of the visual impacts was determined to be 'high' for four points, moderate-high' for five points, 'moderate' for two points, and 'negligible' for one point (which mapping showed was not within the viewshed in any case). Overall, the impact on the key selected viewpoints within and around the town of Augusta could correctly be described as moderate at the very least, but frequently high.	See **Appendix B: Section 4.3** All locations identified by DPLH as having the greatest potential for visibility have been field-verified and assessed through new viewpoint commentary, updated photomontages and ZTV analysis, with results cross-referenced to existing LVIA viewpoints to confirm that visibility from Augusta, Hardy Inlet, coastal areas and key road corridors is appropriately and comprehensively addressed.

SUMMARY OF SUBMISSION	RESPONSE
Further analysis advised The significance of the project's potential visual impacts on the tourist town of Augusta warrants further work by consultants: **1.** Provision of photomontages for the additional viewpoints listed above, possibly using a simpler method to produce wireframe images but with vegetation overlaid; **2.** Provision of a project site plan showing individually numbered turbines, with numbers also shown on the existing and new photomontages, to enable further assessment of the siting of individual turbines with a view to relocating some of the turbines elsewhere within the project site.	See **Appendix B: Section 4.4** Additional fieldwork has been undertaken to assist in addressing this comment. All specific locations outlined were visited, including sites within Augusta. Photomontages have been prepared for all four locations. An amended layout has also been explored in relation to views from In addition, a photomontage overlay has been prepared from the Viewpoint 01 Augusta Hotel comparing the proposed 250 m tip height turbines with 235 m tip height turbines illustrating that lower wind turbines may not result in a substantial reduction in visual impacts from this viewpoint location.
Mitigation measures Two measures to mitigate visual impacts are recommended: **1.** Relocate approximately three of the outlying turbines at each of the north and south ends of the layout, using numbered photomontages to identify the particular turbines which have the greatest impact; **2.** Plant local trees to form a screen along the Scott River Road and Governor Broome Road boundaries of the project site (see Photos 5-7).	A revised turbine layout has been developed using 3D modelling to relocate five turbines at the northern, southern and eastern extents of the array, reducing visual clustering and improving visual balance across key viewpoints, with updated photomontages and ZTV mapping provided in **Appendix B**: Addendum to the LVIA to address agency comments **Section 4.4** to illustrate these changes. Additional illustrative material from both LVIA and newly requested viewpoints confirms the visual influence of relocated turbines and demonstrates the resulting reduction in visual prominence along key public viewing corridors, including Scott River Road, the Augusta town centre and the coastal foreshore.
Conclusions The proponent concludes that a grid layout would be preferable to the proposed irregular layout, on the basis that this is more appropriate for the open, agricultural setting. This is consistent with Scottish wind farm guidance which recommends a regular layout for wide open and level landscapes with regular agricultural fields. It is noted that there is a significant proportion of woodland vegetation so the landscape is not fully 'open', and the overall landscape setting is gently undulating, not level, partly due to clumps of trees set amongst areas of lower dune and wetland vegetation. From distant viewpoints such as Augusta and the coastline south of town, the horizon-line is not level, but hillocky, with variations in colour and texture of remnant vegetation. Although the turbines are located in an agricultural setting, from the significant viewpoints the wind farm appears to be located within a broadly natural wider landscape. Therefore, the currently proposed irregular layout is considered to be the most suitable and should therefore be retained. As mentioned above, it is recommended that some turbines are relocated, with the specific altered layout dependent on further analysis of the existing photomontages once turbine numbers are added to the images, and the consideration of further images of views from important locations that were not initially assessed. Examples derived from Google Streetview images and the photomontages in the LVIA are: **1.** In Viewpoint 4, which is on the western shore of the Blackwood River just upstream from Molly Island, if the northern two or three turbines were relocated further south, it appears that no turbines would be visible, and potentially other viewpoints in the vicinity of Molloy Island, assuming that intervening vegetation remains. **2.** In views from the western shore of Hardy Inlet, near the inlet mouth, several turbines are apparent at the focal point of easterly views, adjacent to the steep southerly face of the dune at the mouth of Swan Lake. Relocation of those turbines would retain the natural character of this important view. **3.** In viewpoints along the ocean coastline, relocation of southern turbines would decrease the perception that turbines are very close to the coast. In views from town, the wind farm would be less prominent if turbines were in a more compact, clustered layout rather than locating them in an open, roughly linear pattern extending further north and south over a larger area.	The Department's comments and recommendations regarding turbine layout are noted. Relocating the turbines identified by DPLH is not feasible due to wind resource loss, landowner constraints, geotechnical limitations, environmental and planning constraints, and the limited visual benefit demonstrated in detailed testing. Instead, an alternative refined layout was developed, relocating five turbines (T3, T5, T6, T10, T20) to meaningfully reduce visual prominence and improve skyline cohesion, supported by updated photomontages and ZTV analysis (Appendix C). • Relocating northern turbines further south is not viable due to reduced wind resource, impacts on committed landowners, less favourable geotechnical conditions and limited visual improvement. • Compact clustering of southern turbines was tested; only WTG 20 demonstrated meaningful benefit, with WTG 18 and WTG 19 showing negligible change in visual effect. • A refined layout relocating five turbines (T3, T5, T6, T10, T20) was implemented to reduce clustering, smooth the skyline and lessen edge prominence in key views from Augusta, Albany Terrace, Town Beach and Scott River Road. • Updated photomontages and revised ZTVs confirm that the alternative layout improves visual cohesion across the viewpoints identified by DPLH. **See Appendix B: Section 4.6 and Appendix C**: DPLH Community SVA and LVIA **Section 2.**

SUMMARY OF SUBMISSION	RESPONSE
The **Social Values Assessment Report** provided by the proponent does not adequately address the community's perception of landscape character and views as required by the WAPC Visual landscape Planning in Western Australia – a manual for evaluation, assessment, siting, and design. For example, study participants were not asked about the importance of views of the landscape. The list of values that participants were asked about did not include "scenic views" or similar. The closest category was "preserving what is unique about this area'' and "being able to see the clouds, horizon and sky", neither of which adequately interrogates opinions about views of this landscape. Only a small proportion of participants (15%) were residents of Augusta and as such would be directly impacted by views of the wind farm. Overall, the social values report likely results in under-estimating the likely social impacts of the proposed wind farm. Public submissions on the wind farm proposal could be reviewed to gain a more comprehensive overview of community perceptions. **Additional Viewpoints for Photomontages Saved in Separate Attachment.**	Additional work has been undertaken to address DPLH's concern that the Social Values Assessment did not adequately examine community perceptions of landscape character and scenic views. This includes supplementary analysis of public submissions, expanded consideration of landscape-related community values, and integration of updated photomontages, alternative layout testing and mitigation measures. See **Appendix C: Section 2.**

2.2 Department of Water and Environmental Regulation (DWER)

SUMMARY OF SUBMISSION	RESPONSE
This proposal has been referred to the Environmental Protection Authority (EPA). On 8 December 2025, the EPA determined to not assess the proposal under Part IV of the *Environmental Protection Act 1986*. The EPA's public record and summary of reasons include public advice to other decision-making authorities to ensure that their statutory decision-making processes achieve and assure environmental outcomes consistent with the EPA's environmental factor objectives. Further information about the EPA process and what stage this application is at can be found at Wind Farm in Scott River | EPA Western Australia. The Department has identified that the proposal has the potential for impact on environment and/or water resource values and/or management. Key issues and recommendations are provided below, and these matters should be addressed:	Noted.
1. Issue: Water licensing **Advice:** The following advice notes are recommended to be applied: Advice Note: The proposal is in the Lower Blackwood Surface Water Area proclaimed under the *Rights in Water and Irrigation Act 1914*, therefore a Bed and Bank permit will be required for any interference with the bed and bank of any watercourses. For more information, please contact the Department of Water and Environmental Regulation's Water Licensing staff on 08 9781 0188 or busselton.admin@dwer.wa.gov.au. Advice Note: The proposal is in the Lower Blackwood Surface Water Area and Beenup and Rosa Beenup Groundwater subareas proclaimed under the *Rights in Water and Irrigation Act 1914*, therefore any take of surface water from a watercourse or groundwater will require a licence to take water. For more information, please contact the Department of Water and Environmental Regulation's Water Licensing staff on 08 9781 0188 or busselton.admin@dwer.wa.gov.au. **Discussion:** The proposal includes the take for groundwater for dewatering and proposed works across creek lines for transmission lines and access roads. It has not yet been determined where the water supply will be sourced, which may be drawn from groundwater. The subject property is in the Lower Blackwood Surface Water Area as proclaimed under the *Rights in Water and Irrigation Act 1914*. Any taking or diversion of surface water in this proclaimed area (whether by direct pumping, construction of a dam, or excavation) can be subject to licensing. Any interference of the watercourse (such as the construction of a dam or crossing, or excavation of the watercourse) may require a *permit to interfere with the bed or banks* from the department. Exemptions from regulation can be sought from the department related to the presence of any springs at the head of a watercourse rising on the property.	SynergyRED commits to applying for any necessary licences under the *Rights in Water and Irrigation Act 1914* (**RIWI Act**), as these relate to: • temporary dewatering (i.e. removal of groundwater) during the construction phase of the Proposal to support excavation and installation of below ground infrastructure; and • any interference with the bed and banks of a watercourse. SynergyRED accepts the advice notes as proposed.

SUMMARY OF SUBMISSION	RESPONSE
The proponent is advised to contact the department to determine licensing and permit requirements or whether any exemptions apply. As of Dec 2025, there was water available in the Lower Blackwood Estuarine Reach surface water sub area under the *Whicher surface water allocation plan (DoW 2009)* which relates to the subject land. The subject property is in the Beenup and Rosa Beenup Groundwater subareas as proclaimed under the *Rights in Water and Irrigation Act 1914*. Any groundwater abstraction in this proclaimed area is subject to licensing by the department, other than supply from the shallow watertable (superficial aquifer) for domestic and non-intensive stock watering purposes. Note: *Domestic use* generally refers to the take of water to service ordinary use associated with a household and for firefighting purposes. *Intensive stock watering* relates to the watering of stock that are generally confined to an area smaller than that required for grazing under normal conditions. Under these latter circumstances, stock is usually fed by hand or mechanical means. As of Dec 20205 there was: • water available in the Perth-Superficial Scott aquifer of the Beenup ground water sub area; • no water available in the Perth-Lesueur Sandstone South aquifer of the Rosa Beenup ground water sub area; • water available in the Perth-Leederville aquifer of the Beenup ground water sub area; under the *South West groundwater areas allocation plan (DoW_2009)* which relates to the subject land. Available water is allocated on a first-in first-served basis and as such, there is no guarantee that water will be available at the time of development. The availability of water resources can be viewed at the department's public water register is available at https://maps.water.wa.gov.au/#/webmap/register.	
2. Issue: Water supply **Advice:** The following condition is recommended to be applied: Condition: Prior to any ground disturbing activities, the proposal water balance and Water Sourcing Strategy is to be prepared to the satisfaction of the Local Government. **Discussion:** The water demand has not yet been determined, and Sect 3.4 of *Preliminary Construction Environmental Management Plan (SynergyRED 2025)* states 'Permanent and temporary water tanks and/or storage dams will be installed to support construction and operational water requirements (Figure 3-1). Water will be sourced elsewhere, purchased and ported in. There is a possibility that any dewater collected during construction, if treated appropriately to a suitable quality, may also be able to be used during construction'. Furthermore, Sect 2.3.6 of *Development Application Report (Urbis 2025)* states that '*Once the water sourcing strategy has been finalised, engagement with Department of Water and Environmental Regulation (**DWER**), Water Corporation and the Shire AMR prior to the commencement of construction will be undertaken as required'.* The Department supports the preparation of a water balance and Water Sourcing Strategy, and this should be conditioned.	SynergyRED accepts the condition as proposed.
3. Issue: Surface water management **Advice:** The following condition is recommended to be applied: Condition: Prior to any ground disturbing activities, a post-development flood model is to be prepared to the satisfaction of the Local Government, on advice from the Department of Water and Environmental Regulation.	SynergyRED accepts the conditions as proposed.

SUMMARY OF SUBMISSION	RESPONSE
Condition: Prior to any ground disturbing activities, a Stormwater Management Plan shall be prepared to the satisfaction of the Local Government. **Discussion:** Sect 3.12 of *Development Application Report (Urbis 2025)* states 'Surface water – flood characterisation assessment and modelling to identify inundation areas to inform the future placement of infrastructure and mitigate impacts on surface flow post-construction'. Preliminary pre-development flood modelling has been undertaken and presented in the *Hydrological & Hydrogeological Assessment (Stantec 2025)*, which has provided plans with the 1% AEP peak flood depths and peak flood velocity. Noting the scale of the subject site, Key Model Parameters presented in Section 5.4.1, and application of the 1% AEP climate change high emissions scenario Representative Concentration Pathway 8.5 the model is considered fit for purpose by the Department. It is recommended that this work is used to help inform the overall surface water plan for the development site. A post development flood model will assist in informing infrastructure locations, road crossing designs to comply with Shire requirements, road drainage designs mitigate erosion and sediment mobilisation, and all electrical installations are suitably located and insulated to increase resilience to major flooding. The post development flood model along with a Stormwater Management Plan is recommended to be conditioned.	
4. Issue: Industry Regulation **Advice:** The following advice notes are recommended to be applied: Advice Note: Insufficient information was provided to enable Department of Water and Environmental Regulation to determine whether the proposal will be categorised as Prescribed Premises as per Schedule 1 of the *Environmental Protection Regulations 1987*. Based on the information provided the proposed crushing and screening of material taken from borrow pits operations may cause the premises to become Prescribed Premises as per for the purposes of Part V Division 3 of the *Environmental Protection Act 1986*, if it has the capability to meet or exceed the specified production or design capacity of category 12 or 70 under Schedule 1 of the *Environmental Protection Regulations 1987*. The Applicant is therefore advised to refer to the information and Industry Regulation Guide to Licensing available at http://www.der.wa.gov.au/our-work/licences-and-works-approvals and / or if they have queries relating to works approvals and licences to contact DWER at info@dwer.wa.gov.au or 6364 7000. Advice Note: Insufficient information was provided to enable Department of Water and Environmental Regulation to determine whether the proposal will be categorised as Prescribed Premises as per Schedule 1 of the *Environmental Protection Regulations 1987*. Based on the information provided the proposed concrete batching plant operations may cause the premises to become Prescribed Premises as per for the purposes of Part V Division 3 of the *Environmental Protection Act 1986*, if the concrete produced is used at another premises or if the proposed concrete batching plant has the capability to meet or exceed the specified production or design capacity of category 77 under Schedule 1 of the *Environmental Protection Regulations 1987*. The Applicant is therefore advised to refer to the information and Industry Regulation Guide to Licensing available at http://www.der.wa.gov.au/our-work/licences-and-works-approvals and / or if they have queries relating to works approvals and licences to contact DWER at info@dwer.wa.gov.au or 6364 7000. Advice Note: The concrete batching plant will need to demonstrate compliance with the *Environmental Protection (Concrete Batching and Cement Product Manufacturing) Regulations 1998* irrespective of whether the premises meets the threshold to become a Prescribed Premises as per Schedule 1 of the *Environmental Protection Regulations 1987* or not. **Discussion:** Sect 2.3.1 of *Development Application Report (Urbis 2025)* refers to both the 'Installation and operation of concrete batching plants' and 'Extraction of borrow material (may include crushing and screening by mobile plant)'.	SynergyRED commits to applying for any necessary Works Approval or Licence/Registration under Part V of the *Environmental Protection Regulations*. A concrete batching plant will be required during construction of the Proposal and may comprise a temporary/mobile crushing and screening plant. A Works Approval and Operating Licence/ Registration may be required if the proposed temporary/mobile crushing and screening plant and/or concrete batching plant triggers the prescribed activities outlined within Schedule 1 of these Regulations. This requirement will be confirmed following detailed design, geotechnical investigations and contract award. SynergyRED accepts the advice notes as proposed.

SUMMARY OF SUBMISSION	RESPONSE
However, Table 3-1 of *Section 38 Referral Supporting Document (Eco Logical 2025)* details that 'A Works Approval and Operating License/Registration for crushing and screening will be applied for', but there is no reference to any regulatory considerations for the concrete batching plant. Insufficient information was provided to enable DWER to determine whether the proposal will be categorised as Prescribed Premises as per Schedule 1 of the *Environmental Protection Regulations 1987* (EP Regulations). Based on the information provided the proposed crushing and screening and concrete batching plant operations may cause these premises to become Prescribed Premises as per for the purposes of Part V Division 3 of the *Environmental Protection Act (*EP Act), if it has the capability to meet or exceed the specified production or design capacity* of the relevant category under Schedule 1 of the EP Regulations. e.g.	

12	Screening, etc. of material: premises (other than premises within category 5 or 8) on which material extracted from the ground is screened, washed, crushed, ground, milled, sized or separated	50000 tonnes or more per year
70	Screening, etc. of material: premises on which material extracted from the ground is screened, washed, crushed, ground, milled, sized or separated	More than 5000 but less than 50000 tonnes per year
77	Concrete batching or cement products manufacturing: premises on which cement products or concrete are manufactured for use at places other than those premises.	100 tonnes or more per year

The EP Act makes it an offence to undertake any work which causes a premises to become, or become capable of being, a Prescribed Premises unless the work is undertaken in accordance with a works approval. It is also an offence under the EP Act to cause an emission or alter the nature or volume of waste, noise or odour from the Prescribed Premises, unless done so in accordance with a works approval or licence or a registration (for operation) is held for the premises.

The Applicant is therefore advised to refer to the information and Industry Regulation Guide to Licensing available at http://www.der.wa.gov.au/our-work/licences-and-works-approvals and / or if they have queries relating to works approvals and licences to contact DWER at info@dwer.wa.gov.au or 6364 7000.

It is noted that category 77 Prescribed Premises are premises where cement products or concrete are manufactured for use at other premises. If cement products or concrete produced at a premises are used solely at that premises, it is not considered a category 77 Prescribed Premises under Schedule 1 of the *Environmental Protection Regulations 1987*.

The application will need to demonstrate compliance with the *Environmental Protection (Concrete Batching and Cement Product Manufacturing) Regulations 1998* irrespective of whether the premises is Prescribed or not.

* Production capacity and design capacity definitions:

- The **production capacity** is the rate at which a product is produced as relevant to the description of the prescribed premises category; and
- **design capacity** is the maximum capacity for which the facility or equipment is designed to receive, handle, process, contain or emit, as relevant to the description of the prescribed premises category.

In view of the uncertainty regarding regulation under Part V of the EP Act advice has been provided on environmental risks and mitigation strategies, based on the available information. If the applicant determines that a works approval or licence application is required under Part V of the *Environmental Protection Act 1986* (EP Act), the advice provided in this communication does not prejudice and must not be considered to infer the outcome of the EP Act licence and works approval process.

5. Issue: Onsite domestic wastewater management **Advice:** The following condition is recommended to be applied: Condition: Prior to the installation of onsite domestic wastewater systems, a site and soil evaluation report is to be prepared that takes account of the principles of the *Government Sewerage Policy (WAPC 2019)*. **Discussion:** It is noted that Sect 2.2.9 of *Development Application Report (Urbis 2025)* identifies that no construction camp or temporary onsite accommodation is anticipated to be required, with workers proposed to be accommodated in local accommodation in surrounding towns and localities. Onsite facilities are however proposed to be provided and for domestic wastewater Sect 2.2.11 of *Development Application Report (Urbis 2025)* suggest this may be in the form of mobile self-contained or inground septic systems. The site is in a sewerage sensitive area as defined in the *Government Sewerage Policy (WAPC 2019)* (GSP). Therefore, if inground systems are proposed, it is recommended that the principles of the GSP are applied in the development of a site and soil evaluation report to support the 'Application to Construct or Install an Apparatus for the Treatment of Sewage' required under the *Health (Treatment of Sewage and Disposal of Effluent and Liquid Waste) Regulations 1974*. This requirement is recommended to be conditioned.	SynergyRED accepts the proposed condition, noting this will be relevant only if an inground septic system is utilised.
6. Issue: Construction Environmental Management Plan **Advice:** The following condition is recommended to be applied: Condition: Prior to any ground disturbing activities, a Construction Environmental Management Plan is to be prepared to the satisfaction of the Local Government. **Discussion:** The *Preliminary Construction Environmental Management Plan (SynergyRED 2025)* is noted, and the terrestrial environmental quality and inland waters objective-based management actions are supported. The document does not however provide details of any contingency measures. For example, in the event of a spill what action will occur and what actions will be taken if any significant erosion and/or sediment mobilisation occurs. It is recommended that the report be conditioned and should be updated to include emergency and contingency response actions.	SynergyRED proposes the following amended condition: • Prior to any ground disturbing activities, a Construction Environmental Management Plan (**CEMP**) shall be submitted to the Local Government for approval. Once approved, the Construction Environmental Management Plan shall be implemented at all times during the construction phase of the Proposal to the satisfaction of the Local Government upon advice from relevant agencies.
7. Issue: Native Vegetation **Advice:** The following advice notes are recommended to be applied: Based on the information provided the proposed clearing may not be exempt and a clearing permit may need to be obtained under the Environmental Protection Act 1986. For more information, please contact the Department of Water and Environmental Regulation's Native Vegetation Regulation staff on 08 6364 7098 or admin.nvp@dwer.wa.gov.au. **Discussion:** It is noted that the clear of native vegetation has been reduced as much as practical. Some clearing will however be required and Table 3-1 of *Section 38 Referral Supporting Document (Eco Logical 2025)*: states that 'A native vegetation clearing permit will be applied for'.	SynergyRED is aware that the proposed native vegetation clearing may not be exempt under the Environmental Protection (Clearing of Native Vegetation) Regulations 2004 and intends to submit a Native Vegetation Clearing Permit **(NVCP)** application prior to construction. SynergyRED accepts the advice note as proposed.

Under section 51C of the *Environmental Protection Act 1986* (EP Act), clearing of native vegetation is an offence unless: • it is undertaken under the authority of a clearing permit • it is done after the person has received notice under Section 51DA (5) that a clearing permit is not required • the clearing is subject to an exemption Exemptions for clearing that are a requirement of written law, or authorised under certain statutory processes, are contained in Schedule 6 of the EP Act. Exemptions for low impact routine land management practices outside of environmentally sensitive areas (ESAs) are contained in the *Environmental Protection (Clearing of Native Vegetation) Regulations 2004* (the Clearing Regulations). Based on the information provided, should development approval be issued, clearing to construct a building or structure is likely to be exempt from the requirement for a clearing permit under Regulation 5, Item 1 of the Clearing Regulations, if the vegetation to be cleared is not riparian. Riparian vegetation is defined as the distinctive vegetation associated with a wetland or watercourse. If any riparian vegetation is required to be cleared for the proposed development, a clearing permit is required. Clearing to construct vehicular tracks is likely to be exempt from the requirement for a clearing permit under Regulation 5, Item 12 of the Clearing Regulations. Noting that: • Construction of vehicle tracks within riparian vegetation is generally not allowed, but where there is no reasonable alternative route, and the track is necessary for the commercial activities of the property, it may pass through riparian vegetation. • There must be at least 100 metres between the track and any other cleared land that can be used for the purpose intended for that track. This may include other cleared areas. Note that these exemptions will not apply prior to development approval being issued. Please also note that that clearing for a building / structure and vehicular tracks, combined with other exempt clearing activities on the property, must not exceed five hectares in a financial year. If further clarification is required, please contact the Department's Native Vegetation Regulation section by email (admin.nvp@dwer.wa.gov.au) or by telephone (6364 7098).	
8. Issue: Potential contamination and acid sulfate soils **Advice:** The following condition and advice note are recommended to be applied: Condition: Prior to any ground disturbing activities, an Acid Sulfate Soils and Dewatering Management Plan is to be prepared to the satisfaction of the Local Government, on advice from the Department of Water and Environmental Regulation. Advice Note: For condition [INSERT VALUE] the following document provides guidance on the assessment and management of contaminated sites in Western Australia (WA) within the legislative framework provided by: the *Contaminated Sites Act 2003* and the *Contaminated Sites Regulations 2006*; and the revised national site assessment framework provided in the *National Environment Protection (Assessment of Site Contamination) Measure 1999*: Guideline: Assessment and management of contaminated sites (www.wa.gov.au). Further information on Contaminated Sites can be obtained by email (contaminated.sites@dwer.wa.gov.au) or by telephone on 1300 762 982. **Discussion:** Contamination • The location of the proposed windfarm is adjacent east and north-east of the site of the former Beenup Mineral Sands Mine. The former Beenup mine site (Lot 4254 on Plan 208478 and Lot 200 on Plan 36387) was classified under the Contaminated Sites Act 2003 (CS Act) on 26 June 2013 as remediated for restricted use, and a memorial (number M345894ML) was placed on the certificates of title. The site was classified because site investigations during mine closure confirmed that groundwater and surface water at the site contain elevated levels of metals and sulfate, some exceeding environmental and health guidelines. The observed impacts to surface water and groundwater have resulted from historical mining activities, including disturbance and poor management of ASS and deposition of mineral processing waste.	SynergyRED accepts the condition and advice note as proposed.

• As the regional groundwater flow is south to south-west, generally towards the Scott River, legacy contamination at the former Beenup mine site is not expected to impact the location of the proposed wind farm. However, those historical impacts highlight the fact that soil and groundwater conditions in the area present a high risk of acidification, and potential ASS will require management during construction activities. • CS has reviewed the document "Proposed Wind Farm in Scott River, Preliminary Geotechnical and Baseline Contamination Report (Stantec, 1 July 2024)", and considers that it provides an appropriate assessment of baseline contamination conditions at the site. <u>Acid Sulfate Soils</u> • The proposed wind farm is located in an area that is mapped as having a high to moderate risk of ASS occurring within • CS has reviewed the document "*Proposed Wind Farm in Scott River, Preliminary Acid Sulfate Soils and Dewatering Management Plan* (PTG Consulting, 10 September 2025)", and considers that it provides an adequate preliminary assessment of ASS risks associated with construction of the proposed wind farm. CS considers that risks associated with disturbance of ASS are able to be appropriately managed should the proposed development of the wind farm proceed. • The report notes that dewatering drawdown has been modelled to a maximum depth of approximately 2 metres for turbine construction and 3 metres for construction of meteorological towers. The report presents options for management of ASS risk during dewatering and excavation which appear appropriate and generally consistent with the guidance provided in DWER's ASS guidelines and national guidelines for the management of ASS. • As the ASS Dewatering Management Plan is preliminary only, CS expects that further, more detailed investigations will be required once all aspects of the proposal design are finalised, at which stage the proposed options for dewatering management can be reviewed and refined.	
9. Issue: Noise **Advice:** Please see the attached Technical Review Report prepared by the Department's Environmental Noise Branch - **Appendix D**: Updated Noise .	Noted. SynergyRED is aware that the Proposal's noise emissions must comply with the *Environmental Protection (Noise Regulations) 1997* (*as amended)* (**Noise Regulations**) and has demonstrated that the Proposal will comply based on a maximum case scenario. The Noise Report has been amended to include discussion on modulation mitigation options both pre-construction and during operations to ensure compliance will be achieved. The Amended Noise Report is attached in **Appendix D** DWER also noted that the Noise Regulations apply to new dwellings. SynergyRED is aware that some proposed dwellings were approved by the Shire in the vicinity of the Proposal after the noise assessment included in the Development Application was completed. SynergyRED is committed to: – Ensuring that the final WTG layout will be compliant with the Noise Regulations. – Providing updated noise modelling prior to construction to demonstrate the final WTG model and layout will achieve compliance with the Noise Regulations. SynergyRED proposes the following conditions to address noise: • Prior to any ground disturbing activities, an updated Noise Impact Assessment from a qualified acoustic consultant is to be provided confirming the development can comply with the relevant provisions of the *Environmental Protection (Noise) Regulations 1997* (as amended), to the

	satisfaction of the Local Government upon advice from the Department of Water and Environmental Regulation. • Prior to operations commencing, an Operational Noise Management and Monitoring Plan is to be approved and implemented to the satisfaction of the Local Government, on advice from the Department of Water and Environmental Regulation.
10. Issue: Terrestrial fauna **Advice:** The following condition is recommended to be applied: Condition: Prior to operating any turbine, a Bird and Bat Adaptive Management Plan is to be prepared to the satisfaction of the Local Government, on advice from the Department of Water and Environmental Regulation and other relevant stakeholders. **Discussion:** As detailed in the EPA Chairman's Determination it was considered that the impacts of the proposal, including on birds and bats, were not so significant that assessment by the EPA under Part IV of the *Environmental Protection Act 1986* (EP Act) was required and determined to not assess the proposal. While the EPA determined not to assess the proposal, it was identified that the construction and operation of the proposal has the potential to impact birds and bats from collision/strike and barotrauma. The EPA's decision was made on the basis of other decision-making processes being able to manage the potential impacts to birds and bats, and the proponent implementing the proposal in accordance with the Preliminary Bird and Bat Adaptive Management Plan (Eco Logical 2025, dated 24 November 2025). Other decision-making processes the EPA identified included: • authorisation under s40 of the *Biodiversity Conservation Act 2016* (BC Act) to take or disturb threatened fauna • Part V Division 2 of the EP Act to regulate impacts associated with loss of fauna habitat • referral under the Commonwealth *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) for assessment of potential impacts to species of Matters of National Significance (MNES) The EPA identified that these decision-making processes can consider threatened and migratory fauna species but cannot consider risks to fauna species that are not specially protected. Noting that one conservation significant bird (Priority 3) and one bat species (Priority 4) were recorded during site surveys. The EPA made specific reference to the ability to include a condition requiring preparation of a Bird and Bat Adaptive Management Plan provides assurance that impacts to birds and bats are monitored and managed appropriately, including species that are not considered under other decision-making processes. The EPA has committed that requests to review and provide advice on the adequacy of any Bird and Bat Adaptive Management Plan submitted to the Shire can be made to the Department's Green Energy team via greenenergy.exec@dwer.wa.gov.au. Where the Department has a statutory role, planning applications should be considered prior to the Department issuing any relevant permits, licenses, and/or approvals. If the applicant determines that a works approval or licence application is required under Part V of the *Environmental Protection Act 1986* (EP Act), the advice provided in this communication does not prejudice and must not be considered to infer the outcome of the EP Act licence and works approval process. In the event there are modifications to the proposal that may have implications on aspects of environment and/or water management, the Department should be notified to enable the implications to be assessed.	SynergyRED proposes the following alternative condition wording, noting the preliminary Bird and Bat Adaptive Management Plan (**BBAMP**) provides for monitoring commencing prior to operations: • Prior to commissioning of WTG, a Bird and Bat Adaptive Management Plan is to be approved and implemented to the satisfaction of the Local Government, on advice from relevant environmental agencies.

2.3 Water Corporation

SUMMARY OF SUBMISSION	RESPONSE
We offer the following comments regarding this proposal. Reticulated water and sewerage are not available to the subject land. The Water Corporation has no objection to the proposed wind farm development. It has been noted in the report water will be trucked to the site to service potable and non-potable water requirements. Onsite effluent disposal managed by a septic system and removed by a certified contractor, or an in-ground septic system will be installed. The information provided above is subject to review and may change. If the proposal has not proceeded within the next 12 months, please contact us to confirm that this information is still valid. Please provide the above comments to the landowner, developer and/or their representative.	SynergyRED proposes the following condition regarding effluent disposal to address Water Corporation and DWER requirements: • Prior to the installation of any inground domestic wastewater systems, a site and soil evaluation report is to be prepared that takes account of the principles of the *Government Sewerage Policy (WAPC 2019)*. SynergyRED also proposes the following advice note: • Potable water supply and effluent disposal facilities / infrastructure shall be designed, installed and maintained for the life of the development in accordance with the Local Government's requirements, upon advice of the Department of Health.

2.4 Department of Primary Industries and Regional Development (DPIRD)

SUMMARY OF SUBMISSION	RESPONSE
The Department of Primary Industries and Regional Development (DPIRD) and the South West Development Commission has reviewed the development application by Synergy Renewable Energy Developments Pty Ltd (SynergyRED), a wholly owned subsidiary of Synergy, to build a wind farm. The project will be located 15km north-east of Augusta on the Scott River plain, an agricultural district predominantly hosting beef grazing, dairy farming and blue gum plantations. The project includes the construction and operation of: • up to 20 wind turbines over 3,597 ha with a production capacity of up to 100MW • associated infrastructure, including a 4.3km 132kV transmission line, a new 132kV electrical sub-station, a permanent site office, up to 2 met masts, up to 2 communications towers and associated water tanks and roads. The development is not large by the standards of other wind farms being proposed in the state. The following comments relevant to regional development were received from DPIRD's Strategic Programs team and Local Content Adviser Network(SWDC).	Noted.
Strategic Programs team and Local Content Adviser Network	
DPIRD notes the wind farm proposal presents a positive economic development opportunity for the region, with the proponent making efforts to ensure the host communities share in project benefits.	Noted. SynergyRED has committed to establishing a Fund consistent with the State's Community Benefits Guideline, which will benefit the local community.
Provided the environmental mitigations can be addressed, the project provides for some renewable energy to feed into the SWIS from the south of the state, which will help power supply locally as well as provide feed in via the nearby Beenup 132 KVA line that runs to Manjimup. The project may not significantly increase the range of jobs on offer to the local community in the longer term.	Noted. The Proposal has been subject to substantial environmental investigations and reporting and found to be acceptable from an environmental perspective at State and Federal level, subject to a range of Management Plans being prepared. The Proposal is expected to provide for up to 150 employees during the peak Construction Phase and up to five (5) employees (operational staff) following construction and commissioning.
The proponent has not factored in an accommodation strategy and 'likely' accommodation model. Even as a staged project, occasions when up to 150 staff are employed at once are expected to strain the local housing market. An accommodation strategy should be provided that includes all sources of housing demand generated by the project and addresses both the temporary and longer-term workforce accommodation requirements.	Noted SynergyRED proposes the following condition: • Prior to construction commencing, an Accommodation Strategy shall be developed in consultation with the Local Government and implemented to the satisfaction of the Local Government.
DPIRD's Local Content Adviser Network (LCAN) considers the Scott River project to present a strong opportunity for achievable local content outcomes. There is significant potential for local participation in the civil and enabling works, as well as onsite support services, including fabrication and electrical.	Noted
There are several capable businesses across Busselton, Margaret River, and the wider South West region that could contribute to the delivery of this project.	SynergyRED encourages participation of West Australian and Regional businesses in its supply chains. This includes application of the WA Industry Participation Strategy and State Government Aboriginal procurement policy. As part of ongoing community engagement activities, local businesses have been encouraged to register their interest in the Proposal. This information will help identify suitable local suppliers and connect them with project work opportunities. As the Proposal progresses and procurement pathways are finalised, SynergyRED will further develop its Local Content approach, including identifying appropriate work packages for local companies and promoting opportunities through established procurement and industry engagement channels.

SUMMARY OF SUBMISSION	RESPONSE
The LCAN sees this project as an excellent opportunity to both utilise and further build local capability in wind farm construction.	Noted
The following recommendations to SynergyRED have been provided by DPIRD's Strategic Programs team and Local Content Adviser Network: 1. Carefully analyse how its accommodation needs will be met given concerns about the availability of local housing. 2. Note Recommendation 2 of the social impact report in addressing concerns in the Scott River locality and being flexible and open to suggestions for improved local benefits. 3. Apply more focus on developing neighbour programs, local content and training opportunities for employees and businesses that are not adequately defined at this stage. 4. Contact DPIRD's Local Adviser Network (local.content@dpird.wa.gov.au) to find out how they might best engage local regional businesses to supply the project.	1. SynergyRED proposes the following condition • Prior to construction commencing, an Accommodation Strategy will be developed in consultation with the Local Government and implemented to the satisfaction of the Local Government. 2. See Shire RFI Key Theme 7 – Community Benefit Fund 3. Noted 4. Noted
South West Development Commission (SWDC).	
LGA Draft Policy: The Shire of Augusta Margaret River has released a Draft Local Planning Policy – Large-Scale Renewable Energy Facilities for comment. It is strongly recommended that SynergyRED review this draft policy and work with the Shire to see how they can respond and accommodate any necessary changes in the project proposal as the policy is progressed and formalised. It is noted that several of the provisions in the draft Local Planning Policy are already addressed in SynergyRED's proposal.	SynergyRED has reviewed and provided a submission to the Shire in relation to Draft LPP23. It has also met with the Shire to discuss Draft LPP23 in the context of this Proposal, given Draft LPP23 was advertised after SynergyRED prepared its Proposal, with advertising of the Development Application and Draft LPP23 occurring concurrently. The Proposal has been prepared in the context of extensive and robust technical investigations and industry best practice and is considered to be generally compliant with the Policy direction of Draft LPP23. SynergyRED is also reviewing the Draft Code and considers the Proposal to be largely consistent with its Policy direction. A detailed submission to the Draft Code is being prepared by SynergyRED and will be submitted during the public comment period.
Aviation impact assessment: The conducted aviation impact assessment only considered certified aerodromes within 30 nautical miles and non-certified aerodromes within 5 nautical miles of the project site. However, there are two airstrips within the Shire of Augusta Margaret River, one located in Augusta and one in Margaret River, which have received Regional Airports Development Scheme funding from the State and which support the Royal Flying Doctor Service, small general aviation and charters and potential aerial support for Department of Fire and Emergency Services, WA Police and Department of Biodiversity, Conservation and Attractions. The aviation impact assessment did not receive responses from several key aviation stakeholders including the Royal Flying Doctor Service. It is strongly recommended that further consultation occur with the aerodrome manager/s and key users of airstrips in the region to ensure that these smaller operations can continue safely during and following construction.	SynergyRED is committed to ensuring that aviation operations can continue safely during construction, and once the Proposal is operational. The Aviation Impact Assessment (**AIA**) assessed aerodromes in accordance with Civil Aviation Safety Authority (**CASA**) and National Airports Safeguarding Framework (**NASF**) guidance, and consultation with agencies including the Royal Flying Doctor Service (**RFDS**) and emergency services. The Augusta Airstrip at Lot 315 Hillview Road, Augusta, is located approximately 16 km from the nearest WTG, and further from the Augusta Aerodrome which was already assessed in the AIA. The Margaret River Airstrip on Nozzle Road is approximately 32 km from the Proposal. The AIA will be updated to include commentary on both airstrips; however, no impacts to their operations are anticipated. Further engagement with key aviation stakeholders, including aerodrome managers and major airstrip users is ongoing, and any additional constraints or requirements identified will be incorporated into the revised assessment.
Community contribution*:* SynergyRED should be commended for proposing adoption of the *Draft Guideline on Community Benefits for Renewable Energy Projects in Western Australia* with respect to a community benefit fund. Further proposed structure of this fund is in the Shire's draft policy linked above. Opportunities to support local employment, training and accommodation should continue to be explored. Ancillary improvements to telecommunications or power for (at a minimum) landholders within the development envelope should also be considered.	As addressed in responses to Key Theme 7 to the Shire Request For Further Information (RFI) ISSUED ON 23/01/2026I, SynergyRED has committed to provide a contribution to the local community through a fund consistent with the State Government's Community Benefits Guideline. SynergyRED will work with the Shire and community to distribute funds to community projects.

The following comments relevant to agricultural resource management were received from DPIRD's Agricultural Resource Management and Assessment (ARMA) branch. ***Local economic impact**:* It is understood from the proposal that agricultural uses within the project envelope will be able to continue during and following construction. This is an excellent outcome for the landholders and for the broader regional economy. Every opportunity to mitigate impact to these operations should be taken. This includes engagement with landholders with regards to seasonal traffic variations (for example, around harvest) and peak construction, which may require traffic planning or traffic management on some internal roads.	Agricultural activities will be able to continue in parallel with the proposed Wind Farm activity. SynergyRED will engage with landowners during the construction phase to minimise impacts at peak times including harvest. Prior to construction commencing on-site, a Traffic and Transport Management Plan shall be submitted to the Shire for approval.
***Stakeholder engagement**:* There is clearly mixed sentiment towards the development of a wind farm in this location, particularly from residents in the immediate vicinity. Ongoing stakeholder engagement is required to continue to provide information to the community about the wind farm, the technology, the impact and the opportunities it provides. While the proposal details how to manage the water table, acid sulphate soils and construction to the level of detail it can at this stage, the assessments on noise and shadow flicker are not well articulated for community members. SynergyRED could consider development of additional fact sheets or infographics outlining what the practical impact is likely to be, and/or engage an independent assessment to counter existing misinformation. It is also unclear if the Shire of Nannup has been engaged, which – while not the directly responsible local government – does run very close to the project envelope. There will also be a requirement to continue to work with neighbours to mitigate or compensate for impacts to their plans for their properties.	SynergyRED has undertaken and facilitated comprehensive community engagement throughout the feasibility assessment and will continue to provide information to the community regarding the Proposal and the approvals process. SynergyRED has developed and published infographics related to noise and ASS, , as these topics were of particular interest to the community. The noise infographic explains the anticipated, maximum case noise levels at significant locations in the area and compares the noise level to other real-world examples. This was presented in the Community Drop-in Sessions and published in the Community Information Book - Part One. The ASS infographic depicts options of WTG foundations, which will mitigate risks related to exposure of ASS. Assessments indicate that expected shadow flicker durations will be within guidelines and should not cause nuisance. If the Proposal is approved and final WTG positioning confirmed, SynergyRED will work with neighbours to reduce any impacts related to shadow flicker. Some neighbours have indicated they have no interest in entering a neighbour agreement with SynergyRED, for a variety of reasons. Neighbour agreements provide the means of delivering financial benefits to impacted neighbours. Neighbour agreement negotiations and neighbour engagement with the intent of mitigating impact will continue where relevant and where neighbours are receptive to such engagement.
***Viewing platform**:* While little planning has been conducted at this stage with regards to the viewing platform, it is recommended that if there is the opportunity to do so, that SynergyRED engage with Karri Karrak Aboriginal Corporation in designing and developing the signage, to also articulate relevant Aboriginal culture and heritage in the project area/region.	Noted. SynergyRED intends to engage with Karri Karrak Aboriginal Corporation (**KKAC**) in the design process for signage at the tourist viewing platform, to explore opportunities to incorporate local Aboriginal culture and heritage.
***Construction workforce**:* The proposal suggests that the construction workforce be accommodated in local accommodation in surrounding towns and localities. Adequate forward planning is required for this due to limited availability of accommodation in the South West, some of which is already utilised by other projects in the region.	SynergyRED acknowledges the concern regarding potential workforce pressures on the local housing market. As the Proposal is in a preliminary development stage and no construction contractors have been appointed, detailed workforce forecasts are not yet available. Current workforce estimates are based on comparable renewable energy projects of similar scale. Peak workforce numbers are expected only during the civil construction phase (2–6 months) and are not anticipated to continue throughout the broader 18–24 month construction period. SynergyRED proposes the following Advice note in this regard: • As part of the sourcing process, SynergyRED will refine the accommodation requirements to select an accommodation option that aims to balance the needs of the Proposal and community.

	A condition of Development Approval is supported as follows: • Prior to construction commencing, an Accommodation Strategy will be developed in consultation with the Local Government. The Accommodation Strategy shall be implemented to the satisfaction of the Local Government.
Agricultural Resource Management and Assessment (ARMA)	
DPIRD has reviewed the Preliminary Construction and Environmental Management Plan (CEMP) and supports use of the CEMP to outline measures to manage biosecurity and water erosion risks during construction. DPIRD provides the following considerations for finalising the CEMP. • It is essential to outline biosecurity management measures to reduce the risk of introducing or disturbing pathogens and weed species within the vegetation across the development envelope. Managing biosecurity risks during construction, ongoing operations, and eventual decommissioning of the wind farm will help minimise impacts on landholders, adjoining farms, and transport routes. • DPIRD is aware of wind farms where soils/landscapes considered at low risk of water erosion under agricultural use, have suffered serious erosion under other uses. The movement of very large and heavy machinery, combined with access roads, pads for turbines and other features can concentrate water flow resulting in erosion. The management measures will need to address any potential surface water or groundwater impacts associated with the development.	The finalised CEMP will outline measures to manage erosion and biosecurity.
DPIRD requests a copy of the final CEMP document, when it becomes available, and the opportunity to advise whether the biosecurity and soil degradation risks associated with this project are being managed.	SynergyRED will provide DPIRD with a copy of the CEMP once finalised.
The Soil and Land Conservation team have advised that within the project area there are several Agreements to Reserve native vegetation in perpetuity. Should SynergyRED and their contactors require to undertake activities within these areas, or to obtain more information on these agreements, they should contact the Commissioner of Soil and Land Conservation, by email at commsoil@dpird.wa.gov.au, prior to commencing any activities.	Noted.

2.5 Department of Biodiversity, Conservation and Attractions (DBCA)

SUMMARY OF SUBMISSION	RESPONSE
The following comments are provided pursuant to DBCA's responsibilities under the *Conservation and Land Management Act 1984* (CALM Act) and *Biodiversity Conservation Act 2016* (BC Act).	
DBCA-Managed Lands	
a. The proposal area surrounds and partially intersects with an unnamed Nature Reserve (R 42377 / Lot 4924) accessed from Dennis Road, as well as Crown freehold Lot 101, currently held by the Department of Planning, Lands and Heritage but actively managed since 2016 by DBCA and accessed via Scott River Road. It is intended that Lot 101 will ultimately be transferred to the conservation estate to be managed as a nature reserve by DBCA under the CALM Act.	SynergyRED is aware of the Department of Biodiversity Conservation and Attractions (**DBCA**) manages land within and neighbouring the Development Envelope and has considered these in the preparation of the Development Application. SynergyRED has undertaken preliminary consultation with both the Department of Planning Lands and Heritage (**DPLH**) and DBCA regarding the Proposal's partial intersection with R 42377 & Lot 101 and will seek the appropriate approvals for access to reserves following receipt of primary approvals, and detailed design.
b. The project area also adjoins Crown freehold Lot 1 Governor Broome Road to the southeast, acquired by DBCA through an environmental offset process. To the northeast of the project area, adjoining Dennis Road/Pagett Road, is the Pagett and Chester Nature Reserves and South Blackwood State Forest. To the south and west of the project area, along the Blackwood and Scott Rivers, is the Scott National Park.	
c. The proposed development should not result in impositions being placed upon the management of the adjoining and nearby DBCA-managed lands. There should be no direct or indirect impacts, including vehicle, pedestrian and/or stock access, fire management, dewatering/groundwater impacts, surface water run-off, erosion, pollution, pests, Phytophthora dieback or weed spread from the proposed development to the adjacent DBCA-managed land.	The Proposal will be developed to limit impact on DBCA's land management activities, most likely to occur during construction of any portion of the footprint that intersects/traverses these properties (e.g., access tracks and transmission line). These direct impacts will be limited to areas of cleared land within these landholdings and will be discussed with DBCA when seeking the above approvals.
d. The submitted Development Application Report (Urbis, October 2025) provides indicative locations for the 20 proposed Wind Turbine Generators (WTGs) and associated infrastructure such as wind monitoring and communication towers, electrical substation, site buildings, transmission line, dams, temporary concrete batching plant, storage and stockpile areas. The proposal states that the maximum tip height for the WTGs is 250m, with a hub height of 164m and a minimum tip height of 40m. For this proposal, the rotor swept area (RSA), -the physical area swept by the blades during operation - is between 23,000m2 and 26,000m2 and has the potential to impact on fauna movements across the landscape.	As noted, the Proposal's layout has been designed to avoid the placement of WTG in proximity (within 100 m from the centre point of the WTG) to remnant native vegetation within R 42377 and Lot 101, and as a result no groundwater drawdown is currently anticipated. (Stantec 2025; Attachment 4- Appendix A). Note during assessment of the Proposal's referral under the EPBC Act, the minimum blade ground clearance was increased from 40 metres above ground level to 59 metres above ground level to avoid significant impacts to black cockatoos and migratory birds. The BBAMP (Attachment 4 – Appendix N) will be updated to reflect this change. Other indirect impacts will be managed through the implementation of Management Plans, including a CEMP (Attachment 4 -Appendix H), detailed ASSDMP (Attachment 4-Appendix B), and **Appendix E**: Bushfire Risk Management Plan (BRMP) - and Dieback Management Plan (**DMP**) where required (to be informed by Phytophthora dieback survey prior to construction). The ASSDMP will be updated to include the following drawdown limit: Drawdown will not exceed natural seasonal variation (i.e. will remain above natural seasonal low in watertable) at GDEs and the location of native vegetation within R 42377 and Lot 101.
Advice:	
1. Adequate boundary fencing and gates should be installed to restrict vehicle or stock access to the adjoining DBCA-managed reserves.	Noted. SynergyRED understands that the vegetated values within both R 42377 and Lot 101 are currently fenced to protect them from surrounding agricultural activities including grazing. Following receipt of primary approvals and detailed design, and when seeking the above approvals, SynergyRED will discuss with DBCA any potential impacts to

SUMMARY OF SUBMISSION	RESPONSE
	existing fencing associated with the Proposal along with proposed mitigation (e.g. installation of gates) to ensure vehicle and stock access to reserve values continue to be restricted.
2. Recommend a minimum 100m setback from the boundary of the adjoining nature reserves to any of the proposed buildings, structures and earthworks, to mitigate potential impacts on DBCA-managed lands. A greater setback distance to WTGs or supporting development may be identified, based on finalisation of the development plans following a further design and procurement process, as noted in the Development Application Report (Urbis October 2025).	Noted. The current indicative disturbance footprint has no direct impact on the adjoining nature reserves, and largely falls outside a 100m buffer applied to the protected values within adjoining reserves[1], excepting: • A number of existing access tracks proposed for upgrade/use – selected to minimise disturbance/clearing of native vegetation and associated impacts on landowner. • A portion of the overhead transmission line, associated access track and Western Power laydown area which have been positioned to avoid direct impacts on reserves and minimise impacts on landowner farming practices. In response to DBCA's comments, SynergyRED is committed to locating: • All WTGs 100 m from R 42377, Lot 101 and Lot 1. • The proposed substation, operation and maintenance area and all temporary construction areas (e.g. laydown areas, construction site offices, concrete batching plant, topsoil/vegetation stockpiles, ASS/dewatering management infrastructure) at least 100 m from the protected values within R 42377 & Lot 101[1] to mitigate potential impacts on DBCA-managed lands. • The proposed transmission line and associated access track to ensure that there is no direct impact on R 42377 & Lot 101, with consideration for ongoing asset management and protection. These commitments will be reflected in the CEMP (Attachment 4 -Appendix H).
3. The proposed gravel-capped access road alignments cross the access ways to Lot 101 and R42377. Further discussions with DBCA will be required in relation to current and future access to the lands and appropriate roading materials to minimise Phytophthora disease spread.	Noted. SynergyRED will consult with DBCA and seek the appropriate approvals for access to reserves following receipt of primary approvals and detailed design.
Visual Amenity The majority of the assessment focuses on the WTGs as these are the largest elements in the landscape - this includes the mapping of ZVIs. Other infrastructure worthy of the same detailed assessment as the WTGs include the access and maintenance roads, transmission line, meteorological masts and the substation, given they are of significant scale or length in the landscape and will be seen in a different context to the towers. Individual ZVIs for the other infrastructure will determine where these elements will be seen from the landscape and sensitive visual receptors. These ZVIs could inform mitigation measures that could reduce the individual visual impact of these items and therefore reduce the collective total visual impact for the project as a whole. The report notes that there will be an impact to the quality of the visual landscape from this proposal. Because of this acknowledgment, and the degree of the impact, the proposed mitigation measures appear limited. More advanced assessment of mitigation measures, based on a more detailed assessment of sensitive visual receptors, infrastructure assessment and associated ZVI may provide more protection of landscape quality and the viewer's sensitivity to the proposal.	Noted. See responses to advice below.

[1] Note: The 100m buffer has not been applied to the mostly cleared portions of R 42377 & Lot 101 that support access to the protected values.

SUMMARY OF SUBMISSION	RESPONSE
Advice:	
1. The methodology, process and outcomes as presented in Attachment 4 - Referral Supporting Documents (RSD), Eco Logical Australia 2025 and the main assessment documented in Proposed Wind Farm - Scott River Landscape and Visual Impact Assessment by GHD 2025 are generally supported given: • The methodology aligns with industry standards using established methodologies and approved documents, including the WAPC Visual Landscape Planning in Western Australia: a manual for evaluation, assessment, siting, and design. • Suitable Landscape Character Units (LCU) were developed highlighting the variety of landscape types that surround the project. These were then extended to describe the public's acceptance of visual change to the landscape quality of those LCUs. • The Zones of Visual Influence (ZVI) capture where the wind farm infrastructure will be seen across the landscape.	Noted and confirm comment.
2. Views specific to DBCA managed lands are largely absent, including the Cape to Cape Track, recreation sites and activity on and along the Blackwood River / Scott River and Hardy Inlet, and the Cape Leeuwin Lighthouse (from the ground and the top viewing deck). Assessing more receptors could help to identify small scale or local mitigation measures.	Updated hub- and tip-height ZTV mapping now includes the Cape to Cape Track, Leeuwin Lighthouse, key waterways and Scott River National Park confirming that the Cape to Cape Track and the Lighthouse fall outside the visible area, while other recreational areas such as Scott River National Park, Hardy Inlet, Blackwood River and Scott River lie within it, noting that ZTV outputs do not account for vegetation, buildings or distance effects. In addition, photomontages in the Proposal LVIA (2025) demonstrate that views from both the top and bottom of Cape Leeuwin Lighthouse are obscured by intervening landform, confirming no visibility of the Proposal from these locations. See **Appendix B: Section 3.2**
3. The viewing deck at the Cape Leeuwin Lighthouse sits ~40m above ground, and the base of the lighthouse is ~ 20m above sea level. As this is a significant tourism site it would warrant an assessment	
The Visual Impact Assessment identifies that this proposal will be highly visible in the surrounding landscape and that there is limited scope in most instances to reduce this visual impact. The proposed mitigation measures are limited and reflect the high impact of the proposal from scattered receptor sites but do not consider local or small-scale mitigation measures or interventions to protect visual quality from the entire landscape. Potential mitigation measures to address landscape-wide and locally identified impacts could include: • Road edge vegetation screening along surrounding travel route corridors of all types managing and screening views along the length of these corridors. • Localised screening surrounding the ancillary infrastructure. • Broadscale landscape planting within the project area.	Noted. See **Appendix B: Section 3.5 and Appendix C: Section 2.** SynergyRED is committed to offering targeted visual screening, vegetation strategies, or similar low-impact mitigation measures to adjacent landowners should these prove effective and appropriate in consultation with affected parties.
Flora **Discussion** DBCA provides the following comments on Attachment 4 (RSD) - Appendix I Detailed Flora and Vegetation Survey undertaken by Phoenix Environmental Services in February 2025 (the Flora Survey). a. Vegetation complex information has not been assessed correctly. For the southwest Regional Forest Agreement Area, the Mattiske and Havel (1998) mapping should be used. b. Threatened flora, *Conospermum quadripetalum* (CR), has been recorded in previous surveys from 2019, including in close proximity to proposed WTGs in the northwestern vegetation and in the road reserve as recently as 2022. The Flora Survey did not record this species, although it was noted that its habitat was not thoroughly searched. *C. quadripetalum* is wetland dependant and may be impacted by dewatering.	a) Phoenix Environmental Sciences has confirmed that vegetation has been assessed in accordance with relevant guidance material - *EPA Technical Guidance (2016)* and the *Environmental Factor Guideline* (2022). Neither of these Guidelines stipulate a requirement for Mattiske and Havel (1998) mapping to be used. b) Noted. As detailed in Attachment 4 (Referral Supporting Document (**RSD**) - Section 8.6.6 and Section 9.6.11, given the temporary and spatially constrained nature of the proposed dewatering, and the implementation of the detailed ASSDMP, drawdown of groundwater is not expected to significantly impact groundwater dependent vegetation within or surrounding the Development Envelope. Furthermore, through the implementation of mitigation measures within the CEMP and design, the Proposal is not expected to result in significant impacts to surface hydrological regimes to cause significant vegetation impact.

SUMMARY OF SUBMISSION	RESPONSE
c. 71 individual specimens of the threatened *Verticordia plumosa* var. *vassensis* (EN) have been recorded on Governor-Broome Road, some of which appear to be in proximity to the proposed track that crosses the road. *V. plumosa var. vassensis* is often found in seasonally inundated areas and may be impacted by alterations to hydrology / drawdown. d. Survey sites BEE030 and BEE061 have incorrectly identified a known population of threatened flora *Banksia nivea* subsp. *uliginosa* (EN) as the common subspecies *Banksia nivea* subsp. *nivea*. The common subspecies has not been recorded on the Scott Coastal Plain. Survey sites BEE114, BEE115R also recorded *Banksia nivea* subsp. *nivea*. e. The Flora Survey did not locate any plants of the threatened *Darwinia ferricola* (EN). DBCA records indicate there are nine populations within the area surveyed. f. Records of *Leucopogon alternifolius* (P3) have likely been confused with the Priority 3 species *Leucopogon wheelerae*, which is endemic to the Scott Coastal Plain and only known between Walpole to Albany. g. It is possible that some of these BC Act listed threatened species may no longer persist on site, however a soil stored seed bank is still likely to be present and plants may germinate at this location in future. h. At present, there are several tracks within the footprint that occur very close to known threatened plant occurrences (e.g. *Darwinea fericola*, *Verticordia plumosa* var. *vassensis)*. i. Attachment 1 [inserted below] provides a list of DBCA identified regionally significant species (assuming correct ID) from the Flora Survey records. • *Actinodium cunninghamii* - western range end. Disjunct western populations. • *Calothamnus lehmannii* - disjunct and rare on Scott Coastal Plain. • *Cyathochaeta equitans* - no known previous record on Scott Coastal Plain. • *Daviesia flexuosa* - western populations are disjunct from the eastern south coastal populations. • *Goodenia micrantha* - first known record on Scott Coastal Plain. • *Grevillea diversifolia* subsp. *subtersericata* - no known previous record on Scott Coastal Plain. Disjunct from usual distribution. Nearest record near Northcliffe. • *Hakea tuberculata* - disjunct western populations are endemic to the Scott Ironstone TEC. • *Isolepis congrua* - no known previous record on Scott Coastal Plain. Nearest record near Denmark. • *Isolepis hookeriana* - no known previous record on the Scott Coastal Plain. Nearest record near Bridgetown. • *Lepidosperma leptostachyum* - no known previous record on the Scott Coastal Plain • *Melaleuca densa* - western range end. Uncommon on Scott Coastal Plain. • *Myriophyllum salsugineum* - Poorly recorded. First record on the Scott Coastal Plain landform. • *Persoonia graminea* - western populations are disjunct from eastern populations. Uncommon. • *Scaevola striata* var. *striata* - western range end at Scott River. • *Sphaerolobium grandiflorum* - First record on the Scott Coastal Plain landform. Disjunct. Not recorded west of Walpole • *Sphaerolobium racemulosum* - western populations highly disjunct from populations east of Albany. • *Stylidium megacarpum* - southern range end. Poorly recorded on the Scott Coastal Plain landform. • *Synaphea obtusata* - no known previous record on the Scott Coastal Plain. Not previously recorded west of Manjimup. j. The flora survey does not provide a table of locations or precisely identify the spatial location of conservation listed or significant flora. k. Attachment 4 (RSD) – Appendix D Preliminary Oversize and/or Over Mass (OSOM) Route Study (Ares Group April 2025) indicates that some native vegetation clearing along the transport route from Bunbury Port to the site may be required, and potentially around Site Entrance A. Vegetation to be cleared in association with the transport route was not assessed in the Flora Survey. **Advice:**	c) No dewatering is expected for access track construction. See response to item (b) above. d) Noted – See response to related advice (2) below. e) Section 5.1.2 of Appendix I of Attachment 4 (RSD) details desktop records for this species. Most of these locations were visited and could not be located (i.e. appeared to be cleared), with the exception of three (3) records which weren't visited and confirmed, given they were located outside of expected areas of disturbance. As detailed in Attachment 4 (RSD) - Section 8.3.3.1, unconfirmed desktop records have been treated as present, and will be avoided in line with the Proposal's commitments for Threatened flora. f) Phoenix Environmental Sciences has confirmed that *Leucopogon alternifolius* records are likely *Leucopogon wheelerae*. Note, as both species are P3, misidentification will not result in any change to predicted impacts to this species or require change to mitigation (i.e. SynergyRED has already committed to avoid clearing of P3 species, including any contiguous native vegetation within 20m, as detailed in Attachment 4 (RSD) - Section 8.7. g) Noted – See response to related advice (5) below. h) As detailed in Attachment 4 (RSD) - Section 8.5 and 9.7, the Proposal has also committed to avoid clearing of conservation significant flora (including contiguous native vegetation within 50 m of known Threatened and P1 species and within 20 m of P2, P3 and P4 species). i) Noted. SynergyRED will review these species and avoid these where possible. j) Noted. This information can be exported from the spatial data and provided to DBCA during the relevant Section 40/45 Authorisation process under the BC Act. k) Noted – See response to related advice (9) below.

1. It is recommended that the proponent obtain detailed flora survey records from DBCA via a data request.	Search of DBCA Threatened and Priority Flora Database was conducted as part of the Detailed Flora and Vegetation Survey (See Attachment 4 (RSD) - Appendix I – Section 4.1).
2. Pre-clearance surveys of the northwestern vegetation for *Conospermum quadripetalum* should be conducted to determine whether it is present and in proximity to the clearing.	An additional targeted flora survey has now been conducted over the Eco Logical gap survey area in the north-west. No Threatened flora species listed under the *Environment Protection and Biodiversity Conservation Act 1999* (**EPBC Act**) or the *Biodiversity Conservation Act 2016* (**BC Act)**, or Priority species listed by DBCA were recorded within this area (ELA, 2025). A copy of this report can be made available to DBCA during relevant Section 40/45 Authorisation processes under the BC Act.
3. Pre-clearance surveys of the northwestern vegetation for *Verticordia plumosa* var. *vassensis* should be conducted to determine whether it is present and in proximity to the clearing.	See response to item (2) above.
4. Records of *Banksia nivea* subsp. *nivea* need to be reviewed to determine if it is the threatened sub species *B. nivea* subsp. *Uliginosa*.	Phoenix Environmental Sciences has advised that *Banksia nivea* subsp. *nivea* and Banksia *nivea* subsp. *uliginosa* could be considered cryptic to each other and are difficult to split due to overlap in most taxonomic characters, and that on the basis of range, subsp. nivea is possible at this location (i.e. would only represent a slight range extension). Recognising the higher conservation status of Banksia *nivea* subsp. *uliginosa* (T), all *Banksia nivea* subsp. *nivea* records will be treated as Banksia *nivea* subsp. *uliginosa* (i.e. will be avoided, including avoiding clearing of any contiguous native vegetation within 50 m, as detailed in Attachment 4 - Section 8.7) until specimens are independently identified at the WA Herbarium and confirmed otherwise.
5. Where possible, a 50 metre buffer be applied to all confirmed threatened plant records (even if the plant no longer persists on site). If this is not feasible, a BC Act section 40 authorisation will be required for the take of plants, soil stored seed and inadvertent take of threatened species of plants, which may be subject to conditions to mitigate and offset any potential impacts.	The CEMP (RSD - Appendix H – Attachment 4) commits to no clearing of contiguous native vegetation within the Clearing Exclusion Area Buffer (50 m) for Threatened species, including recorded and unconfirmed desktop records. SynergyRED will consult with DBCA during relevant Section 40/45 Authorisation processes under the BC Act regarding impacts to recorded and desktop Threatened flora records, including those considered to no longer be present.
6. Given the project area is predominately cleared agricultural land (72.4%) it is recommended that any WTGs, associated development such as BESSs, concrete batching plant, extraction pits and supporting infrastructure such as access tracks, transmission lines target existing cleared areas.	As detailed in Attachment 4 (RSD) – Section 8.5, Section 8.6.1 and Section 8.7, the Indicative Disturbance Footprint has been designed to utilise existing cleared areas and tracks as much as practicable to reduce clearing of native vegetation. The Proposal will result in the clearing of no more than 1 ha of native vegetation, including a maximum of 0.02 ha of vegetation in Very Good or better condition.
7. It is noted that several of the proposed access tracks currently bisect drainage lines. Clearing of drainage lines should be avoided where possible.	While the Indicative Disturbance Footprint does bisect a number of drainage lines, no clearing of native vegetation is anticipated at these locations. SynergyRED will avoid clearing of native vegetation growing in association with drainage lines wherever possible or otherwise obtain the relevant approvals (e.g., NVCP under Part V of the EP Act and Bed and Banks Permit under the RIWI Act).
8. Transmission line fire mitigation measures such as vegetation pruning and grass spraying should not result in any clearing or modification to the remnant vegetation in the DBCA managed nature reserve (R42377) to achieve transmission line fire protection objectives.	Noted. The transmission line will be located to ensure that the construction and ongoing maintenance of this infrastructure (i.e., Western Power clearance and regrowth zones) will not result in any impact to remnant vegetation within R42377.
9. Planning access for construction traffic off Scott River Road and Governor Broome Road should consider presence and avoid any impacts on threatened and conservation significant flora within these road reserves.	While the Preliminary Over Size Over Mass (**OSOM**) identified a number of site entrances that might require native vegetation clearing, the Proposal has selected

	those site entrances that do not require native vegetation clearing, with one exception ('Area 1') as assessed in Attachment 4 (RSD) – Section 8.6.1. Clearing of this entrance is not anticipated to have any impact on conservation significant flora.
Threatened Ecological Communities **Discussion** a. The ironstone soils, which are the foundation of the Scott River Ironstone Threatened Eco Logical Community (TEC), are highly restricted in distribution on the Scott River Plain. The Scott River Ironstone TEC is listed as Critically Endangered under the BC Act and Endangered under the federal *Environmental Protection and Biodiversity Conservation Act 1999* (EPBC Act). Currently there are 24 occurrences from the Scott River area recorded on DBCA's TEC database. The occurrences total 377 hectares over an extent of occurrence of approximately 150 km2. The loss of any occurrence of this TEC is considered significant. b. The Scott River Ironstone Association Interim Recovery Plan 2015–2020 (DPAW, 2015) (IRP) for the TEC refers to the underlying geology's physical properties as being important for local moisture retention and to sustain the TEC vegetation. The TEC relies on relatively shallow groundwater depth in summer and autumn (1-2 metres below ground). c. Ponding occurs in low-lying areas during the winter because vertical drainage of rainfall and runoff is prevented by the relatively impervious ironstone layer and shallow groundwater level. Inundation usually persists for a period of three months during winter, although some occurrences may have little surface water. The vegetation community is tolerant of periodic inundation (usually for several months during winter). d. The IRP also states that "any groundwater use that has the potential to lower the summer minimum groundwater levels at the water table by more than 0.3 metre should be considered a potential threat" (p16). If groundwater levels are impacted or dewatering occurs, this could result in vegetation deaths within the community. e. Areas currently mapped as Scott Ironstone TEC that were considered to be in degraded condition were not included as occurrences of the TEC, as they do not meet the criteria of good or better to be listed under the relevant acts. These occurrences are still considered to be important, as with intervention (e.g. fencing, weed control and grazing management) they have the ability to recover sufficiently to be considered part of the TEC. These areas of vegetation should also be considered for potential impacts from clearing and groundwater drawdown. f. Some of the proposed WTG locations are very close to known occurrences of Scott Ironstone TEC and vegetation within conservation reserves (Lot 101, Lot 1 and R42377). For example, the proposed WTG on the east side of Lot 101 is immediately adjacent to native vegetation within Lot 101 as well as vegetation mapped as Scott River Ironstone TEC in the Flora Survey. Groundwater drawdown here has a high potential to impact native vegetation, including the Scott River Ironstone TEC. The information provided does not include sufficient detail to demonstrate that modification of the TEC is unlikely to occur. g. The proposed site office, concrete batching plant and laydown areas are in close proximity to Lot 101 and DBCA's access gate into Lot 101. **Advice:**	Noted. See response to DBCA comments in advice responses below.
1. It is recommended that footings that require minimal dewatering are used for any of the WTGs near the Scott River Ironstone vegetation.	As detailed in Attachment 4 (RSD) – Section 2.2.1.1, two (2) primary WTG foundation options (above ground/partial above ground) will be utilised to minimise the volume of ASS disturbed, and dewatering volume and depth. Typical below ground foundation will only be used where it is confirmed, prior to construction, through detailed site investigation and revised modelling, so that no dewatering will be required.
2. Further discussion is required with DBCA to ensure there is no impact to vegetation in Lot 101 and DBCA's operations/access.	Noted.

	SynergyRED will consult with DBCA to seek the appropriate approvals for access to reserves following receipt of primary approvals and detailed design and during relevant Section 40/45 Authorisation processes under the BC Act.
3. The access track construction should consider appropriate culvert installation to ensure surface hydrology flows are not altered, which may impact the Scott River Ironstone TEC.	SynergyRED has accepted DWER proposed conditions relating to stormwater management, see Section 2.2 issue 3.. The SMP will give consideration to locations of TEC and ensure that drainage controls (e.g. drains and culverts) will be appropriately located, designed, constructed and maintained to maintain surface water flow regimes and minimise erosion.
4. A minimum 100m setback is recommended from proposed buildings, structures and earthworks and the Scott River Ironstone TEC occurrences, to mitigate potential impacts on the TEC.	The Approved Conservation Advice for Scott River Ironstone Association (DSEWPaC 2013) recommends the application of a minimum 50 m buffer for the Scott River Ironstone TEC, *'However, the width of the buffer required may be greater depending on the type of threat, the local hydrology and other factors'*. The Proposal layout has been designed to avoid the placement of WTG in proximity (minimum of 100 m from the centre point of the WTG) to remnant native vegetation, including the TEC. In response to DBCA advice, SynergyRED commits to locating: • WTGs a minimum of 100 m from TEC (as measured from the centre point of the WTG) and inclusive of a 50m buffer between associated ground disturbance (i.e., WTG and hardstand) and the TEC. • Infrastructure which may be a source of contamination (e.g. substation and switchyard, operations and maintenance building and workshop, and refuelling locations) 100 m from TEC. • The concrete batching plant 500 m from TEC. • All temporary construction areas (e.g. laydown areas, construction site offices, concrete batching plant, topsoil/vegetation stockpiles, ASS/dewatering management infrastructure) 100 m from TEC. SynergyRED, however, cannot commit to locating roads and cabling 50 m from TEC, noting that it is seeking to utilise existing tracks/access roads as much as practicable (many of which are already in proximity to TEC), as cabling often follows roads. SynergyRED has proposed to clear 0.01 ha within 50 m buffer of TEC to facilitate transport of WTG components south of Governor Broome Road as detailed in Section 8.6.1 of the RSD (Attachment 4). Any infrastructure and potential impacts within 50 m of TEC will be discussed with DBCA during relevant Section 40/45 Authorisation processes under the BC Act.
5. It is recommended a site-specific hydrological study is undertaken. If this information identifies potential impacts to TEC vegetation from the proposal, authorisation under section 45 of the BC Act will be required. If further advice is required in relation to requirements under the BC Act including whether authorisation is required to modify a TEC, email speciesandcommunities@dbca.wa.gov.au.	A Surface Water and Hydrogeological Assessment (Appendix A to Attachment 4 (RSD)) was undertaken to investigate the hydrological and hydrogeological regimes within the Development Envelope and to assess potential impacts. SynergyRED has committed to managing dewatering so that drawdown does not exceed 0.1 m beyond 100 m from any dewatering location or natural seasonal variation (i.e. will remain above natural seasonal low in watertable) at groundwater dependent ecosystems, including TEC. SynergyRED is committed to undertaking further detailed site investigations and modelling to support selection of WTG foundations and the development of the ASSDMP.

6. It is recommended that the Preliminary Acid Sulfate Soils and Dewatering Management Plan (Attachment 4 (RSD) - Appendix B – PTG Consulting September 2025) be updated in consultation with DBCA to include appropriate monitoring and mitigation measures relating to the Scott River Ironstone TEC and be conditioned on any development approval.	SynergyRED will consult DBCA on the ASSDMP as appropriate when seeking approvals for access to reserves, following receipt of primary approvals and detailed design, and during relevant Section 40/45 Authorisation processes under the BC Act. SynergyRED proposes a condition as follows: • Prior to any ground disturbing activities, an Acid Sulfate Soils and Dewatering Management Plan (ASSDMP) is to be prepared to the satisfaction of the Local Government, on advice from the Department of Water and Environmental Regulation (DWER).
7. The proponent may also need to address any referral requirements under the EBPC Act.	The Proposal was referred to DCCEEW on the 28 November 2025. On the 27 February 2026 the DCCEEW made the Referral Decision - Not controlled action if taken in a particular manner. More information on the decision is available via its website: EPBC Act Public Portal.
Wetlands The majority of the development area is mapped as palusplain in the Geomorphic Wetlands Augusta to Walpole dataset, with a cluster of sumplands and damplands around the middle of the development area, particularly within Lots 4152, 4263 and 4265. Any alterations in hydrology may impact the palusplain. There may also be indirect impacts to the sumplands that are in close proximity to development.	Impacts to wetlands were considered in Section 9.6.1 and Section 9.6.11 of Attachment 4 (RSD).
Fauna **Discussion** a. DBCA notes potential impacts of the development on conservation significant values including breeding, roosting and foraging habitat of the threatened Carnaby's cockatoo (*Zanda latirostris*), Baudin's Cockatoo (*Zanda baudinii*), Forest Red-tailed Black Cockatoo (*Calyptorhynchus banksia naso*), and the Priority species Western False Pipistrelle bat (*Falsistrellus mackenziei*), all of which were observed within the proposal area. b. Evidence from studies at other windfarms has shown that operational impacts affect particular species disproportionately, compared to habitat loss or stationary elevated structures (Willis et al. 2010). While research on Australian wind farms is limited, evidence to date suggests the species most affected by collision mortality fall into the following groups (MacMahon 2010): • Large sedentary raptors. • Fast high flying microchiropteran bats. • Fast high flying non-passerines. Representative species from all of these groups are known to occur within the locality of the Scott River proposal. c. Studies reported in the literature reviewing the operational impacts at Australian wind farms using data from operational monitoring (i.e. carcass searches) at Australian wind farms found an average mortality of 0.71 birds and 0.55 bats per turbine per year, although these rates are imperfect given the limited datasets (Heinze et al, 2014). d. It is noted that some species such as the wedge-tailed eagle (*Aquila audax*) and white-striped freetailed bat (*Austronomus australis*) have an 'almost certain' risk of collision with the turbines and high mortality rates/carcass counts have been recorded at other wind farms in Australia. However, as these species are not conservation listed, the impact to these species has not been assessed.	Noted – See response to related advice and clarification on discussion item (e) and (g) below: (e) The Forest Red-tailed Black Cockatoo was the only conservation listed species recorded flying at heights above 40m, specifically two records within a flight range of 25-50m. As detailed in the BBAMP (Appendix N of Attachment 4 (RSD), these two records have been conservatively assumed to be within the RSA for the risk assessment; however, it is acknowledged that these records are likely to be below 40 m based on known behaviour and flight height records of this species collected for other wind farm projects. (g) The Proposal layout has been designed to avoid the placement of WTG in proximity (minimum of 100 m from the centre point of the WTG) to remnant native vegetation/habitat. The dense vegetation surrounding WTGs BP_01 and BP_02 in the north west of the Development Envelope is Bluegum plantation, scheduled for removal prior to the implementation of the Proposal.

e. How black cockatoos use the landscape in the presence of wind turbines is not well known at present. It may change their foraging, roosting and breeding behaviour. Locating turbines and tracks away from trees and vegetation may minimise disruption to their normal behaviour patterns. Black cockatoos may fly a distance of around 20-30 km on average over open areas (e.g. agriculture areas). Black cockatoos utilise vegetation corridors, such as those formed by the adjacent remnant vegetation, to access known patches of foraging, roosting and breeding habitat. Often the birds will fly to the ground to drink on dusk before returning to their night roost in the forested areas. f. The RSA of the proposed WTGs is between 40-250m above the ground. The supporting Attachment 4 (RSD) - Appendix L Bird and Bat Risk Assessment – Level Two (Phoenix Environmental Sciences August 2025) indicates that certain conservation significant species such as Red-Tail and Carnaby's Black Cockatoos have been recorded flying to heights of 50m. g. Many of the WTGs appear to be placed close (or within) areas of remnant vegetation/Black Cockatoo habitat. h. There is evidence in other bird species that the impact of noise from the turbines may be detrimental to reproductive success. Studies also indicate that birds may exhibit avoidance behaviour near windfarms, with reports of displacement effects ranging from 75 to 800 metres from turbines (Strickland 2004, Winkelman 1994). Potential noise impacts to fauna are considered in Attachment 4 Referral Supporting Document (RSD) and is proposed to be managed through Attachment 4 (RSD) - Appendix N Preliminary Bird and Bat Adaptive Management Plan (both Eco Logical September 2025). i. The Preliminary Bird and Bat Adaptive Management Plan **(**Attachment 4 (RSD) - Appendix N – Eco Logical September 2025) (BBAMP) emphasises carcass monitoring but lacks detail on adaptive responses if collision triggers are exceeded. j. There are high-quality habitat areas and records for Western Ringtail Possum (*Pseudocheirus occidentalis*) (WRP) in the southeast corner of the development area, which is in proximity to two proposed WTGs. **Advice**	

1. Where possible, a minimum 100m buffer between remnant vegetation and individual WTGs is recommended, to reduce bird strike and any potential impacts from the turbine noise. In particular, recommend the following specific WTGs be considered for relocation to reduce impacts for black cockatoos and WRP: a. WTG in the northeast of the Development Area adjacent to red-tailed black cockatoo records [BP_04] b. WTG cluster north of Governor Broome Road [BP_13, BP_15, BP_16] c. northwest WTG in dense vegetation [BP_01 and BP_02], and d. southwest WTG just to the north of Governor Broome Road [BP_17].	The Proposal layout has been designed to avoid the placement of WTG in proximity (minimum of 100 m from the centre point of the WTG) to remnant native vegetation/habitat, and so the current indicative layout is in accordance with this advice. The final location of the WTGs will be subject to detailed design and site investigations and will ensure this buffer is maintained by siting WTGs within the 'Wind Turbine Envelope ''as detailed in the **Shire** (**RFI) - Item 1** and further discussed in **Appendix A** Substantial disturbance to fauna movement patterns and behaviour from WTG movement, light, noise and/or vibration is not anticipated, and will be minimised through the implementation of the CEMP (Appendix H – Attachment 4 (RSD) and BBAMP (Appendix N – Attachment 4 (RSD). Note: • WTGs BP_5 and BP_6 in the north east of the Development Envelope have been relocated in support of mitigating visual impacts and are now located further away from Forest Red-tailed Black Cockatoo records. See Appendix C: DPLH Community SVA and LVIA- Figure 1 • WTG BP_10 and BP_20 have also been relocated in support of mitigating visual impacts and are now located further away from Carnaby's Cockatoo records, and in the case of BP_10 further away from DBCA managed land. • The dense vegetation surrounding WTGs BP_01 and BP_02 in the northwest of the Development Envelope is Bluegum plantation, scheduled for removal prior to the implementation of the Proposal. As noted previously, the Proposal has received a NCA-PM referral decision from DCCEEW. The 'particular manner' includes a new commitment to ensure the minimum blade ground clearance is 59 metres above ground level (increased from 40 metres above ground level at time of referral), to avoid significant impacts to black cockatoos and migratory birds. For more information on the decision and the required actions, refer : EPBC Act Public Portal.
2. Recommend the proponent identify any water sources such as fire water points/soaks/troughs/bores etc. in the agricultural land and consider not placing turbines between the existing water points and the vegetation to ensure no disruption to flight paths and reduce the potential for bird strike.	Noted. The BBAMP (Appendix N – Attachment 4 (RSD) includes the following preventative management and mitigation measure: Where possible and agreed to by landholders, sources of water (e.g. cattle troughs) will be restricted to/relocated more than two (2) times the blade length from operational WTG to reduce the risk of birds being attracted to the area. The implementation of this mitigation measure will require close coordination with landholders through discussion and notification of water sources and the annual BBAMP implementation program.
3. Recommend the BBAMP **(**Attachment 4 (RSD) - Appendix N – Eco Logical September 2025) be updated in consultation with DBCA and be conditioned on any development approval.	SynergyRED proposes a condition as follows: • Prior to WTG commissioning, a Bird and Bat Adaptive Management Plan (BBAMP) is to be approved and implemented, to the satisfaction of the Local Government, upon advice from DWER and DBCA.
4. Recommend the BBAMP be updated to include specific operational adjustments such as blade feathering, appropriate RSA for the proposed WTGs, painted blades, acoustic deterrents, and radar/camera-based smart curtailment of the turbine speed during periods of high species activity, in response to carcass reporting.	Following submission of the Development Application, the BBAMP has been updated in response to a RFI from the Environmental Protection Authority (**EPA**) during its assessment of the referral under the *Environmental Protection Act 1986* (**EP Act**). The latest version can be found on the DCCEEW website. The response was updated to include threshold criteria and contingency actions, including use deterrents (e.g. noise,

	visual) or WTG curtailment. The selection of the most appropriate contingency action will be selected in consultation with relevant agencies. As identified in Item (3) above, a condition is accepted in this regard.
5. WRP and Black Cockatoo species are listed as threatened under the BC Act and EPBC Act. The proponent should be aware of their obligations and approval requirements under section 40 of the BC Act, which requires Ministerial authorisation to take or disturb threatened species. If further advice is required in relation to requirements under the BC Act including whether an authorised fauna spotter is required for activities such as vegetation clearing, email speciesandcommunities@dbca.wa.gov.au.	Noted. SynergyRED is aware of the requirements under s 40 of the BC Act and will apply for a Section 40 authorisation, where required.
Construction Environmental Management **Discussion** a. The submitted Attachment 4 (RSD) - Appendix H Preliminary Construction Environmental Management Plan (CEMP) Fig 3.1 identifies a temporary concrete batching plant being located approximately 300 metres southwest from Lot 101, which contains Scott River Ironstone TEC vegetation. There is potential for dust impacts on DBCA-managed lands and TEC vegetation from the prevailing wind direction. b. The proposed construction laydown area and communications tower appear to be located in close proximity to the access gate/track for Lot 101. c. The entirety of the Development Area and surroundings are identified as a Dieback Vulnerable Zone. In terms of specific occurrences of dieback, the intersection of Brockman Highway and Sues Road and the northern side of Brockman Highway was assessed as infested in 2001 and 2008. The vegetation to the south and east of the intersection of Brockman Highway and Dennis Road was assessed as dieback infested in 2008 and 2009, respectively, potentially including the road verge vegetation. In addition, Lot 101 and R42377, were assessed as dieback infested in 2009/2010. d. Priority Protection Areas (**PPA**) are the highest Phytophthora dieback disease priority management areas within the State. The focus of PPAs is to reduce the risk of Phytophthora dieback spread. In the development area, there are two Priority Protection Areas – an uninfested high value hotspot in the southeast corner of Lot 1 and eastern portion of Lot 4154 and an infested high value hotspot in the southwest corner of the site, extending over around a quarter of Lot 4260. The section within the infested high value hotspot PPA along Scott River Road / Governor Broome Road is actively managed to reduce impacts. PPA on-ground management measures include fencing, road improvements, drainage control and phosphite treatments. e. Attachment 4 (RSD) - Appendix H Preliminary Construction Environmental Management Plan (SynergyRED September 2025) indicates that a Dieback Management Plan will be developed and will be informed by a Phytophthora dieback survey completed prior to construction. The Dieback Management Plan will need to include appropriate prevention and mitigation measures such as ensuring that vehicles and machinery are cleaned when arriving and leaving the development area, with information provided on how and where vehicles machinery and equipment will be cleaned of soil (e.g. wash down bays). f. DBCA is aware that Governor Broome Road can be subject to seasonal saturation causing road deterioration and summer dust. The current proposal will increase existing truck movements, and the adjoining TEC vegetation and flora species may be subject to increased Phytophthora dieback spread impacts, vehicles straying off-road to avoid road damage, and dust coverage. Existing fencing along Governor Broome Road, installed to protect TEC vegetation and threatened flora from cattle movement between sites at this location, has an increased damage risk from stock and vehicles during the construction period. **Advice**	Noted. See response to related advice below.

1. Recommend further modelling be undertaken to identify and address potential dust impacts from the proposed temporary concrete batching plant on DBCA-managed lands and TEC occurrences.	The current location of the concrete batching plant is over 200m from the nearest DBCA managed land. Dust emissions from the concrete batching plant are expected to be minimal, localised and temporary. SynergyRED commits to relocating the concrete batching plant at least 500 m from DBCA managed land, TEC and wetland habitat during detailed design.
2. The proposed construction laydown area and communication tower be relocated further to the south so that DBCA access to Lot 101 is not restricted.	SynergyRED notes that whilst it might appear, based on the scale of the map, that the proposed communication tower and construction laydown area intersect Lot 101, this infrastructure will be located outside of this property. Only a small portion of the overhead transmission line and an access track intersect Lot 101. SynergyRED has undertaken preliminary consultation with both DPLH and DBCA regarding the Proposal's partial intersection with R 42377 & Lot 101 and will seek the appropriate approvals for access to reserves following receipt of primary approvals and detailed design. The Proposal will be developed to limit imposition on DBCA's land management activities.
3. Recommend that the proposed Dieback Management Plan (**DMP**) be produced in consultation with DBCA and be a condition of any development approval, to be completed prior to the commencement of works.	SynergyRED will consult DBCA on the DMP as appropriate when seeking approvals for access to reserves following receipt of primary approvals and detailed design, and during relevant Section 40/45 Authorisation processes under the BC Act. SynergyRED proposes a condition as follows: • Prior to any ground disturbing activities, a Dieback Management Plan must be prepared to the satisfaction of the Local Government, on advice from the Department of Biodiversity, Conservation and Attractions (DBCA).
4. Recommend water sources used for dust mitigation measures be clean or treated to minimise the risk of moving/spreading pathogens and impacting upon native vegetation.	Noted. SynergyRED will consult DBCA on the DMP as appropriate when seeking approvals for access to reserves following receipt of primary approvals and detailed design, and during relevant Section 40/45 Authorisation processes under the BC Act.
5. Recommend the proponent consider suitable traffic management measures during construction to ensure fencing along Governor Broome Road is not damaged. 6. Recommend that any mulch or topsoil stockpiles, or hydrocarbon/hazardous material stores, are not located upslope and/or within 100m of DBCA-managed lands and TEC occurrences. 7. Recommend all cleared vegetation be mulched and disposed offsite every day to minimise fauna utilising/moving into the cleared vegetation. If spoil is stockpiled and not mulched or disposed offsite within this timeframe, stockpiles should be checked for fauna before they are mulched or removed from the site. 8. CEMP Table 6.7 Terrestrial Fauna Management refers to incidents where loss or injury of native fauna occurs. Regional Wildlife Officers at DBCA's Southwest Region should be notified within 24 hours of any incident occurring.	Noted. The CEMP and/or DMP will be updated to consider and address the following: 1. Protection of fencing around DBCA managed land. 2. Management of mulch/topsoil stockpiles 3. Hydrocarbon storage. 4. Notification of DBCA Southwest Regions Regional Wildlife Officers in the event of loss or injury of native fauna Note: Infrastructure which may be a source of contamination (e.g. substation and switchyard, operations and maintenance building and workshop, and refuelling locations) will be located at least 100 m from wetland habitat, TEC and DBCA managed land. SynergyRED is committed to relocating the concrete batching plant at least 500 m from DBCA managed land, TEC and wetland habitat during detailed design.

2.6 Department of Health (DoH)

SUMMARY OF SUBMISSION	RESPONSE
DoH position: No objection – with comments and/or recommended conditions and advice notes provided below. **1. Site servicing** The DoH advises that the treatment and disposal of wastewater generated on site, either temporarily or permanently, is required to comply with the *Health (Treatment of Sewage and Disposal of Effluent and Liquid Waste) Regulations 1974* and the Government Sewerage Policy 2019 requirements. A site-specific Site and Soil Evaluation (SSE) should be undertaken by a qualified consultant during the wettest seasonal time of the year (mid-July/August) as per AS/NZS 1547:2012, to ensure the land application area for each wastewater treatment system is appropriately sized and located.	SynergyRED acknowledges that reticulated water and sewerage are not available at the site, and that water will be trucked to the site to service potable and non-potable water requirements. SynergyRED proposes the following conditions: • Prior to the installation of any inground domestic wastewater systems, a site and soil evaluation report is to be prepared that takes account of the principles of the Government Sewerage Policy (WAPC 2019). • The Proponent is to ensure suitable potable water supply and effluent disposal facilities / infrastructure are designed, installed and maintained for the life of the development in accordance with the Local Government's requirements, upon advice of the Department of Health as necessary.
2. Health and amenity	
Mosquitoes The subject land is in a region that occasionally experiences problems with nuisance and disease carrying mosquitoes. These mosquitoes are known carriers of Ross River (RRV) and Barmah Forest (BFV) viruses. Human cases of RRV and BFV diseases have been reported in this region. Future development should avoid the creation of additional mosquito breeding habitats. The DoH recommends that the proponent ensures the proposed site works and infrastructure do not create additional mosquito breeding habitat as follows: • Changes to topography resulting from earthworks must prevent run-off from creating surface ponding as it may become mosquito breeding habitat. • Water tanks and other water-holding containers must be sealed or screened to prevent mosquito access and breeding. On-site infrastructure and constructed water bodies must be located, designed and maintained so they do not create or contribute to mosquito breeding.	Management of mosquito risk will be addressed in the CEMP.
Approvals An Application to Construct or Install an Apparatus for the Treatment of Sewage for each onsite wastewater treatment system, temporary or otherwise, will be required to be submitted to the Shire of Augusta Margaret River. All drinking water provided on site must meet the health-related requirements of the *Australian Drinking Water Guidelines 2011*.	SynergyRED accepts the advice notes as proposed.
Temporary concrete batching plant Concrete batching facilities may impact human health due to contaminant types such as lime, calcium hydroxide, alkalis, hydrocarbons, asbestos and metals (nickel, zinc). Concrete batching plants are also considered a potentially contaminating land use as described in the Department of Water and Environmental Regulation's *Assessment and management of contaminated sites* (DWER, Nov 2021). The DoH considers it appropriate that these matters are addressed through the development application, including considerations to protect public health and to avoid the creation of a new contaminated site. The DoH recommends that the applicant provide details of effective management of the proposed temporary concrete batching plant, including contingency measures and actions in the event of facility malfunctions or spills.	The temporary concrete batching plant will be operated in accordance with standard guidelines and licensing.
Noise	

SUMMARY OF SUBMISSION	RESPONSE
The DoH is unable to provide noise-related comments as noise falls outside of the DoH's regulatory area. Please refer the request to the Department of Water and Environmental Regulation noise branch for advice concerning noise impacts and comment on the proposed wind farm application: Noise regulation | Western Australian Government.	See Department of Water and Environmental Regulation (DWER) Section 2.2 Response
Contaminated sites There is a large area adjacent to the western boundary of the site comprising a series of linear ponds and wetlands known as the former Beenup Titanium Minerals Mine. The site was reported (DMO25933/25934) under the *Contaminated Sites Act 2003* based on the presence of groundwater contamination derived from deposits of mineral processing wastes and disturbance of acid sulfate soils, and elevated radiation derived from the titanium mineral processing waste deposited on site. The mine operations were rehabilitated to wetlands in 2004 and a radiation survey conducted at the time concluded that the site was suitable as a wetland reserve but not for any other sensitive land uses. The proponent may wish to discuss this with the Radiological Council of Western Australia.	Noted.

2.7 Department of Fire and Emergency Services (DFES)

SUMMARY OF SUBMISSION	RESPONSE
I refer to your email dated 19 November 2025 regarding the submission of a Bushfire Management Plan (BMP) (Revision 1.0), prepared by Linfire and dated 27 March 2025, for the above proposed development. The BMP is accompanied by a Bushfire Risk Management Plan (BRMP) (Revision 0) from the proponent dated 27 March 2025 in relation to the proposal. This advice relates to the State Planning Policy 3.7 Bushfire (SPP 3.7) and supporting Planning for Bushfire Guidelines (Guidelines), as well as DFES' role and responsibilities as Hazard Management Agency (HMA) for Fire in Western Australia.	Noted.
General Comments	
DFES acknowledges that the development site consists of multiple owners of land primarily used for agricultural purposes. The proposed development includes the installation of 20 wind turbines and associated infrastructure, including a substation and operations and maintenance building/office.	Noted.
Specific requirements of SPP 3.7 and the Guidelines are to be further addressed in the BMP as outlined in the below assessment Tables 1 and 2.	Noted, refer comments below. Other than addition of correct Class B Woodland photos to the **Appendix E**: Bushfire Risk Management Plan (BRMP), no other amendments to the BRMP and **Appendix F**: Bushfire Management Plan (BMP) are considered necessary.
DFES notes that the current version of SPP 3.7 and the Guidelines no longer makes reference to 'high risk land use'. The decision maker has referred this proposal to DFES as a discretionary referral. DFES considers that SPP 3.7 and the Guidelines do not adequately address high risk land use such as renewable energy facilities. Given the temperature sensitive nature of the infrastructure, it is critical to ensure that the proposed design adequately responds to facility fire risks and bushfire.	Noted and agreed regarding application of SPP 3.7 and the WA Guidelines, removal of 'high-risk land use', and lack of guidance for renewable energy facilities. The statement regarding 'temperature sensitive infrastructure' appears out of place and suggest it may be related to BESS infrastructure which is not included in this Proposal. Notwithstanding, SynergyRED does concur that the proposal needs to respond to facility fire and bushfire risks to protect life, property and infrastructure, despite the lack of a statutory trigger to do so and noting the Draft Code and Draft LPP23 recommend preparation of a BMP. In this regard, the Draft Code identifies a proposed performance outcome of BAL-29 for WTG in bushfire prone areas. The BMP and BRMP commit to non-vegetated zones (**NVZ**) and Asset Protection Zones (**APZ**) to achieve BAL-29 or lower at the WTG tower casing.
Accordingly, DFES has also assessed the proposal against the CFA Design Guidelines and Model Requirements – Renewable Energy Facilities as amended (REF Guidelines) which is currently considered best practice for the development of renewable energy facilities.	SynergyRED has voluntarily adopted the Country Fire Authority (**CFA**) Guidelines in the bushfire risk assessment and management of the Proposal (see Section 1.3 in BMP and Section 1.3 in BRMP). Some CFA Guideline requirements have been rationalised for a Western Australian (**WA**) context, such as technical specifications for private driveways, firewater tanks, where consistency with standard WA expectations were considered appropriate, rather than introducing Victorian specifications. These rationalisations were explained in meetings with the Department of Fire and Emergency Services (**DFES**) Land Use Planning Branch, Built Environment Branch and the Lower South West Regional Office in 2024 with no concerns raised.
Specific requirements of SPP 3.7 and the supporting Guidelines and the REF Guidelines are to be further addressed in the BMP and BRMP as outlined in the below assessment. The assessment comments relating to the REF Guidelines have been incorporated into the below overall assessment comments for the respective	Noted and addressed in detail below.

issue/element.	
Recommendation: Compliance with acceptable solutions not demonstrated – modifications required	
DFES advises that the BMP has not demonstrated that the proposed development complies with the Element 2: Siting and Design requirements of SPP 3.7 and the Guidelines.	There is no non-compliance with Element 2 (from SPP 3.7 and WA Guidelines), as this only applies to the proposed habitable building. The DFES comment relates to the WTG, which are not subject to Element 2. Further comment on WTG siting is addressed in detail below and in the BMP and BRMP.
Further information should also be submitted to demonstrate compliance with the Victorian Country Fire Authority REF Guidelines, considered best practice for the development of renewable energy facilities.	Table 2 (Section 4.0) of the BRMP addresses the CFA guidelines and how the proposal complies. Notwithstanding this, the CFA Guidelines are voluntary only in WA, but have been used as guidance to demonstrate appropriate management of bushfire risk to and from the renewable energy infrastructure in the absence of formal guidance in WA.
DFES recommends the BMP and BRMP be modified as per the Assessment advice provided in Tables 1-3 to ensure it is accurate and the bushfire risk management/mitigation measures are effective and can be implemented in perpetuity to manage/mitigate the bushfire risk to people, property and infrastructure to an acceptable level and appropriate to the land use and location. The required modifications are listed in the table(s) below. Should the modified BMP and BRMP affect the design of the proposal, the proposal should be amended to reflect these modifications.	See sections below for response.
DFES recommends that due consideration be given to the below assessment of the extreme bushfire hazard level and unacceptable risk (see Tables 1 – 3) [copied below].	See sections below for response.

Table 1: Policy Measure 7.1 ii. c. Compliant Preparation of a BAL Contour Map	
Vegetation Classification or Exclusions - Classified Plot 6 – not demonstrated • Vegetation Plot 6 cannot be substantiated as Class B Woodland with the limited information and photographic evidence provided. Photograph IDs 6a-c do not represent Class B Woodland. The foliage cover appears to exceed 30% and most of the Plots are contiguous with Class A Forest. • The BMP should detail specifically how the Class B Woodland classification was derived as opposed to Class A Forest. • If unsubstantiated, the vegetation classification should be revised to consider the vegetation as per AS 3959, or the resultant BAL ratings may be inaccurate. • Evidence is required to support the vegetation classification of Plots 19-20 and the exclusion of Plot 21. • No photographic evidence has been provided for these plot areas. • The BMP should detail specifically how the relevant classification and exclusion are derived. • It is noted that these areas are unlikely to affect the BAL rating due to the separation distance, however for accuracy the BAL assessment should reflect conditions on site. <u>Action</u> BAL Rating cannot be validated. Further evidence to support the vegetation classification of Plot 6 as Class B Woodland is required.	An updated BRMP has been provided with correct photos in BRMP. • The BMP (for habitable buildings) doesn't detail Class B woodland, it is only in the BRMP (for renewables) • Acknowledge the photos are incorrect and are replications of forest vegetation • The following photos (in BRMP) are correct for the woodland vegetation • Woodland vegetation classification occurred where there was little to no understorey fuel loads • This does not impact actual bushfire measures as woodland is treated same as forest for WTG  Plate 1: Correct Woodland Photos
Table 2: Policy Measure 7.1 ii. e. Compliance with the Bushfire Protection Criteria 7: Development – Commercial and Industrial	
<u>Siting and Design - A2.1a – not demonstrated</u> The BAL ratings cannot be validated for the reason(s) outlined in Table 1. There are two turbines located in a high-risk environment within a timber plantation, the timeline for harvesting is unknown. Should the plantation land use continue it is suggested from a HMA perspective that these turbines be located to a lower risk environment on the site.	No amendment to BMP required. The correct Class B Woodland classification has been included and turbine siting must balance multiple constraints, including circumstances where High-Risk locations are unavoidable and wider APZs are required in accordance with CFA Guidelines, the Draft Code.

Furthermore, although SPP 3.7 does not require commercial or industrial land uses achieve anything less than BAL-29 for habitable buildings, evidence is required that the proposal meets the separation distance requirements (whichever is greater) to ensure: a) that radiant heat from a nearby bushfire will not trigger a failure in the infrastructure (whatever the most susceptible component is); and b) that radiant heat emitted from a failure in infrastructure should be used to inform the minimum separation distance required (i.e. radiant heat level that the weakest component can withstand) and provided to demonstrate compliance. Sufficient evidence in the form of technical specifications and/or standards should be provided. Action BAL Rating cannot be validated. Modification to the BMP is required to address the Assessment advice.	An APZ extending to the turbine blade envelope will be implemented as documented in the BMP (Section 5.1.2) and BRMP (Section 3.1.1) for High-Risk turbines. Furthermore, turbines within existing timber plantations have been conservatively rated, with the expectation that plantation clearing will reduce the risk. As discussed in Table 2 and Section 3.1.1 of the BRMP, compliance with recommended BAL outcomes is achieved through the NVZ/APZ , which demonstrate BAL-29 or lower (and in some cases BAL-19 or BAL-12.5), supported by non-combustible turbine tower construction. This meets or exceeds the Draft Code. It is noted that WTGs are not habitable buildings, so the requirements of SPP3.7 do not apply. As detailed in Table 2 and Section 3 of the BRMP, comprehensive turbine-fire prevention and response measures are incorporated, including operational status monitoring, fault detection, fire detection and alarm systems, automatic nacelle suppression, establishment of NVZ/APZ, and onsite emergency response capability to reduce the likelihood of uncontrolled turbine fire. See **Appendix E and F** for updated BMP and BRMP.
<u>Vehicular Access</u> – A3.1 – demonstrated The BMP has demonstrated compliance with the driveway and turning circle requirements of the Guidelines. REF Guidelines The REF Guidelines requires a larger turning circle or T-head to allow for the turning of fire appliance. It is recommended that consideration is given to these Guidelines, in consultation with the local brigades and units, to determine the minimum driveway compliance requirements. **Action** Compliance with vehicular access requirements of the REF Guidelines not demonstrated. Modification to the BRMP is required to address the Assessment advice.	No amendment to BMP or BRMP is required to address this comment. • While the CFA Guidelines have been used to provide design guidance for the WTG (noting no other detailed design guidance currently exists), it is noted that this has been rationalised for a WA context (see Sections 1.3 of BMP and 1.3 of BRMP) • In the case of vehicular access, rather than adopt Victorian technical specifications, SynergyRED has retained the WA private driveway specifications, other than a longer separation distance between passing bays (from 200 m to 600 m). This is detailed in Section 3.1.2 and Table 2 of the BRMP, and Section 5.2.2 of the BMP • This approach to use WA private driveway standards is considered to be more appropriate to ensure continuity with the expectations in WA, rather than introduce Victorian standards which might not be applicable to WA • This approach was raised with DFES in meetings in 2024 and no concerns were raised.
<u>Water Supply</u> A4.1 - demonstrated The BMP has demonstrated compliance with Element 4: Water Supply of the Guidelines. REF Guidelines The REF Guidelines require a 45,000L water tank at each site entrance and there are four site entrances listed in the vehicle access compliance statement. However, only three water tanks for firefighting purposes are shown on Figures 8 and 9 and they are located throughout the site at various driveway intersections. Action Compliance with firefighting Water Supply requirements of the REF Guidelines not demonstrated. Modification to the BRMP is required to address the Assessment advice	An updated BRMP and BMP have been provided in **Appendix E** and **Appendix F** respectively to address additional water tank requirements. • The water tanks were located away from entrances based on recommendations made by the Community Emergency Services Manager (**CESM**) regarding water theft in the area – see Table 2 in BRMP. • The BRMP and BMP have been updated to include 4 x 45kL water tanks (180kL total WTG firewater) with the additional tank proposed south of Governor Broome road as depicted below (see yellow tank symbol).

	 Plate 2: Additional 45kL firewater tank (incorporated into amended BMP and BRMP) • Also mentioned in Section 5.3.2 of BMP (and in BRMP) is that final locations are flexible to relocation (or amalgamation) based on consultation with DFES, CESM, local brigades.
Table 3: Policy Measure 7.1 iv. and Section 9.4.2 of the Guidelines: DFES Role as Hazard Management Agency (HMA) DFES wishes to provide the below additional advice in its role and responsibilities of HMA for Fire in Western Australia	
Emergency Management Plan (EMP) Given the high-risk land use at this location, it is considered appropriate that an 'Emergency Management Plan' be prepared. Consideration should be given to the Bushfire Emergency Plan (BEP) Manual (as published by the Western Australian Planning Commission), Section 7 of the REF Guidelines and the comments from DFES Aviation Services below. These contain details of information that should be included in a EMP and will ensure the appropriate content is detailed when finalising the EMP to the satisfaction of the decision maker. Action Comment Only	No amendment to BMP or BRMP is required to address this comment. • While the proposed development is not a 'vulnerable' land use as defined by SPP 3.7, and there is no statutory requirement to produce a Bushfire Emergency Plan (BEP), it is agreed that there does need to be bushfire emergency management procedures in place for a bushfire emergency. • Significant bushfire emergency management guidance has been provided in the BMP as follows: ▪ Development of an Emergency Information Book and Signage – see Section 5.6 ▪ Strong liaison with DFES – see Section 5.7 ▪ Incorporation of bushfire emergency management measures into the overarching Emergency Management Plan for the facility (i.e. for all hazards) – see Section 5.8 and Appendix 7. It is expected that development of an Emergency Response Plan and an updated Bushfire Management Plan prior to operations will be conditions of Development Approval, with the following proposed conditions - • Prior to operations commencing, an Emergency Response Plan shall be developed in consultation with the Local Government. The Emergency Response Plan shall be implemented at all times during the operational phase to the satisfaction of the Local Government. • Prior to operations commencing, an updated Bushfire Management Plan shall be submitted to the Local Government for approval. Once approved, the Bushfire Management Plan shall be implemented at all times during the operational phase, to the satisfaction of the Local Government upon advice from the Department of Fire and Emergency Services.

Consultation
 	
In the event that an approval is granted, the DFES District Officer responsible for this region and the local fire and emergency services should be consulted during the development, construction, and leading up to the commissioning of the facility.
It is considered critical for the local fire and emergency services to understand the hazards present in the facility and the measures required to ensure the safety of firefighting personnel when working in or around different parts of the facility.
This may impact on how crews respond to a fire within the facility, which may in turn have ramification regarding the optimal number and location of water supplies.
 	
Action
Comment Only
	• It is agreed that a strong connection should exist between the wind farm operator and local fire and emergency services
	• Consultation was undertaken with DFES, CESM and volunteer fire brigades prior to submission of the Development Application and development of the BMP and BRMP.
	• The BMP details the following liaison with DFES that is expected as part of the project, including
	  ○ Prior to commissioning – see Sections 5.4 and 5.7
	  ○ As part of Emergency Information Book development – see Section 5.6
	  ○ Ongoing during operation – see Sections 5.5 and 5.7.

DFES Other Technical Advice	
DFES Regional and Special Operations DFES Land Use Planning have referred the Scott River wind farm proposal to both the Lower South West regional and special operations branches. Due to operational priorities no comment has been received to date. Should any comment be provided within the near future it will be provided to the Shire. **Action** Comment Only	Comment noted. SynergyRED met with a representative of the DFES Lower South West Regional Office in November 2024 to discuss the Proposal.

DFES Aviation Services
 	
Aviation Services provide the following comments:
• No wind turbines to be located within 300 metres of one another.
• Wind turbines will be provided with automatic shut-down and the ability to be completely disconnected from the power supply in the event of fire.
• All weather monitoring stations to be notified to the Civil Aviation Safety Authority.
• All guy-wires to be clearly marked.
 	
Action
Turbine locations to be provided to DFES Aviation Services.
	No amendment to BMP or BRMP is required to address this comment.
	
	• The requirements raised by DFES Aviation Services are addressed as follows in the BMP:
	  ○ WTG spacing –Section 5.1.2
	  ○ Auto shut-down and disconnection from power –Section 5.4.1.3
	  ○ Weather monitoring stations –Section 5.4.1.4
	  ○ Guy wires –Section 5.4.1.4
	• SynergyRED will provide the final WTG locations to DFES prior to construction, in addition to Airservices Australia. SynergyRED has no objections to this being included as an advice note in the Development Approval and proposes the following –
	• Once WTG locations and parameters have been finalised and at least one (1) month before construction commencing, the Proponent will submit the details of all WTGs to Airservices Australia via the Vertical Obstacle Data Form and to DFES.
	• On the completion of works, the Vertical Obstacle Data Form should be resubmitted to Airservices Australia and DFES with the surveyed height and location of each installed WTG and wind monitoring mast.

DFES Land Use Planning It is the responsibility of the proponent to ensure the proposal complies with relevant planning and building requirements. This advice does not exempt the applicant/proponent from obtaining approvals that apply to the proposal including planning, building, environmental health or any other approvals required by a relevant authority under written laws. **Action** Comment Only	Noted.

2.8 Department of Energy and Economic Diversification (DEED)

SUMMARY OF SUBMISSION	RESPONSE
Officers from the Energy Policy WA and PoweringWA groups have previously met with representatives from Synergy to discuss SynergyRED's (the Applicant) proposal. The Department notes SynergyRED has a successful track record of developing renewable projects in the South West Interconnected System (SWIS), including joint venture projects like the Mumbida Wind Farm and the Warradarge Wind Farm. **Electricity Demand** The State Government has committed to the retirement of state-owned coal fired power stations by 2030, with the Collie Power Station due to retire in 2027 and the remaining Muja Power Station units in 2029. The Australian Energy Market Operator's (AEMO) 2025 *Wholesale Electricity Market (WEM) Electricity Statement of Opportunities* highlights a need for new generation capacity in the SWIS from 2027 onwards. This is due to the planned retirement of these facilities, plus growth in peak demand and overall electricity consumption. The Clean Energy Link – North transmission project, due for completion at the end of 2027, will enable the connection of new generation and storage projects between Three Springs and the Perth metropolitan area. This transmission infrastructure will support a range of energy sources, including wind and solar projects, with connections enabled from 2028 onwards. In advance of completion of this transmission program of works, and noting growing demand, the Department is supportive of renewable energy projects connecting to the existing Western Power network and making use of any available capacity. Additionally, whole-of-system modelling indicates that wind generation assets should be developed across the SWIS to access diverse wind profiles over the day and year to maximise the availability of renewable generation at any one time. Excess renewable power also fills the growing fleet of Battery Energy Storage System facilities across the SWIS, providing a lower cost and lower emissions energy source to 'firm' intermittent renewable energy generation. **Connection to the SWIS** Connection to Western Power's transmission network and confirmation of project financing are essential to the viability of the proposed wind farm in Scott River. The Department notes the applicant; proposes to connect up to 100 megawatts of wind generation capacity to the Beenup to Manjimup 132 kilovolt transmission line via a 4.3 kilometre connection asset, and has been engaging with Western Power regarding the connection of their project to the SWIS via fortnightly meetings since February 2025. The Department notes the progress being made towards a connection agreement and that ongoing work is required to connect the project to the SWIS, including approvals, confirmation of project financing and available network capacity, and construction of the connection asset. **Stakeholder Engagement and Community Benefits** The State Government expects renewable energy proponents to follow best practice when engaging with landowners, stakeholders and the communities in which they intend to operate. The Department notes SynergyRED has undertaken the first steps in obtaining social licence for their project through: engagement across the community since 2024, including community drop-in sessions, monthly updates in the local newsletter, letter drops and targeted advertising; performing a Social Values Assessment to inform the development of their project; and committing to provide $100,000 per annum towards a Community Benefits Fund, the allocation of which will be informed by the development of a Community Benefit Fund Implementation Plan in consultation with the Shire of Augusta Margaret River (the Shire) and the community. The Department notes the Applicant's proposed community benefits contribution is in line with the recommended amount outlined in the PoweringWA *Draft Guideline on Community Benefits for Renewable Energy Projects*. The Draft Guideline is subject to finalisation. As such, SynergyRED should continue to work	Noted and agreed.

SUMMARY OF SUBMISSION	RESPONSE
with the Shire and local community to ensure funds may be allocated in a way that meets the long-term needs of the community and is consistent with the final Guideline once published. The Department does not have a formal role in approvals required to deliver the Project, and encourages SynergyRED to continue to engage relevant agencies, including Western Power and AEMO, to understand its complete approval pathways from development through to energisation. The Department also encourages the applicant to continue to undertake on-going engagement regarding the development, prioritising transparency and collaboration with the Shire and local community.	

2.9 Western Power

SUMMARY OF SUBMISSION	RESPONSE
I refer to the Development Assessment Panel development application - Shire of August Margaret River for SynergyRED Scott River Wind Farm. The applicant's report states that the *"Feasibility assessment Area"* (subject area) and the *"latest draft development boundary…is subject to change as the feasibility assessment progresses"*. Western Power recommend that a Detailed Design and Construction Phase plan as agreed with Western Power be provided by the proponent/applicant.	Noted and agreed. Western Power will receive the requested documentation as part of the Western Power network connection process that SynergyRED is currently progressing. It is unnecessary and inappropriate to duplicate Western Power's existing approvals as part of the Development Approval process.
Noting the existing and potential Western Power assets relevant to the proposal, Western Power's internal customer connection team in respect to the proposed development advise that the customer/proponent has been progressing the development with Western Power. However, prior to commencement of works, the proponent shall ensure that the connection and stages, location, design, access and ongoing maintenance and operations of assets is supported and agreed with Western Power.	Noted. This matter is adequately covered by the existing Western Power network connection process.
Western Power recommends the following standard Advice Notes prior to development or subdivision on the subject site, pursuant to Section 167 of the *Planning and Development Act 2005*: *Advice Notes* (i) The development shall be designed and constructed to protect Western Power infrastructure and interests from potential land use conflict. (ii) No development (including drainage, fill, fencing, storage or parking) will be permitted within Western Power line and cable easements or restriction zones without the prior written approval of Western Power. (iii) The applicant should formally progress the Western Power network connection and substation arrangements with Western Power. (iv) Arrangements being made to the specifications of Western Power for the provision of necessary electricity easements as and where required.	SynergyRED has no objection to Advice Notes (i), (ii) or (iv). In relation to Advice Note (iii),SynergyRED is already in discussion with Western Power regarding the connection and substation arrangements.

2.10 Main Roads WA (MRWA)

SUMMARY OF SUBMISSION	RESPONSE
I refer to your email of 19 November 2025 and advise that Main Roads has no objections in principle to the proposed development, subject to further engagement being undertaken with Main Roads regarding the intersection construction required to facilitate the movement of components from the Bunbury Port to site.	Noted and agreed.

2.11 CASA

SUMMARY OF SUBMISSION	RESPONSE
CASA has reviewed the Aviation Impact Assessment (AIA) prepared by Aviation Projects dated April 2025 for the Scott River (Beenup) Wind Farm project located in the Shire of Augusta Margaret River Local Government Area in Western Australia. CASA notes the following information contained in the AIA: • This wind farm development compromises 20 wind turbine generators (WTGs), which are up to 250 m Above Ground Level (AGL). • The wind farm is located outside of Busselton Airport's OLS.	Noted.
• The wind farm will affect the minimum sector altitude and GNSS arrival instrument procedures at Busselton aerodrome. Please consult with the aerodrome and aviation operators to ensure that they accept the proposed changes. We need confirmation from the aerodrome operator before we will make any changes (Airservices Australia - 25 February 2025).	Noted and agreed. SynergyRED will consult with Busselton aerodrome and aviation operators regarding the proposed changes to airspace procedures and advise Airservices Australia.
• There are 2 uncertified aerodromes identified within 3 nm: o Unknown Aerodrome 1. The proposed wind farm would be considered potentially hazardous obstacles. When the wind blows from the north, downstream wake turbulence from the closer WTGs will extend into the aerodrome's right side of the circuit area. Further consultation with the owner/operator of this aerodrome would be beneficial in understanding the potential extent of these impacts. o Boley Aerodrome. The proposed wind farm would be considered potentially hazardous obstacles. When the wind blows from east, downstream wake turbulence from the closer WTGs will extend into the aerodrome's right side of the circuit area. Further consultation with the owner/operator of this aerodrome would be beneficial to understand the potential extent of these impacts.	Noted and agreed. SynergyRED will continue to consult with the owners / operators of these uncertified aerodromes; and commits to updating the AIA once the exact WTG locations are confirmed to incorporate any additional constraints or requirements identified through the consultation.
CASA notes from the Airservices Australia response that it concluded that … *The proposed activity will penetrate the current Airservices-designed airspace procedures and/or impact CNS facilities or ATC operations at Busselton aerodrome*. Busselton aerodrome (YBLN) is a certified aerodrome which must operate in accordance with the requirements of *Part 139 (Aerodromes) - Manual of Standards 2020*. Therefore, until such time that the impacts at Busselton Aerodrome are resolved and published, CASA advises that the proposed Scott River (Beenup) Wind Farm as presented, would have an unacceptable effect on the safety of existing and future air transport operations at Busselton Aerodrome. Further, CASA agrees with the AIA that communication with the 2 uncertified aerodromes owners/operators is required regarding the potential impacts associated with the planned 250 m high WTGs.	SynergyRED is aware of the issue raised by CASA and has already initiated a redesign quote from Airservices' Instrument Flight Procedures Design Team to address the impacts on Busselton aerodrome. The impacts are manageable and will be fully resolved prior to construction commencing, once the final coordinates and height of each WTG have been confirmed. Separately, see response above regarding ongoing consultation with the owners/operators of the two uncertified aerodromes.
CASA's assessment was conducted in accordance with the *National Airports Safeguarding Framework (Guideline D)* as developed by the Department of Infrastructure, Transport, Regional Development,	Noted.

SUMMARY OF SUBMISSION	RESPONSE
Communications and the Arts, and as developed to provide planning advice to State and Local Planning Authorities to aid in safeguarding Australian airports from incompatible development.	
Post the above being resolved and published, with regards to Visual Flight Rules (VFR) operations, pilots are permitted to fly as low as 500 ft AGL. The WTGs will reach up to a height of approximately 820 ft (or 250 m) AGL, and therefore the turbine blades will infringe navigable airspace by 320 ft. Therefore, CASA would recommend the proponent install obstacle lighting on the WTGs due to the height of these structures. To limit any potential visual impact on the community, CASA would also recommend consideration of a radar-activated type system of steady red low intensity (200 cd) aviation hazard lighting or contacting obstacle lighting suppliers and discussing whether a cowling system, much like a typical "lampshade", could be incorporated into the lighting system that could result in little or no downward light spill without impacting aviation safety.	As the Proposal site is located outside the horizontal extent of Obstacle Limitation Surfaces **(OLS)** of any certified aerodrome, CASA may recommend, but not mandate, obstacle lighting on tall structures. The NASF (Guideline D) states that "*During the day, large wind turbines are sufficiently conspicuous due to their shape and size, provided the colour of the turbine is of a contrasting colour to the background*." On this basis, and consistent with the recommendation in the AIA prepared by Aviation Projects, daytime lighting of the WTG is not required. As recommended in the Guideline, an obstacle lighting risk assessment has been included in the AIA and concludes that lighting of the WTG at night is also not required to maintain an acceptable level of safety to aircraft. Furthermore, SynergyRED notes that: • The WTG will be reported to Airservices Australia via the Vertical Obstacle Database and will be depicted on aeronautical maps and charts. • Aircraft flying at night are required to maintain a minimum height of 1000 feet above the tallest recorded obstacle. • Lighting of WTG at night is likely to have significant visual amenity impacts (including loss of dark sky) and may lead to community complaints (e.g. from light pollution). Draft LPP23 notes that 'lighting on wind turbines where it results in visual impact is generally not supported'. Further, the Draft Code recognises the adverse impacts of obstacle lighting on 'views and landscapes', dark skies and astrotourism, and requires proponents to avoid or mitigate these. • Night lighting may also have environmental impacts as it could attract insects and in turn bats and nocturnal animals, resulting in significant cumulative impacts to these species. • Radar-activated lighting is not a proven technology. SynergyRED is aware of only one wind farm proposal in Australia where this system was used but malfunctioned (due to numerous false activations and 'auto flashing' events) and was ultimately turned off in response to community complaints.
Any wind monitoring masts associated with the development should be marked as per Section 8.110 of CASA's *Part 139 (Aerodromes) - Manual of Standards (MOS139)* with the inclusion of aviation hazard markers.	The requirements for obstacle marking in Section 8.110 of CASA's Part 139 (Aerodromes) – Manual of Standards does not apply to the proposed met masts as they are not located within the OLS of any certified aerodrome or above an aircraft movement area. SynergyRED proposes marking of the wind monitoring masts in accordance with the principles in the NASF (Guideline D) and the supporting AIA. That is, three marker balls being placed on the outside guy wires near the top of the mast, guy wires being run through orange PVC piping up to at least 2.5m Above Ground Level (**AGL**) and paint markings (in alternating contrasting bands of colour) being applied to at least the top third of the mast.
The coordinates and estimated survey heights of each WTG and wind monitoring mast must be reported to the Airservices Australia Vertical Obstacle Database (VOD) email address, once Development Approval is granted to ensure that the location of the wind farm can be mapped for the information of pilots. Changes to maps can take in excess of six months, therefore one month prior to works commencing, Airservices should be contacted via the VOD email address so that a NOTAM (Notice to Airmen) can be published by Airservices advising pilots that the construction of tall structures in the area is imminent. On the completion of works, the VOD should be advised of the surveyed height and location of each WTG and wind monitoring mast so that the wind farm details can be accurately recorded in the database.	Noted and agreed. SynergyRED will notify Airservices' Vertical Obstacle Database Team (VOD) once the final coordinates and height of each WTG have been confirmed. Airservices requires this notification at least two (2) weeks before construction commences, however SynergyRED agrees to notify the VOD team one month prior to construction commencing to reflect CASA's comments. Consistent with CASA's advice, SynergyRED will advise Airservices' VOD team of the actual surveyed height and location of each WTG and wind monitoring mast on completion of construction.

3 PUBLIC SUBMISSIONS SUMMARY

3.1 Submissions of Support (152 submissions)

No.	KEY THEME	SUMMARY OF KEY ISSUES	RESPONSE
1	**Renewable energy & climate change mitigation**	Supporters emphasised the urgent need to transition to renewable energy sources to reduce greenhouse gas emissions and address climate change.	Noted and agreed.
		Submissions noted that wind energy is a proven, low-emissions technology that contributes to long-term environmental sustainability.	
2	**Alignment with State and national policy**	Supporters stated that the Proposal aligns with State and national renewable energy policies, emissions reduction targets and broader government commitments to decarbonisation and energy transition.	Noted and agreed.
3	**Energy security & reliability**	Supporters highlighted the role of the wind farm in diversifying energy supply, improving grid resilience and contributing to reliable electricity generation, particularly as ageing fossil fuel infrastructure is retired and noting growing population and energy demand.	Noted and agreed.
4	**Economic benefits & employment**	Supporters referenced economic benefits associated with the Proposal, including job creation during construction, opportunities for local contractors and longer-term operational employment, as well as potential tourism opportunities.	Noted and agreed.
5	**Public benefit & infrastructure investment**	Supporters considered the wind farm to be essential public infrastructure that would deliver long-term benefits beyond the local area, including investment in Regional infrastructure and contribution to broader community needs.	Noted and agreed.
6	**Manageable impacts with mitigation**	Supporters noted that the layout has clearly been designed with the local environment in mind and acknowledged that the Proposal may result in environmental or amenity impacts, however considered these to be acceptable or capable of being appropriately managed through design refinement, setback distances and planning conditions.	Noted and agreed.
7	**Responsible land use & co-existence**	Supporters noted that wind farms can coexist with agricultural land uses, allowing diversification and continued farming activities while generating renewable energy.	Noted and agreed.
		Supporters noted that the Proposal in addressing climate changes supports the long-term sustainability of farming.	Noted and agreed.
8	**Intergenerational equity & future benefits**	Supporters referred to the responsibility to support infrastructure that benefits future generations, noting that failure to invest in renewable energy would result in greater long-term environmental and economic costs.	Noted and agreed.
9	**Location**	Supporters considered the wind farm to be in the right location for energy production and distribution, noting: the wind conditions, ability to utilise existing road and distribution infrastructure, largely disturbed land with minimal clearing requirements, sparsely populated.	Noted and agreed.
		Supporters noted the proposed site as a better alternative to the previously approved Milyeannup Wind Farm, with less environmental impact and better proximity to existing distribution infrastructure.	Noted and agreed.
10	**Improved bushfire response**	Supporters acknowledged the benefit of improved water supply proposed as part of the Proposal in local bushfire response.	Noted and agreed.
11	**Comprehensive nature of investigations and engagement**	Supporters acknowledged the comprehensive level of community engagement and technical work undertaken to understand and address potential impacts and concerns relating to the Proposal.	Noted and agreed.
12	**Visual Impact**	Supporters noted and accepted potential visual impacts from their property in their support of the Proposal. Others noted their visual enjoyment of wind farms or considered the visual impact to be negligible.	Noted and agreed.
13	**Power reliability & electricity prices**	Submissions encourage inclusion of battery storage to support reliability of the local power network.	Discussed in Theme 1
		Statement was made that the Proposal would improve wholesale electricity price.	Discussed in Theme 1

3.2 Submissions of Objection (369 submissions)

No. KEY THEME	SUMMARY OF KEY ISSUES	RESPONSE
1. The conceptual design of the design & lack of project certainty	The proposal is highly conceptual, with no confirmed turbine model, turbine height, final layout or infrastructure siting, limiting the ability to assess impacts accurately.	The Development Application explains that final WTG models and exact locations will be confirmed during detailed design and procurement. To ensure a robust assessment, the application has been based on a 'maximum case' scenario, representing the highest potential level of impact. All technical studies have been completed using this conservative approach, meaning the final design will deliver impacts that are equal to or less than those assessed in the Development Application.
	Uncertainty remains regarding construction and dewatering methods, foundation depths, access roads, trenching and water management, preventing informed assessment of environmental and amenity impacts.	A significant level of technical investigations has informed the Proposal's position on these matters to date and formed the basis of the environmental referrals (with no formal assessments under State and Federal frameworks being required as a result). These matters will be addressed through the detailed design phase, and in the preparation of the CEMP and detailed ASSDMP.
	Submissions objected to reliance on future studies, management plans and approvals, arguing that impacts should be assessed at application stage rather than deferred.	To the extent possible at the Development Application stage, technical investigations and preliminary Management Plans have been prepared. Once further detail is available through the detailed design and procurement phases, the CEMP, ASSDMP and its supporting technical information will be progressed and finalised for approval by relevant Agencies.
	Minimal separation distances from dwellings and property boundaries.	WTG setbacks will be 1.1 times blade tip height from dwellings and property boundaries
	Lack of certainty as to whether the Proposal will improve local power supply (reliability/consistency of supply).	The reliability and consistency of power supply in any Town depends on many factors, including the condition of transmission and distribution lines, transformers, and other parts of the distribution network. These assets are owned, managed, and maintained by Western Power, which is responsible for ensuring the reliability of electricity supply to homes and businesses. Renewable energy generated by the Proposal would be exported to the existing Western Power 132kV transmission line near Beenup substation. From here it would flow to Augusta, Scott River, Molloy Island, Alexandra Bridge, East Augusta, Karridale, Hamelin Bay, Forest Grove and the rest of the energy system.
	Concern Proposal will result in increased electricity prices.	Electricity pricing is influenced by a wide range of whole-of-system factors, rather than the cost of any single generation technology. A study by CSIRO showed that energy systems with a high proportion of renewable energy consistently deliver lower overall costs compared to systems reliant on fossil fuels. Electricity prices reflect multiple inputs, including the cost of fossil fuels such as gas and coal; the increasing operational and maintenance costs associated with ageing coal and gas assets; and the cost of new generation infrastructure, including renewables, as well as associated transmission and systems strength upgrades. CSIRO's GenCost analysis confirms that renewable technologies such as wind and solar remain the lowest cost forms of new electricity generation in Australia.
	Questions regarding the economic and environmental foundation and impacts of Renewables Facilities and achieving Net Zero, including the sustainability of the Wind Farm proposal given its short lifespan.	The transition to renewable energy in Western Australia is driven by established State Government policy, including the retirement of State-owned coal generation and the need for new, low-cost renewable generation to support the South West Interconnected System **(SWIS)**. Modern wind farms typically operate for 25–30 years. This Proposal aligns with the State's Net Zero objectives while remaining compatible with ongoing agricultural land use.
	Concern and objection to the scale and/or location of the Proposal i.e. That the proposal is too close to Augusta and Kudarup and too visible from the Towns; that the proposal is out of character with its setting and the perception in many submissions that the location is 'wilderness, unspoilt	The scale and location of the Proposal have been determined through detailed environmental, technical and land-use investigations. The site is predominantly cleared agricultural land with very limited remnant vegetation, which significantly reduces the need for clearing and avoids high value environmental areas. The overall scale of the Proposal is shaped by existing transmission

No. KEY THEME	SUMMARY OF KEY ISSUES	RESPONSE
	pristine coastline, peaceful, natural beauty' that will be adversely impacted by the Proposal.	capacity, the strong and consistent wind resource in this part of the South West, and the State's need for new renewable generation. SynergyRED acknowledges community concerns about visibility; however, visual impact is one of many factors considered alongside biodiversity, hydrology, bushfire safety, cultural heritage, and the need to avoid conservation areas. These considerations have directly influenced the layout of WTG, ensuring WTG are placed to minimise environmental and amenity impacts while still enabling a Proposal that supports Western Australia's decarbonisation and energy-transition objectives. Further work is ongoing to investigate relocating some WTGs to minimise visual impact.
	Has alternative technology been considered, i.e., design Vortex Wind Generator, safer for birdlife and are less visually intrusive. Has solar and battery been considered as an alternative.	Alternative technologies have been considered. Vortex-type wind generators are not commercially proven or scalable for utility-scale energy generation and are not suitable for a Proposal of this size. While solar was considered, the solar resource at the site is less favourable than the wind resource and large-scale solar would require extensive land coverage, displacing productive agricultural use, unlike WTG, which allows farming to continue. A battery is not included in the Proposal as there is no network requirement for storage at this location, and the Proposal has been designed to efficiently utilise the existing 132kV transmission line without additional infrastructure such as batteries. This Proposal offers a wind farm site requiring minimal native vegetation clearing. Its location benefits from strong, consistent wind resources, good road access, sparse nearby housing, and proximity to an existing underutilised substation and transmission line, reducing environmental disturbance. The design has been intentionally concentrated within degraded and previously cleared areas, limiting native vegetation clearing to no more than 1 ha.
	Proposal relies on significant government subsidies, as well as being "gifted" a parcel of Crown reserve.	The Proposal does not rely on government subsidies. The viability of the wind farm Proposal is based on its technical and commercial merits, which are being assessed through the current feasibility phase. SynergyRED has not been gifted Crown reserve, and any use of Crown land would be subject to the appropriate statutory land tenure processes following primary approvals.
	Proposal ownership.	If the Proposal is approved, it is likely to be privately funded.
	Concern regarding future expansion.	There are no plans to expand the wind farm beyond the current Proposal. The maximum capacity of up to 100 MW and up to 20 WTG represents the full feasible development potential of the site based on wind resource, land availability, environmental constraints and existing transmission capacity. No further stages or increases in WTG numbers are proposed.
2. Impacts on Biodiversity	a) Submissions raised concern that there is insufficient baseline data, seasonal surveys, groundwater modelling and analysis to confidently define worst case risks/impacts, including to Scott River Ironstone Community and wetlands.	As detailed in the RSD, comprehensive baseline environmental studies, seasonal surveys and groundwater modelling have been undertaken in accordance with relevant policy and guidance to inform a robust assessment of the potential impacts from the Proposal, including potential impacts to the Scott River Ironstone Community and wetlands. The Proposal was referred to both the EPA and DCCEEW in 2025 to determine whether it required formal environmental impact assessment under the *Environmental Protection Act 1986* (EP Act) and the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act). The referral determinations were as follows: • EPA has determined to not assess the Proposal. This outcome was decided by the EPA because the proposed environmental effects of the proposal are not so significant or unmitigated as to warrant formal assessment under Part IV of the EP Act. Further detail on the decision is available on its website: Wind Farm in Scott River | EPA Western Australia. • DCCEEW made the referral decision - Not controlled action if taken in a particular manner. This decision means that the Proposal is not likely to have a significant impact on Federally protected flora, fauna or Ecological communities and so does not require assessment by DCCEEW, provided that the Proposal is developed in accordance with the 'particular manner' specified in the decision.

No. KEY THEME	SUMMARY OF KEY ISSUES	RESPONSE
		The 'particular manner' includes a new commitment to ensure the minimum blade ground clearance is 59 metres AGL (increased from 40 metres AGL above ground level at the time of referral and submission of the Development Application), to avoid significant impacts to black cockatoos and migratory birds. Further information on the decision and the required actions is available on its website: EPBC Act Public Portal. If the Development Application is approved, detailed site investigations and further modelling will be undertaken to confirm the WTG foundation option/s to be used and to update the ASSDMP prior to construction.
	b) Submissions raised concern for threatened and endangered species including the white-bellied frog, snake-neck turtle, short-neck tortoise, ringtail possum, black swans and Baudin's and Carnaby's black cockatoos.	As detailed in the RSD, multiple surveys have been undertaken to inform potential impacts to terrestrial fauna. These surveys have been undertaken in accordance with relevant policy and guidance. . Based on the results of these surveys the Proposal has been designed to avoid impacts to terrestrial fauna where possible. A detailed assessment of the potential impacts to terrestrial fauna is provided in Section 9.6 of the RSD.. Potential impacts to conservation significant fauna including the White-bellied Frog, Western Ringtail Possum and black cockatoos, have been assessed within the RSD, and will be further minimised through the implementation of the mitigation measures outlined within the CEMP, DMP, BBAMP, BMP and BRMP and ASSDMP. The management and mitigation of impacts to conservation significant fauna, detailed in the RSD is expected to ensure other non-Threatened species observed during surveys (i.e. Snake-necked Turtle and Black Swan) are also not significantly affected by the Proposal.. For example, SynergyRED's commitment to avoid clearing of all wetland habitats. The Proposal also recently committed to minimum blade ground clearance of 59 metres above ground level (increased from 40 metres above ground level in the Development Application), to avoid significant impacts to black cockatoos and migratory birds, during DCCEEW assessment of the Proposal 's EPBC Act Referral. The Short-necked Turtle (or Western Swamp Tortoise) is only known to occur in the vicinity of Perth's Swan Valley, with unsubstantiated sightings as far south as Donnybrook and will not be affected by the Proposal.
	c) Submissions argued the proposal fails to demonstrate avoidance of protected communities and does not adequately address habitat loss, fragmentation and cumulative impacts.	The Indicative Disturbance Footprint has been designed to utilise existing cleared areas and tracks as much as practicable to reduce clearing of native vegetation/habitat. Specifically, the Proposal will avoid clearing of: • All Scott River Ironstone TEC • All wetland habitats • All potential and suitable breeding trees for black cockatoos • All High quality Western Ringtail Possum habitat Furthermore, the Proposal will clear no more than 1 ha of habitat represented by native vegetation, including the following specific habitat values: • 0.02 ha of native vegetation in Very Good or better condition • 0.5 ha of native Moderate to Low quality Western Ringtail Habitat, including a maximum of 0.03 ha of native Moderate quality Western Ringtail Possum habitat • 1 ha of native black cockatoo foraging habitat, including maximum of 0.5 ha of Moderate to High quality foraging habitat • 0.01 ha of contiguous native vegetation within 50 m of Scott River Ironstone TEC Potential impacts associated with habitat loss, fragmentation and cumulative impact have been addressed in the RSD.
	d) Submissions expressed concern that construction and turbine related noise, low-frequency sound, vibration and potential electromagnetic fields may adversely affect wildlife behaviour and	Potential disturbance to fauna from WTG movements, noise, light and vibration are described and assessed in the RSD. Overall, the Proposal is not anticipated to substantially alter the movement or behaviour of fauna species. Any potential impacts can be appropriately managed through implementation of the CEMP and BBAMP. The Proposal is not expected to impact marine wildlife, as it is an onshore wind farm located over 5 km from the coast.

No. KEY THEME	SUMMARY OF KEY ISSUES	RESPONSE
	movements, including marine animals, resulting in effective habitat loss and affecting species diversity.	Both the EPA and the DCCEEW determined that the Proposal is not likely to have a significant impact on the environment and so does not require formal assessment.
	e) Submissions expressed concern regarding the impact of installing transmission lines through forest and bushland and related noise impacts.	The proposed new 132kV transmission line that will be constructed within the development envelope to connect to the existing transmission line will not be constructed in bushland or forest areas. Clearing of native vegetation will be restricted to small areas to facilitate ingress of WTG components, minor upgrades to the existing Beenup to Manjimup 132 kV transmission line, and where an alternative layout was not possible due to the avoidance of other significant values (e.g., potential nesting trees for black cockatoos, conservation significant flora, conservation covenant areas and higher quality habitat). Less than 0.16 ha of native vegetation clearing is required in support of proposed transmission line upgrade and connection. These areas were selected to avoid potential nesting trees for black cockatoos and to avoid impacts to adjacent conservation covenant areas.
	f) Submissions raised concern about collision risk to birds and bats, particularly raptors, migratory species, coastal birds and swans.	As addressed previously, the Proposal recently committed to minimum blade ground clearance of 59 metres above ground level (increased from 40 metres above ground level in the Development Application), to avoid significant impacts to black cockatoos and migratory birds, during DCCEEW assessment of the Proposal 's EPBC Act Referral. This revised commitment will reduce the risk of WTG strike and/or barotrauma from 'Negligible to Moderate' to 'Negligible to Low' for all bird and bat species. The implementation of the adaptive management approach as detailed in the preliminary BBAMP will ensure the Proposal does not have a significant impact on any bird and bat species. Following SynergyRED's submission of the Development Application, the BBAMP has been updated in response to the request for further information from the EPA during its assessment of the Proposal's referral under the EP Act. The latest version of the BBAMP was updated to include threshold criteria (i.e., limit of acceptable impact) and contingency actions (i.e. response actions to both early impact triggers and threshold criteria being exceeded) for both conservation significant species and non-listed species.
	g) Concern regarding potential impacts to conservation estate.	SynergyRED is aware of the DBCA managed land within and neighbouring the Development Envelope and has undertaken preliminary consultation with both DPLH and DBCA regarding the Proposal's partial intersection with R 42377 & Lot 101. It will seek the appropriate approvals for access to reserves following receipt of primary approvals and detailed design. The Proposal will be developed to limit impact on DBCA's land management activities, with any direct impacts limited to the areas of cleared land within these land holdings. The current Indicative Disturbance Footprint has no direct impact and largely falls outside a 100 m buffer applied to the protected values within adjoining reserves. Furthermore, to mitigate potential impacts on DBCA managed land, SynergyRED is committed to locating: • All WTGs at least 100 m from R 42377, Lot 101 and Lot 1 (measured from the WTG centrepoint) • The concrete batching plant at least 500 m from R 42377, Lot 101 and Lot 1 • The substation, operation and maintenance area and all other temporary construction areas (e.g., laydown areas, construction site offices, topsoil/vegetation stockpiles, ASS/dewatering management infrastructure) at least 100 m from the protected values within R 42377 & Lot 101 • The transmission line and associated access track so that there is no direct impact on R 42377 & Lot 101, with consideration for ongoing asset management and protection zones. As the Proposal has been designed to avoid the placement of WTG in proximity to remnant native vegetation, no groundwater drawdown is currently predicted on protected values within R 42377 & Lot 101. The ASSDMP will be updated to specify drawdown to not exceed natural seasonal variation (i.e. will remain above natural seasonal low in watertable) at GDE's and the location of native vegetation within R 42377 and Lot 101. Other indirect impacts will be managed through the implementation of management plans, including a CEMP, detailed ASSDMP , BMP, and DMP where required.

No. KEY THEME	SUMMARY OF KEY ISSUES	RESPONSE
	h) Referral under EPBC Act is necessary not optional.	The Proposal was referred under the EPBC Act to the DCCEEW which determined that the Proposal is not likely to have a significant impact on the environment and so does not require formal assessment.

	i) Submissions queried the use of sonic bat deterrents and radar/camera technology to mitigate collision risk.	The BBAMP takes an adaptive management approach to allow for flexibility in response to:
		• Detailed design
		• Monitoring findings and/or
		• As more relevant information becomes available and experience is gained through ongoing research and monitoring, specifically with regard to:
		  ○ Relevant bird and bat species and their populations
		  ○ Effectiveness of different mitigation strategies, including the use of noise deterrents and radar/camera technology, for these species.
		This is particularly important for Australian wind farms, as the majority of published research on the effectiveness of different mitigation strategies is from overseas, and/or species specific.
		Following the submission of the DA, the BBAMP has been updated in response to a request for further information from the EPA during its assessment of the Proposal 's referral under the EP Act. The latest version can be found on the DCCEEW website, and was updated to include threshold criteria (i.e., limit of acceptable impact) and contingency actions (i.e., response actions to both early impact triggers and threshold criteria being exceeded), including use deterrents (e.g. noise, visual) or WTG curtailment. Where adaptive mitigations strategies are required, these will be selected and implemented in consultation with relevant agencies.
		The preliminary BBAMP will be updated in consultation with the Shire and other government agencies prior to commissioning.

3 Impacts **on hydrology, groundwater & dependent ecosystems**	a) Large-scale excavation, piling and trenching may alter groundwater flow paths and water table levels in a hydrologically sensitive area.	Two (2) primary WTG foundation options (above ground/partial above ground) will be utilised to minimise the depth of excavation limiting impacts to groundwater (and reducing the volume of ASS disturbed). A typical below ground foundation will only be used where it is confirmed, prior to construction, through detailed site investigation and revised modelling, that no dewatering will be required. Transmission poles and tower foundations will be concrete caisson construction and so not require dewatering. Noting the maximum depth of the primary foundation options is 1.2 mbgl and that traditional below ground foundations will only be utilised where there is no potential for interception with groundwater, the Proposal is not expected to result in groundwater mounding or flow disruption beyond levels of natural seasonal variation.
	b) Submissions raised concern for impacts on wetlands, rivers, bores, dams and groundwater-dependent vegetation.	SynergyRED will ensure that dewatering is minimised, managed and monitored in accordance with a detailed ASSDMP, to ensure that drawdown does not present an unacceptable impact on the environment, including to TEC, wetlands and other groundwater users. Attachment 4 – RSD - Impacts to surface water and/or groundwater quality resulting from ASS disturbance and management, construction dewatering, erosion and sedimentation, mobilisation of nutrients, and/or the accidental loss or spill of hazardous materials are anticipated to be minor, localised and temporary and will be managed through the implementation of the ASSDMP and CEMP.
	c) The application lacks an independent hydrogeological assessment demonstrating baseline conditions, predicted impacts and cumulative effects.	A Surface Water and Hydrogeological Assessment (was undertaken by Stantec, a highly regarded consultancy engaged on the basis of its ability to provide suitably qualified and independent expertise to undertake the assessment. This assessment was supported by 12 months of site-specific baseline water monitoring along with review of other local and more regional water quality data provided by BHP, the DWER and other desktop sources. Baseline data continues to be collected by SynergyRED in support of preparing detailed ASSDMP.

No. KEY THEME	SUMMARY OF KEY ISSUES	RESPONSE
		This assessment also included flood characterisation and modelling, characterisation of hydrogeology, drawdown modelling and a preliminary risk assessment to provide an understanding of key hydrogeological and hydrological risks associated with the Proposal. .
	d) Potential for groundwater contamination from ASS disturbance.	The potential for acidification and/or toxicity of surface water and/or groundwater during construction due to the disturbance and/or inappropriate handling of PASS and inappropriate management of dewater is addressed in the RSD.. PASS material remains benign when in a natural, undisturbed and anoxic state. Construction of the Proposal, including excavation and dewatering, has the potential to expose PASS to oxygen, which may result in impacts to surface water or groundwater quality. Typical impacts include elevated sulfate, low pH, high acidity, elevated acidity, elevated metals (particularly Iron and Aluminium) and low alkalinity in groundwater. It is noted that some areas within the Proposal already observe some of these conditions. Potential for exposure of PASS, during excavation and dewatering has been minimised through the Proposals design and can be appropriately managed through the implementation of the detailed ASSDMP and associated approvals under the RIWI Act, including the treatment of soil and dewater in accordance with DWER guidelines (2015b). As a result, while the Proposal presents a risk of minor, short term and localised surface water and/or groundwater acidification, with the above mitigation the Proposal it is not expected to result in significant impacts to surface water or groundwater quality.
4 Acid sulfate soils & irreversible environmental risk	a) The Scott River area is known to contain acid sulfate soils that may be exposed through excavation and groundwater drawdown leading to long-term contamination of the environment within and beyond the Development Envelope, including into waterways.	SynergyRED is aware of the potential for indirect impact of ASS exposure within and beyond the Development Envelope. The geotechnical and baseline contamination assessment undertaken for the Proposal included a preliminary ASS investigation of the Development Envelope, including field screening and laboratory testing. The results indicate that PASS is present within all soil types of the Development Envelope except for shallow pale grey/white sands.. Consideration of related impacts and proposed mitigation are summarised in response to Key Theme 3 above, including the use of alternative foundation options to limit depth of excavation and dewatering.
	b) Concern regarding the depth of, and volume of soil excavation (up to 7m) and lack of clarity in how ASS and dewatering will be managed.	As detailed in response to Key Theme 3, potential for exposure of PASS has been minimised through the Proposals design (e.g., alternative shallower foundation options and use of concrete caisson construction for transmission poles/towers) and can be appropriately managed through the implementation of a detailed ASSDMP and associated approvals under the RIWI Act. SynergyRED has committed to the preparation and implementation of an ASSDMP in accordance with relevant guidance to manage the potential risks to the environment during construction of the Proposal. A Preliminary ASSDMP has been prepared which details the proposed management framework, controls and monitoring measures to be included in the detailed ASSDMP to be developed following the completion of detailed site investigations and detailed design prior to construction of the Proposal. The ASSDMP will include the following key management measures: • Soils requiring management will be treated with aglime upon excavation and reinterred, reused on-site and or taken off site for disposal, with limestone pads constructed where needed to manage treated soil stockpiles. • All stockpiled material will be stored an adequate distance away from waterways and wetlands to minimise the potential for leachate/runoff entering waterbodies. • ASS material that cannot be reused (i.e. geotechnically unsuitable and cannot be used as non-structural fill) will be disposed of offsite at a licensed facility. • In areas requiring soil management and treatment, soils at the base of excavations will be covered with a thin layer of aglime as a precautionary measure to provide buffering capacity against minor releases of acidity. • Treated soil will be assessed to validate the adequacy of the lime treatment. Where soils do not meet the validation criteria, soils will be retreated and retested until the criteria are met. Application of drawdown limits (as discussed in response to Key theme 3(a).

No. KEY THEME	SUMMARY OF KEY ISSUES	RESPONSE
	c) Submissions objected to the absence of a site-specific acid sulfate soil investigation and a detailed and enforceable dewatering, monitoring and emergency response plans.	Publicly available datasets and a Preliminary Geotechnical and Baseline Contamination Assessment which included a preliminary ASS investigation have been utilised to inform an understanding of the soil landscape, composition and geology within the Development Envelope.. The Proposals impact assessment was also supported by 12 months of site-specific baseline water monitoring along with review of other local and more regional water quality data. SynergyRED has committed to the preparation and implementation of an ASSDMP in accordance with relevant guidance to manage the potential risks to the environment during construction of the Proposal. A Preliminary ASSDMP has been prepared which details the proposed management framework, controls and monitoring measures to be included in the detailed ASSDMP to be developed following the completion of detailed site investigations and detailed design prior to construction of the Proposal.
	d) Limited lime resources.	As discussed in response to Key Theme 3 and 4, the Proposal involves the use of alternative WTG foundation designs that minimise excavation depth, thereby reducing the volume of excavated soils and associated dewatering, which in turn limits the amount of PASS requiring treatment. Civil construction, specifically activities that require excavation, will be scheduled to occur during the dry season, where practicable, to reduce the likely requirement to dewater. Final lime requirements will be determined during detailed design. These quantities will be defined in the detailed ASSDMP prepared prior to construction.
	e) Concern relating to the failed Beenup Mine experience	Acid sulfate soils only present a potential risk when they are disturbed during activities such as excavation. For wind farms, this disturbance occurs only briefly during the construction phase. Open-pit mines involve ongoing excavation, making the risk of disturbing acid sulfate soils much more persistent and significant. The potential for exposure of PASS from the Proposal has been minimised through the Proposal's design. Excavations for WTGs, met mast and communication tower foundations will be open for a period of approximately 33 days each. Furthermore, excavation and associated dewatering for the installation of transmission poles will be avoided by utilising concrete caisson construction methodology. By comparison dredge mining at Beenup mine was undertaken between 1997-1999 at depths of up to 50m. It's also worth noting that at the time the Beenup mine was operational ASS was not as well understood or governed, and there are now comprehensive guidelines, informed by over a decade of practical experience, that govern the identification and investigation of acid sulfate soils and acidic landscapes, as well as the treatment and management of soil and water in acid sulfate soil landscapes.
5 Impacts on visual impact & landscape character	a) Submissions argued that the proposal does not adequately address cumulative impacts, night-time aviation lighting, or the permanent loss of dark-sky and landscape values.	SynergyRED does not propose to install night-time obstacle lighting on the WTG. This is consistent with the risk assessment in the AIA which concludes that lighting of the WTG at night is not necessary to maintain an acceptable level aviation safety. SynergyRED's position reflects CASA guidance (noting that CASA may recommend but not mandate lighting in this instance), aviation safety requirements, community feedback (regarding amenity and environmental impacts), environmental considerations and provisions in Draft LPP23 dealing with protection of dark sky. At present, SynergyRED is not aware of any other wind farm proposals or significant development of similar scale in the region. In the absence of such proposals, no cumulative night-time lighting or cumulative dark-sky impacts can be reliably modelled. Also, the grid capacity and transmission infrastructure in the area is unlikely to support another project of comparable scale at this time. Should additional wind farm developments be brought forward in the region in future, these will be assessed by regulators in accordance with the applicable planning framework and statutory guidance at that time. Each project is required to undertake its own LVIA, including cumulative impact assessment where relevant, and is assessed on its individual merits.

No. KEY THEME	SUMMARY OF KEY ISSUES	RESPONSE
	b) Submissions suggested that the photomontages provided do not adequately convey the true scale, worst-case or cumulative visual impacts, and that additional photomontages are required to accurately assess the impact of the Proposal.	The LVIA follows best-practice methods, and additional work was completed at the request of DPLH to improve the visual assessment. This includes new photomontages, red-overlay images and detailed viewpoint assessments for Scott River Road, the Augusta town centre, Town Beach and Albany Terrace, along with individually numbered WTGs and updated ZTV mapping. These additions provide a clearer and more complete understanding of potential visual impacts.
	c) The proposal does not comply with the intent of the Shire's Draft Local Planning Policy which permits wind turbines only where they do not detract from visual amenity.	Whilst Draft LPP23 identifies the need for wind farms to address and minimise visual impact, and be located to avoid areas of visual significance, this is difficult to achieve given the nature of WTG, the subjective nature of visual impact, and as wind farms are typically located in areas of higher topography to maximise the wind resource. There are many factors which influence the location and height of WTG. Visual impact is just one of any number of considerations. A balanced approach to the environmental, technical and social impacts of wind farms is required in the consideration and determination of applications. Additional work is underway to investigate relocating several WTGs within the development envelope to reduce overall visual impact.
	d) Concerned about amenity impacts of aviation lighting on neighbour (and broader community) amenity and environmental impact.	SynergyRED does not propose to install night-time obstacle lighting on the WTG. This is consistent with the risk assessment in the AIA which concludes that lighting of the WTG at night is not necessary to maintain an acceptable level aviation safety. SynergyRED's position reflects CASA guidance (noting that CASA may recommend but not mandate lighting in this instance), aviation safety requirements, community feedback (regarding amenity and environmental impacts), environmental considerations and provisions in Draft LPP23 dealing with protection of dark sky.
6 Noise, shadow flicker and EMI and associated health & residential amenity impacts	a) Operational noise, low-frequency sound and infrasound were raised as concerns for nearby residents.	Infrasound is all around us and can be generated from natural sources (like the ocean) or manmade sources (like cars). A study commissioned by the National Health and Medical Research Council has confirmed that noise from wind farms does not harm human health, particularly for dwellings located 1500 m or more from WTGs. Synergy's Noise Impact Assessment was reviewed by DWER's Environmental Noise Branch and was deemed to be acceptable. The operational noise of the wind farm will be managed through a Noise Management Plan. The Proposal is committed to be compliant with the WA Noise Regulations.
	b) Submissions cited potential impacts on sleep, mental health, stress levels and overall wellbeing.	According to the National Health and Medical Research Centre there is no evidence that wind farms cause adverse health effects in humans. A report published by the Environmental Health Sciences Research Centre found no link between health outcomes and proximity to WTG.
	c) Shadow flicker, light spill and pulsation effects were identified as unacceptable intrusions in a rural living environment.	Construction and operational lighting will be managed through detailed design and included in the CEMP to ensure any potential impacts to nearby residents are managed. SynergyRED conducted an assessment to determine the potential for shadow flicker to occur as a result of the Proposal and identify mitigation options. All predicted actual shadow flicker durations are anticipated to be below the 10 hours per year as recommended by the *National Wind Farm Development Guidelines - Draft July 2010* (published by the Australian Environment Heritage and Protection Council). Aviation lighting is not proposed as part of this Proposal. See item 5 (d).
	d) Leaching of fluorochemicals, BPAs, microplastics and asbestos from blades.	WTG blades contain only trace, chemically bound BPA that does not produce measurable environmental emissions, and independent scientific reviews confirm coatings are non-toxic with no evidence of harmful BPA or microplastic release, noting that any particles are far smaller than everyday sources like tyres or paint; additionally, WTG blades are made from fiberglass and epoxy resin, not asbestos.

No. KEY THEME	SUMMARY OF KEY ISSUES	RESPONSE
	e) How will acceptable noise and shadow flicker impacts on nearby residents be monitored/enforced.	SynergyRED conducted an assessment to determine the potential for shadow flicker to occur as a result of the Proposal and identify mitigation options. All predicted actual shadow flicker durations are anticipated to be below the 10 hours per year as recommended by the *National Wind Farm Development Guidelines - Draft July 2010* (published by the Australian Environment Heritage and Protection Council). Suitable conditions are expected to be imposed at Development Approval stage such as the provision of an Operational Noise Management and Monitoring Plan will include the requirement for noise monitoring to be undertaken to ensure that noise levels are not greater than those predicted and detail the contingency measures to be implemented if exceedances are recorded.
	f) Concern regarding the noise modelling methodology and adequacy of baseline noise monitoring locations; along with need to monitor noise levels during the operational phase and mitigate noise if issues are found to occur.	The DWER Environmental Noise Branch has reviewed and provided technical advice on the NIA and confirmed that the noise modelling calculation method and assumptions are acceptable. Noise monitoring will be undertaken in accordance with conditions imposed on the Development Approval.
	g) Concern regarding the adequacy of baseline studies and the request that these studies should be updated to address neighbouring proposed and approved chalets.	Baseline noise studies were conducted in support of developing noise criteria in accordance with accordance with the South Australia Environment Protection Authority's (**SA EPA**) Wind Farms Environmental Noise Guidelines. The DWER subsequently advised that the Noise Regulations are statutory requirements in Western Australia and will be the standards used to assess compliance, and that the SA Guidelines may only be followed to the extent that they do not conflict with the requirements of the Noise Regulations. This prevents the 'adjustment' of assigned noise levels based on measured background noise levels. On this basis no further baseline noise studies are required or proposed for the Proposal. Noise compliance at recently approved dwellings will be ensured through implementation of conditions of Development Approval.
	h) Concern regarding impacts to telecommunications and request for baseline and post-construction signal-strength testing at nearby sensitive dwellings and mandatory rectification by Synergy for any degradation.	SynergyRED is committed to ensuring the Proposal does not disrupt existing services, and if any issues are identified during detailed design or construction, appropriate mitigation measures will be implemented in consultation with the relevant service providers.
7 Planning and other approval processes & community consultation	The proposal does not comply with the Shire's Draft LPP23: Large Scale Renewable Energy Facilities	The Shire's Draft LPP was released for advertising following preparation and lodgement of the Development Application (as was the release of the State Code). Notwithstanding, the proposal has been assessed against the Draft LPP and found to be generally consistent given it has been prepared in the context of extensive and robust technical investigations and industry best practise, informed by a range of Federal and State legislation, policy and other guidance. Compliance with Draft LPP23 is one of many considerations which will need to be given 'due regard' in the decision making process. It is also noted that a number of submissions were stated to relate to Draft LPP23 which the Shire advertised at the same time as the Development Application, and therefore these submissions did not relate to the Proposal.
	Consultation was described as inadequate in timing, accessibility and transparency.	The Development Application was advertised as a Complex Application in accordance with clause 64 of the *Planning and Development (Local Planning Schemes) Regulations 2015*, for a period of 28 days from 21 November to 19 December 2025. The Shire advertised the proposal on its website and at its office, and letters were sent to all landowners within a 15 km radius. The application was therefore advertised in accordance with the statutory requirements. SynergyRED's community engagement commenced in February 2024 when the community was advised of the proposed Wind Farm through letterbox drops, newspaper advertisements and social media posts. Since then, SynergyRED has been active in the community to share information, seek feedback and answer questions through a variety of methods. During the

No. KEY THEME	SUMMARY OF KEY ISSUES	RESPONSE
		feasibility assessment, SynergyRED has delivered 14 community drop-in sessions, opened a drop-in office in Augusta from February 2025, and held over 170 meetings with landowners, neighbours and community members. SynergyRED also sent letters to homes within five (5) kilometres of the Proposal site, inviting landowners to meet with a SynergyRED representative. Holiday homeowners were also contacted directly via the Stayz booking platform to share information about the Proposal and invite owners to meet with SynergyRED. An information display was established at the Augusta Library in October 2024 to ensure the community had ongoing access to information on the Proposal. In addition to these methods, community members are able to reach SynergyRED's Community Engagement Team by phone, email or through the Q&A function on its website.
	Submissions stated that community feedback was not meaningfully reflected in the Proposal design.	The following changes have been made to the Proposal as a result of the feasibility assessment findings and community feedback: • **Reduced Proposal scale**: The Proposal has been scaled down from a maximum of 30 WTG (150 MW) to a maximum of 20 WTG (100 MW), aligning with available transmission line capacity and reducing the visual impact, noise and overall footprint. • **Environmentally sensitive siting**: WTG locations have been adjusted to avoid areas containing TEC, and the Development Envelope has been revised to exclude environmentally sensitive areas. The minimum blade ground clearance has been increased from 25m to 40m and now to 59m to reduce risk of bird strike. • **Minimised vegetation clearing**: The preferred transport route was chosen to avoid the need for vegetation clearing, further reducing environmental disturbance. Total clearing within the wind farm will not exceed one hectare (1 ha). • **Acid sulfate soil and dewatering management**: Bespoke WTG foundation designs will be used to minimise disruption to shallow groundwater and soils containing acid sulfate materials. • **Tourist viewing platform**: A tourist viewing platform has been incorporated into the design to support increased tourism and provide future educational opportunities about renewable energy. SynergyRED intends to engage with KKKAC in the design process for signage at the tourist viewing platform, to explore opportunities to incorporate local Aboriginal culture and heritage.
	Lack of transparent and consistent communication undermining public confidence.	Refer to response to **Key Theme 7** above. The additional engagement undertaken by SynergyRED has occurred in addition to the statutory advertising period. SynergyRED has facilitated significant community engagement on the Proposal.
	Submissions raised concern about the lack of formal environmental assessment required by the EPA.	The Proposal has followed the correct statutory environmental assessment pathway, and the EPA has determined that a formal assessment under Part IV of the EP Act 1986 was not required. This decision reflected the EPA's review of the project characteristics, likely residual impacts, avoidance and minimisation measures, and the overall environmental risk profile. The Proposal was also referred to DCCEEW and received a "not a controlled action if taken in a particular manner" (NCA-PM) referral decision. This decision means that the proposed wind farm isn't likely to have a significant impact on Federally protected flora, fauna or Ecological communities and so does not require assessment by DCCEEW, provided that the wind farm is developed in accordance with the 'particular manner' specified in the decision. The 'particular manner' includes a new commitment to ensure the minimum blade ground clearance is 59 metres above ground level (increased from 40 metres above ground level at time of referral), to avoid significant impacts to black cockatoos and migratory birds.
	The DAP pathway limits meaningful local input.	The proposal has been subject to extensive community engagement over a number of years by SynergyRED, and the proposal was advertised in accordance with statutory requirements. The use of the Development Assessment Panel (**DAP**) pathway is a transparent, statutory, and valid standard approach to considering and determining Development Applications, with significant input from the local Shire. The DAP process allows for verbal and written deputations to be presented by submitters in addition to submissions being received during the statutory comment period, which are considered by the DAP prior to determination of the application.

No. KEY THEME	SUMMARY OF KEY ISSUES	RESPONSE
	The Proposal is not compliant with local planning policy or town planning scheme (including proposing non-compliant setbacks and height and introducing industrial uses to a rural area).	Section 4 of the Development Application demonstrates general compliance with the Planning Framework. Where matters of interpretation or discretion apply, such as in the case of LVIA, the report responds and provide appropriate justification. SynergyRED prepared and submitted its Development Application prior to the release of the Draft LPP. Upon review of the Draft LPP during the public advertising period, SynergyRED considers its application is generally compliant with the Policy's direction, as it had been prepared in the context of extensive technical investigations and industry best practice, informed by a range of Federal and State legislation and policy. A detailed submission has been provided to the Shire for its consideration in finalising its Policy. **Height** In relation to the height of the WTG, clause 5.13.3 of Local Planning Scheme No.21 (**LPS21**) specifies that maximum height limits specified under the Scheme do not apply to wind farms (including masts), provided the structure is sited and/or treated so as not to detract from the visual amenity of the locality. LVIA has been a significant focus of investigation and reporting in relation to this Proposal. Whilst it is acknowledged the proposal will have a visual impact, the number of WTG has been reduced to a maximum of 20 from an initial 30 WTG layout. and the WTG will be coloured white or light grey to minimise visual intrusion to the extent possible. **Setbacks** The Proposal generally complies with a range of setback requirements set out in LPS21, DBCA guidelines, the Shire's Draft LPP23 and Draft State Code, with only minor variations proposed. WTG will be setback a minimum of 100m from the edge of permanent streams and comply with or exceed LPS21 setbacks to boundaries. The Proposal is not able to achieve a 30m setback to intermittent watercourses required by the LPP. A 1500m setback from existing sensitive premises is proposed (in lieu of 1600m in the Draft LPP). A setback of 1.1 times blade tip height from non-host lots and road reserves, and existing and approved habitable buildings on host and non-host lots will be achieved. WTG will also be setback 100 m from road reserves (measured form their centrepoint) in line with DBCA advice (see Section 2.2, issue 2). **Land Use Permissibility** A number of submissions held the view that the use is Industrial. In response, it is confirmed that a wind farm is specifically defined in LPS1 and an 'A' (discretionary) use in the General Agricultural Zone. It is not defined as an Industrial land use.
	Concerns were raised regarding the involvement of the Augusta Margaret River Clean Community Energy (AMRCCE) and the integrity of the DAP process.	SynergyRED became aware of the wind farm proposal led by the Augusta-Margaret River Clean Community Energy (AMRCCE) in late 2022 while engaging with landowners in the area. SynergyRED commenced engagement with AMRCCE in late 2022 and Synergy entered into an agreement to assume ownership and responsibility for the AMRCCE development in early 2023. Since then, SynergyRED has led the development of the Proposal in line with Synergy's decarbonisation strategy. The use of the **DAP** pathway is a transparent, statutory, and valid standard approach to considering and determining Development Applications.
8 Impacts on agricultural land & rural productivity	The proposal may result in direct and indirect loss of productive agricultural land and disruption to farming operations.	In principle, wind farm projects do not compromise the ongoing use of land for agricultural purposes – the average impact of a wind farm footprint is approximately 1-2% of the land area. This is inclusive of using pre-existing access tracks, so the area lost to productive agriculture is typical less than 2%. This allows agricultural activities to continue, whilst providing landowners with an additional income stream. In turn, this allows for more financially sustainable farming given the seasonal, and often high-risk nature of agriculture, which is further exacerbated by climate change.

No. KEY THEME	SUMMARY OF KEY ISSUES	RESPONSE
		Often, the positioning of WTG involves broad consultation between the Proponent and landowners to ensure agricultural activities are considered – this is one of a wide range of considerations that are taken into account in the preparation of a Development Approval application and determining the final layout of WTG and other infrastructure.
	Concerns were raised regarding contamination risks and altered drainage affecting agricultural viability.	SynergyRED will manage contamination and drainage risks through detailed hydrogeological assessment and strict CEMP/ASSDMP controls, and because the wind farm occupies only a very small portion of largely cleared grazing land, and agricultural viability and farming operations will remain unchanged.
	Impacts on livestock, including animal welfare, behaviour and productivity due to noise, vibration, shadow flicker and infrasound exposure.	There is no evidence to support the view that wind farms have a negative impact on livestock. Livestock are known to use WTG towers for shade, shelter, and as a rubbing post. Meat and Livestock Australia updated wording on the Livestock Production Assurance (**LPA**) website, communicating "...it is safe for livestock to graze in a paddock which also contains solar panels, WTGs and turbines or other equipment."
9 Impacts on property values, investment & rural lifestyle	Submissions expressed concern about declining property values and reduced rental demand, and impact on investment by Proponents in the Augusta townsite as a result of the Wind Farm.	Independent evidence shows no consistent link between wind farms and reduced property values, and broader factors—such as access to services, amenities, land availability and revenue-generating potential typically play a much stronger role in influencing local property and investment outcomes. Property values are not a valid planning consideration in any case.
	Some submitters indicated they would reconsider their plans for investment in planned residential, commercial or cultural projects due to visual and amenity impacts.	Noted.
	Concern regarding increased insurance prices or insurance denial due to increased fire risk.	A BMP has been prepared to support the proposal. Whilst the whole site is declared a 'Bushfire Prone Area', a BAL assessment and associated **Appendix F**: Bushfire Management Plan (BMP) and **Appendix E**: Bushfire Risk Management Plan (BRMP) determined that the risk can be reduced through the implementation of APZ which are cleared and managed area around a house or building that reduces bushfire risk. The WTG will also be designed with fire detection and suppression systems to further reduce risk. As noted by the Australasian Fire and Emergency Services Authorities Council, the likelihood of WTG fires is considered to be low given appropriate protection measures are applied.
10 Impacts on tourism & local economy	Visual industrialisation was raised as a risk to visitor numbers and tourism-dependent businesses. Concern was raised that the proposal may undermine Augusta's reputation as a nature based tourism destination.	It is not expected that the proposal will result in adverse impact to visitor numbers and tourism dependent businesses. The Augusta area provides a range of tourism attractors which are not expected to be adversely affected by this proposal. As with the Albany Wind Farm which is a significant local tourist attraction, a viewing platform and suitable renewable energy interpretive information will be developed to further diversify the tourism experience for visitors.
	The Proposal will not result in significant employment numbers, or the employment of local people.	The construction phase alone could provide economic benefit into the region, supporting local contractors, suppliers, accommodation providers, and businesses. It could also generate up to 150 new job opportunities. Local employment will be encouraged.
11 How the project will contribute to community benefits & energy equity	Electricity generated would be exported to Perth with no improvement to local energy reliability despite ongoing outages.	Western Power is responsible for ensuring the reliability of electricity supply to homes and businesses. The reliability of power supply in any Town depends on many factors, including the condition of local poles and wires, transformers, and other parts of the distribution network. These assets are owned, managed, and maintained by Western Power. Renewable energy generated by the Proposal would be exported to the existing Western Power 132kV transmission line near Beenup substation. From here it would flow to Augusta, Scott River, Molloy Island, Alexandra Bridge, East Augusta, Karridale, Hamelin Bay, Forest Grove and the rest of the energy system.
	Submissions noted the absence of community ownership, benefit-sharing or cooperative models.	SynergyRED acknowledges that the Proposal does not incorporate community ownership, benefit-sharing or cooperative investment models. It does, however, include a $100,000 per-year Community Benefit Fund , a publicly accessible tourist

No. KEY THEME	SUMMARY OF KEY ISSUES	RESPONSE
		viewing platform, engagement with local businesses to maximise Regional participation during the procurement phase, and the creation of full-time operational roles for the operational life of the wind farm.
	Concern regarding how the Community Benefit Fund will be ensured.	SynergyRED has committed to providing a Community Benefit Fund of $100,000 per year, indexed to CPI, as part of the Development Application. Its commitment is expected to be applied as an Advice Note, consistent with other recent Wind Farm determinations. SynergyRED will align the implementation of the Fund with DEED's Community Benefits Guideline, which was released on 4 March 2026.
	Concern regarding how the Community Benefit Fund will be allocated.	SynergyRED will align the implementation of the Fund with DEED's Community Benefits Guideline.
	Concern that the Community Benefit Fund will not offset ongoing/permanent impacts experienced by nearby neighbours, and impact on the land.	SynergyRED acknowledges that the Community Benefit Fund is not designed to offset individual or property-specific impacts. Rather, it provides a stable, long-term mechanism for broader community benefit, while potential impacts on neighbouring landholders are addressed directly through technical assessments, regulatory compliance and enforceable management plans.
	Concern the Proposal will bring negatives to Augusta without any benefits	SynergyRED is committed to managing or mitigating any potential impacts associated with the Proposal in line with regulatory requirements. Beyond understanding if the Proposal is feasible, the feasibility assessment provided valuable information to tailor the Proposal's design to reduce impacts and enhance benefits. Whilst the WTG would be visible from Augusta, if the Proposal proceeds, there could be a number of benefits to Augusta. In addition to the Community Benefit Fund, the construction phase alone could provide economic benefit into the region, supporting local contractors, suppliers, accommodation providers, and businesses. It could also generate up to 150 new job opportunities. Beyond construction, the Proposal could position the Augusta Margaret River region as a frontrunner in Western Australia's energy transition, demonstrating leadership in adopting sustainable infrastructure. This is further supported by SynergyRED's development of a Tourist Viewing Platform to support increased tourism to the area. Augusta would also receive renewable energy generated by the Proposal, as electricity generated by the Proposal would flow to Augusta, as well as Scott River, Molloy Island, Alexandra Bridge, East Augusta, Karridale, Hamelin Bay, Forest Grove and the rest of the energy system.
12 Traffic, roads & roadside vegetation	Increased construction and operational traffic may require road upgrades, posing risk of clearing of native vegetation, erosion, sedimentation, and long-term environmental degradation. Movement of blades and other equipment may create safety concerns for tourist coaches which access roads in the area.	There is limited modification expected to current roads in the area to accommodate the Proposal. Any impact would be limited to the construction phase and not the operational phase where little to no traffic will be generated. Predominantly, existing roads and access tracks will be used. An OSOM Route Assessment concluded minor modifications to road design are required to accommodate vehicles transporting blades and other infrastructure. Any oversized movements, such as blades, would be approved by Main Roads WA (**MRWA**) Some minor vegetation clearing will be required for the main accesses on Scott River Road, which will be addressed through the CEMP. A Traffic Impact Assessment (**TIA**) was also undertaken and identified that vehicle movements during construction will have low to moderate impact and can be accommodated within the existing capacity of the road network.
	Particular concern was raised for mature karri trees along Scott River Road.	There will be no clearing of mature Karri trees along Scott River Road.
13 Extreme weather, fire & safety	Submissions raised safety concerns regarding whether turbine design adequately considers extreme wind forces in the area.	WTG used in Australia are required to meet strict international engineering and safety standards that account for extreme wind events. As part of the detailed design phase, the selected WTG model will undergo site-specific engineering assessments to ensure it is suitable for the conditions at Scott River. These standards are designed so WTG can operate safely across a wide range of weather conditions.

No. KEY THEME	SUMMARY OF KEY ISSUES	RESPONSE
	Submissions raised concern the Proposal inadequately addresses bushfire-related risks (e.g., restrictions on aerial firefighting which may impact a broader area).	A BMP and BRMP have been prepared to address bushfire-related risks. SynergyRED is committed to having fire detection and suppression systems as standard, and in the unlikely event of a WTG fire, WTG can be paused remotely to support aerial firefighting operations. SynergyRED has consulted with DFES and DBCA throughout the assessment process, and this consultation will continue through detailed design to ensure appropriate mitigation measures are in place. Aerial firefighting access will remain possible, with pilots determining safe operating conditions at the time.
14 Decommissioning & rehabilitation risks	Insufficient information was provided regarding decommissioning, rehabilitation and recycling of turbine components.	The Development Application provides an overview of the Decommissioning Strategy, which will be developed further following the Construction phase, and in accordance with the Appendix C Wind Farm in Scott River Preliminary Decommissioning Plan.
	Concerns were raised about long-term liability and responsibility for environmental remediation at the end of project life, and whether funds are available for removal of turbines and resolving site remediation and contamination removal.	The project owner holds full financial responsibility for all end-of-life works, ensuring WTG removal, site rehabilitation, and any required contamination remediation are fully funded and not transferred to landholders or external parties.
	Concern was raised regarding the limitations on future land use following decommissioning.	Following decommissioning, the land will be returned in a condition where it can continue to be used for agricultural purposes. It is not feasible to remove all infrastructure, including footings and subsurface components. Removal of sub-surface infrastructure is only required to ensure compatibility with the intended land use. In some cases, leaving subsurface infrastructure in place may be preferable, for example, to minimise excavation in areas with ASS, as is the case with the subject land. It can also be more sustainable to leave some infrastructure (e.g. buildings, access tracks and water tanks) in place where these can be used by the landowners. The preferences of landowners at the time of decommissioning will be considered. The overall objective is to minimise adverse impacts on the environment, which is not always consistent with excavating all subsurface infrastructure.

3.3 Other Submissions of Objection (369 submissions)

No. KEY THEME	SUMMARY OF KEY ISSUES	RESPONSE
1 Aboriginal heritage	Scott River area holds cultural significance for TO's. Inadequate consultation has occurred with traditional owners and risks to cultural sites.	SynergyRED has entered into a Noongar Standard Heritage Agreement (**NSHA**) with KKAC on behalf of South West Boojarah People. The NSHA outlines the processes for conducting Aboriginal heritage surveys and assessments. An Ethnographic and Archaeological Site Avoidance Heritage Survey has been conducted within areas of potential disturbance.
2. Cumulative impacts & precedent	The proposal may contribute to cumulative environmental, visual and social impacts when combined with existing or future developments.	SynergyRED is not aware of any other proposals for wind farms in the vicinity. Should other developments be proposed, these will be assessed by regulatory bodies in accordance with the current statutory and policy framework at that time, which is expected to consider cumulative impacts e.g. noise, road transport, visual impact etc.
	Objectors argued that cumulative construction impacts across the site have not been adequately assessed.	Cumulative construction impacts have been considered as part of the technical assessments submitted with the Development Application. Construction impacts such as noise, traffic, dust and ground disturbance will be managed through the CEMP. This will outline measures to minimise and coordinate activities across the site, ensuring impacts are appropriately managed and do not exceed acceptable levels.
	Submissions raised concern that approval may set a precedent for further large-scale energy infrastructure in the region.	Should other wind farm developments be proposed, these will be considered by the regulators in the context of the planning framework and other statutory and policy context at the time. Each application is considered on its respective merits.

3.4 Submissions of Indifference (7 submissions)

No.	KEY THEME	SUMMARY OF KEY ISSUES	RESPONSE
1	**Submissions appeared to support an opposed position**	No formal environmental assessment Concern Shire representatives are both pro renewable Concern regarding scale of Proposal Threats to wildlife Risks of ASS Increased risk of fire Impacts to visual amenity and tourism Lack of consistent and transparent communication Health impacts	Refer to technical information contained in Development Application and responses to matters raised in Agency and Community submissions.
2	**Submissions were supportive subject to conditions**	Supportive subject to no adverse wildlife impacts Supportive subject to size of Proposal being reduced, adequate bushfire management	Impacts to wildlife and management of bushfire risk have been addressed in the technical reports included in the Development Application and found to be acceptable. Following consideration of a level of assessment of the Proposal under State and Federal legislation, no formal assessment of the proposal has been required. The size of the Proposal is not able to be reduced due to technical and feasibility considerations.
3	**Position could not be determined on basis further information is required.**	Will the Proposal improve power reliability in Augusta How will it be ensured that the commitment to implement CBF is delivered Will layout be adjusted to avoid ASS and when will this be conducted Shadow flicker modelling – is this per WTG, near buildings or in general farm areas What is the recommended distance that houses be built to WTG, is this distance considered when putting turbines near boundary fences Noise from WTG, the feasibility study doesn’t mention the noise from the WTG and hence distance from houses.	Addressed in themes above

Appendices

Appendix A: Proposed Wind Turbine Envelope

Proposed Wind Farm in Scott River - Proposed Wind Turbine Envelope

Consideration

The Scott River site presents a complex combination of environmental, technical, and planning constraints that must be balanced when determining appropriate turbine placement. The Draft Renewable Energy Planning Code currently proposes a 100 m micro-siting radius. However, SynergyRED understands DPLH is likely to increase this based on industry feedback during the public consultation sessions. To support both the Shire's need for certainty and the Project's technical requirements, SynergyRED proposes a refined, and constraint informed micro-siting approach for consideration as set out below.

1. Planning Context

- Whilst the Draft Code proposes a wind turbine envelope with a radius of 100 m, SynergyRED understands that DPLH is considering increasing this distance in response to strong industry feedback during DPLH consultation sessions that 100 m is too restrictive.
- The Shire's Draft LPP 23 (which is yet to be adopted) includes a 100 m micro-siting provision which reflects the approach in the advertised Draft Code.
- As SynergyRED lodged its Development Application prior to the release of both the Draft Code and Draft LPP 23, it did not consider these in preparing its site layout.
- Recognising this, SynergyRED proposes the following alternative approach to that set out in Item 2 of the Shire's RFI dated 23 January 2026 that is technically robust and reflects the particularly complex nature of the subject site.

2. Proposed Approach

SynergyRED proposes that all turbines be located within the 'constraint free area' (shown by the hatched yellow on the plan[1] provided) **and** with the final location within a 500 m radius from the currently proposed turbine locations.

Application of this approach using the 500 m buffer results in a substantially smaller development envelope than that applied under the development approval application (approximately 286 ha, or 8% of the 3,597 ha Development Envelope.

We understand DPLH is currently considering increasing the current 100 m radial distance to 300 m in response to preliminary feedback on the Draft Code's micro-siting provisions.

Table 1 below outlines the various buffer distances considered and the corresponding available area for development under each scenario.

[1] Note this plan may need to be updated to reflect amended turbine layout in response to Shire RFI and revised LVIA.

Table 1: Buffer distances and developable area for micro-siting[2]

Development Envelopes	Total area (ha)	Constraint free land* available for micro-siting of turbines (ha)
Original Development Envelope	3,597	536.53
100 m radial buffer	62.8	35.0
200 m radial buffer	251.3	96.5
300 m radial buffer	565.5	160.5
500 m radial buffer	1488.9	285.7

** Constraint free land is depicted as the 'constraints-based wind turbine envelope' (yellow hashed polygon) on the provided plan.*

Why this approach is more robust

We believe this method provides a balanced and technically robust approach to flexibility for micro-siting, while ensuring all relevant constraints remain fully protected.

The 'constraints free area' (i.e. constraints-based wind turbine envelope' on the provided plan) has been deliberately designed to exclude all areas where turbine placement would be unsuitable for technical reasons (e.g. environmental constraints) and/or inappropriate or inconsistent with regulatory expectations and our Project commitments, including:

- Sensitive receptors - 1,500 m buffer.
- Existing transmission line - 240 m buffer (2 × 80 m blade length × 1.5).
- Roads - 242 m buffer (1.1 × 220 m tip height).
- Registered and lodged heritage sites - 80 m buffer (blade length).
- Landholder development exclusion areas (e.g., dairy operations, centre-pivot irrigation).
- External freehold boundaries - 240 m buffer (1.1 × 220 m tip height).
- DBCA-managed land (Reserve 42377, Lot 101) - 100 m buffer.
- Native vegetation - 100 m buffer, including all potential black cockatoo habitat trees, wetland areas, and covenant areas.

[2] Based on the proposed maximum 20 turbines

This approach provides a more technically robust basis for identifying micro-siting, and:

- Ensures turbines can only be placed in areas already demonstrated to be free from mapped environmental and land-use constraints.
- Provides sufficient flexibility but is still a tightly defined envelope for turbine placement.
- Offers greater transparency and certainty because it is grounded in measurable, defensible, site-specific constraints rather than arbitrary buffers which do not consider technical findings or other constraints such as boundary setbacks.
- Ensures no greater environmental or social impact than what has already been presented and assessed, when combined with Project commitments.

From a visual impact perspective, applying a 500 m micro-siting radius provides limited flexibility to relocate WTGs, given the constraint-free area on the plan in Figure 1 below. Using this approach, the 'horizontal spread' of the total wind farm will not be able to increase from most key viewpoints (the south west around Augusta). That is, the most northern turbine and southern turbine cannot move any further away from the center of the site which therefore limits any increase to visual impact. Hence, any future turbine relocation is not expected to materially increase visual impacts from those identified in the updated visual assessment, completed to address DPLH's comments (see Section 2.1 - DPLH Agency Response).

3. Summary of SynergyRED's position

SynergyRED proposes that all turbines be located within the 'constraint free area' AND within a 500 m radius from the current proposed turbine locations.

This proposed micro-siting approach represents a technically robust, low risk and defensible approach that:

- Provides clarity and certainty to the Shire.
- Maintains technical feasibility for the Project.
- Ensures no increased environmental or social impacts.
- Aligns with the evolving intent of the Draft Code and Draft LPP 23.
- Provides transparency to turbine location and transparency in decision making.
- Reflects feedback from both the Shire and DPLH consultation.

We believe this methodology offers the most balanced path forward for assessment, approval and future implementation.

4. Proposed Condition of Development Approval (Draft)

The following draft condition has been prepared for consideration by the Shire and DAP in the preparation of the Shire's RAR and determination of the application, respectively. The condition is based on the SDAU's decision on Narrogin Wind Farm (September 2025), and adapted to this Project, applying the rationale outlined above:

XX. Prior to the commencement of development, a Micrositing plan, drawn to scale and provided in a suitable format, shall be submitted for approval of the Shire of Augusta-Margaret River identifying the footprint at ground level within which each turbine must be located. The footprint for each turbine identified in the Micrositing plan:

a. *Must be no more than 500 m in any horizontal direction from the centre of the turbine at ground level as shown on the approved plans; and*
b. *Must be located within the Constraints Based Wind Turbine Envelope identified on approved Map No.XXX which forms part of this approval; and*
c. *Must not be within 1.1 times blade tip height from non-host lots, reserves located outside the Development Envelope, road reserves, and existing and approved habitable buildings on host lots and non-host lots.*
